      2.2.4 ESP-TLS ............................................................. 157
      2.2.5 ESP HTTP Client .................................................... 168
      2.2.6 ESP Local Control ................................................... 180
      2.2.7 ESP Serial Slave Link ............................................. 188
      2.2.8 ESP WebSocket Client .............................................. 204
      2.2.9 ESP x509 Certificate Bundle ..................................... 210
      2.2.10 HTTP Server ........................................................ 212
      2.2.11 HTTPS server ........................................................ 234
      2.2.12 ICMP Echo ........................................................... 237
      2.2.13 mDNS Service ........................................................ 241
      2.2.14 IP Network Layer ................................................... 256
   2.3 Bluetooth API .............................................................. 256
      2.3.1 BT COMMON .......................................................... 256
      2.3.2 BT LE ................................................................. 260
      2.3.3 CLASSIC BT .......................................................... 353
      2.3.4 Controller & VHCI ................................................... 428
      2.3.5 ESP-BLE-MESH ....................................................... 436
      2.3.6 NimBLE-based host APIs .......................................... 647
   2.4 Error Codes Reference .................................................... 650
   2.5 Networking APIs .......................................................... 656
      2.5.1 Wi-Fi ................................................................. 656
      2.5.2 Ethernet ............................................................... 739
      2.5.3 Thread ................................................................. 765
      2.5.4 ESP-NETIF ............................................................ 770
2.5.5 IP Network Layer ................................................................. 787
2.5.6 Application Layer .............................................................. 790
2.6 Peripherals API ................................................................. 790
  2.6.1 Analog to Digital Converter (ADC) ........................................... 791
  2.6.2 Digital To Analog Converter (DAC) .......................................... 810
  2.6.3 GPIO & RTC GPIO ............................................................ 813
  2.6.4 General Purpose Timer (GPTimer) .......................................... 831
  2.6.5 Inter-Integrated Circuit (I2C) ................................................ 839
  2.6.6 Inter-IC Sound (I2S) .......................................................... 855
  2.6.7 LCD ........................................................................ 870
  2.6.8 LED Control (LED) ............................................................ 879
  2.6.9 Motor Control Pulse Width Modulator (MCPWM) ......................... 894
  2.6.10 Pulse Counter (PCNT) ......................................................... 917
  2.6.11 Remote Control (RMT) ....................................................... 927
  2.6.12 SD Pull-up Requirements .................................................... 945
  2.6.13 SDMMC Host Driver .......................................................... 949
  2.6.14 SD SPI Host Driver ........................................................... 954
  2.6.15 SDIO Card Slave Driver ..................................................... 959
  2.6.16 Sigma-delta Modulation ...................................................... 968
  2.6.17 SPI Master Driver ............................................................ 971
  2.6.18 SPI Slave Driver ............................................................. 992
  2.6.19 ESP32-WROOM-32SE (Secure Element) .................................. 999
  2.6.20 Touch Sensor ................................................................. 999
  2.6.21 Two-Wire Automotive Interface (TWAI) ................................... 1013
  2.6.22 Universal Asynchronous Receiver/Transmitter (UART) ............... 1029
2.7 Project Configuration .......................................................... 1051
  2.7.1 Introduction ................................................................. 1051
  2.7.2 Project Configuration Menu ................................................. 1051
  2.7.3 Using sdkconfig defaults ................................................... 1052
  2.7.4 Kconfig Formatting Rules ................................................... 1052
  2.7.5 Backward Compatibility of Kconfig Options .............................. 1052
  2.7.6 Configuration Options Reference ....................................... 1053
2.8 Provisioning API ............................................................... 1303
  2.8.1 Protocol Communication .................................................... 1303
  2.8.2 Unified Provisioning .......................................................... 1313
  2.8.3 Wi-Fi Provisioning ........................................................... 1318
2.9 Storage API ........................................................................ 1334
  2.9.1 FAT Filesystem Support ...................................................... 1334
  2.9.2 Manufacturing Utility ........................................................ 1340
  2.9.3 Non-volatile storage library ................................................ 1344
  2.9.4 NVS Partition Generator Utility .......................................... 1363
  2.9.5 SD/SDIO/MMC Driver ......................................................... 1370
  2.9.6 SPI Flash API ................................................................. 1379
  2.9.7 SPIFFS Filesystem ............................................................. 1405
  2.9.8 Virtual filesystem component .............................................. 1408
  2.9.9 Wear Levelling API .......................................................... 1421
2.10 System API ...................................................................... 1424
  2.10.1 App Image Format .......................................................... 1424
  2.10.2 Application Level Tracing .................................................. 1430
  2.10.3 Call function with external stack ....................................... 1434
  2.10.4 Console ..................................................................... 1435
  2.10.5 eFuse Manager ............................................................... 1443
  2.10.6 Error Codes and Helper Functions ................................... 1459

5 ESP-IDF 5.0 Migration Guides

5.1 Migrate Build System to ESP-IDF 5.0
  5.1.1 Migrating from make to cmake
  5.1.2 Update fragment file grammar

5.2 Migrate Windows Environment to ESP-IDF 5.0

5.3 Migrate Ethernet Drivers to ESP-IDF 5.0
  5.3.1 esp_eth_ioctl() API
  5.3.2 KSZ8041/81 and LAN8720 Driver Update
  5.3.3 ESP NETIF Glue Event Handlers

5.4 Migrate FreeRTOS to ESP-IDF 5.0
  5.4.1 Legacy API and Data Types
  5.4.2 Tasks Snapshot
  5.4.3 FreeRTOS Asserts

5.5 Migrate Peripherals to ESP-IDF 5.0
  5.5.1 Peripheral Clock Gating
  5.5.2 SPI Flash Interface
  5.5.3 ADC
  5.5.4 GPIO
  5.5.5 Timer Group Driver

5.6 Removed or deprecated components

5.7 Migrate Storage to ESP-IDF 5.0
  5.7.1 Breaking changes:

5.8 Migrate System to ESP-IDF 5.0
  5.8.1 Inter-Processor Call
  5.8.2 ESP Clock
  5.8.3 Cache Error Interrupt
  5.8.4 Brownout
  5.8.5 Trax
  5.8.6 ROM
  5.8.7 ESP HW Support

4.33 Wi-Fi Security
  4.33.1 ESP32 Wi-Fi Security Features
  4.33.2 Protected Management Frames (PMF)
  4.33.3 WPA3-Personal

4.34 Wi-Fi Security

This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

**Note:** This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

### 1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An ESP32 board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

If you have one of ESP32 official development boards listed below, you can click on the link to learn more about the hardware.
ESP32-DevKitC V4 Getting Started Guide

This guide shows how to start using the ESP32-DevKitC V4 development board.

What You Need

• ESP32-DevKitC V4 board
• USB A / micro USB B cable
• Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

• different ESP32 modules
  – ESP32-WROOM-DA
  – ESP32-WROOM-32E
  – ESP32-WROOM-32UE
  – ESP32-WROOM-32D
  – ESP32-WROOM-32U
  – ESP32-SOLO-1
  – ESP32-WROVER-E
  – ESP32-WROVER-IE
• male or female pin headers.

For details please refer to ESP Product Selector.

Functional Description The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

![Fig. 1: ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered](image-url)

<td></td>
</tr>
</tbody>
</table>

### Notes
- The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

- The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

### Power Supply Options
There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

### Header Block
The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, as shown in ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered. The numbering and names are the same as in the ESP32-DevKitC V4 schematics (PDF).

P: Power supply; I: Input; O: Output.

**Note on C15** The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows the location of C15 highlighted in yellow.
Chapter 1. Get Started

ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options.

What You Need

- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-E module
- LCD screen
- microSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 6: ESP-WROVER-KIT block diagram

Fig. 7: ESP-WROVER-KIT board layout - front

Fig. 8: ESP-WROVER-KIT board layout - back
**Key Component** | **Description**
---|---
**FT2232HL** | The FT2232HL chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232HL also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232HL chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V4.1 schematic.

**32.768 kHz** | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

**0R** | Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.

**ESP32-WROVER-E module** | This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.

**Diagnostic LEDs** | Four red LEDs connected to the GPIO pins of FT2232HL. Intended for future use.

**UART** | Serial port. The serial TX/RX signals of FT2232HL and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

**SPI** | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the voltage of this interface is 3.3 V.

**CTS/RTS** | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

**JTAG** | JTAG interface. JTAG signals of FT2232HL and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

**USB Port** | USB interface. Power supply for the board as well as the communication interface between a computer and the board.

**EN Button** | Reset button.

**BOOT Button** | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

**Power Switch** | Power On/Off Switch. Toggling toward the Boot button powers the board on, toggling away from Boot powers the board off.

**Power Selector** | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.

**5V Input** | 5V power supply interface for a standard coaxial power connector, 5.5 x 2.1 mm, center positive. This interface can be more convenient when the board is operating autonomously (not connected to a computer).

**5V Power On LED** | This red LED turns on when power is supplied to the board, either from USB or 5V Input.

**LDO** | NCP1117(1A), 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage, but the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V4.1 schematic.

**Camera Connector** | Camera interface, a standard OV7670 camera module.

**RGB LED** | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).

**I/O Connector** | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, 12C, 12S, SPI, etc.

**microSD Card Slot** | Useful for developing applications that access microSD card for data storage and retrieval.

**LCD** | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown in figure ESP-WROVER-KIT board layout - back.
Setup Options  There are three jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.
<table>
<thead>

</tbody>
</table>
**Allocation of ESP32 Pins** Some pins or terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data/Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1** The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>

Start Application Development  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the Power Switch to ON, and the 5V Power On LED should light up.

Now to Development  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

The application examples that use some hardware specific to your ESP-WROVER-KIT can be found below.
Chapter 1. Get Started

- On-board LCD example: peripherals/spi_master/lcd
- SD card slot example: storage/sd_card
- Camera connector example: https://github.com/espressif/esp32-camera

ESP-WROVER-KIT V3 Getting Started Guide  This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need
- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:
- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note:  The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview  The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description  The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:
- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
### Key Component Description

#### 32.768 kHz
External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

#### Zoe
Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.

#### ESP32 Module
Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.

#### FT2232
The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V3 schematic.

#### UART
Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

#### SPI
By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.

#### CTS/RTS
Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

#### JTAG
JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

#### EN
Reset button.

#### Boot
Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

#### USB
USB interface. Power supply for the board as well as the communication interface between a computer and the board.

#### Power Key
Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.

#### Power Select
Power supply selection. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options. jumper header JP7.

ESP-WROVER-KIT V2 Getting Started Guide  This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview   ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview   The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description   The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Submit Document Feedback
Chapter 1. Get Started

**Start Application Development** Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development** Please proceed to **Get Started**, where Section **Installation** will quickly help you set up the development environment and then flash an example project onto your board.

**ESP32-PICO-KIT V4 / V4.1 Getting Started Guide**

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check **ESP32 Hardware Reference**.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

**What You Need**

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section **Start Application Development**.
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.
2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

![Fig. 15: ESP32-PICO-KIT block diagram](image)

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.
Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.
**Pin Descriptions**  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *ESP32-PICO-KIT board layout*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

Chapter 1. Get Started

Note:

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input, b) output.
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development  Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions  The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4” ).

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-Ethernet-Kit V1.2 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.2 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet
Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

![Ethernet Board (A)](image)

**Fig. 21: ESP32-Ethernet-Kit V1.2 (click to enlarge)**

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

**Functionality Overview**  
The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

**Functional Description**  
The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)**  
The table below provides description starting from the picture’s top right corner and going clockwise.
Chapter 1. Get Started

<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
<tr>
<td>GPIO Header 1</td>
<td>This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see GPIO Header 1.</td>
</tr>
</tbody>
</table>

**Note:** Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users don’t need to do any operation with BOOT button or EN button.

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an
Chapter 1. Get Started

Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

</tr>
</tbody>
</table>

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

**RMII Clock Sourced Externally by PHY**  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GR PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).
Fig. 25: RMII Clock from IP101GRI PHY
Fig. 26: RMII Clock from ESP Internal APLL
RMII Clock Sourced Internally from ESP32’s APLL  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

GPIO Allocation  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

IP101GRI (PHY) Interface  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>

<td>MDIO</td>
</tr>
<tr>
<td>PHY Reset</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

Note: The allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IO MUX or GPIO Matrix. REF_CLK can only be selected from GPIO0, GPIO16 or GPIO17 and it can not be changed through GPIO Matrix.

GPIO Header 1  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RE-
Chapter 1. Get Started

SET_N with GPIO5 to turn the clock output on. See also RMII Clock Sourced Externally by PHY. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

Start Application Development  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development  Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board. Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example  After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.2 (click to enlarge).

Summary of Changes from ESP32-Ethernet-Kit V1.1

- Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
- Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
- Replace ESP32-WROVER-B with ESP32-WROVER-E.

ESP32-Ethernet-Kit V1.0 Getting Started Guide  This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.
**Functionality Overview** The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

![ESP32-Ethernet-Kit block diagram](image)

Fig. 28: ESP32-Ethernet-Kit block diagram (click to enlarge)

**Functional Description** The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)** The table below provides description starting from the picture’s top right corner and going clockwise.
### Key Component | Description
--- | ---
ESP32-WROVER-B | This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
GPIO Header 2 | Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see GPIO Header 2.
Flow Control | A jumper header with access to the board signals. For details, see Flow Control.
Function Switch | A DIP switch used to configure the functionality of selected GPIOs of ESP32. For details, see Function Switch.
Tx/Rx LEDs | Two LEDs to show the status of UART transmission.
GPIO Header 3 | Provides access to some GPIOs of ESP32 that can be used depending on the position of the Function Switch.
FT2232H | The FT2232H chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232H also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232H chip enhances user-friendliness in terms of application development and debugging. See ESP32-Ethernet-Kit V1.0 Ethernet board (A) schematic.
USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Switch | Power On/Off Switch. Toggling toward the Boot button powers the board on, toggling away from Boot powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
5V Power On LED | This red LED turns on when power is supplied to the board, either from USB or 5V Input.

Fig. 29: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
Chapter 1. Get Started

PoE Board (B)  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

Note:

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPI RAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

Start Application Development  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development**  Proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

To use the older GNU Make compilation system, please refer to *Installation* section.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**  After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on *ESP32-Ethernet-Kit V1.0 board*.

For other design documentation for the board, please contact us at sales@espressif.com.

**ESP32-Ethernet-Kit V1.1 Getting Started Guide**  This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- **ESP32-Ethernet-Kit V1.1 board**
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**  ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.
Chapter 1. Get Started

</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
<tr>
<td>GPIO Header 1</td>
<td>This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see GPIO Header 1.</td>
</tr>
</tbody>
</table>

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.
Chapter 1. Get Started

Fig. 34: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)

### Table 4: Table PoE board (B)

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options** This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch** When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

### RMII Clock Selection

The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.

### RMII Clock Sourced Externally by PHY

By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).
Fig. 35: RMII Clock from IP101GRI PHY
RMII Clock Sourced Internally from ESP32’s APLL. Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

![Diagram of RMII Clock from ESP Internal APLL](image)

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

**GPIO Allocation** This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface** The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).
Chapter 1. Get Started

- **ESP32 Pin (MAC)**
  - RMII Interface
    - 1: GPIO21  TX_EN
    - 2: GPIO19  TXD[0]
    - 3: GPIO22  TXD[1]
    - 4: GPIO25  RXD[0]
    - 5: GPIO26  RXD[1]
    - 6: GPIO27  CRS_DV
    - 7: GPIO0  REF_CLK
  - Serial Management Interface
    - 8: GPIO23  MDC
    - 9: GPIO18  MDIO
  - PHY Reset
    - 10: GPIO5  Reset_N

**Note:** Except for REF_CLK, the allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1** This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>.</th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
<tr>

</tr>
<tr>
<td>9</td>
<td>GND</td>
<td>Ground</td>
</tr>
<tr>
<td>10</td>
<td>3V3</td>
<td>3.3 V power supply</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-32D module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the **Function Switch**.

</tbody>
</table>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [*ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic*](https://example.com).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

## Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

## Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.
Now to Development  Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example  After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.1.

Summary of Changes from ESP32-Ethernet-Kit V1.0

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

ESP32-DevKitS(-R)

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif.

ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
Chapter 1. Get Started

The document consists of the following major sections:

• **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.

• **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)’s hardware.

• **Related Documents**: Gives links to related documentation.

**Getting Started**  
This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section *How to Flash a Board* provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

**Overview**  
ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

• **ESP32-DevKitS**:
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

• **ESP32-DevKitS-R**:  
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

For information about above modules, please refer to **ESP32 Series Modules**.

**Description of Components**
Fig. 37: ESP32-DevKitS - front

Fig. 38: ESP32-DevKitS-R - front
Chapter 1. Get Started

### Key Component | Description
--- | ---
Spring Pins | Click the module in. The pins will fit into the module’s castellated holes.
2.54 mm Female Headers | These female headers are connected to pins of the module mounted on this board. For description of female headers, please refer to Header Blocks.
USB-to-UART Bridge | Single-chip USB to UART bridge provides transfer rates of up to 3 Mbps.
LDO | 5V-to-3.3V low-dropout voltage regulator (LDO).
Micro-USB Connector/Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
EN Button | Reset button.
Boot Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
Power On LED | Turns on when the USB or power supply is connected to the board.

**How to Flash a Board**  
Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Hardware Setup**  
Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:

- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

**Software Setup**

**Preferred Method**  
The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

**Alternative Method**  
As an alternative, Windows users can flash binaries using the Flash Download Tool. Just download it, unzip it, and follow the instructions inside the doc folder.

---

**Note:**

1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

---

**Board Dimensions**

**Contents and Packaging**
Fig. 39: ESP32-DevKitS board dimensions - back

Fig. 40: ESP32-DevKitS-R board dimensions - back
**Retail orders**  If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram**  A block diagram below shows the components of ESP32-DevKitS(-R) and their interconnections.

![Block Diagram](Fig.41: ESP32-DevKitS(-R) (click to enlarge))

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

ESP32-PICO-KIT-1

Overview  ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-V3 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
• RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

Fig. 42: ESP32-PICO-KIT-1 Overview (click to enlarge)
This guide covers:

- **Getting Started**: Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
- **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference**: Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
- **Related Documents**: Gives links to related documentation.

**Getting Started** This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

**Description of Components** The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

![ESP32-PICO-KIT-1 board layout - front](click to enlarge)

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

Submit Document Feedback
Start Application Development Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

Required Hardware

- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS

Software Setup Please proceed to Get Started, where Section Installation will quickly help you set up the development environment.

Contents and Packaging

Retail Orders If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

![ESP32-PICO-KIT-1 Block Diagram](click to enlarge)

Fig. 44: ESP32-PICO-KIT-1 Block Diagram (click to enlarge)

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
Pin Descriptions  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see Description of Components. The pin numbering and header names are the same as in the schematic given in Related Documents.

**Note:**

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

ESP32-PICO-DevKitM-2

Overview     ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-MINI-02(02U) module with complete Wi-Fi and Bluetooth functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02(02U) are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

• Getting Started: Provides an overview of the ESP32-PICO-DevKitM-2 and software setup instructions to get started.
• Contents and Packaging: Provides information about packaging and contents for retail and wholesale orders.
• Hardware Reference: Provides more detailed information about the ESP32-PICO-DevKitM-2’s hardware.
• Hardware Revision Details: Covers revision history, known issues, and links to user guides for previous versions (if any) of the ESP32-PICO-DevKitM-2.
• Related Documents: Gives links to related documentation.

Getting Started     This section describes how to get started with the ESP32-PICO-DevKitM-2. It begins with a few introductory sections about the ESP32-PICO-DevKitM-2, then Section Start Application Development provides instructions on how to flash firmware onto the ESP32-PICO-DevKitM-2.

Description of Components     The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-DevKitM-2 board. We take the board with a ESP32-PICO-MINI-02 module as an example in the following sections.

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-1(1U)-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.

The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentaton.

**Getting Started**  This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section **Start Application Development** provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.
Chapter 1. Get Started

Overview  This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

Contents and Packaging

Retail orders  If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Description of Components  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.

**Start Application Development**  Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.

**Attention:**  ESP32-DevKitM-1 is a board with a single core module, please enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing your applications.

**Hardware Reference**

**Block Diagram**  A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

**Power Source Select**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

**Warning:**

- The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.
Pin Descriptions  The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

### 1.2.2 Software

To start using ESP-IDF on ESP32 you’ll need the following software installed:

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full Application for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain

### 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

#### 1.3.1 IDE

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.
Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to Espressif IDF Eclipse Plugins IDF for further instructions.

Note: In Espressif IDF Eclipse Plugins, though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

Quick Install Guide   Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

Supported Features

• Setup, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
• Build, with one click build and multi target build, you can easily build and deploy your applications.
• Flash, with both UART and JTAG flash out of the box.
Chapter 1. Get Started

- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** ([https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md](https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md)), with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the `.svdat` files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

**Bugs & Feature Requests**   If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the [forum](https://github.com/espressif/vscode-esp-idf-extension), or open a [github issue](https://github.com/espressif/vscode-esp-idf-extension) for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, [raise your feature request on github](https://github.com/espressif/vscode-esp-idf-extension).

### 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

**Standard Setup of Toolchain for Windows**

**Introduction**   ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse](https://www.eclipse.org) or another graphical IDE with CMake support instead.

**Note:**   Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

**ESP-IDF Tools Installer**   The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.
Chapter 1. Get Started

What is the use case for Online and Offline Installer

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation

The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

Launching ESP-IDF Environment

At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
**First Steps on ESP-IDF**  Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

**Note:** If you haven’t yet installed the ESP-IDF, please go to **Installation** and follow the instruction in order to get all the software needed to use this guide.

**Start a Project**  Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

**Windows**

```
cd %userprofile%\esp
xcopy /e /i $IDF_PATH\examples\get-started\hello_world hello_world
```

**Linux/macOS**

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Connect Your Device**  Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to **Establish Serial Connection with ESP32** for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure your Project**  Navigate to your `hello_world` directory, set ESP32 chip as the target and run the project configuration utility `menuconfig`.

**Windows**

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```
Linux/macOS

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32` should be done once after opening a new project. If the project contains some existing builds and configurations, they will be cleared and initialized. The target may be saved in the environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”. This example will run with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MINI-1(1U) module, enable single core mode `CONFIG_FREERTOS_UNICORE` in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project**  Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
```

(continues on next page)
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin

```
esptool.py v2.3.1
```

Project build complete. To flash, run this command:
```
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
```
```
→ -partition-table.bin
```
or run 'idf.py -p PORT flash'

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash on the Device**  Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:
```
idf.py -p PORT [-b BAUD] flash
```
Replace PORT with your ESP32 board’s serial port name.
You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.
For more information on idf.py arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashers the project, so running `idf.py build` is not necessary.

**Encountered Issues While Flashing?**  If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

`esptool.py` resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [*Establish Serial Connection with ESP32*]). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the *Boot* button (GPIO0) and press the *EN* button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.
Normal Operation  When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
→ after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
→ 0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
→ 0x10000 hello_world.bin

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out the Eclipse guide, VS Code guide.

Monitor the Output  To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
→ world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+C | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
```

(continues on next page)
After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26 MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

```
$idf.py -p PORT flash monitor
```

See also:

- IDF Monitor for handy shortcuts and more details on using IDF monitor.
- idf.py for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

Important: Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

Additional Tips
Permission issues /dev/ttyUSB0  With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Python compatibility  ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script  From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

Add ESP-IDF tools to PATH using an export script  ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.ps1:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

Establis Serial Connection with ESP32  This section provides guidance how to establish serial connection between ESP32 and PC.

Connect ESP32 to PC  Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:
• CP210x: CP210x USB to UART Bridge VCP Drivers
• FTDI: FTDI Virtual COM Port Drivers

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows**  Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

![Device Manager](image)

Fig. 57: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

**Check port on Linux and macOS**  To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*  
```

**macOS**

```
ls /dev/cu.*  
```

**Note:** macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check...
Fig. 58: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

**Adding user to `dialout` on Linux**  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection**  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32.

**Windows and Linux**  In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![Fig. 59: Setting Serial Communication in PuTTY on Windows](image-url)
Fig. 60: Setting Serial Communication in PuTTY on Linux
Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32, see Example Output.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

  ```bash
  ls /dev/cu.*
  ```

- You should see similar output:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART
  ```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

  ```bash
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32, see Example Output. To exit the `screen` session type `Ctrl-A \`. 

**Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log by ESP32 is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst::0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst::0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0000,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.
Chapter 1. Get Started

If you got here from Step 5. First Steps on ESP-IDF when installing s/w for ESP32 development, then you can continue with Step 5. First Steps on ESP-IDF.

**IDF Monitor** The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features. This tool can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character it-</td>
<td></td>
</tr>
<tr>
<td></td>
<td>self to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character it-</td>
<td></td>
</tr>
<tr>
<td></td>
<td>self to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project <code>flash</code> target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target <code>encrypted-flash</code> is run if idf_monitor was started with argument <code>-E</code>.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-<code>flash</code> target, then resumes idf_monitor. Similar to the <code>flash</code> target, but only the main app is built and re-flashed. Target <code>encrypted-app-flash</code> is run if idf_monitor was started with argument <code>-E</code>.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>

<td>tion</td>
<td></td>
</tr>
</tbody>
</table>

Any keys pressed, other than `Ctrl-]` and `Ctrl-`T, will be sent through the serial port.
IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form `0x4_______`, IDF Monitor uses `addr2line` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was... unhandled.
Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : ...
  → 0x3ff7e00
A2  : 0x3ff136c A3  : 0x00000005 A4  : 0x00000000 A5  : ...

  → 0x400dbf82:0x3ff7e60 0x400dd071d:0x3ff7e90
```

IDF Monitor adds more details to the dump:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was... unhandled.
Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : ...
  → 0x3ff7e00

  → main/./hello_world_main.c:57 (inlined by) inner_dont_crash at /home/gus/esp/32/idf/examples/get-started/hello_world/
  → main/./hello_world_main.c:52
A2  : 0x3ff136c A3  : 0x00000005 A4  : 0x00000000 A5  : ...
  → 0x00000000
A6  : 0x00000000 A7  : 0x00000080 A8  : 0x00000000 A9  : ...
  → 0x3ff7e00
A10 : 0x00000003 A11 : 0x00060f23 A12 : 0x00060f20 A13 : ...
  → 0x3ff6a6d
A14 : 0x00000047 A15 : 0x0000000f SAR : 0x00000019 EXCCAUSE:...
  → 0x0000001d
EXCVADDR: 0x00000000 LBE1G: 0x4000c46c LEND: 0x4000c477 LCOUNT: ...
  → 0x00000000
Backtrace: 0x400f360d:0x3ff7e00 0x400dbf56:0x3ff7e20 0x400dbf5e:0x3ff7e40...
  → 0x400dbf82:0x3ff7e60 0x400dd071d:0x3ff7e90
```

To decode each address, IDF Monitor runs the following command in the background:
Chapter 1. Get Started

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

---

**Launching GDB with GDBStub**  
By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (`idf.py menuconfig`) and set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic or set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
```

---

**Output Filtering**  
IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the `logging library`. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
• "*:N" suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
• Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
• Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
• Rule "tag1:I tag2:W" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
• Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
• `tag3:N` in the rule "tag1:I tag2:W tag3:N `*:V`" is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example**  
The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID...
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `\`PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N `*:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

**Known Issues with IDF Monitor**

**Issues Observed on Windows**

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when "idf.py" exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When "gdb" is run, it might stall for a short time before it begins communicating with the GDBStub.

**Standard Toolchain Setup for Linux and macOS**

**Installation Step by Step**  
This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment**  
These are the steps for setting up the ESP-IDF for your ESP32.

- **Step 1. Install Prerequisites**
Chapter 1. Get Started

- Step 2. Get ESP-IDF
- Step 3. Set up the tools
- Step 4. Set up the environment variables
- Step 5. First Steps on ESP-IDF

Step 1. Install Prerequisites  In order to use ESP-IDF with the ESP32, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

For Linux Users  To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

  ```bash
  sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

- CentOS 7 & 8:

  ```bash
  sudo yum -y update && sudo yum install git wget flex bison gperf python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb
  ```

  CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja --ccache dfu-util libusb
  ```

  Note:
  - CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF will use the version of Python installed by default on macOS.

- Install pip:

  ```bash
  sudo easy_install pip
  ```

- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:

    ```bash
    brew install cmake ninja dfu-util
    ```

  - If you have MacPorts, you can run:

    ```bash
    sudo port install cmake ninja dfu-util
    ```

  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

  - It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

  Note:  If an error like this is shown during any step:

  ```bash
  ```
Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

### Installing Python 3

Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:
  
  ```
brew install python3
  ```

- If you have MacPorts, you can run:
  
  ```
sudo port install python38
  ```

### Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

### Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

```
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32,esp32c3,esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`. 
Chapter 1. Get Started

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell’s profile (.profile,.bashrc,.zprofile, etc.)

   ```bash
   alias get_idf='$. $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.
Chapter 1. Get Started

**Note:** If you haven’t yet installed the ESP-IDF, please go to *Installation* and follow the instruction in order to get all the software needed to use this guide.

**Start a Project** Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from examples directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Linux/macOS**

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Connect Your Device** Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure your Project** Navigate to your `hello_world` directory, set ESP32 chip as the target and run the project configuration utility `menuconfig`.

**Windows**

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

**Linux/macOS**

```bash
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```
Chapter 1. Get Started

Setting the target with `idf.py set-target esp32` should be done once after opening a new project. If the project contains some existing builds and configurations, they will be cleared and initialized. The target may be saved in the environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello_word". This example will run with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MINI-1(1U) module, enablesinglecoremode (`CONFIG_FREERTOS_UNICORE`) in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option --style. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
```
Chapter 1. Get Started

(continued from previous page)

Generating hello_world.bin

esptool.py v2.3.1

Project build complete. To flash, run this command:

```
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device** Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see *idf.py*.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

**Encountered Issues While Flashing?** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in *Troubleshooting*.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see *Establish Serial Connection with ESP32*). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (GPIO0) and press the **EN** button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation** When flashing, you will see the output log similar to the following:
Chapter 1. Get Started

... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB --0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin
→ 0x10000 hello_world.bin

Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the Eclipse guide, VS Code guide.

Monitor the Output  To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
→ world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+| | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)

(continues on next page)
After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```plaintext
... Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/Bluetooth, silicon revision 1, 2MB...
-> external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```plaintext
e666|Xn@y,!66(6P+)06Hn9a~'/96!6t566P8-6k66~e6a856jA
~zY66Y(161 66 e666)|Xn@y,!6b6Y(6 jpiU)6+z5Ymp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```bash
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

---

**Additional Tips**

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*
**Python compatibility**  ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Tip: Updating ESP-IDF**  It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

## 1.4  Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following Step 5. First Steps on ESP-IDF.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

• C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
• Build system functions, predefined variables and options. These are documented in the build system guide.
• Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
• Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with esp_err_t type. See Error Handling section for more information about error handling approaches. Error Code Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
```
Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on
the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
const esp_timer_create_args_t my_timer_args = {    
   .callback = &my_timer_callback,
   /* Correct, fields .arg and .name are zero-initialized */
};
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way
of setting a subset of fields, and zero-initializing the remaining fields:

```c
esp_timer_create_args_t my_timer_args = {};    
/* All the fields are zero-initialized */
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially
supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};    
/* All the fields are zero-initialized */
```

### Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();    
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.  
   Now all fields are set to the default values.  
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applica-
tions. Such header files often contain private or esp_private in their name or path. Certain components, such as hal
only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code
duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.
This includes components located in common_components directory, as well as some of the components located in
the examples themselves. These components are not considered to be part of the ESP-IDF API.
It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses **Semantic Versioning** as explained in the [versions page](#). Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system renaming mechanism ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- **Private APIs**.
- **Components in example projects**.
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
• Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
• Location of Kconfig options in menuconfig.
• Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be found under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

**Application Example**

ESP examples are based on standard asio protocols/asio:

- protocols/asio/udp_echo_server
- protocols/asio/tcp_echo_server
- protocols/asio/asio_chat
- protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

2.2.2 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:
• **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

• **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":" ) and trailing newline (CR/LF).

• **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’s with protocol specifications for specifics.

### Messaging Model And Data Mapping

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

**Note:** It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’s data to the four types of registers.

The following sections give an overview of how to use the ESP_Modbus component found under components/freemodbus. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- **Modbus Port Initialization**
- **Modbus Slave API Overview**
- **Modbus Master API Overview**

### Modbus Port Initialization

The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER, MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER, MB_PORT_TCP_SLAVE` are reserved for internal usage.

```c
void* master_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
```

(continues on next page)
UID-1 (UNIT ID = slave address)  N - number of slaves in the network segment usually <= 32

Modbus Slave 1

Modbus Master

UID-2

Modbus Slave 2

Network (RS485 for Modbus RTU and ASCII, Ethernet or WiFi connection for Modbus TCP)

UID-N

Modbus Slave N

Slave devices listen for communication from the master and simply respond as instructed

Fig. 1: Modbus segment diagram

Device Application memory

Modbus Application data (example)

- Device description data
- Other device data parameters
- Analog input data (sensor data from ADC)
- Device output data (DAC, PWM, counts, etc.)
- Discrete input data (set point state, flags, etc.)
- Discrete output state (relay states)

Data mapping

Modbus data model

- Modbus access: Modbus device having 4 separate blocks to map actual device data
  - 4x register area
  - 3x register area
  - 1x register area
  - 0x register area

Modbus stack

Fig. 2: Modbus data mapping
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}

This example code to initialize slave port:

```c
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Master Data Access** - Configure data descriptors to access slave parameters.
3. **Master Communication Options** - Allows to setup communication options for selected port.
4. **Master Communication** - Start stack and sending/receiving data.
5. **Modbus Master Teardown** - Destroy Modbus controller and its resources.

**Configuring Master Data Access**  The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:
Table 1: Table 1 Modbus master Data Dictionary description

// Enumeration of modbus slave addresses accessed by master device
enum {
    MB_DEVICE_ADDR1 = 1,
    MB_DEVICE_ADDR2,
    MB_SLAVE_COUNT
}
### Enumeration of all supported CIDs for device

```c
enum {
  CID_SER_NUM1 = 0,
  CID_SW_VER1,
  CID_TEMP_DATA_1,
  CID_SER_NUM2,
  CID_SW_VER2,
  CID_TEMP_DATA_2
};
```

// Example Data Dictionary for Modbus parameters in 2 slaves in the segment
```c
mb_parameter_descriptor_t device_parameters[] = {
  // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus Reg read length,
  // Instance offset (NA), Instance type, Instance length (bytes), Options (NA), Permissions
  { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_TRIGGER },
  { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_TRIGGER },
  { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MB_DEVICE_ADDR1, MB_PARAM_HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 16, 30, 1 ), PAR_PERMS_READ_WRITE_TRIGGER },
  { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_TRIGGER },
  { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_TRIGGER },
  { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 20, 30, 1 ), PAR_PERMS_READ_WRITE_TRIGGER },
};
```

// Calculate number of parameters in the table
```c
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_parameters[0]));
```

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as the parameter of the function below.

**mbc_master_set_descriptor():** Initialization of master descriptor.

```c
ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_parameters));
```

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initialization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included in descriptor table using its CID.

**Master Communication Options** Calling the setup function allows for specific communication options to be defined for port.
mbc_master_setup()

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```c
mb_communication_info_t comm_info = {
  .port = MB_PORT_NUM,       // Serial port number
  .mode = MB_MODE_RTU,       // Modbus mode of communication (MB_MODE_RTU or MB_MODE_ASCII)
  .baudrate = 9600,          // Modbus communication baud rate
  .parity = MB_PARITY_NONE   // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

The order of IP address string corresponds to short slave address in the Data Dictionary.

```c
#define MB_SLAVE_COUNT 2  // Number of slaves in the segment being accessed (as defined in Data Dictionary)
char* slave_ip_address_table[MB_SLAVE_COUNT] = {
  "192.168.1.2",       // Address corresponds to UID1 and set to predefined value by user
  "192.168.1.3",       // corresponds to UID2 in the segment
  NULL                  // end of table
};
mb_communication_info_t comm_info = {
  .ip_port = MB_TCP_PORT,   // Modbus TCP port number (default = 502)
  .ip_addr_type = MB_IPV4,  // version of IP protocol
  .ip_mode = MB_MODE_TCP,  // Port communication mode
  .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
  .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

**Note:** Refer to esp_netif component for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to protocols/modbus/tcp/mb_tcp_master for more information.

**Note:** RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to Running UART Communication section of UART documentation.

**Master Communication** The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```c
mbc_master_start()
```
The list of functions below are used by the Modbus master stack from a user’s application:

mbc_master_send_request(): This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure mb_param_request_t) and then blocks until a response from the corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

mbc_master_get_cid_info(): The function gets information about each characteristic supported in the data dictionary and returns the characteristic’s description in the form of the mb_parameter_descriptor_t structure. Each characteristic is accessed using its CID.

mbc_master_get_parameter(): The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```c
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;
....
// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #\%d %s (%s) value = (0x%08x) read successful.
        " param_descriptor->cid,
        (char*)param_descriptor->param_key,
        (char*)param_descriptor->param_units,
        "(uint32_t")temp_data);
    } else {
        ESP_LOGE(TAG, "Characterstic #\%d (%s) read fail, err = 0x%x (%s).",
        param_descriptor->cid,
        (char*)param_descriptor->param_key,
        (int)err,
        (char*)esp_err_to_name(err));
    }
} else {
    ESP_LOGE(TAG, "Could not get information for characteristic #\%d.", cid);
}  
```

mbc_master_set_parameter()

The function writes a characteristic’s value defined as a name and cid parameter in the corresponding slave device. The additional data for parameter request is taken from master parameter description table.

```c
uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer
esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.
    " param_descriptor->cid,
    (char*)param_descriptor->param_key,
    (int)err,
    (char*)esp_err_to_name(err));
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err,
    (char*)esp_err_to_name(err));
}
```
Modbus Master Teardown  This function stops Modbus communication stack and destroys controller interface and free all used active objects.

mbc_master_destroy()

ESP_ERROR_CHECK(mbc_master_destroy());

Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Slave Data Access** - Configure data descriptors to access slave parameters.
3. **Slave Communication Options** - Allows to setup communication options for selected port.
4. **Slave Communication** - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. **Modbus Slave Teardown** - Destroy Modbus controller and its resources.

**Configuring Slave Data Access**  The following functions must be called when the Modbus controller slave port is already initialized. Refer to **Modbus Port Initialization**.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

**Note:** One slave can define several area descriptors per each type of Modbus register area with different start_offset.

Register area is defined by using the `mb_register_area_descriptor_t` structure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Zero based register relative offset for defined register area. Example: register address = 40002 (4x register area - Function 3 - holding register), start_offset = 2</td>
</tr>
<tr>
<td>type</td>
<td>Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.</td>
</tr>
<tr>
<td>address</td>
<td>A pointer to the memory area which is used to store the register data for this area descriptor.</td>
</tr>
<tr>
<td>size</td>
<td>The size of the memory area in bytes which is used to store register data.</td>
</tr>
</tbody>
</table>

`mbc_slave_set_descriptor()`

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```c
#define MB_REG_INPUT_START_AREA0 (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT (100)
#define MB_REG_INPUT_CNT (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor_t

unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding_registers
unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input_registers
```

(continues on next page)
reg_area.type = MB_PARAM_HOLDING; // Set type of register area
reg_area.start_offset = MB_REG_HOLDING_START_AREA0; // Offset of register area in Modbus protocol
reg_area.address = (void*)holding_reg_area[0]; // Set pointer to storage instance
reg_area.size = sizeof(holding_reg_area) << 1; // Set the size of register storage area in bytes
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

reg_area.type = MB_PARAM_INPUT;
reg_area.start_offset = MB_REG_INPUT_START_AREA0;
reg_area.address = (void*)input_reg_area[0];
reg_area.size = sizeof(input_reg_area) << 1;
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);

**Slave Communication Options**  The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

`mbc_slave_setup()`

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```c
esp_netif_init();
...
mb_communication_info_t comm_info = {
  .ip_port = MB_TCP_PORT, // Modbus TCP port number (default = 502)
  .ip_addr_type = MB_IPV4, // version of IP protocol
  .ip_mode = MB_MODE_TCP, // Port communication mode
  .ip_addr = NULL, // This field keeps the client IP_
  .address_to_bind, NULL - bind to any client
  .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr = pointer to the_
  // corresponding network interface
};

// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)comm_info));
```

Example initialization of Modbus serial communication:

```c
#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...

// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
```
.mode = MB_MODE_RTU, // Communication type
.slave_addr = MB_SLAVE_ADDR, // Short address of the slave
.port = MB_SLAVE_PORT_NUM, // UART physical port number
.baudrate = MB_SLAVE_DEV_SPEED, // Baud rate for communication
.parity = MB_PARITY_NONE // Parity option
};

ESP_ERROR_CHECK(mbc_slave_setup((void*)comm_info));

Slave Communication The function below is used to start Modbus controller interface and allows communication.

mbc_slave_start()

ESP_ERROR_CHECK(mbc_slave_start());

mbc_slave_check_event()

The blocking call to function waits for a event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event mb_event_group_t which describes the type of register access being done.

mbc_slave_get_param_info()

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The mb_param_info_t structure contains information about accessed parameter.

Table 4: Description of the register info structure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_stamp</td>
<td>the time stamp of the event when defined parameter is accessed</td>
</tr>
<tr>
<td>mb_offset</td>
<td>start Modbus register accessed by master</td>
</tr>
<tr>
<td>type</td>
<td>type of the Modbus register area being accessed (See the mb_event_group_t for more information)</td>
</tr>
<tr>
<td>address</td>
<td>memory address that corresponds to accessed register in defined area descriptor</td>
</tr>
<tr>
<td>size</td>
<td>number of registers being accessed by master</td>
</tr>
</tbody>
</table>

Example to get event when holding or input registers accessed in the slave:

```c
#define MB_READ_MASK   (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK   (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10/portTICK_PERIOD_MS)

...  

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));

const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u
          ", rw_str,
```
Chapter 2. API Reference

(continued from previous page)

```c
(uint32_t)reg_info.time_stamp,
(uint32_t)reg_info.mb_offset,
(uint32_t)reg_info.type,
(uint32_t)reg_info.address,
(uint32_t)reg_info.size);
}
else if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
            rw_str,
            (uint32_t)reg_info.time_stamp,
            (uint32_t)reg_info.mb_offset,
            (uint32_t)reg_info.type,
            (uint32_t)reg_info.address,
            (uint32_t)reg_info.size);
}
```

**Modbus Slave Teardown**  This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

```c
mbc_slave_destroy()
```

ESP_ERROR_CHECK(mbc_slave_destroy());

**Possible Communication Issues And Solutions**

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```c
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master get_-
--parameter failure error=(0x107) (ESP.ERR.TIMEOUT).
```
Table 5: Table 5 Modbus error codes and troubleshooting

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>Possible solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x106</td>
<td>ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.</td>
<td>Refer to slave register map. Check the master data dictionary for correctness.</td>
</tr>
<tr>
<td>0x107</td>
<td>ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.</td>
<td>Measure and increase the maximum slave response timeout <code>idf.py menu-config</code>, option <code>CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND</code>. Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than <code>CONFIG_FMB_PORT_TASK_PRIO</code> it is recommended to place Modbus tasks on the other core using an option <code>CONFIG_FMB_PORT_TASK_AFFINITY</code>. Configure the Modbus task’s priority <code>CONFIG_FMB_PORT_TASK_PRIO</code> to ensure that the task gets sufficient processing time to handle Modbus stack events.</td>
</tr>
<tr>
<td>0x108</td>
<td>ESP_ERR_INVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.</td>
<td>Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.</td>
</tr>
<tr>
<td>0x103</td>
<td>ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.</td>
<td>Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.</td>
</tr>
</tbody>
</table>

Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support …” for appropriate communication mode and related configuration keys.

- `protocols/modbus/serial/mb_slave`
- `protocols/modbus/serial/mb_master`
- `protocols/modbus/tcp/mb_tcp_slave`
- `protocols/modbus/tcp/mb_tcp_master`

Please refer to the specific example README.md for details.

Enumerations

enum mb_port_type_t
Types of actual Modbus implementation.

Values:

MB_PORT_SERIAL_MASTER = 0x00
    Modbus port type serial master.

MB_PORT_SERIAL_SLAVE
    Modbus port type serial slave.

MB_PORT_TCP_MASTER
    Modbus port type TCP master.

MB_PORT_TCP_SLAVE
    Modbus port type TCP slave.

MB_PORT_COUNT
    Modbus port count.

MB_PORT_INACTIVE = 0xFF

enum mb_event_group_t
Event group for parameters notification.

Values:

MB_EVENT_NO_EVENTS = 0x00

MB_EVENT_HOLDING_REG_WR = BIT0
    Modbus Event Write Holding registers.

MB_EVENT_HOLDING_REG_RD = BIT1
    Modbus Event Read Holding registers.

MB_EVENT_INPUT_REG_RD = BIT3
    Modbus Event Read Input registers.

MB_EVENT_COILS_WR = BIT4
    Modbus Event Write Coils.

MB_EVENT_COILS_RD = BIT5
    Modbus Event Read Coils.

MB_EVENT_DISCRETE_RD = BIT6
    Modbus Event Read Discrete bits.

MB_EVENT_STACK_STARTED = BIT7
    Modbus Event Stack started

enum mb_param_type_t
Type of Modbus parameter.

Values:
Chapter 2. API Reference

**MB_PARAM_HOLDING** = 0x00
Modbus Holding register.

**MB_PARAM_INPUT**
Modbus Input register.

**MB_PARAM_COIL**
Modbus Coils.

**MB_PARAM_DISCRETE**
Modbus Discrete bits.

**MB_PARAM_COUNT**

**MB_PARAM_UNKNOWN** = 0xFF

*enum mb_mode_type_t*

Modbus serial transmission modes (RTU/ASCII).

*Values:*

**MB_MODE_RTU**
RTU transmission mode.

**MB_MODE_ASCII**
ASCII transmission mode.

**MB_MODE_TCP**
TCP communication mode.

**MB_MODE_UDP**
UDP communication mode.

*enum mb_tcp_addr_type_t*

Modbus TCP type of address.

*Values:*

**MB_IPV4** = 0
TCP IPV4 addressing

**MB_IPV6** = 1
TCP IPV6 addressing

**Header File**

- components/freemodbus/common/include/esp_modbus_master.h

**Functions**

*esp_err_t mbc_master_init_tcp (void **handler)*

Initialize Modbus controller and stack for TCP port.

*Return*

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

*Parameters*

- [out] handler: handler(pointer) to master data structure

*esp_err_t mbc_master_init (mb_port_type_t port_type, void **handler)*

Initialize Modbus Master controller and stack for Serial port.

*Return*

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: type of stack

void mbc_master_init_iface (void *handler)
Initialize Modbus Master controller interface handle.

Parameters
• [in] handler: pointer to master data structure

esp_err_t mbc_master_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_master_start (void)
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t mbc_master_setup (void *comm_info)
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

esp_err_t mbc_master_set_descriptor (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
Assign parameter description table for Modbus controller interface.

Return
• esp_err_t ESP_OK - set descriptor successfully
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

Parameters
• [in] descriptor: pointer to parameter description table
• num_elements: number of elements in the table

esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

Return
• esp_err_t ESP_OK - request was successful
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] request: pointer to request structure of type mb_param_request_t
• [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

esp_err_t mbc_master_get_cid_info (uint16_t cid, const mb_parameter_descriptor_t **param_info)
Get information about supported characteristic defined as cid. Uses parameter description table to get this
information. The function will check if characteristic defined as a cid parameter is supported and returns its
description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return

- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP.ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP.ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters

- [in] cid: characteristic id
- param_info: pointer to pointer of characteristic data.

`esp_err_t mbc_master_get_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)`

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data
for request is taken from parameter description (lookup) table.

Return

- esp_err_t ESP_OK - request was successful and value buffer contains representation of actual pa-
  rameter data from slave
- esp_err_t ESP.ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP.ERR.INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP.ERR.INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP.ERR.TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP.ERR.NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP.ERR.NOT_FOUND - the parameter is not found in the parameter description table
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

`esp_err_t mbc_master_set_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)`

Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request
is taken from master parameter lookup table.

Return

- esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
- esp_err_t ESP.ERR.INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP.ERR.INVALID_RESPONSE - an invalid response from slave during processing of
  parameter
- esp_err_t ESP.ERR.INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP.ERR.TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP.ERR.NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in
  binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup
  table.

Unions

`union mb_parameter_opt_t`

#include <esp_modbus_master.h> Modbus parameter options for description table.

**Public Members**

```c
int opt1
  Parameter option1
int opt2
  Parameter option2
int opt3
  Parameter option3
```

```c
struct mb_parameter_opt_t:
  [anonymous] [anonymous]
```

```c
int min
  Parameter minimum value
int max
  Parameter maximum value
int step
  Step of parameter change tracking
```

```c
struct mb_parameter_opt_t:
  [anonymous] [anonymous]
```

**Structures**

```c
struct mb_parameter_descriptor_t
```

Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

**Public Members**

```c
uint16_t cid
  Characteristic cid
const char *param_key
  The key (name) of the parameter
const char *param_units
  The physical units of the parameter
```

```c
uint8_t mb_slave_addr
  Slave address of device in the Modbus segment
```

```c
mb_param_type_t mb_param_type
  Type of modbus parameter
```

```c
uint16_t mb_reg_start
  This is the Modbus register address. This is the 0 based value.
```

```c
uint16_t mb_size
  Size of mb parameter in registers
```

```c
uint16_t param_offset
  Parameter name (OFFSET in the parameter structure)
```

```c
mb_descr_type_t param_type
  Float, U8, U16, U32, ASCII, etc.
```

```c
mb_descr_size_t param_size
  Number of bytes in the parameter.
```

```c
mb_parameter_opt_t param_opts
  Parameter options used to check limits and etc.
```

```c
mb_param_perms_t access
  Access permissions based on mode
```
struct mb_param_request_t
    Modbus register request type structure.

Public Members

uint8_t slave_addr
    Modbus slave address

uint8_t command
    Modbus command to send

Enumerations

enum mb_descr_type_t
    Modbus descriptor table parameter type defines.

Values:

PARAM_TYPE_U8 = 0x00
    Unsigned 8

PARAM_TYPE_U16 = 0x01
    Unsigned 16

PARAM_TYPE_U32 = 0x02
    Unsigned 32

PARAM_TYPE_FLOAT = 0x03
    Float type

PARAM_TYPE_ASCII = 0x04
    ASCII type

enum mb_descr_size_t
    Modbus descriptor table parameter size in bytes.

Values:

PARAM_SIZE_U8 = 0x01
    Unsigned 8

PARAM_SIZE_U16 = 0x02
    Unsigned 16

PARAM_SIZE_U32 = 0x04
    Unsigned 32

PARAM_SIZE_FLOAT = 0x04
    Float size

PARAM_SIZE_ASCII = 0x08
    ASCII size

PARAM_SIZE_ASCII24 = 0x18
    ASCII24 size
PARAM_MAX_SIZE

define mb_param_perms_t
Permissions for the characteristics.

Values:

PAR_PERMS_READ = 1 << BIT0
the characteristic of the device are readable

PAR_PERMS_WRITE = 1 << BIT1
the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 << BIT2
the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = PAR_PERMS_READ | PAR_PERMS_WRITE
the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = PAR_PERMS_READ | PAR_PERMS_TRIGGER
the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = PAR_PERMS_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = PAR_PERMS_READ_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are readable & writable & triggerable

Header File

- components/freemodbus/common/include/esp_modbus_slave.h

Functions

esp_err_t mbc_slave_init_tcp (void **handler)
Initialize Modbus Slave controller and stack for TCP port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] handler: handler(pointer) to master data structure

esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
Initialize Modbus Slave controller and stack for Serial port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] handler: handler(pointer) to master data structure
- [in] port_type: the type of port

void mbc_slave_init_iface (void *handler)
Initialize Modbus Slave controller interface handle.

Parameters

- [in] handler: - pointer to slave interface data structure

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

```c
esp_err_t mbc_slave_start (void)
```
Start Modbus communication stack.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

```c
esp_err_t mbc_slave_setup (void *comm_info)
```
Set Modbus communication parameters for the controller.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Incorrect parameter data

**Parameters**
- `comm_info`: Communication parameters structure.

```c
mb_event_group_t mbc_slave_check_event (mb_event_group_t group)
```
Wait for specific event on parameter change.

**Return**
- `mb_event_group_t` event bits triggered

**Parameters**
- `group`: Group event bit mask to wait for change

```c
esp_err_t mbc_slave_get_param_info (mb_param_info_t *reg_info, uint32_t timeout)
```
Get parameter information.

**Return**
- ESP_OK Success
- ESP_ERR_TIMEOUT Cannot get data from parameter queue or queue overflow

**Parameters**
- `[out] reg_info`: parameter info structure
- `timeout`: Timeout in milliseconds to read information from parameter queue

```c
esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)
```
Set Modbus area descriptor.

**Return**
- ESP_OK: The appropriate descriptor is set
- ESP_ERR_INVALID_ARG: The argument is incorrect

**Parameters**
- `descr_data`: Modbus registers area descriptor structure

**Structures**

```c
struct mb_param_info_t
```
Parameter access event information type.

**Public Members**

```c
uint32_t time_stamp
```
Timestamp of Modbus Event (uS)

```c
uint16_t mb_offset
```
Modbus register offset

```c
mb_event_group_t type
```
Modbus event type

```c
uint8_t *address
```
Modbus data storage address
size_t size
   Modbus event register size (number of registers)

struct mb_register_area_descriptor_t
   Parameter storage area descriptor.

Public Members

uint16_t start_offset
   Modbus start address for area descriptor

mb_param_type_t type
   Type of storage area descriptor

void *address
   Instance address for storage area descriptor

size_t size
   Instance size for area descriptor (bytes)

Macros

MB_SLAVE_CHECK(a, err_code, format, ...)
MB_SLAVE_ASSERT(con)

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

• Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
• Easy to setup with URI
• Multiple instances (Multiple clients in one application)
• Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

• protocols/mqtt/tcp: MQTT over tcp, default port 1883
• protocols/mqtt/ssl: MQTT over tcp, default port 8883
• protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
• protocols/mqtt/ws: MQTT over Websocket, default port 80
• protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

• Currently support mqtt, mqtts, ws, wss schemes
• MQTT over TCP samples:
  - mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883:
  - mqtt://mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884:
Chapter 2. API Reference

- `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io:8883` MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884` MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:
  ```c
  const esp_mqtt_client_config_t mqtt_cfg =
  {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
  };
  esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
  esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ...
  --client);
  esp_mqtt_client_start(client);
  ```

  - Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: examples/mqtt_ssl
- Configuration:
  ```c
  const esp_mqtt_client_config_t mqtt_cfg =
  {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
  };
  ```

  If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

  - `use_global_ca_store`: use the global certificate store to verify server certificate, see esp-tls.h for more information
  - `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
  - `client_cert_len`: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
  - `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
  - `client_key_len`: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
  - `psk_hint_key`: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
  - `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

  - `lwt_topic`: pointer to the LWT message topic
  - `lwt_msg`: pointer to the LWT message
  - `lwt_msg_len`: length of the LWT message, required if lwt_msg is not null-terminated
  - `lwt_qos`: quality of service for the LWT message
* lwt_retain: specifies the retain flag of the LWT message

**Other Configuration Parameters**

* disable_clean_session: determines the clean session flag for the connect message, defaults to a clean session
* keepalive: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
* disable_auto_reconnect: enable to stop the client from reconnecting to server after errors or disconnects
* user_context: custom context that will be passed to the event handler
* task_prio: MQTT task priority, defaults to 5
* task_stack: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
* buffer_size: size of MQTT send/receive buffer, default is 1024 bytes
* username: pointer to the username used for connecting to the broker
* password: pointer to the password used for connecting to the broker
* client_id: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
* host: MQTT broker domain (ipv4 as string), setting the uri will override this
* port: MQTT broker port, specifying the port in the uri will override this
* transport: sets the transport protocol, setting the uri will override this
* refresh_connection_after_ms: refresh connection after this value (in milliseconds)
* event_handle: handle for MQTT events as a callback in legacy mode
* event_loop_handle: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
• MQTT_EVENT_ERROR: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

API Reference

Header File

• components/mqtt/esp-mqtt/include/mqtt_client.h

Functions

esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
Creates mqtt client handle based on the configuration.

Return mqtt_client_handle if successfully created, NULL on error

Parameters

• config: mqtt configuration structure

esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Return ESP_FAIL if URI parse error, ESP_OK on success

Parameters

• client: mqtt client handle
• uri:

esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
Starts mqtt client with already created client handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
This api is typically used to force reconnection upon a specific event.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
This api is typically used to force disconnection from the broker.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
Stops mqtt client tasks.

• Notes:
• Cannot be called from the mqtt event handler

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

Parameters

• client: mqtt client handle

int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
Subscribe the client to defined topic with defined qos.

Notes:

• Client must be connected to send subscribe message
• This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Return** message_id of the subscribe message on success -1 on failure

**Parameters**
- `client`: mqtt client handle
- `topic`:
- `qos`:

```c
int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)
```

Unsubscribe the client from defined topic.

**Notes:**
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message_id of the subscribe message on success -1 on failure

**Parameters**
- `client`: mqtt client handle
- `topic`:

```c
int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
```

Client to send a publish message to the broker.

**Notes:**
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

**Parameters**
- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag

```c
int esp_mqtt_client_enqueue(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)
```

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

**Return** message_id if queued successfully, -1 otherwise

**Parameters**
- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag
- `store`: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued
**esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)**

Destroys the client handle.

**Notes:**
- Cannot be called from the mqtt event handler

**Return** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
- **client**: mqtt client handle

**esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)**

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

**Return** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

**Parameters**
- **client**: mqtt client handle
- **config**: mqtt configuration structure

**esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)**

Registers mqtt event.

**Return** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

**Parameters**
- **client**: mqtt client handle
- **event**: event type
- **event_handler**: handler callback
- **event_handler_arg**: handlers context

**int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)**

Get outbox size.

**Return** outbox size 0 on wrong initialization

**Parameters**
- **client**: mqtt client handle

**Structures**

**struct esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

**Important:** This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

- error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last esp_err, esp_tls stack err, esp_tls cert verify flags, sock_errno | Error reported from tcp_transport/esp-tls | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect return code | Internal error reported from MQTT broker on connection |

**Public Members**

**esp_err_t esp_tls_last esp_err**

last esp_err code reported from esp-tls component
Chapter 2.  API Reference

#define esp_tls_stack_err
tls specific error code reported from underlying tls stack

#define esp_tls_cert_verify_flags
tls flags reported from underlying tls stack during certificate verification

def esp_mqtt_error_type_t
error type referring to the source of the error

def esp_mqtt_connect_return_code_t
connection refused error code reported from MQTT broker on connection

#define esp_transport_sock_errno
errno from the underlying socket

struct esp_mqtt_event_t
MQTT event configuration structure

Public Members

def esp_mqtt_event_id_t event_id
MQTT event type

def esp_mqtt_client_handle_t client
MQTT client handle for this event

void *user_context
User context passed from MQTT client config

char *data
Data associated with this event

int data_len
Length of the data for this event

int total_data_len
Total length of the data (longer data are supplied with multiple events)

int current_data_offset
Actual offset for the data associated with this event

char *topic
Topic associated with this event

int topic_len
Length of the topic for this event associated with this event

int msg_id
MQTT message id of message

int session_present
MQTT session_present flag for connection event

esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool retain
Retained flag of the message associated with this event

int qos
Qos of the messages associated with this event

bool dup
dup flag of the message associated with this event

struct esp_mqtt_client_config_t
MQTT client configuration structure
Public Members

`mqtt_event_callback_t event_handle`
handle for MQTT events as a callback in legacy mode

`esp_event_loop_handle_t event_loop_handle`
handle for MQTT event loop library

`const char* host`
MQTT server domain (ipv4 as string)

`const char* uri`
Complete MQTT broker URI

`uint32_t port`
MQTT server port

`bool set_null_client_id`
Selects a NULL client id

`const char* client_id`
Set client id. Ignored if set_null_client_id == true. If NULL set the default client id. Default client id is 
ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

`const char* username`
MQTT username

`const char* password`
MQTT password

`const char* lwt_topic`
LWT (Last Will and Testament) message topic (NULL by default)

`const char* lwt_msg`
LWT message (NULL by default)

`int lwt_qos`
LWT message qos

`int lwt_retain`
LWT retained message flag

`int lwt_msg_len`
LWT message length

`int disable_clean_session`
mqtt clean session, default clean_session is true

`int keepalive`
mqtt keepalive, default is 120 seconds

`bool disable_auto_reconnect`
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

`void* user_context`
pass user context to this option, then can receive that context in event->user_context

`int task_prio`
MQTT task priority, default is 5, can be changed in make menuconfig

`int task_stack`
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

`int buffer_size`
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)
const char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len.

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
overrides URI transport

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

exp_err_t(*crt_bundle_attach)(void *conf)
Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int reconnect_timeout_ms
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
Client key decryption password string

int clientkey_password_len
String length of the password pointed to by clientkey_password

exp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
enable secure element for enabling SSL connection
void *ds_data
  carrier of handle for digital signature parameters

int network_timeout_ms
  Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
  Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
  Path in the URI

int message_retransmit_timeout
  timeout for retransmit of failed packet

---

**Macros**

**MQTT_ERROR_TYPE_ESP_TLS**
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**Type Definitions**

```c
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

```c
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
typedef esp_err_t (*esp_mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

**Enumerations**

type enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- user_context - user data from esp_mqtt_client_config_t
- client - mqtt client handle
- various other data depending on event type

Values:

- **MQTT_EVENT_ANY** = -1
- **MQTT_EVENT_ERROR** = 0
  on error event, additional context: connection return code, error handle from esp_tls (if supported)
- **MQTT_EVENT_CONNECTED**
  connected event, additional context: session_present flag
MQTT_EVENT_DISCONNECTED
  disconnected event

MQTT_EVENT_SUBSCRIBED
  subscribed event, additional context:
  • msg_id message id
  • data pointer to the received data
  • data_len length of the data for this event

MQTT_EVENT_UNSUBSCRIBED
  unsubscribed event

MQTT_EVENT_PUBLISHED
  published event, additional context: msg_id

MQTT_EVENT_DATA
  data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received
  • retain retain flag of the message
  • qos qos level of the message
  • dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
  The event occurs before connecting

MQTT_EVENT_DELETED
  Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  • Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
  MQTT connection error codes propagated via ERROR event
  Values:
  MQTT_CONNECTION_ACCEPTED = 0
    Connection accepted
  MQTT_CONNECTION_REFUSE_PROTOCOL
    MQTT connection refused reason: Wrong protocol
  MQTT_CONNECTION_REFUSE_ID_REJECTED
    MQTT connection refused reason: ID rejected
  MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
    MQTT connection refused reason: Server unavailable
  MQTT_CONNECTION_REFUSE_BAD_USERNAME
    MQTT connection refused reason: Wrong user
  MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
    MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
  MQTT connection error codes propagated via ERROR event
Chapter 2. API Reference

Values:

MQTT_ERROR_TYPE_NONE = 0
MQTT_ERROR_TYPE_TCP_TRANSPORT
MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
Values:

MQTT_TRANSPORT_UNKNOWN = 0x0
MQTT_TRANSPORT_OVER_TCP
    MQTT over TCP, using scheme: mqtt
MQTT_TRANSPORT_OVER_SSL
    MQTT over SSL, using scheme: mqtts
MQTT_TRANSPORT_OVER_WS
    MQTT over Websocket, using scheme: ws
MQTT_TRANSPORT_OVER_WSS
    MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection
Values:

MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

• esp_tls_conn_new(): for opening a new TLS connection.
• esp_tls_conn_read(): for reading from the connection.
• esp_tls_conn_write(): for writing into the connection.
• esp_tls_conn_destroy(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
```
Chapter 2. API Reference

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - cacert_buf - pointer to the buffer which contains the CA cert.
  - cacert_bytes - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESPx509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#).
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. **WARNING:** Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at [https://github.com/espressif/esp-wolfssl](https://github.com/espressif/esp-wolfssl). The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.:
Chapter 2. API Reference

2) Add wolfssl as an extra component in your project.
   - Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```
   - Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19Kb</td>
<td>~37Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2Kb</td>
<td>~3.6Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858Kb</td>
<td>~736Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedtls as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

Note: ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer esp_cryptoauth_utility

To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add esp-cryptoauthlib in your project, for details please refer esp-cryptoauthlib with ESP_IDF
2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```

3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit ATECC608A chip type
4) Enable use of ATECC608A in ESP-TLS by providing following config option in esp_tls_cfg_t

```c
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

## API Reference

### Header File
- components/esp-tls/esp_tls.h

### Functions

- **esp_tls_t**
  - *esp_tls_init*(void)
    
    Create TLS connection.

    **Return**
    - tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

  - **esp_tls_t**
    - *esp_tls_conn_new*(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
      
      Create a new blocking TLS/SSL connection.

      **Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is **esp_tls_conn_new_sync** (and its asynchronous version **esp_tls_conn_new_async**)

    **Return**
    - pointer to esp_tls_t, or NULL if connection couldn’t be opened.

    **Parameters**
    - [in] hostname: Hostname of the host.
    - [in] port: Port number of the host.
    - [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

- **int**
  - *esp_tls_conn_new_sync*(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
    
    Create a new blocking TLS/SSL connection.

    **Return**
    - -1 If connection establishment fails.
    - 1 If connection establishment is successful.
    - 0 If connection state is in progress.

    **Parameters**
    - [in] hostname: Hostname of the host.
    - [in] port: Port number of the host.
    - [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
    - [in] tls: Pointer to esp-tls as esp-tls handle.

  - **esp_tls_t**
    - *esp_tls_conn_http_new*(const char *url, const esp_tls_cfg_t *cfg)
      
      Create a new blocking TLS/SSL connection with a given “HTTP” url.

      The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

    **Return**
    - pointer to esp_tls_t, or NULL if connection couldn’t be opened.

    **Parameters**
Chapter 2. API Reference

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

```c
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Return
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

Parameters
- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. `non_block` member of this structure should be set to be true.
- [in] tls: pointer to esp-tls as esp-tls handle.

```c
int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

Parameters
- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

```c
static ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

Return
- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. If the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

```c
static ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer ‘data’.

Return
- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.
Chapter 2. API Reference

**Parameters**

- **[in]** `tls`: pointer to esp-tls as esp-tls handle.
- **[in]** `data`: Buffer to hold read data.
- **[in]** `datalen`: Length of data buffer.

```c
void esp_tls_conn_delete(esp_tls_t *tls)
```

Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

**Parameters**

- **[in]** `tls`: pointer to esp-tls as esp-tls handle.

```c
int esp_tls_conn_destroy(esp_tls_t *tls)
```

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

**Return**

- 0 on success
- -1 if socket error or an invalid argument

**Parameters**

- **[in]** `tls`: pointer to esp-tls as esp-tls handle.

```c
ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
```

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedTLS’s mbedtls_ssl_get_bytes_avail() API.

**Return**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

**Parameters**

- **[in]** `tls`: pointer to esp-tls as esp-tls handle.

```c
esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
```

Returns the connection socket file descriptor from esp_tls session.

**Return**

- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

**Parameters**

- **[in]** `tls`: handle to esp_tls context
- **[out]** `sockfd`: int pointer to sockfd value.

```c
esp_err_t esp_tls_init_global_ca_store(void)
```

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Return**

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls resources.

```c
esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
```

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Return**

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**
• [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

void esp_ttls_free_global_ca_store(void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_ttls_get_and_clear_last_error(esp_ttls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
• ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK (0) if no error occurred
• specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
• [in] h: esp-ttls error handle.
• [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
• [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

esp_err_t esp_ttls_get_and_clear_error_type(esp_ttls_error_handle_t h, esp_ttls_error_type_t err_type, int *error_code)
Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

Return
• ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK if a valid error returned and was cleared

Parameters
• [in] h: esp-ttls error handle.
• [in] err_type: specific error type
• [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

mbedtls_x509_crt *esp_ttls_get_global_ca_store(void)
Get the pointer to the global CA store currently being used.

The application must first call esp_ttls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

Note Modifying the pointer might cause a failure in verifying the certificates.

Return
• Pointer to the global CA store currently being used if successful.
• NULL if there is no global CA store set.

esp_err_t esp_ttls_plain_tcp_connect(const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_ttls_error_handle_t error_handle, int *sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters
• [in] host: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
• [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
• [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format
const size_t key_size
length of the key
const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout
int keep_alive_idle
Keep-alive idle time (second)
int keep_alive_interval
Keep-alive interval time (second)
int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.

Note
Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };
• where ‘h2’ is the protocol name

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM
const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtlss-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtlss-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_aliveCfg
Enable TCP keep-alive timeout for SSL connection
**const psk_hint_key_t** *psk_hint_key*
  Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection.

**esp_err_t (crt_bundle_attach)** (void *conf)
  Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig.

**void *ds_data**
  Pointer for digital signature peripheral context.

**bool is_plain_tcp**
  Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API.

**struct ifreq *if_name**
  The name of interface for data to go through. Use the default interface without setting.

**struct esp_tls**
  ESP-TLS Connection Handle.

### Public Members

**mbedtls_ssl_context ssl**
  TLS/SSL context.

**mbedtls_entropy_context entropy**
  mbedTLS entropy context structure.

**mbedtls_ctr_drbg_context ctr_drbg**
  mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256.

**mbedtls_ssl_config conf**
  TLS/SSL configuration to be shared between mbedtls_ssl_context structures.

**mbedtls_net_context server_fd**
  mbedTLS wrapper type for sockets.

**mbedtls_x509_crt cacert**
  Container for the X.509 CA certificate.

**mbedtls_x509_crt *cacert_ptr**
  Pointer to the cacert being used.

**mbedtls_x509_crt clientcert**
  Container for the X.509 client certificate.

**mbedtls_pk_context clientkey**
  Container for the private key of the client certificate.

**int sockfd**
  Underlying socket file descriptor.

**ssize_t (**read**)(struct esp_tls *tls, char *data, size_t datalen)**
  Callback function for reading data from TLS/SSL connection.

**ssize_t (**write**)(struct esp_tls *tls, const char *data, size_t datalen)**
  Callback function for writing data to TLS/SSL connection.

**esp_tls_conn_state_t conn_state**
  ESP-TLS Connection state.

**fd_set rset**
  Read file descriptors.
Chapter 2. API Reference

fd_set wset
write file descriptors

bool is_tls
indicates connection type (TLS or NON-TLS)

.esp_tls_role_t esp-tls role

- ESP_TLS_CLIENT
- ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
handle to error descriptor

Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx

Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
ESP-TLS configuration parameters.

Note
Note about format of certificates:
- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t
ESP-TLS Connection Handle.

Enumerations

define esp_tls_conn_state
ESP-TLS Connection State.

Values:

ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE

enum esp_tls_role

Values:

ESP_TLS_CLIENT = 0
ESP_TLS_SERVER
2.2.5 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note**: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)
HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI

  ```c
  esp_http_client_config_t config = {
  .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

- Authentication with username and password entry

  ```c
  esp_http_client_config_t config = {
  .url = "http://httpbin.org/basic-auth/user/passwd",
  .username = "user",
  .password = "passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

Functions

`esp_http_client.h`

- `esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)`
  - Start a HTTP session. This function must be the first function to call, and it returns an `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.
  - **Return**
    - `esp_http_client_handle_t`
    - `NULL` if any errors
  - **Parameters**
    - `[in] config: The configurations, see `http_client_config_t`

- `esp_err_t esp_http_client_perform(esp_http_client_handle_t client)`
  - Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.
  - **Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.
  - **Return**
    - `ESP_OK` on successful
    - `ESP_FAIL` on error
  - **Parameters**
    - `client: The esp_http_client handle`

- `esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)`
  - Set URL for client, when performing this behavior, the options in the URL will replace the old ones.
  - **Return**
    - `ESP_OK`
    - `ESP_FAIL`
  - **Parameters**
    - `[in] client: The esp_http_client handle`
    - `[in] url: The url`

- `esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)`
  - Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.
  - **Return**
    - `ESP_OK`
    - `ESP_FAIL`
  - **Parameters**
    - `[in] client: The esp_http_client handle`
    - `[in] data: post data pointer`
Chapter 2. API Reference

- [in] len: post length

**int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)**

Get current post field information.

**Return** Size of post data

**Parameters**
- [in] client: The client
- [out] data: Point to post data pointer

**esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)**

Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [in] value: The header value

**esp_err_t esp_http_client_get_header (esp_http_client_handle_t client, const char *key, char **value)**

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [out] value: The header value

**esp_err_t esp_http_client_get_username (esp_http_client_handle_t client, char **value)**

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The username value

**esp_err_t esp_http_client_set_username (esp_http_client_handle_t client, const char *username)**

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] username: The username value

**esp_err_t esp_http_client_get_password (esp_http_client_handle_t client, char **value)**

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **[in]** client: The `esp_http_client` handle
- **[out]** value: The password value

```c
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **[in]** client: The `esp_http_client` handle
- **[in]** password: The password value

```c
esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
```

Set http request auth_type.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **[in]** client: The `esp_http_client` handle
- **[in]** auth_type: The `esp_http_client` auth type

```c
int esp_http_client_get_errno(esp_http_client_handle_t client)
```

Get HTTP client session errno.

**Return**

- (-1) if invalid argument
- errno

**Parameters**

- **[in]** client: The `esp_http_client` handle

```c
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)
```

Set http request method.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **[in]** client: The `esp_http_client` handle
- **[in]** method: The method

```c
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
```

Set http request timeout.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **[in]** client: The `esp_http_client` handle
- **[in]** timeout_ms: The timeout value

```c
esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)
```

Delete http request header.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**
Chapter 2. API Reference

- [in] client: The esp_http_client handle
- [in] key: The key

**esp_err_t esp_http_client_open**(esp_http_client_handle_t client, int write_len)
This function will open the connection, write all header strings and return.

**Parameters**
- [in] client: The esp_http_client handle
- [in] write_len: HTTP Content length need to write to the server

**Return**
- ESP_OK
- ESP_FAIL

**int esp_http_client_write**(esp_http_client_handle_t client, const char* buffer, int len)
This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Return**
- (-1) if any errors
- Length of data written

**Parameters**
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

**int64_t esp_http_client_fetch_headers**(esp_http_client_handle_t client)
This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Return**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**
- [in] client: The esp_http_client handle

**bool esp_http_client_is_chunked_response**(esp_http_client_handle_t client)
Check response data is chunked.

**Return** true or false

**Parameters**
- [in] client: The esp_http_client handle

**int esp_http_client_read**(esp_http_client_handle_t client, char* buffer, int len)
Read data from http stream.

**Return**
- (-1) if any errors
- Length of data was read

**Parameters**
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The length

**int64_t esp_http_client_get_status_code**(esp_http_client_handle_t client)
Get http response status code, the valid value if this function invoke after esp_http_client_perform

**Return** Status code

**Parameters**
- [in] client: The esp_http_client handle

**int64_t esp_http_client_get_content_length**(esp_http_client_handle_t client)
Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform
Return

- (-1) Chunked transfer
- Content-Length value as bytes

Parameters

- [in] client: The esp_http_client handle

`esp_err_t esp_http_client_close(esp_http_client_handle_t client)`

Close http connection, still kept all http request resources.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] client: The esp_http_client handle

`esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)`

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] client: The esp_http_client handle

`esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)`

Get transport type.

Return

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

Parameters

- [in] client: The esp_http_client handle

`esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] client: The esp_http_client handle

`void esp_http_client_add_auth(esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters

- [in] client: The esp_http_client handle

`bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

Return

- true
- false

Parameters
**Chapter 2. API Reference**

- **[in] client: The esp_http_client handle**

```c
int esp_http_client_read_response(esp_http_client_handle_t client, char *buffer, int len)
```

Helper API to read larger data chunks. This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Return**
- Length of data was read

**Parameters**
- **[in] client: The esp_http_client handle**
- **buffer: The buffer**
- **[in] len: The buffer length**

```c
esp_err_t esp_http_client_flush_response(esp_http_client_handle_t client, int *len)
```

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Return**
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**Parameters**
- **[in] client: The esp_http_client handle**
- **len: Length of data discarded**

```c
esp_err_t esp_http_client_get_url(esp_http_client_handle_t client, char *url, const int len)
```

Get URL from client.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- **[in] client: The esp_http_client handle**
- **[inout] url: The buffer to store URL**
- **[in] len: The buffer length**

```c
esp_err_t esp_http_client_get_chunk_length(esp_http_client_handle_t client, int *len)
```

Get Chunk-Length from client.

**Return**
- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

**Parameters**
- **[in] client: The esp_http_client handle**
- **[out] len: Variable to store length**

**Structures**

```c
struct esp_http_client_event
```

HTTP Client events data.

**Public Members**

```c
esp_http_client_event_id_t event_id
```

`event_id`, to know the cause of the event

```c
esp_http_client_handle_t client
```

`esp_http_client_handle_t context`
void *data
    data of the event

int data_len
    data length of data

void *user_data
    user_data context, from esp_http_client_config_t user_data

char *header_key
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct esp_http_client_config_t
    HTTP configuration.

Public Members

const char *url
    HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
    Using for Http authentication

const char *password
    Using for Http authentication

esp_http_client_auth_type_t auth_type
    Http authentication type, see esp_http_client_auth_type_t

const char *path
    HTTP Path, if not set, default is /

const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password
**const** char *user_agent

The User Agent string to send with HTTP requests

*esp_http_client_method_t* method

HTTP Method

int timeout_ms

Network timeout in milliseconds

bool disable_auto_redirect

Disable HTTP automatic redirects

int max_redirection_count

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http_event_handle_cb* event_handler

HTTP Event Handle

*esp_http_client_transport_t* transport_type

HTTP transport type, see *esp_http_client_transport_t*

int buffer_size

HTTP receive buffer size

int buffer_size_tx

HTTP transmit buffer size

void *user_data

HTTP user_data context

bool is_async

Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store

Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check

Skip any validation of server certificate CN field

*esp_err_t (*crt_bundle_attach)(void *conf)*

Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable

Enable keep-alive timeout

int keep_alive_idle

Keep-alive idle time. Default is 5 (second)

int keep_alive_interval

Keep-alive interval time. Default is 5 (second)

int keep_alive_count

Keep-alive packet retry send count. Default is 3 counts

*struct ifreq *if_name*

The name of interface for data to go through. Use the default interface without setting

**Macros**

**DEFAULT_HTTP_BUF_SIZE**

**ESP_ERR_HTTP_BASE**

Starting number of HTTP error codes
ESP_ERR_HTTP_MAX_REDIRECT
The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
Read FIN from peer and the connection closed

Type Definitions
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations
enum esp_http_client_event_id_t
HTTP Client events id.

Values:
HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

HTTP_EVENT_REDIRECT
Intercepting HTTP redirects to handle them manually
enum esp_http_client_transport_t
HTTP Client transport.

Values:
HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown
HTTP_TRANSPORT_OVER_TCP
Transport over tcp
HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.

Values:
HTTP_METHOD_GET = 0
HTTP GET Method
HTTP_METHOD_POST
HTTP POST Method
HTTP_METHOD_PUT
HTTP PUT Method
HTTP_METHOD_PATCH
HTTP PATCH Method
HTTP_METHOD_DELETE
HTTP DELETE Method
HTTP_METHOD_HEAD
HTTP HEAD Method
HTTP_METHOD_NOTIFY
HTTP NOTIFY Method
HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method
HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method
HTTP_METHOD_OPTIONS
HTTP OPTIONS Method
HTTP_METHOD_COPY
HTTP COPY Method
HTTP_METHOD_MOVE
HTTP MOVE Method
HTTP_METHOD_LOCK
HTTP LOCK Method
HTTP_METHOD_UNLOCK
HTTP UNLOCK Method
HTTP_METHOD_PROPFIND
HTTP PROPFIND Method
HTTP_METHOD_PROPPATCH
HTTP PROPPATCH Method
HTTP_METHOD_MKCOL
HTTP MKCOL Method
Chapter 2. API Reference

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
    HTTP Authentication type.
    Values:
    HTTP_AUTH_TYPE_NONE = 0
        No authentication
    HTTP_AUTH_TYPE_BASIC
        HTTP Basic authentication
    HTTP_AUTH_TYPE_DIGEST
        HTTP Digest authentication

enum HttpStatus_Code
    Enum for the HTTP status codes.
    Values:
    HttpStatus_Ok = 200
    HttpStatus_MultipleChoices = 300
    HttpStatus_MovedPermanently = 301
    HttpStatus_Found = 302
    HttpStatus_TemporaryRedirect = 307
    HttpStatus_BadRequest = 400
    HttpStatus_Unauthorized = 401
    HttpStatus_Forbidden = 403
    HttpStatus_NotFound = 404
    HttpStatus_InternalError = 500

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------
                * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOL_SEC0,
            .custom_handle = NULL,
        }
    }
};
```
(continues on next page)
Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOL_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

You may set security for transport in ESP local control using following options:
1. **PROTOCOM_SEC1**: specifies that end-to-end encryption is used.
2. **PROTOCOM_SEC0**: specifies that data will be exchanged as a plain text.
3. **PROTOCOM_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

Creating a property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g. enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the `size` field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_)
{  
    void *usr_ctx)
    {
        for (uint32_t i = 0; i < props_count; i++) {
            ESP_LOGI(TAG, "Reading %s", props[i].name);
            if (props[i].type == TYPE_TIMESTAMP) {
                /* Obtain the timer function from ctx */
                int32_t (*func_get_time)(void) = props[i].ctx;

                /* Use static variable for saving the value.
                 * This is essential because the value has to be valid even after this function returns.
                 * Alternative is to use dynamic allocation and set the free_fn field */
                static int32_t ts = func_get_time();
                prop_values[i].data = &ts;
            }
        }
        return ESP_OK;
    }
```
Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count,
    const esp_local_ctrl_prop_t *props,
    const esp_local_ctrl_prop_val_t *prop_values,
    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl

**Client Side Implementation**

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. **get_prop_count**: This should simply return the total number of properties supported by the service
2. **get_prop_values**: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. **set_prop_values**: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

Table 6: Endpoints provided by ESP Local Control
API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
Function for obtaining BLE transport mode.

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
Start local control service.

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] config: Pointer to configuration structure

esp_err_t esp_local_ctrl_stop (void)
Stop local control service.

esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] prop: Property description structure

esp_err_t esp_local_ctrl_remove_property (const char *name)
Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Return
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

Parameters
- [in] name: Name of the property to remove

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known

Return
- Pointer to property
- NULL if not found

Parameters
- [in] name: Name of the property to find

esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.
Note In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Return
- ESP_OK: Success
- ESP_FAIL: Failure

Parameters
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

Unions
union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h> Transport mode (BLE/HTTPD) configuration.

Public Members

```c
esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.
```

```c
esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.
```

Structures
struct esp_local_ctrl_prop
Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

```c
char *name
Unique name of property
```

```c
uint32_t type
Type of property. This may be set to application defined enums
```

```c
size_t size
Size of the property value, which:
- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property
```

```c
uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant
```

```c
void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.
```
void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when
esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
Pointer to memory holding property value

size_t size
Size of property value

void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl
to call this function on the data pointer above, for freeing its resources after sending the
get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
                          const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for retrieving current values of properties.

Note If any of the properties have fixed sizes, the size field of corresponding element in prop_values
need to be set.

Return Returning different error codes will convey the corresponding protocol level errors to the client
:
  • ESP_OK : Success
  • ESP_ERR_INVALID_ARG : InvalidArgument
  • ESP_ERR_INVALID_STATE : InvalidProto
  • All other error codes : InternalError

Parameters
  • [in] props_count: Total elements in the props array
  • [in] props: Array of properties, the current values for which have been requested by the client
  • [out] prop_values: Array of empty property values, the elements of which need to be
    populated with the current values of those properties specified by props argument
  • [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
                          const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for changing values of properties.

Note If any of the properties have variable sizes, the size field of the corresponding element in
prop_values must be checked explicitly before making any assumptions on the size.

Return Returning different error codes will convey the corresponding protocol level errors to the client
:
  • ESP_OK : Success
  • ESP_ERR_INVALID_ARG : InvalidArgument
  • ESP_ERR_INVALID_STATE : InvalidProto
  • All other error codes : InternalError

Parameters
  • [in] props_count: Total elements in the props array
Chapter 2. API Reference

- [in] props: Array of properties, the values for which the client requests to change
- [in] prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

void *usr_ctx
  Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

void (*usr_ctx_free_fn)(void *usr_ctx)
  Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

struct esp_local_ctrl_proto_sec_cfg
  Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t version
  This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via proto_sec_custom_handle below

void *custom_handle
  Custom security handle if security is set custom via proto_sec above. This handle must follow protocomm_security_t signature

void *pop
  Proof of possession to be used for local control. Could be NULL.

struct esp_local_ctrl_config
  Configuration structure to pass to esp_local_ctrl_start()
Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```c
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE / HTTPD) over which the service will be provided.

    This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.

    This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.

    This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to `esp_local_ctrl_start()`
```

### Enumerations

```c
enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.

    Values:

    PROTOCOM_SEC0 = 0
    PROTOCOM_SEC1
    PROTOCOM_SEC_CUSTOM
```

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.
Communication with ESP SDIO Slave  This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif chips  The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDIO slave</td>
<td>Y</td>
</tr>
<tr>
<td>To host intr</td>
<td>8</td>
</tr>
<tr>
<td>Fr host intr</td>

* Not including the interrupt registers

ESP SDIO Slave Initialization  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of SDIO Simplified Specification). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. SDIO reset  CMD52 (Write 0x6=0x8)
2. SD reset  CMD0
3. Check whether IO card (optional)  CMD8
4. Send SDIO op cond and wait for card ready  CMD5 arg=0x00000000
   CMD5 arg=0x00ff8000 (according to the response above, poll until ready)
   Example:  Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFFF00.
   Keep sending CMD5 with arg=0x00FFFFF00 until the R4 shows card ready (arg bit 31=1).
5. Set address  CMD3
6. Select card  CMD7 (arg address according to CMD3 response)
   Example:  Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. Select 4-bit mode (optional)  CMD52 (Write 0x07=0x02)
8. Enable func1  CMD52 (Write 0x02=0x02)
9. Enable SDIO interrupt (required if interrupt line (DAT1) is used)  CMD52 (Write 0x04=0x03)
10. Set Func0 blocksize (optional, default value is 512 (0x200))  CMD52/53 (Read 0x10~0x11)
   CMD52/53 (Write 0x10=0x00)
   CMD52/53 (Write 0x11=0x02)
   CMD52/53 (Read 0x10~0x11, read to check the final value)
11. Set Func1 blocksize (optional, default value is 512 (0x200))  CMD52/53 (Read 0x110~0x111)
   CMD52/53 (Write 0x110=0x00)
   CMD52/53 (Write 0x111=0x02)
   CMD52/53 (Read 0x110~0x111, read to check the final value)

ESP SDIO Slave Protocol  The ESP SDIO Slave protocol is based on the SDIO Specification’s I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.
Check the code example peripherals/sdio.

The ESP Serial Slave Link component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

**Slave register table**

### 32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

### 8-bit

#### Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

#### Interrupt Registers:

- 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

### FIFO (sending and receiving)

0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[
\text{requested length} = 0x1F800 - \text{address}
\]

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the requested length, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

**Note**: The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

### Interrupts

SDIO interrupts are “level sensitive”. For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.
Receiving FIFO  To write to the slave’s receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the requested length should not exceed the length calculated at Step 2, and the FIFO address is related to requested length.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

Sending FIFO  To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. **Update the read length.**

---

**Warning:** The driver for ESP32 hasn’t been developed yet.

### ESP SPI Slave HD (Half Duplex) Mode Protocol

**Introduction**  In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
  This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address:** 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.
Data IO Modes  In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>command WN</th>
<th>address WN</th>
<th>dummy cycles</th>
<th>data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>

<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

QPI Mode  The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

Supported Commands

Note:  The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>
Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>

</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode**  
Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line. (optional)
Chapter 2. API Reference

2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See SDIO Slave Capabilities of Espressif chips and SPI Slave Capabilities of Espressif chips for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave  The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave  

Note: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the SDIO interface instead.

Hasn’t been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.
Chapter 2. API Reference

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional)  Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

API Reference

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

- ```
  esp_err_t essl_init(essl_handle_t handle, uint32_t wait_ms)
  Initialize the slave.
  ```

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

- ```
  esp_err_t essl_wait_for_ready(essl_handle_t handle, uint32_t wait_ms)
  Wait for interrupt of an ESSL slave device.
  ```

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

- ```
  esp_err_t essl_get_tx_buffer_num(essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)
  Get buffer num for the host to send data to the slave. The buffers are size of buffer_size.
  ```

Return
Chapter 2. API Reference

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters
- handle: Handle of a ESSL device.
- out_tx_num: Output of buffer num that host can send data to ESSL slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)`
Get the size, in bytes, of the data that the ESSL slave is ready to send

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters
- handle: Handle of an ESSL device.
- out_rx_size: Output of data size to read from slave, in bytes
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_reset_cnt (essl_handle_t handle)`
Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

Parameters
- handle: Handle of an ESSL device.

`esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`
Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)`
Get a packet from ESSL slave.

Return
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
Chapter 2. API Reference

- [out] out_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- [out] out_length: Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)
```

Write general purpose R/W registers (8-bit) of ESSL slave.

**Note** sdio 28-31 are reserved, the lower API helps to skip.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see essl_spi.h
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_read_reg (essl_handle_t handle, uint8_t addr, uint8_t* value_o, uint32_t wait_ms)
```

Read general purpose R/W registers (8-bit) of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- handle: Handle of a essl device.
- addr: Address of register to read. For SDIO, valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see essl_spi.h
- value_o: Output value read from the register.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

**Return**
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

**Parameters**
- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to clear.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t* intr_raw, uint32_t* intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

**Return**
- ESP_OK: Success
**Chapter 2. API Reference**

- **ESP_INVALID_ARG**: If both `intr_raw` and `intr_st` are NULL.
- **ESP_ERR_NOT_SUPPORTED**: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of an ESSL device.
- `intr_raw`: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t esssl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)**

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**

- **ESP_OK**: Success
- **ESP_ERR_NOT_SUPPORTED**: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of an ESSL device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t esssl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

**Return**

- **ESP_OK**: Success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of an ESSL device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t esssl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**

- **ESP_OK**: Success
- **ESP_ERR_NOT_SUPPORTED**: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Type Definitions**

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.

**Header File**

- components.esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t esssl_sdio_init_dev (essl_handle_t *out_handle, const esssl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

**Return**

- **ESP_OK**: on success
- **ESP_ERR_NO_MEM**: memory exhausted.
Chapter 2. API Reference

Parameters
- out_handle: Output of the handle.
- config: Configuration for the ESSL SDIO device.

```
esp_err_t essl_sdio_deinit_dev(essl_handle_t handle)
```
Deinitialize and free the space used by the ESSL SDIO device.

Return
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

Parameters
- handle: Handle of the ESSL SDIO device to deinit.

Structures
```
struct essl_sdio_config_t
```
Configuration for the ESSL SDIO device.

Public Members
```
sdmmc_card_t *card
```
The initialized sdmmc card pointer of the slave.
```
int recv_buffer_size
```
The pre-negotiated recv buffer size used by both the host and the slave.

Header File
```
- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h
```

Functions
```
esp_err_t essl_spi_init_dev(essl_handle_t *out_handle, const essl_spi_config_t *init_config)
```
Initialize the ESSL SPI device function list and get its handle.

Return
- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

Parameters
- [out] out_handle: Output of the handle
- init_config: Configuration for the ESSL SPI device

```
esp_err_t essl_spi_deinit_dev(essl_handle_t handle)
```
Deinitialize the ESSL SPI device and free the memory used by the device.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters
- handle: Handle of the ESSL SPI device

```
esp_err_t essl_spi_read_reg(void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)
```
Read from the shared registers.

Note  The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spi_device_transmit.
Chapter 2. API Reference

Parameters

- **arg**: Context of the component. (Member arg from essl_handle_t)
- **addr**: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **[out]** **out_value**: Read buffer for the shared registers.
- **wait_ms**: Time to wait before timeout (reserved for future use, user should set this to 0).

```c
esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)
```

Get a packet from Slave.

Return

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

Parameters

- **arg**: Context of the component. (Member arg from essl_handle_t)
- **[out]** **out_data**: Output data address
- **size**: The size of the output data.
- **wait_ms**: Time to wait before timeout (reserved for future use, user should set this to 0).

```c
esp_err_t essl_spi_write_reg (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```

Write to the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see tx_sync_reg in essl_spi_config_t)

Note Feature of checking the actual written value (out_value) is not supported.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set out_value to NULL. See note 2.
- or other return value from :cpp:func:spi_device_transmit.

Parameters

- **arg**: Context of the component. (Member arg from essl_handle_t)
- **addr**: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value**: Buffer for data to send, should be align to 4.
- **[out]** **out_value**: Not supported, should be set to NULL.
- **wait_ms**: Time to wait before timeout (reserved for future use, user should set this to 0).

```c
esp_err_t essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)
```

Send a packet to Slave.

Return

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

Parameters

- **arg**: Context of the component. (Member arg from essl_handle_t)
- **data**: Address of the data to send
- **size**: Size of the data to send.
- **wait_ms**: Time to wait before timeout (reserved for future use, user should set this to 0).

```c
void essl_spi_reset_cnt (void *arg)
```

Reset the counter in Master context.

Note Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized.
Parameters

- **arg**: Context of the component. (Member arg from essl_handle_t)

`esp_err_t essl_spi_rdbuf(spi_device_handle_t spi, uint8_t* out_data, int addr, int len, uint32_t flags)`

Read the shared buffer from the slave in ISR way.

**Note** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- ESP_OK: on success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters

- **spi**: SPI device handle representing the slave
- [out] **out_data**: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr**: Address of the slave shared buffer
- **len**: Length to read
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_rdbuf_polling(spi_device_handle_t spi, uint8_t* out_data, int addr, int len, uint32_t flags)`

Read the shared buffer from the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- ESP_OK: on success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters

- **spi**: SPI device handle representing the slave
- [out] **out_data**: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr**: Address of the slave shared buffer
- **len**: Length to read
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_wrbuf(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)`

Write the shared buffer of the slave in ISR way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters

- **spi**: SPI device handle representing the slave
- **data**: Buffer for data to send, strongly suggested to be in the DRAM
- **addr**: Address of the slave shared buffer
- **len**: Length to write
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)`

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.
Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_polling_transmit`.

Parameters
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- addr: Address of the slave shared buffer,
- len: Length to write
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma (spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

Note This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len: Total length of data to receive.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_seg (spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)
```

Read one data segment from the slave through its DMA.

Note To read long buffer, call :cpp:func:`essl_spi_rddma` instead.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- seg_len: Length of this segment
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_done (spi_device_handle_t spi, uint32_t flags)
```

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even if there are data unsent, and maybe prepare the next buffer to send.

Note This is required only when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters
- spi: SPI device handle representing the slave
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma (spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)
```

Send long buffer in segments to the slave through its DMA.

Note This function combines several :cpp:func:`essl_spi_wrdma_seg` and one :cpp:func:`essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.
mode.

Return

- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `len`: Total length of data to send.
- `seg_len`: Length of each segment, which is not larger than the maximum transaction length allowed for the `spi` device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- `flags`: SPI_TRANS_\_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)
```

Send one data segment to the slave through its DMA.

Note To send long buffer, call `cpp:func:essl_spi_wrdma` instead.

Return

- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `seg_len`: Length of this segment
- `flags`: SPI_TRANS_\_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note This is required only when the slave is working in segment mode.

Return

- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `flags`: SPI_TRANS_\_* flags to control the transaction mode of the transaction to send.

Structures

```c
struct essl_spi_config_t
```

Configuration of ESSL SPI device.

Public Members

```c
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```c
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```c
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.
2.2.8 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32.

Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports ws, wss schemes
- WebSocket samples:
  - ws://echo.websocket.org: WebSocket over TCP, default port 80
  - wss://echo.websocket.org: WebSocket over SSL, default port 443

Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org:123",
  .port = 4567,
};
```

//WebSocket client will connect to websocket.org using port 4567

TLS Configuration:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "wss://echo.websocket.org",
  .cert_pem = (const char *)websocket_org_pem_start,
};
```

Note: If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default to not requiring verification.

PEM certificate for this example could be extracted from an openssl `s_client` command connecting to websocket.org. In case a host operating system has openssl and sed packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used).

```bash
  echo "" | openssl s_client -showcerts -connect websocket.org:443 > root.pem
```
This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol**  The subprotocol field in the config struct can be used to request a subprotocol

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

**Note:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Events**

- **WEBSOCKET_EVENT_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```c
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

**Limitations and Known Issues**

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

**Application Example**

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the `websocket.org` server can be found here: protocols/websocket.

**Sending Text Data**  The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```c
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

**API Reference**

**Header File**

- `components/esp_websocket_client/include/esp_websocket_client.h`
Functions

**esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)**

Start a Websocket session. This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**Return**

- `esp_websocket_client_handle_t`
- `NULL` if any errors

**Parameters**

- `[in] config`: The configuration

**esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)**

Set URL for client, when performing this behavior, the options in the `uri` will replace the old ones. Must stop the WebSocket client before setting URI if the client has been connected.

**Return** `esp_err_t`

**Parameters**

- `[in] client`: The client
- `[in] uri`: The uri

**esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)**

Open the WebSocket connection.

**Return** `esp_err_t`

**Parameters**

- `[in] client`: The client

**esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)**

Stops the WebSocket connection without websocket closing handshake. This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

**Notes:**

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- `[in] client`: The client

**esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)**

Destroy the WebSocket connection and free all resources. This function must be the last function to call for a session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

**Notes:**

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- `[in] client`: The client

**int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)**

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- `[in] client`: The client
- `[in] data`: The data
• [in] `len`: The length
• [in] `timeout`: Write data timeout in RTOS ticks

```c
int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data,
    int len, TickType_t timeout)
```

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**
- Number of data was sent
- (-1) if any errors

**Parameters**
- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

```c
esp_err_t esp_websocket_client_close(esp_websocket_client_handle_t client, TickType_t timeout)
```

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:
- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

**Notes:**
- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**
- [in] `client`: The client
- [in] `timeout`: Timeout in RTOS ticks for waiting

```c
esp_err_t esp_websocket_client_close_with_code(esp_websocket_client_handle_t client, int code,
    const char *data, int len, TickType_t timeout)
```

Close the WebSocket connection in a clean way with custom code/data

Closing sequence is the same as for `esp_websocket_client_close()`

**Notes:**
- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**
- [in] `client`: The client
- [in] `code`: Close status code as defined in RFC6455 section-7.4
- [in] `data`: Additional data to closing message
- [in] `len`: The length of the additional data
- [in] `timeout`: Timeout in RTOS ticks for waiting

```c
bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
```

Check the WebSocket client connection state.

**Return**
- `true`
- `false`

**Parameters**
- [in] `client`: The client handle

```c
esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client,
    esp_websocket_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register the Websocket Events.
Return esp_err_t

Parameters

• client: The client handle
• event: The event id
• event_handler: The callback function
• event_handler_arg: User context

Structures

struct esp_websocket_event_data_t
Websocket event data.

Public Members

const char *data_ptr
Data pointer

int data_len
Data length

uint8_t op_code
Received opcode

esp_websocket_client_handle_t client
esp_websocket_client_handle_t context

void *user_context
user_data context, from esp_websocket_client_config_t user_data

int payload_len
Total payload length, payloads exceeding buffer will be posted through multiple events

int payload_offset
Actual offset for the data associated with this event

struct esp_websocket_client_config_t
Websocket client setup configuration.

Public Members

const char *uri
Websocket URI, the information on the URI can be overrides the other fields below, if any

const char *host
Domain or IP as string

int port
Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char *username
Using for Http authentication - Not supported for now

const char *password
Using for Http authentication - Not supported for now

const char *path
HTTP Path, if not set, default is /

bool disable_auto_reconnect
Disable the automatic reconnect function when disconnected

void *user_context
HTTP user data context
int task_prio
Websocket task priority

int task_stack
Websocket task stack

int buffer_size
Websocket buffer size

const char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char *client_key
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_websocket_transport_t transport
Websocket transport type, see `esp_websocket_transport_t`

const char *subprotocol
Websocket subprotocol

const char *user_agent
Websocket user-agent

const char *headers
Websocket additional headers

int pingpong_timeout_sec
Period before connection is aborted due to no PONGs received

bool disable_pingpong_discon
Disable auto-disconnect due to no PONG received within pingpong_timeout_sec

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)
Chapter 2. API Reference

**Type Definitions**

typedef struct esp_websocket_client *esp_websocket_client_handle_t

**Enumerations**

enum esp_websocket_event_id_t
  Websocket Client events id.

  **Values:**

  WEBsocket_EVENT_ANY = -1

  WEBsocket_EVENT_ERROR = 0
  This event occurs when there are any errors during execution

  WEBsocket_EVENT_CONNECTED
  Once the Websocket has been connected to the server, no data exchange has been performed

  WEBsocket_EVENT_DISCONNECTED
  The connection has been disconnected

  WEBsocket_EVENT_DATA
  When receiving data from the server, possibly multiple portions of the packet

  WEBsocket_EVENT_CLOSED
  The connection has been closed cleanly

  WEBsocket_EVENT_MAX

enum esp_websocket_transport_t
  Websocket Client transport.

  **Values:**

  WEBsocket_TRANSPORT_UNKNOWN = 0x0
  Transport unknown

  WEBsocket_TRANSPORT_OVER_TCP
  Transport over tcp

  WEBsocket_TRANSPORT_OVER_SSL
  Transport over ssl

2.2.9 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.
Chapter 2. API Reference

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE: automatically build and attach the bundle.
- CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE: decide which certificates to include from the complete root list.
- CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script mk-ca-bundle.pl that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crt_authorities.csv, from this list provided by Mozilla.
Chapter 2. API Reference

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in Updating the Certificate Bundle.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

```c
esp_err_t esp_crt_bundle_attach(void *conf)
```

Attach and enable use of a bundle for certificate verification.

- Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

  Return
  - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

  Parameters
  - [in] conf: The config struct for the SSL connection.

```c
void esp_crt_bundle_detach(mbedtls_ssl_config *conf)
```

Disable and deallocate the certification bundle.

- Removes the certificate verification callback and deallocates used resources

  Parameters
  - [in] conf: The config struct for the SSL connection.

```c
void esp_crt_bundle_set(const uint8_t *x509_bundle)
```

Set the default certificate bundle used for verification.

- Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

  Parameters
  - [in] x509_bundle: A pointer to the certificate bundle.

2.2.10 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:
• `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

• `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

• `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri` name, `method` type (eg. `HTTPD_GET`, `HTTPD_POST`, `HTTPD_PUT` etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

**Application Example**

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
    * httpd_req_recv() accepts char* only, but content could
    * as well be any binary data (needs type casting).
    * In case of string data, null termination will be absent, and
    * content length would give length of string */
    char content[100];
    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));
    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
        /* In case of timeout one can choose to retry calling
        * httpd_req_recv(), but to keep it simple, here we
        * respond with an HTTP 408 (Request Timeout) error */
        httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
    * ensure that the underlying socket is closed */
    return ESP_FAIL;
}

/* Send a simple response */
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
} (continues on next page)
```
Chapter 2. API Reference

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP server example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context */
        req->free_ctx = free_ctx_func; /* Function to free context */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ............
    ............
    ............

    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

Websocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see CONFIG_HTTPD_WS_SUPPORT. Please check the example under protocols/http_server/ws_echo_server.

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (...) {
        // Return fail to close session //
        // Return ESP_FAIL;
    }
}
```

(continues on next page)
// On success
return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
  .uri = "/my_uri/path/xyz",
  .method = HTTPD_GET,
  .handler = my_uri_handler,
  .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
  // If failed to register handler
  ....
}

Note URI handlers can be registered in real time as long as the server handle is valid.

Return
• ESP_OK: On successfully registering the handler
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
• ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri_handler: pointer to handler that needs to be registered

esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)

Unregister a URI handler.

Return
• ESP_OK: On successfully deregistering the handler
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri: URI string
• [in] method: HTTP method

esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Return
• ESP_OK: On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_NOT_FOUND: No handler registered with specified uri string

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri: uri string specifying all handlers that need to be deregistered

esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
Chapter 2. API Reference

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

Parameters
- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] recv_func: The receive function to be set for this session

esp_err_t httpd_sess_set_send_override (httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

Note
This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

Parameters
- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] send_func: The send function to be set for this session

esp_err_t httpd_sess_set_pending_override (httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

Note
This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

Parameters
- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] pending_func: The receive function to be set for this session

int httpd_req_to_sockfd (httpd_req_t *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

Note
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

Return
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NUL request pointer

Parameters
- [in] r: The request whose socket descriptor should be found

int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.
This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

Return
- Bytes: Number of bytes read into the buffer successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that the data will be read into
- [in] buf_len: Length of the buffer

size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char *field)

Search for a field in request headers and return the string length of its value.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- Length: If field is found in the request URL
- Zero: Field not found / Invalid request / Null arguments

Parameters
- [in] r: The request being responded to
- [in] field: The header field to be searched in the request

esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

Return
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_HTTPD_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

Parameters
- [in] r: The request being responded to
- [in] field: The field to be searched in the header
- [out] val: Pointer to the buffer into which the value will be copied if the field is found
- [in] val_size: Size of the user buffer “val”
size_t httpd_req_get_url_query_len (httpd_req_t *r)
Get Query string length from the request URL.

Note This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Return
• Length: Query is found in the request URL
• Zero: Query not found / Null arguments / Invalid request

Parameters
• [in] r: The request being responded to

esp_err_t httpd_req_get_url_query_str (httpd_req_t *r, char* buf, size_t buf_len)
Get Query string from the request URL.

Note
• Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
• Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return
• ESP_OK : Query is found in the request URL and copied to buffer
• ESP_ERR_NOT_FOUND : Query not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

Parameters
• [in] r: The request being responded to
• [out] buf: Pointer to the buffer into which the query string will be copied (if found)
• [in] buf_len: Length of output buffer

esp_err_t httpd_query_key_value (const char* qry, const char* key, char* val, size_t val_size)
Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note
• The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
• If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return
• ESP_OK : Key is found in the URL query string and copied to buffer
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters
• [in] qry: Pointer to query string
• [in] key: The key to be searched in the query string
• [out] val: Pointer to the buffer into which the value will be copied if the key is found
• [in] val_size: Size of the user buffer “val”

esp_err_t httpd_req_get_cookie_val (httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)
Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return
Chapter 2. API Reference

- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

**Parameters**
- [in] req: Pointer to the HTTP request
- [in] cookie_name: The cookie name to be searched in the request
- [out] val: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- [inout] val_size: Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

```c
bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)
```

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “??” to make the previous character optional, and if present, allow anything to follow.

Example:
- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/* or /foo/?* (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

**Return** true if a match was found

**Parameters**
- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

```c
esp_err_t httpd_respsend(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_respsend_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_respsetstatus() - for setting the HTTP status string, httpd_respset_type() - for setting the Content Type, httpd_respset_hdr() - for appending any additional field value entries in the response header

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

**Parameters**
• [in] r: The request being responded to
• [in] buf: Buffer from where the content is to be fetched
• [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```c
esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpdRespSetStatus() - for setting the HTTP status string, httpdRespSetType() - for setting the Content Type, httpdRespSetHdr() - for appending any additional field value entries in the response header

**Note**

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• When you are finished sending all your chunks, you must call this function with buf_len as 0.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

• ESP_OK : On successfully sending the response packet chunk
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

• [in] r: The request being responded to
• [in] buf: Pointer to a buffer that stores the data
• [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```c
static esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)
```

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

• ESP_OK : On successfully sending the response packet
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

• [in] r: The request being responded to
• [in] str: String to be sent as response body

```c
static esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)
```

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

• ESP_OK : On successfully sending the response packet
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

• [in] r: The request being responded to
• [in] str: String to be sent as response body (NULL to finish response packet)

**esp_err_t** httpd_resp_set_status (httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**
- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to
- [in] status: The HTTP status code of this response

**esp_err_t** httpd_resp_set_type (httpd_req_t *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**
- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to
- [in] type: The Content Type of the response

**esp_err_t** httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**
- ESP_OK : On successfully appending new header
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to
- [in] field: The field name of the HTTP header
- [in] value: The value of this HTTP header
**esp_err_t httpd_resp_send_err** (httpd_req_t *req, httpd_err_code_t error, const char *msg)

For sending out error code in response to HTTP request.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

**static esp_err_t httpd_resp_send_404** (httpd_req_t *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**static esp_err_t httpd_resp_send_408** (httpd_req_t *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**static esp_err_t httpd_resp_send_500** (httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.
Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to

int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)
Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

Return
- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

Parameters
- [in] r: The request being responded to
- [in] buf: Buffer from where the fully constructed packet is to be read
- [in] buf_len: Length of the buffer

int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

Note This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Return
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

int httpd_socket_recv (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().
**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**
- **Bytes**: The number of bytes received successfully
- **0**: Buffer length parameter is zero / connection closed by peer
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket recv()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket recv()

**Parameters**
- **[in] hd**: server instance
- **[in] sockfd**: session socket file descriptor
- **[in] buf**: buffer with bytes to send
- **[in] buf_len**: data size
- **[in] flags**: flags for the send() function

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

**Return**
- **ESP_OK**: handler registered successfully
- **ESP_ERR_INVALID_ARG**: invalid error code or server handle

**Parameters**
- **[in] handle**: HTTP server handle
- **[in] error**: Error type
- **[in] handler_fn**: User implemented handler function (Pass NULL to unset any previously set handler)

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

**Example usage:**

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    // If server failed to start, handle will be NULL
    return server;
}
```

**Return**
- **ESP_OK**: Instance created successfully
- **ESP_ERR_INVALID_ARG**: Null argument(s)
- **ESP_ERR_HTTPD_ALLOC_MEM**: Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK: Failed to launch server task

**Parameters**

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

```c
esp_err_t httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Return**

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is null

**httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)**

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

**Note** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**Return**

- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in ctrl socket
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**

- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD’s context
- [in] arg: Pointer to the arguments that should be passed to this function

```c
void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
```

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Return**

- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

```c
void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session context by socket descriptor.

**Parameters**

- [in] handle: Handle to server returned by httpd_start
Chapter 2. API Reference

- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free_fn: Function that should be called to free the context

```c
void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
```
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

Return
- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

```c
Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
```

```c
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```
Set session ‘transport’ context by socket descriptor.

See `httpd_sess_set_ctx()`

```c
Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Transport context object to assign to the session
- [in] free_fn: Function that should be called to free the transport context
```

```c
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```
Get HTTPD global user context (it was set in the server config struct)

Return global user context

```c
Parameters
- [in] handle: Handle to server returned by httpd_start
```

```c
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```
Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

```c
Parameters
- [in] handle: Handle to server returned by httpd_start
```

```c
eesp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```
Trigger an httpd session close externally.

Note Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Return
- ESP_OK : On successfully initiating closure
- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

```c
Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session to be closed
```

```c
eesp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```
Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sock-
Chapter 2. API Reference

ets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

```c
esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t* fds, int* client_fds)
```

Returns list of current socket descriptors of active sessions.

**Note** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Return**
- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [inout] fds: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- [out] client_fds: Array of client fds

**Structures**

```c
struct httpd_config
HTTP Server Configuration Structure.
```

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

```c
unsigned task_priority
Priority of FreeRTOS task which runs the server
```

```c
size_t stack_size
The maximum stack size allowed for the server task
```

```c
BaseType_t core_id
The core the HTTP server task will run on
```

```c
uint16_t server_port
TCP Port number for receiving and transmitting HTTP traffic
```

```c
uint16_t ctrl_port
UDP Port number for asynchronously exchanging control signals between various components of the server
```

```c
uint16_t max_open_sockets
Max number of sockets/clients connected at any time
```

```c
uint16_t max_uri_handlers
Maximum allowed uri handlers
```

```c
uint16_t max_resp_headers
Maximum allowed additional headers in HTTP response
```

```c
uint16_t backlog_conn
Number of backlog connections
```
Chapter 2. API Reference

bool lru_purge_enable
    Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
    Timeout for recv function (in seconds)

uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.

    This field can be used to store arbitrary user data within the server context. The value can be retrieved
    using the server handle, available e.g. in the httpd_req_t struct.

    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
    If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.

    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
    will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

httpd_open_func_t open_fn
    Custom session opening callback.

    Called on a new session socket just after accept(), but before reading any data.

    This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
    session overrides.

    If a context needs to be maintained between these functions, store it in the session using
    httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

    Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn
    Custom session closing callback.

    Called when a session is deleted, before freeing user and transport contexts and before closing the socket.
    This is a place for custom de-init code common to all sockets.

    The server will only close the socket if no custom session closing callback is set. If a custom callback is
    used, close(sockfd) should be called in here for most cases.

    Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

    This function is run for all terminated sessions, including sessions where the socket was closed by the
    network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t uri_match_fn
    URI matcher function.

    Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP
    request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using
    httpd_register_uri_handler()

    Available options are: 1) NULL : Internally do basic matching using strncmp() 2)
    httpd_uri_match_wildcard(): URI wildcard matcher

    Users can implement their own matching functions (See description of the
    httpd_uri_match_func_t function prototype)
struct httpd_req
    HTTP Request Data Structure.

    Public Members

    httpd_handle_t handle
        Handle to server instance

    int method
        The type of HTTP request, -1 if unsupported method

    const char uri[HTTPD_MAX_URI_LEN + 1]
        The URI of this request (1 byte extra for null termination)

    size_t content_len
        Length of the request body

    void *aux
        Internally used members

    void *user_ctx
        User context pointer passed during URI registration.

    void *sess_ctx
        Session Context Pointer

        A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

        By default, this is NULL. URI Handlers can set this to any meaningful value.

        If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

    httpd_free_ctx_fn_t free_ctx
        Pointer to free context hook

        Function to free session context

        If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

    bool ignore_sess_ctx_changes
        Flag indicating if Session Context changes should be ignored

        By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
    Structure for URI handler.

    Public Members

    const char *uri
        The URI to handle

    httpd_method_t method
        Method supported by the URI
**esp_err_t** (*handler*) *(httpd_req_t *r)*

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

**void *user_ctx**

Pointer to user context data which will be available to handler

**Macros**

- **HTTPD_MAX_REQ_HDR_LEN**
- **HTTPD_MAX_URI_LEN**
- **HTTPD_SOCK_ERR_FAIL**
- **HTTPD_SOCK_ERR_INVALID**
- **HTTPD_SOCK_ERR_TIMEOUT**
- **HTTPD_200**
  - HTTP Response 200
- **HTTPD_204**
  - HTTP Response 204
- **HTTPD_207**
  - HTTP Response 207
- **HTTPD_400**
  - HTTP Response 400
- **HTTPD_404**
  - HTTP Response 404
- **HTTPD_408**
  - HTTP Response 408
- **HTTPD_500**
  - HTTP Response 500
- **HTTPD_TYPE_JSON**
  - HTTP Content type JSON
- **HTTPD_TYPE_TEXT**
  - HTTP Content type text/HTML
- **HTTPD_TYPE_OCTET**
  - HTTP Content type octet-stream
- **HTTPD_DEFAULT_CONFIG**
- **ESP_ERR_HTTPD_BASE**
  - Starting number of HTTPD error codes
- **ESP_ERR_HTTPD_HANDLERS_FULL**
  - All slots for registering URI handlers have been consumed
- **ESP_ERR_HTTPD_HANDLER_EXISTS**
  - URI handler with same method and target URI already registered
- **ESP_ERR_HTTPD_INVALID_REQ**
  - Invalid request pointer
- **ESP_ERR_HTTPD_RESULT_TRUNC**
  - Result string truncated
- **ESP_ERR_HTTPD_RESP_HDR**
  - Response header field larger than supported
Chapter 2. API Reference

**ESP_ERR_HTTPD_RESP_SEND**
Error occurred while sending response packet

**ESP_ERR_HTTPD_ALLOC_MEM**
Failed to dynamically allocate memory for resource

**ESP_ERR_HTTPD_TASK**
Failed to launch server task/thread

**HTTPD_RESP_USE_STRLEN**

**Type Definitions**

typedef struct _httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct _httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

**Note** User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

**Return**
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

**Note** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

**Return**
- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

**Return**
Chapter 2. API Reference

- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

**Parameters**

- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Return**

- ESP_OK: error handled successful
- ESP_FAIL: failure indicates that the underlying socket needs to be closed

**Parameters**

- [in] req: HTTP request for which the error needs to be handled
- [in] error: Error type

```c
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

```c
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

```c
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
```

Prototype for freeing context data (if any)

**Parameters**

- [in] ctx: object to free

```c
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**

- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**

- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**

- [in] hd: server instance
Chapter 2. API Reference

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

Return: true on match

Parameters:
- [in] reference_uri: URI/template with respect to which the other URI is matched
- [in] uri_to_match: URI/template being matched to the reference URI/template
- [in] match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function. Please refer to httpd_queue_work() for more details.

Parameters:
- [in] arg: The arguments for this work function

Enumerations

enum httpd_err_code_t
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:
- HTTPD_500_INTERNAL_SERVER_ERROR = 0
- HTTPD_501_METHOD_NOT_IMPLEMENTED
- HTTPD_505_VERSION_NOT_SUPPORTED
- HTTPD_400_BAD_REQUEST
- HTTPD_401_UNAUTHORIZED
- HTTPD_403_FORBIDDEN
- HTTPD_404_NOT_FOUND
- HTTPD_405_METHOD_NOT_ALLOWED
- HTTPD_408_REQ_TIMEOUT
- HTTPD_411_LENGTH_REQUIRED
- HTTPD_414_URI_TOO_LONG
- HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
- HTTPD_ERR_CODE_MAX

2.2.11 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.
Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()

- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config_t.global_transport_ctx
  - httpd_config_t.global_transport_ctx_free_fn
  - httpd_config_t.open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - httpd_ssl_config.transport_mode. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- components/esp_https_server/include/esp_https_server.h

Functions

esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Return success

Parameters

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

void httpd_ssl_stop (httpd_handle_t handle)

Stop the server. Blocks until the server is shut down.

Parameters

- [in] handle:
Structures

**struct esp_https_server_user_cb_arg**
Callback data struct, contains the ESP-TLS connection handle.

**struct httpd_ssl_config**
HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

`httpd_config_t httpd`
Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```
const uint8_t * servercert
Server certificate
size_t servercert_len
Server certificate byte length

const uint8_t * cacert_pem
CA certificate ((CA used to sign clients, or client cert itself)
size_t cacert_len
CA certificate byte length

const uint8_t * prvtkey_pem
Private key
size_t prvtkey_len
Private key byte length

httpd_ssl_transport_mode_t transport_mode
Transport Mode (default secure)
```

```
uint16_t port_secure
Port used when transport mode is secure (default 443)

uint16_t port_insecure
Port used when transport mode is insecure (default 80)

bool session_tickets
Enable tls session tickets
```

```
esp_https_server_user_cb * user_cb
User callback for esp_https_server
```

Macros

**HTTPD_SSL_CONFIG_DEFAULT()**
Default config struct init

(httpd_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to ‘transport_mode’
- one socket uses ~40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application
Type Definitions

typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t

Callback data struct, contains the ESP-TLS connection handle.

typedef void esp_https_server_user_cb(esp_https_server_user_cb_arg_t *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Parameters

• user_cb: Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations

enum httpd_ssl_transport_mode_t

Values:

HTTPD_SSL_TRANSPORT_SECURE
HTTPD_SSL_TRANSPORT_INSECURE

2.2.12 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
}
```

(continues on next page)
printf("%d bytes from %s icmp_seq=%d time=%d ms\n", 
    recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(&target_addr, &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
Chapter 2. API Reference

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: `protocols/icmp_echo`

API Reference

Header File

- `components/lwip/include/apps/ping/ping_sock.h`

Functions

```c
esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)
```
Create a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

Parameters

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

```c
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
```
Delete a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

Parameters

- `hdl`: handle of ping session

```c
esp_err_t esp_ping_start(esp_ping_handle_t hdl)
```
Start the ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

Parameters

- `hdl`: handle of ping session

```c
esp_err_t esp_ping_stop(esp_ping_handle_t hdl)
```
Stop the ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

**Parameters**
- `hdl`: handle of ping session

```c
esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)
```

Get runtime profile of ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**
- `hdl`: handle of ping session
- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

**Structures**

```c
define struct esp_ping_callbacks_t
  Type of ping callback functions.

  void cb_args
    arguments for callback functions

  void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when received ICMP echo reply packet.

  void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when receive ICMP echo reply packet timeout.

  void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when a ping session is finished.
```

```c
define struct esp_ping_config_t
  Type of “ping” configuration.

  uint32_t count
    A “ping” session contains count procedures

  uint32_t interval_ms
    Milliseconds between each ping procedure

  uint32_t timeout_ms
    Timeout value (in milliseconds) of each ping procedure

  uint32_t data_size
    Size of the data next to ICMP packet header

  uint8_t tos
    Type of Service, a field specified in the IP header

  ip_addr_t target_addr
    Target IP address, either IPv4 or IPv6

  uint32_t task_stack_size
    Stack size of internal ping task
```
Chapter 2. API Reference

```c
uint32_t task_prio
Priority of internal ping task
```

```c
uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX
```

**Macros**

```c
ESP_PING_DEFAULT_CONFIG()  
Default ping configuration.
ESP_PING_COUNT_INFINITE  
Set ping count to zero will ping target infinitely
```

**Type Definitions**

```c
typedef void *esp_ping_handle_t
Type of “ping” session handle.
```

**Enumerations**

```c
enum esp_ping_profile_t
Profile of ping session.
```

Values:

- **ESP_PING_PROF_SEQNO**
  - Sequence number of a ping procedure

- **ESP_PING_PROF_TTL**
  - Time to live of a ping procedure

- **ESP_PING_PROF_REQUEST**
  - Number of request packets sent out

- **ESP_PING_PROF_REPLY**
  - Number of reply packets received

- **ESP_PING_PROF_IPADDR**
  - IP address of replied target

- **ESP_PING_PROF_SIZE**
  - Size of received packet

- **ESP_PING_PROF_TIMEGAP**
  - Elapsed time between request and reply packet

- **ESP_PING_PROF_DURATION**
  - Elapsed time of the whole ping session

### 2.2.13 mDNS Service

**Overview**

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.
mDNS Properties

- **hostname**: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32 will resolve to my-esp32.local
- **default_instance**: friendly name for your device, like Jhon’s ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service() {
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

mDNS Services  mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- **instance_name**: friendly name for your service, like Jhon’s EESP32 Web Server. If not defined, default_instance will be used.
- **service_type**: (required) service type, prepended with underscore. Some common types can be found here.
- **proto**: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
- **port**: (required) network port that the service runs on
- **txt**: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_instance_name_set("http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board","esp32"},
        {"u","user"},
        {"p","password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

mDNS Query  mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses.
Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u ]", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }

        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf("AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&a->addr.u_addr.ip4));
            }
            a = a->next;
        }
        r = r->next;
    }
}
```
```
void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}
```

Example of using the methods above:
```
void my_app_some_method(){
    //search for esp32-mdns.local
    resolve_mdns_host("esp32-mdns");

    //search for HTTP servers
    find_mdns_service("_http", "_tcp");

    //or file servers
    find_mdns_service("_smb", "_tcp"); //windows sharing
    find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
    find_mdns_service("_nfs", "_tcp"); //NFS server
    find_mdns_service("_ftp", "_tcp"); //FTP server

    //or networked printer
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}
```

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- components/mdns/include/mdns.h

Functions

```
esp_err_t mdns_init(void)
```

Initialize mDNS on given interface.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mDNS task

```
void mdns_free(void)
```

Stop and free mDNS server.
**mdns_hostname_set (const char *hostname)**

Set the hostname for mDNS server required if you want to advertise services.

*Return*

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

*Parameters*

- hostname: Hostname to set

**mdns_delegate_hostname_add (const char *hostname, const mdns_ip_addr_t *address_list)**

Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

*Return*

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

*Parameters*

- hostname: Hostname to add
- address_list: The IP address list of the host

**mdns_delegate_hostname_remove (const char *hostname)**

Remove a delegated hostname All the services added to this host will also be removed.

*Return*

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

*Parameters*

- hostname: Hostname to remove

**mdns_hostname_exists (const char *hostname)**

Query whether a hostname has been added.

*Return*

- true The hostname has been added.
- false The hostname has not been added.

*Parameters*

- hostname: Hostname to query

**mdns_instance_name_set (const char *instance_name)**

Set the default instance name for mDNS server.

*Return*

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

*Parameters*

- instance_name: Instance name to set

**mdns_service_add (const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)**

Add service to mDNS server.

*Note* The value length of txt items will be automatically decided by strlen

*Return*

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service
Chapter 2. API Reference

Parameters

- **instance_name**: instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **port**: service port
- **txt**: string array of TXT data (eg. {{“var”, “val” }, {“other”, “2” }})
- **num_items**: number of items in TXT data

```c
esp_err_t mdns_service_add_for_host(const char *instance_name, const char *service_type,
                                    const char *proto, const char *hostname, uint16_t port,
                                    mdns_txt_item_t txt[], size_t num_items)
```

Add service to mDNS server with a delegated hostname.

Note The value length of txt items will be automatically decided by strlen

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters

- **instance_name**: instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **port**: service port
- **txt**: string array of TXT data (eg. {{“var”, “val” }, {“other”, “2” }})
- **num_items**: number of items in TXT data

```c
bool mdns_service_exists(const char *service_type, const char *proto, const char *hostname)
```

Check whether a service has been added.

Return

- true Corresponding service has been added.
- false Service not found.

Parameters

- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, checks for the local hostname.

```c
bool mdns_service_exists_with_instance(const char *instance, const char *service_type,
                                        const char *proto, const char *hostname)
```

Check whether a service has been added.

Return

- true Corresponding service has been added.
- false Service not found.

Parameters

- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, checks for the local hostname.

```c
esp_err_t mdns_service_remove(const char *service_type, const char *proto)
```

Remove service from mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)

```c
def esp_err_t mdns_service_remove_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname)
{
    // Remove service from mDNS server with hostname.
}
```

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.

```c
def esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto, const char *instance_name)
{
    // Set instance name for service.
}
```

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- instance_name: instance name to set

```c
def esp_err_t mdns_service_instance_name_set_for_host(const char *instance_old, const char *service_type, const char *proto, const char *hostname, const char *instance_name)
{
    // Set instance name for service with hostname.
}
```

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance_old: original instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- instance_name: instance name to set

```c
def esp_err_t mdns_service_port_set(const char *service_type, const char *proto, uint16_t port)
{
    // Set service port.
}
```

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• port: service port

```c
esp_err_t mdns_service_port_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, uint16_t port)
```

Set service port with hostname.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- port: service port

```c
esp_err_t mdns_service_txt_set(const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- txt: array of TXT data (eg. [{ “var” ,” val” },{ “other” ,” 2” }])
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service with hostname.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- txt: array of TXT data (eg. [{ “var” ,” val” },{ “other” ,” 2” }])
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

**Note** The value length will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to add/update
• value: the new value of the key

```c
esp_err_t mdns_service_txt_item_set_with_explicit_value_len(const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)
```

Set/Add TXT item for service TXT record.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to add/update
• value: the new value of the key
• value_len: the length of the value

```c
esp_err_t mdns_service_txt_item_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)
```

Set/Add TXT item for service TXT record with hostname.

Note  The value length will be automatically decided by strlen

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• instance: instance name
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, local hostname will be used.
• key: the key that you want to add/update
• value: the new value of the key
\texttt{esp_err_t mdns_service_txt_item_set_for_host_with_explicit_value_len (const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, uint8_t value_len)}

Set/Add TXT item for service TXT record with hostname and txt value length.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- key: the key that you want to add/update
- value: the new value of the key
- value_len: the length of the value

\texttt{esp_err_t mdns_service_txt_item_remove (const char *service_type, const char *proto, const char *key)}

Remove TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- key: the key that you want to remove

\texttt{esp_err_t mdns_service_txt_item_remove_for_host (const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key)}

Remove TXT item for service TXT record with hostname.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error
**Parameters**
- `instance`: instance name
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to remove

```c
esp_err_t mdns_service_subtype_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, const char *subtype)
```

Add subtype for service.

**Return**
- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

**Parameters**
- `instance_name`: instance name. If NULL, will find the first service with the same service type and protocol.
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `subtype`: The subtype to add.

```c
esp_err_t mdns_service_remove_all(void)
```

Remove and free all services from mDNS server.

**Return**
- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t mdns_query_async_delete(mdns_search_once_t *search)
```

Deletes the finished query. Call this only after the search has ended!

**Return**
- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` search has not finished
- `ESP_ERR_INVALID_ARG` pointer to search object is NULL

**Parameters**
- `search`: pointer to search object

```c
bool mdns_query_async_get_results(mdns_search_once_t *search, uint32_t timeout, mdns_result_t **results, uint8_t *num_results)
```

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

**Return** True if search has finished before or at timeout False if search timeout is over

**Parameters**
- `search`: pointer to search object
- `timeout`: time in milliseconds to wait for answers
- `results`: pointer to the results of the query
- `num_results`: pointer to the number of the actual result items (set to NULL to ignore this return value)

```c
mdns_search_once_t *mdns_query_async_new(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_query_notify_t notifier)
```

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

**Return** `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
Chapter 2. API Reference

- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `timeout`: time in milliseconds during which mDNS query is active
- `max_results`: maximum results to be collected
- `notifier`: Notification function to be called when the result is ready, can be NULL

```c
esp_err_t mdns_query_generic(const char *name, const char *service_type, const char *proto,
uint16_t type, mdns_query_transmission_type_t transmission_type,
uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Generic mDNS query. All following query methods are derived from this one.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `transmission_type`: either Unicast query, or Multicast query
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

```c
esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type,
uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Query mDNS for host or service.

Note that querying PTR types sends Multicast query, all other types send Unicast queries.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

```c
void mdns_query_results_free(mdns_result_t *results)
```

Free query results.

**Parameters**
- `results`: linked list of results to be freed

```c
esp_err_t mdns_query_ptr(const char *service_type, const char *proto, uint32_t timeout, size_t
max_results, mdns_result_t **results)
```

Query mDNS for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG parameter error

Parameters
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- max_results: maximum results to be collected
- results: pointer to the results of the query

`esp_err_t mdns_query_srv(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)`

Query mDNS for SRV record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- instance_name: service instance name
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

`esp_err_t mdns_query_txt(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)`

Query mDNS for TXT record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- instance_name: service instance name
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

`esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)`

Query mDNS for A record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer.
- addr: pointer to the resulting IP4 address

`esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)`

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error
Chapter 2. API Reference

Parameters
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
- addr: pointer to the resulting IP6 address

Structures
struct mdns_txt_item_t
mDNS basic text item structure Used in mdns_service_add()

Public Members
const char *key
item key name
const char *value
item value string

struct mdns_ip_addr_s
mDNS query linked list IP item

Public Members
esp_ip_addr_t addr
IP address
struct mdns_ip_addr_s *next
next IP, or NULL for the last IP in the list

struct mdns_result_s
mDNS query result structure

Public Members
struct mdns_result_s *next
next result, or NULL for the last result in the list

mdns_if_t *tcpip_if
interface index

uint32_t ttl
time to live

mdns_ip_protocol_t ip_protocol
ip_protocol type of the interface (v4/v6)

char *instance_name
instance name

char *service_type
service type

char *proto
service protocol

char *hostname
hostname

uint16_t port
service port

mdns_txt_item_t *txt
txt record
Chapter 2. API Reference

```c
uint8_t *txt_value_len
   array of txt value len of each record
size_t txt_count
   number of txt items

mdns_ip_addr_t *addr
   linked list of IP addresses found
```

**Macros**

- MDNS_TYPE_A
- MDNS_TYPE_PTR
- MDNS_TYPE_TXT
- MDNS_TYPE_AAAA
- MDNS_TYPE_SRV
- MDNS_TYPE_OPT
- MDNS_TYPE_NSEC
- MDNS_TYPE_ANY

**Type Definitions**

```c
typedef struct mdns_search_once_s mdns_search_once_t
   Asynchronous query handle.
```

```c
typedef struct mdns_ip_addr_s mdns_ip_addr_t
   mDNS query linked list IP item
```

```c
typedef enum mdns_if_internal mdns_if_t
```

```c
typedef struct mdns_result_s mdns_result_t
   mDNS query result structure
```

```c
typedef void (*mdns_query_notify_t)(mdns_search_once_t *search)
```

**Enumerations**

```c
enum mdns_ip_protocol_t
   mDNS enum to specify the ip_protocol type
```

```c
Values:

- MDNS_IP_PROTOCOL_V4
- MDNS_IP_PROTOCOL_V6
- MDNS_IP_PROTOCOL_MAX
```

```c
enum mdns_if_internal
   Values:

- MDNS_IF_STA = 0
- MDNS_IF_AP = 1
- MDNS_IF_ETH = 2
- MDNS_IF_MAX
```

```c
enum mdns_query_transmission_type_t
   mDNS query type to be explicitly set to either Unicast or Multicast
```

```c
Values:

- MDNS_QUERY_UNICAST
```

ESP_BLE_CONN_INT_MIN
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN
relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX
relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM (x, min, max)
Check the param is valid or not.

ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions

typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]

Bluetooth device address.
typedef uint8_t esp_ble_key_mask_t
Enumerations

enum esp_bt_status_t
Status Return Value.

Values:

ESP_BT_STATUS_SUCCESS = 0
ESP_BT_STATUS_FAIL
ESP_BT_STATUS_NOT_READY
ESP_BT_STATUS_NOMEM
ESP_BT_STATUS_BUSY
ESP_BT_STATUS_DONE = 5
ESP_BT_STATUS_UNSUPPORTED
ESP_BT_STATUS_PARM_INVALID
ESP_BT_STATUS_UNHANDLED
ESP_BT_STATUS_AUTH_FAILURE
ESP_BT_STATUS_RMT_DEV_DOWN = 10
ESP_BT_STATUS_AUTH_REJECTED
ESP_BT_STATUS_INVALID_STATIC_RAND_ADDR
ESP_BT_STATUS_PENDING
ESP_BT_STATUS_UNACCEPT_CONN_INTERVAL
ESP_BT_STATUS_PARAM_OUT_OF_RANGE
ESP_BT_STATUS_TIMEOUT
ESP_BT_STATUS_PEER_LE_DATA_LEN_UNSUPPORTED
ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED
ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
ESP_BT_STATUS_MEMORY_FULL = 20
ESP_BT_STATUS_EIR_TOO_LARGE

enum esp_bt_dev_type_t
Bluetooth device type.

Values:

ESP_BT_DEVICE_TYPE_BREDR = 0x01
ESP_BT_DEVICE_TYPE_BLE = 0x02
ESP_BT_DEVICE_TYPE_DUMO = 0x03

denum esp_ble_addr_type_t
BLE device address type.

Values:

BLE_ADDR_TYPE_PUBLIC = 0x00
BLE_ADDR_TYPE_RANDOM = 0x01
BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
BLE_ADDR_TYPE_RPA_RANDOM = 0x03
enum esp_ble_wl_addr_type_t
    white list address type

Values:
    BLE_WL_ADDR_TYPE_PUBLIC = 0x00
    BLE_WL_ADDR_TYPE_RANDOM = 0x01

BT MAIN API

Overview Instructions

Application Example Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

* esp_bluedroid_status_t esp_bluedroid_get_status (void)
  Get bluetooth stack status.

  Return Bluetooth stack status

* esp_err_t esp_bluedroid_enable (void)
  Enable bluetooth, must after esp_bluedroid_init().

  Return

  - ESP_OK : Succeed
  - Other : Failed

* esp_err_t esp_bluedroid_disable (void)
  Disable bluetooth, must prior to esp_bluedroid_deinit().

  Return

  - ESP_OK : Succeed
  - Other : Failed

* esp_err_t esp_bluedroid_init (void)
  Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

  Return

  - ESP_OK : Succeed
  - Other : Failed

* esp_err_t esp_bluedroid_deinit (void)
  Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

  Return

  - ESP_OK : Succeed
  - Other : Failed

Enumerations

* enum esp_bluedroid_status_t
  Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

  Values:
ESP_BLUEDROID_STATUS_UNINITIALIZED = 0  
Bluetooth not initialized
ESP_BLUEDROID_STATUS_INITIALIZED  
Bluetooth initialized but not enabled
ESP_BLUEDROID_STATUS_ENABLED  
Bluetooth initialized and enabled

BT DEVICE APIs

Overview  Bluetooth device reference APIs.
Instructions

Application Example  Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h

Functions

const uint8_t* esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Return  bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name (const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

Parameters

- [in] name: : device name to be set

2.3.2 BT LE

GAP API

Overview  Instructions

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)

This function is called to occur gap event, such as scan result.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] callback: callback function

esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)

This function is called to override the BTA default ADV parameters.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)

This function is called to set scan parameters.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

esp_err_t esp_ble_gap_start_scanning(uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] duration: Keeping the scanning time, the unit is second.

esp_err_t esp_ble_gap_stop_scanning(void)

This function call to stop the device scanning the peer device which advertising on the air.

Return

- ESP_OK: success
- other: failed

esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)

This function is called to start advertising.

Return

- ESP_OK: success
- other: failed

Parameters
- [in] adv_params: pointer to User defined adv_params data structure.

`esp_err_t esp_ble_gap_stop_advertising (void)`
This function is called to stop advertising.

**Return**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)`
Update connection parameters, can only be used when connection is up.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] params: - connection update parameters

`esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)`
This function is to set maximum LE data packet size.

**Return**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)`
This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] rand_addr: the random address which should be setting

`esp_err_t esp_ble_gap_clear_rand_addr (void)`
This function clears the random address for the application.

**Return**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)`
Enable/disable privacy on the local device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] privacy_enable: - enable/disable privacy on remote device.

`esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)`
set local gap appearance icon

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

`esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)`
Add or remove device from white list.
Return
- ESP_OK: success
- other: failed

Parameters
- [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote_bda: the remote device address add/remove from the white list.
- [in] wl_addr_type: whitelist address type

`esp_err_t esp_ble_gap_clear_whitelist (void)`
Clear all white list.

Return
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_get_whitelist_size (uint16_t *length)`
Get the whitelist size in the controller.

Return
- ESP_OK: success
- other: failed

Parameters
- [out] length: the white list length.

`esp_err_t esp_ble_gap_set_prefer_conn_params (esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)`
This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

`esp_err_t esp_ble_gap_set_device_name (const char *name)`
Set device name to the local device.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] name: device name.

`esp_err_t esp_ble_gap_get_local_used_addr (esp_bd_addr_t local_used_addr, uint8_t *addr_type)`
This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] local_used_addr: current local used ble address (six bytes)
- [in] addr_type: ble address type

`uint8_t *esp_ble_resolve_adv_data (uint8_t *adv_data, uint8_t type, uint8_t *length)`
This function is called to get ADV data for a specific type.
Return  pointer of ADV data
Parameters  
•  [in] adv_data: - pointer of ADV data which to be resolved  
•  [in] type: - finding ADV data type  
•  [out] length: - return the length of ADV data not including type  

esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw advertising data. User need to fill ADV data by self.

Return  
•  ESP_OK : success  
•  other : failed
Parameters  
•  [in] raw_data:raw advertising data  
•  [in] raw_data_len:raw advertising data length, less than 31 bytes  

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw scan response data. User need to fill scan response data by self.

Return  
•  ESP_OK : success  
•  other : failed
Parameters  
•  [in] raw_data: raw scan response data  
•  [in] raw_data_len: raw scan response data length, less than 31 bytes  

esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return  
•  ESP_OK : success  
•  other : failed
Parameters  
•  [in] remote_addr: The remote connection device address.  

esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)
This function is called to add a device info into the duplicate scan exceptional list.

Return  
•  ESP_OK : success  
•  other : failed
Parameters  
•  [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.  
•  [in] device_info: the device information.

esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)
This function is called to remove a device info from the duplicate scan exceptional list.

Return  
•  ESP_OK : success  
•  other : failed
Parameters  
•  [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV ,
device_info is invalid.
  • [in] device_info: the device information.

 esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list (esp_duplicate_scan_exceptional_list_type_t list_type)

 This function is called to clean the duplicate scan exceptional list. This API will delete all device information
 in the duplicate scan exceptional list.

 Return
  • ESP_OK : success
  • other : failed

 Parameters
  • [in] list_type: duplicate scan exceptional list type, the value can be one or more of
esp_duplicate_scan_exceptional_list_type_t.

 esp_err_t esp_ble_gap_set_security_param (esp_ble_sm_param_t param_type, void *value, uint8_t len)

 Set a GAP security parameter value. Overrides the default value.

 Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol'
(CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

 To accept only 'secure connection mode', it is necessary do as...

- following:
  1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is
    `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit
    `ESP_LE_AUTH_REQ_MITM` is optional as required.
  2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_
    `type` is
    `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

 Return - ESP_OK : success
  • other : failed

 Parameters
  • [in] param_type: the type of the param which to be set
  • [in] value: the param value
  • [in] len: the length of the param value

 esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)

 Grant security request access.

 Return - ESP_OK : success
  • other : failed

 Parameters
  • [in] bd_addr: BD address of the peer
  • [in] accept: accept the security request or not

 esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)

 Set a gap parameter value. Use this function to change the default GAP parameter values.

 Return - ESP_OK : success
  • other : failed

 Parameters
  • [in] bd_addr: the address of the peer device need to encryption
  • [in] sec_act: This is the security action to indicate what kind of BLE security level is required
    for the BLE link if the BLE is supported

 esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)

 Reply the key value to the peer device in the legacy connection stage.
Return - ESP_OK : success
  • other : failed
Parameters
  • [in] bd_addr: BD address of the peer
  • [in] accept: passkey entry successful or declined.
  • [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)
Reply the confirm value to the peer device in the secure connection stage.
Return - ESP_OK : success
  • other : failed
Parameters
  • [in] bd_addr: BD address of the peer device

esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
Removes a device from the security database list of peer device. It manages unpairing event while connected.
Return - ESP_OK : success
  • other : failed
Parameters
  • [in] bd_addr: BD address of the peer device

int esp_ble_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.
Return - >= 0 : bonded devices number.
  • ESP_FAIL : failed
Parameters
  • [in] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)
Get the device from the security database list of peer device. It will return the device bonded information immediately.
Return - ESP_OK : success
  • other : failed
Parameters
  • [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t *TK, uint8_t len)
This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.
Return - ESP_OK : success
  • other : failed
Parameters
  • [in] bd_addr: BD address of the peer device.
  • [in] TK: TK value, the TK value shall be a 128-bit random number
  • [in] len: length of tk, should always be 128-bit

esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)
This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.
Return - ESP_OK : success
  • other : failed
Parameters
Chapter 2. API Reference

- [in] remote_device:: BD address of the peer device

**esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)**

This function is called to read the connection parameters information of the device.

Return  - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr: BD address of the peer device.
- [out] conn_params: the connection parameters information

**esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)**

BLE set channels.

Return  - ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] channels: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. I means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)**

This function is called to authorized a link after Authentication(MITM protection)

Return  - ESP_OK : success
- other: failed

Parameters
- [in] bd_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

**esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)**

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Return  - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr:: BD address of the peer device

**esp_err_t esp_ble_gap_set_preferred_default_phy (esp_ble_phy_mask_t tx_phy_mask, esp_ble_phy_mask_t rx_phy_mask)**

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Return  - ESP_OK : success
- other : failed

Parameters
- [in] tx_phy_mask: : indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: : indicates the receiver PHYs that the Host prefers the Controller to use

**esp_err_t esp_ble_gap_set_preferred_phy (esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_phy_mask_t tx_phy_mask, esp_ble_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)**

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Return  - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr:: remote address
Chapter 2. API Reference

- [in] all_phys_mask: a bit field that allows the Host to specify
- [in] tx_phy_mask: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] phy_options: a bit field that allows the Host to specify options for PHYs

`esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)`

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] instance: Used to identify an advertising set
- [in] rand_addr: Random Device Address

`esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)`

This function is used by the Host to set the advertising parameters.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose parameters are being configured.
- [in] params: advertising parameters

`esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`

This function is used to set the data used in advertising PDUs that have a data field.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose data are being configured
- [in] length: data length
- [in] data: data information

`esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)`

This function is used to provide scan response data used in scanning response PDUs.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose response data are being configured.
- [in] length: responsedata length
- [in] scan_rsp_data: response data information

`esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)`

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] num_adv: Number of advertising sets to enable or disable
- [in] ext_adv: adv parameters

`esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t *ext_adv_inst)`

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return** - ESP_OK : success
- other : failed
Chapter 2. API Reference

Parameters
- \([\text{in}]\) num_adv: Number of advertising sets to enable or disable
- \([\text{in}]\) ext_adv_inst: ext adv instance

**esp_err_t esp_ble_gap_ext_adv_set_remove**(uint8_t instance)

This function is used to remove an advertising set from the Controller.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_ext_adv_set_clear**(void)

This function is used to remove all existing advertising sets from the Controller.

Return
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_set_params**(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) instance: identifies the advertising set whose periodic advertising parameters are being configured.
- \([\text{in}]\) params: periodic adv parameters

**esp_err_t esp_ble_gap_config_periodic_adv_data_raw**(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) instance: identifies the advertising set whose periodic advertising parameters are being configured.
- \([\text{in}]\) length: the length of periodic data
- \([\text{in}]\) data: periodic data information

**esp_err_t esp_ble_gap_periodic_adv_start**(uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_periodic_adv_stop**(uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_set_ext_scan_params**(const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

Return
- ESP_OK: success
- other: failed

Parameters
- \([\text{in}]\) params: scan parameters
**Chapter 2. API Reference**

**esp_err_t esp_ble_gap_start_ext_scan**(uint32_t duration, uint16_t period)

This function is used to enable scanning.

**Return** - ESP_OK: success  
• other: failed

**Parameters**
• [in] duration: Scan duration  
• [in] period: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

**esp_err_t esp_ble_gap_stop_ext_scan**(void)

This function is used to disable scanning.

**Return** - ESP_OK: success  
• other: failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync**(const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Return** - ESP_OK: success  
• other: failed

**Parameters**
• [in] params:: sync parameters

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel**(void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Return** - ESP_OK: success  
• other: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_terminate**(uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Return** - ESP_OK: success  
• other: failed

**Parameters**
• [in] sync_handle:: identify the periodic advertiser

**esp_err_t esp_ble_gap_periodicAdv_add_dev_to_list**(esp_ble_addr_type_t addr_type, esp_addr_t addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Return** - ESP_OK: success  
• other: failed

**Parameters**
• [in] addr_type:: address type  
• [in] addr:: Device Address  
• [in] sid: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list**(esp_ble_addr_type_t addr_type, esp_addr_t addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Return** - ESP_OK: success  
• other: failed

**Parameters**
• [in] addr_type:: address type  
• [in] addr:: Device Address  
• [in] sid: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_clear_dev**(void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.
Return - ESP_OK : success
• other : failed

```

ESP\_GAP\_BLE\_SCAN\_RESULT\__EVT.

### Public Members

```c
esp_gap_search_evt_t search_evt
```

Search event type

```c
esp_bd_addr_t \_bda
```

Bluetooth device address which has been searched

```c
esp_bt_dev_type_t \_dev\_type
```

Device type

```c
esp_ble_addr_type_t \_ble\_addr\_type
```

Ble device address type

```c
esp_ble_evt_type_t \_ble\_evt\_type
```

Ble scan result event type
int rssi
    Searched device’s RSSI

uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]
    Received EIR

int flag
    Advertising data flag bit

int num_resps
    Scan result number

uint8_t adv_data_len
    Adv data length

uint8_t scan_rsp_len
    Scan response length

uint32_t num_dis
    The number of discard packets

struct ble_scan_rsp_data_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
    Indicate the set scan response data operation success status

struct ble_scan_rsp_data_raw_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
    Indicate the set raw advertising data operation success status

struct ble_scan_start_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t status
    Indicate scan start operation success status

struct ble_scan_stop_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t status
    Indicate scan stop operation success status

struct ble_set_channels_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
Public Members

```c
esp_bt_status_t stat
BLE set channel status
```

```c
struct ble_set_ext_scan_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

Public Members

```c
esp_bt_status_t status
Indicate extend advertising parameters set status
```

esp_bt_status_t status
Indicate perf default phy set status
```

```c
struct ble_set_perf_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.
```

Public Members

```c
esp_bt_status_t status
Indicate perf phy set status
```

```c
struct ble_set_rand_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

Public Members

```c
esp_bt_status_t status
Indicate set static rand address operation success status
```

```c
struct ble_update_conn_params_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

Public Members

```c
```

```c
esp.bt_status_t status
Indicate update connection parameters success status
```

```c
esp_bd_addr_t bda
Bluetooth device address
```

```c
uint16_t min_int
Min connection interval
```

```c
uint16_t max_int
Max connection interval
```

```c
uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```
### Chapter 2. API Reference

**uint16_t** conn_int
Current connection interval

**uint16_t** timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

### struct ble_update_duplicate_exceptional_list_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.

**Public Members**

**esp_bt_status_t** status
Indicate update duplicate scan exceptional list operation success status

**uint8_t** subcode
Define in esp_bt_duplicate_exceptional_subcode_type_t

**uint16_t** length
The length of device_info

**esp_duplicate_info_t** device_info
device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

### struct ble_update_whitelist_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.

**Public Members**

**esp_BT_status_t** status
Indicate the add or remove whitelist operation success status

**esp_ble_wloperation_t** wl_opration
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

### Structures

**struct esp_ble_adv_params_t**
Advertising parameters.

**Public Members**

**uint16_t** adv_int_min
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

**uint16_t** adv_int_max
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

**esp_ble_adv_type_t** adv_type
Advertising type

**esp_ble_addr_type_t** own_addr_type
Owner bluetooth device address type

**esp_bd_addr_t** peer_addr
Peer device bluetooth device address
**Chapter 2. API Reference**

*esp_ble_addr_type_t* `peer_addr_type`
- Peer device Bluetooth device address type, only support public address type and random address type

*esp_ble_adv_channel_t* `channel_map`
- Advertising channel map

*esp_ble_adv_filter_t* `adv_filter_policy`
- Advertising filter policy

**struct esp_ble_adv_data_t**
- Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

- `bool set_scan_rsp`
  - Set this advertising data as scan response or not

- `bool include_name`
  - Advertising data include device name or not

- `bool include_txpower`
  - Advertising data include TX power

- `int min_interval`
  - Advertising data show slave preferred connection min interval. The connection interval in the following manner: `connInterval_min = Conn_Interval_Min * 1.25 ms` 
  - `Conn_Interval_Min` range: `0x0006 to 0x0C80`
  - Value of `0xFFFF` indicates no specific minimum. Values not defined above are reserved for future use.

- `int max_interval`
  - Advertising data show slave preferred connection max interval. The connection interval in the following manner: `connInterval_max = Conn_Interval_Max * 1.25 ms`
  - `Conn_Interval_Max` range: `0x0006 to 0x0C80`
  - `Conn_Interval_Max` shall be equal to or greater than the `Conn_Interval_Min`. Value of `0xFFFF` indicates no specific maximum. Values not defined above are reserved for future use.

- `int appearance`
  - External appearance of device

- `uint16_t manufacturer_len`
  - Manufacturer data length

- `uint8_t *p_manufacturer_data`
  - Manufacturer data point

- `uint16_t service_data_len`
  - Service data length

- `uint8_t *p_service_data`
  - Service data point

- `uint16_t service_uuid_len`
  - Service uuid length

- `uint8_t *p_service_uuid`
  - Service uuid array point

- `uint8_t flag`
  - Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

**struct esp_ble_scan_params_t**
- BLE scan parameters.

**Public Members**

- `exp_ble_scan_type_t scan_type`
  - Scan type
**esp_ble_addr_type_t** own_addr_type  
Owner address type

**esp_ble_scan_filter_t** scan_filter_policy  
Scan filter policy

uint16_t scan_interval  
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window  
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

**esp_ble_scan_duplicate_t** scan_duplicate  
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp_gap_conn_params_t**  
Connection parameters information

**Public Members**

uint16_t interval  
connection interval

uint16_t latency  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout  
Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x0000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_ble_conn_update_params_t**  
Connection update parameters

**Public Members**

**esp_bd_addr_t** bda  
Bluetooth device address

uint16_t min_int  
Min connection interval

uint16_t max_int  
Max connection interval

uint16_t latency  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout  
Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x0000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_ble_pkt_data_length_params_t**  
BLE pkt date length keys.
Public Members

uint16_t rx_len
   pkt rx data length value
uint16_t tx_len
   pkt tx data length value

struct esp_ble_penc_keys_t
   BLE encryption keys.

Public Members

esp_bt_octet16_t ltk
   The long term key
esp_bt_octet8_t rand
   The random number
uint16_t ediv
   The ediv value
uint8_t sec_level
   The security level of the security link
uint8_t key_size
   The key size(7~16) of the security link

struct esp_ble_pcsrk_keys_t
   BLE CSRK keys.

Public Members

uint32_t counter
   The counter
esp_bt_octet16_t csrk
   The csrk key
uint8_t sec_level
   The security level

struct esp_ble_pid_keys_t
   BLE pid keys.

Public Members

esp_bt_octet16_t irk
   The irk value
esp_ble_addr_type_t addr_type
   The address type
esp_bd_addr_t static_addr
   The static address

struct esp_ble_lenc_keys_t
   BLE Encryption reproduction keys.
Public Members

\texttt{esp\_bt\_octet16\_t} \texttt{ltk}

The long term key

\texttt{uint16\_t} \texttt{div}

The div value

\texttt{uint8\_t} \texttt{key\_size}

The key size of the security link

\texttt{uint8\_t} \texttt{sec\_level}

The security level of the security link

\texttt{struct esp\_ble\_lcsrk\_keys}

BLE SRK keys.

Public Members

\texttt{uint32\_t} \texttt{counter}

The counter value

\texttt{uint16\_t} \texttt{div}

The div value

\texttt{uint8\_t} \texttt{sec\_level}

The security level of the security link

\texttt{esp\_bt\_octet16\_t} \texttt{csrk}

The csrk key value

\texttt{struct esp\_ble\_sec\_key\_notif\_t}

Structure associated with ESP\_KEY\_NOTIF\__EVT.

Public Members

\texttt{esp\_bd\_addr\_t} \texttt{bd\_addr}

peer address

\texttt{uint32\_t} \texttt{passkey}

the numeric value for comparison. If just\_works, do not show this number to UI

\texttt{struct esp\_ble\_sec\_req\_t}

Structure of the security request.

Public Members

\texttt{esp\_bd\_addr\_t} \texttt{bd\_addr}

peer address

\texttt{struct esp\_ble\_bond\_key\_info\_t}

struct type of the bond key information value

Public Members

\texttt{esp\_ble\_key\_mask\_t} \texttt{key\_mask}

the key mask to indicate which key is present

\texttt{esp\_ble\_penc\_keys\_t} \texttt{penc\_key}

received peer encryption key
```c
typedef struct esp_ble_pcsrk_keys_t {
    esp_ble_pcsrk_keys_t pcsrk_key
} esp_ble_pcsrk_keys_t;
```

- `pcsrk_key` received peer device SRK

```c
typedef struct esp_ble_pid_keys_t {
    esp_ble_pid_keys_t pid_key
} esp_ble_pid_keys_t;
```

- `pid_key` peer device ID key

```c
typedef struct esp_ble_bond_dev_t {
    struct esp_ble_bond_dev_t
} struct esp_ble_bond_dev_t;
```

- `struct typeof the bond device value` Public Members

```c
typedef struct esp_ble_bond_key_info_t {
    esp_ble_bond_key_info_t bond_key
} esp_ble_bond_key_info_t;
```

- `bond_key` the bond key information

```c
typedef struct esp_ble_key_t {
    struct esp_ble_key_t
} struct esp_ble_key_t;
```

- `union type of the security key value` Public Members

```c
typedef struct esp_ble_key_value_t {
    struct esp_ble_key_value_t
} esp_ble_key_value_t;
```

- `p_key_value` the pointer to the key value

```c
typedef struct esp_ble_local_id_keys_t {
    struct esp_ble_local_id_keys_t
} struct esp_ble_local_id_keys_t;
```

- `structure type of the ble local id keys value` Public Members

```c
typedef struct esp_ble_auth_cmpl_t {
    struct esp_ble_auth_cmpl_t
} struct esp_ble_auth_cmpl_t;
```

- `Structure associated with ESP_AUTH_CMPL_EVT.` Public Members

```c
typedef struct esp_ble_auth_cmpl_t {
    esp_bd_addr_t bd_addr
    bool key_present
    uint8_t key_type
} esp_ble_auth_cmpl_t;
```

- `BD address peer device. Valid link key value in key element` `key_associated with peer device. The type of Link Key`
bool success
  TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
  The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
  Peer device address type

esp_bt_dev_type_t dev_type
  Device type

esp_ble_auth_req_t auth_mode
  Authentication mode

typedef uint8_t esp_ble_gap_adv_type_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t *event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

Parameters

- event: Event type
- param: Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t
GAP BLE callback event type.

Values:

ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
When advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
When scan response data set complete, the event comes

ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
When scan parameters set complete, the event comes

ESP_GAP_BLE_SCAN_RESULT_EVT
When one scan result ready, the event comes each time

ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_ADV_START_COMPLETE_EVT
When start advertising complete, the event comes

ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
When start scan complete, the event comes
ESP_GAP_BLE_AUTH_CMPL_EVT = 8
ESP_GAP_BLE_KEY_EVT
ESP_GAP_BLE_SEC_REQ_EVT
ESP_GAP_BLE_PASSKEY_NOTIF_EVT
ESP_GAP_BLE_PASSKEY_REQ_EVT
ESP_GAP_BLE_OOB_REQ_EVT
ESP_GAP_BLE_LOCAL_IR_EVT
ESP_GAP_BLE_LOCAL_ER_EVT
ESP_GAP_BLE_NC_REQ_EVT
ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
   When stop adv complete, the event comes
ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
   When stop scan complete, the event comes
ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19
   When set the static rand address complete, the event comes
ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
   When update connection parameters complete, the event comes
ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
   When set pkt length complete, the event comes
ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
   When Enable/disable privacy on the local device complete, the event comes
ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
   When remove the bond device complete, the event comes
ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
   When clear the bond device clear complete, the event comes
ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
   When get the bond device list complete, the event comes
ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
   When read the rssi complete, the event comes
ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
   When add or remove whitelist complete, the event comes
ESP_GAP_BLE_SET_CHANNELS_EVT = 29
   When setting BLE channels complete, the event comes
ESP_GAP_BLE_READ_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT

enum esp_ble_adv_channel_t
   Advertising channel mask.
   Values:
   ADV_CHNL_37 = 0x01
   ADV_CHNL_38 = 0x02
   ADV_CHNL_39 = 0x04
ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
Values:
 ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
   Allow both scan and connection requests from anyone.
 ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
   Allow both scan req from White List devices only and connection req from anyone.
 ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
   Allow both scan req from anyone and connection req from White List devices only.
 ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
   Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
Values:
 ESP_BLE_SEC_ENCRYPT = 1
 ESP_BLE_SEC_ENCRYPT_NO_MITM
 ESP_BLE_SEC_ENCRYPT_MITM

enum esp_ble_sm_param_t
Values:
 ESP_BLE_SM_PASSKEY = 0
 ESP_BLE_SM_AUTHEN_REQ_MODE
 ESP_BLE_SM_IOCAP_MODE
 ESP_BLE_SM_SET_INIT_KEY
 ESP_BLE_SM_SET_RSP_KEY
 ESP_BLE_SM_MAX_KEY_SIZE
 ESP_BLE_SM_MIN_KEY_SIZE
 ESP_BLE_SM_SET_STATIC_PASSKEY
 ESP_BLE_SM_CLEAR_STATIC_PASSKEY
 ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH
 ESP_BLE_SM_OOB_SUPPORT
 ESP_BLE_APP_ENC_KEY_SIZE
 ESP_BLE_SM_MAX_PARAM

enum esp_ble_scan_type_t
Ble scan type.
Values:
 BLE_SCAN_TYPE_PASSIVE = 0x0
   Passive scan
 BLE_SCAN_TYPE_ACTIVE = 0x1
   Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:
 BLE_SCAN_FILTER_ALLOW_ALL = 0x0
   Accept all :
1. advertisement packets except directed advertising packets not addressed to this device (default).

**BLE_SCAN_FILTER_ALLOW_ONLY_WLST** = 0x1

Accept only:
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

**BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR** = 0x2

Accept all:
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR** = 0x3

Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**enum esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:

**BLE_SCAN_DUPLICATE_DISABLE** = 0x0
the Link Layer should generate advertising reports to the host for each packet received

**BLE_SCAN_DUPLICATE_ENABLE** = 0x1
the Link Layer should filter out duplicate advertising reports to the Host

**BLE_SCAN_DUPLICATE_MAX** = 0x2
0x02–0xFF, Reserved for future use

**enum esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

**ESP_GAP_SEARCH_INQ_RES_EVT** = 0
Inquiry result for a peer device.

**ESP_GAP_SEARCH_INQ_CMPL_EVT** = 1
Inquiry complete.

**ESP_GAP_SEARCH_DISC_RES_EVT** = 2
Discovery result for a peer device.

**ESP_GAP_SEARCH_DISC_BLE_RES_EVT** = 3
Discovery result for BLE GATT based service on a peer device.

**ESP_GAP_SEARCH_DISC_CMPL_EVT** = 4
Discovery complete.

**ESP_GAP_SEARCH_DISC_CMPL_EVT** = 5
Discovery complete.

**ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT** = 6
Search cancelled

**ESP_GAP_SEARCH_DISCARD_NUM_EVT** = 7
The number of pkt discarded by flow control

**enum esp_ble_evt_type_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:
ESP_BLE_EVT_CONN_ADV = 0x00
    Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
    Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
    Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
    Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
    Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t
Values:
    ESP_BLE_WHITELIST_REMOVE = 0x00
        remove mac from whitelist
    ESP_BLE_WHITELIST_ADD = 0x01
        add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t
Values:
    ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
        Add device info into duplicate scan exceptional list
    ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
        Remove device info from duplicate scan exceptional list
    ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
        Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
        BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO.Mesh_LINK_ID
        BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
        BLE mesh beacon AD type, the format is |Len |0x2B |Beacon Type |Beacon Data |
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_prov_SRVADV
        BLE mesh provisioning service uuid, the format is |0x02 |0x01 |flags |0x03 |0x03 |0x1827 |… |`
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRVADV
        BLE mesh adv with proxy service uuid, the format is |0x02 |0x01 |flags |0x03 |0x03 |0x1828 |… |`

enum esp_duplicate_scan_exceptional_list_type_t
Values:
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
        duplicate scan exceptional addr list
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
        duplicate scan exceptional mesh link ID list
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
        duplicate scan exceptional mesh beacon type list
    ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_prov_SRVADV_LIST = BLE_BIT(3)
        duplicate scan exceptional mesh adv with provisioning service uuid
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)  
duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF  
duplicate scan exceptional all list

GATT DEFINES

Overview

Application Example

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t
  #include <esp_gatt_defs.h> GATT remote read request response type.

  Public Members

  esp_gatt_value_t attr_value  
      Gatt attribute structure

  uint16_t handle  
      Gatt attribute handle

Structures

struct esp_gatt_id_t
  Gatt id, include uuid and instance id.

  Public Members

  esp_bt_uuid_t uuid  
      UUID

  uint8_t inst_id  
      Instance id

  struct esp_gatt_srvc_id_t
      Gatt service id, include id (uuid and instance id) and primary flag.

  Public Members

  esp_gatt_id_t id  
      Gatt id, include uuid and instance id

  bool is_primary  
      This service is primary or not

  struct esp_attr_desc_t
      Attribute description (used to create database)
Public Members

```c
uint16_t uuid_length
    UUID length
uint8_t* uuid_p
    UUID value
uint16_t perm
    Attribute permission
uint16_t max_length
    Maximum length of the element
uint16_t length
    Current length of the element
uint8_t* value
    Element value array
```

```c
struct esp_attr_control_t
    attribute auto response flag
```

Public Members

```c
uint8_t auto_rsp
    if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by 
    replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read 
    operation will be replied by GATT stack automatically.
```

```c
struct esp_gatts_attr_db_t
    attribute type added to the gatt server database
```

Public Members

```c
esp_attr_control_t attr_control
    The attribute control type
esp_attr_desc_t att_desc
    The attribute type
```

```c
struct esp_attr_value_t
    set the attribute value type
```

Public Members

```c
uint16_t attr_max_len
    attribute max value length
uint16_t attr_len
    attribute current value length
uint8_t* attr_value
    the pointer to attribute value
```

```c
struct esp_gatts_incl_svc_desc_t
    Gatt include service entry element.
```
Public Members

uint16_t start_hdl
    Gatt start handle value of included service

uint16_t end_hdl
    Gatt end handle value of included service

uint16_t uuid
    Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
    Gatt include 128 bit service entry element.

Public Members

uint16_t start_hdl
    Gatt start handle value of included 128 bit service

uint16_t end_hdl
    Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
    Gatt attribute value.

Public Members

uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value

uint16_t handle
    Gatt attribute handle

uint16_t offset
    Gatt attribute value offset

uint16_t len
    Gatt attribute value length

uint8_t auth_req
    Gatt authentication request

struct esp_gatt_conn_params_t
    Connection parameters information.

Public Members

uint16_t interval
    connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
    read multiple attribute
Public Members

uint8_t num_attr
The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t type
The attribute type

uint16_t attribute_handle
The attribute handle, it’s valid for all of the type

uint16_t start_handle
The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
The attribute uuid, it’s valid for all of the type

struct esp_gattc_service_elem_t
service element

Public Members

bool is_primary
The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
The start handle of the service

uint16_t end_handle
The end handle of the service

esp_bt_uuid_t uuid
The uuid of the service

struct esp_gattc_char_elem_t
characteristic element

Public Members

uint16_t char_handle
The characteristic handle

esp_gatt_char_prop_t properties
The characteristic properties

esp_bt_uuid_t uuid
The characteristic uuid
struct esp_gattc_descr_elem_t
  
  descriptor element

Public Members

uint16_t handle
  The characteristic descriptor handle

esp_bt_uuid_t uuid
  The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
  
  include service element

Public Members

uint16_t handle
  The include service current attribute handle

uint16_t incl_srvc_s_handle
  The start handle of the service which has been included

uint16_t incl_srvc_e_handle
  The end handle of the service which has been included

esp_bt_uuid_t uuid
  The include service uuid

GATT maximum attribute length.

ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
If callback report gatte_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t

Gatt interface type, different application on GATT client use different gatt_if

Enumerations

denum esp_gatt_prep_write_type
Attribute write data type from the client.

Values:
ESP_GATT_PREP_WRITE_CANCEL = 0x00
Prepare write cancel

ESP_GATT_PREP_WRITE_EXEC = 0x01
Prepare write execute

enum esp_gatt_status_t
GATT success code and error codes.

Values:

ESP_GATT_OK = 0x0
ESP_GATT_INVALID_HANDLE = 0x01
ESP_GATT_READ_NOT_PERMIT = 0x02
ESP_GATT_WRITE_NOT_PERMIT = 0x03
ESP_GATT_INVALID_PDU = 0x04
ESP_GATT_INSUF_AUTHENTICATION = 0x05
ESP_GATT_REQ_NOT_SUPPORTED = 0x06
ESP_GATT_INVALID_OFFSET = 0x07

ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

enum esp_gatt_conn_reason_t
Gatt Connection reason enum.

Values:
ESP_GATT_CONN_UNKNOWN = 0
Gatt connection unknown
ESP_GATT_CONN_L2C_FAILURE = 1
General L2cap failure
ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout
ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user
ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host
ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
Connection fail to establish
ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout
ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled
ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

enum esp_gatt_auth_req_t
Gatt authentication request type.

Values:
ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t

Values:
ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
```
ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t
    Gatt write type.
    Values:
    ESP_GATT_WRITE_TYPE_NO_RSP = 1
        Gatt write attribute need no response
    ESP_GATT_WRITE_TYPE_RSP
        Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
    the type of attribute element
    Values:
    ESP_GATT_DB_PRIMARY_SERVICE
        Gattc primary service attribute type in the cache
    ESP_GATT_DB_SECONDARY_SERVICE
        Gattc secondary service attribute type in the cache
    ESP_GATT_DB_CHARACTERISTIC
        Gattc characteristic attribute type in the cache
    ESP_GATT_DB_DESCRIPTOR
        Gattc characteristic descriptor attribute type in the cache
    ESP_GATT_DB_INCLUDED_SERVICE
        Gattc include service attribute type in the cache
    ESP_GATT_DB_ALL
        Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache
```

**GATT SERVER API**

**Overview**  
**Instructions**

**Application Example**  
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h
 Functions

`esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)`

This function is called to register application callbacks with BTA GATTS module.

  Return
  - ESP_OK : success
  - other : failed

`esp_err_t esp_ble_gatts_app_register (uint16_t app_id)`

This function is called to register application identifier.

  Return
  - ESP_OK : success
  - other : failed

`esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)`

unregister with GATT Server.

  Return
  - ESP_OK : success
  - other : failed

Parameters
  - [in] gatts_if: GATT server access interface

`esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)`

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

  Return
  - ESP_OK : success
  - other : failed

Parameters
  - [in] gatts_if: GATT server access interface
  - [in] service_id: service ID.
  - [in] num_handle: number of handle requested for this service.

`esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)`

Create a service attribute tab.

  Return
  - ESP_OK : success
  - other : failed

Parameters
  - [in] gatts_attr_db: the pointer to the service attr tab
  - [in] gatts_if: GATT server access interface
  - [in] max_nb_attr: the number of attribute to be added to the service database.
  - [in] srvc_inst_id: the instance id of the service

`esp_err_t esp_ble_gatts_add_included_service (uint16_t service_handle, uint16_t included_service_handle)`

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

  Return
  - ESP_OK : success
  - other : failed

Parameters
  - [in] service_handle: service handle to which this included service is to be added.
  - [in] included_service_handle: the service ID to be included.
```c
void esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid,
                          esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
                          esp_attr_value_t *char_val, esp_attr_control_t *control);
```

This function is called to add a characteristic into a service.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: Characteristic UUID.
- [in] perm: Characteristic value declaration attribute permission.
- [in] property: Characteristic Properties
- [in] char_val: Characteristic value
- [in] control: attribute response control byte

```c
void esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid,
                                   esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val,
                                   esp_attr_control_t *control);
```

This function is called to add characteristic descriptor. When it's done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] char_descr_val: Characteristic descriptor value
- [in] control: attribute response control byte

```c
void esp_ble_gatts_delete_service(uint16_t service_handle);
```

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: service_handle to be deleted.

```c
void esp_ble_gatts_start_service(uint16_t service_handle);
```

This function is called to start a service.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: the service handle to be started.

```c
void esp_ble_gatts_stop_service(uint16_t service_handle);
```

This function is called to stop a service.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: -service to be topped.

```c
void esp_ble_gatts_send_indicate(esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle,
                                 uint16_t value_len, uint8_t *value, bool need_confirm);
```

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise
indication.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] conn_id: connection id to indicate.
• [in] attr_handle: attribute handle to indicate.
• [in] value_len: indicate value length.
• [in] value: value to indicate.
• [in] need_confirm: Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

```
esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
```

This function is called to send a response to a request.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] trans_id: transfer id
• [in] status: response status
• [in] rsp: response data.

```
esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)
```

This function is called to set the attribute value by the application.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] attr_handle: the attribute handle which to be set
• [in] length: the value length
• [in] value: the pointer to the attribute value

```
esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)
```

Retrieve attribute value.

Return
• ESP_GATT_OK: success
• other: failed

Parameters
• [in] attr_handle: Attribute handle.
• [out] length: pointer to the attribute value length
• [out] value: Pointer to attribute value payload, the value cannot be modified by user

```
esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)
```

Open a direct open connection or add a background auto connection.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] remote_bda: remote device bluetooth device address.
• [in] is_direct: direct connection or background auto connection
Chapter 2. API Reference

```c
esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)
```

Close a connection a remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

```c
esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if,
              esp_bd_addr_t remote_bda)
```

Send service change indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device.

**Unions**

```c
union esp_ble_gatts_cb_param_t
```

#include <esp_gatts_api.h> Gatt server callback parameters union.

**Public Members**

```c

uint16_t app_id
Application id which input in register API
```

```
#include <esp_gatts_api.h> ESP_GATTS_RESPONSE_EVT.
```

Public Members

```
esp_gatt_status_t status
Operation status
```

```
uint16_t handle
Attribute handle which send response
```

```
#include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.
```

Public Members

```
esp_gatt_status_t status
Operation status
```

```
uint16_t handle
Attribute handle which send response
```

```
#include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.
```
Public Members

\texttt{esp\_gatt\_status\_t status}
Operation status

\texttt{struct gatts\_set\_attr\_val\_evt\_param}
#include <\texttt{esp\_gatts\_api.h}> ESP_GATTS_SET_ATTR_VAL_EVT.

Public Members

uint16\_t \texttt{srvc\_handle}
The service handle

uint16\_t \texttt{attr\_handle}
The attribute handle

\texttt{esp\_gatt\_status\_t status}
Operation status

\texttt{struct gatts\_start\_evt\_param}
#include <\texttt{esp\_gatts\_api.h}> ESP_GATTS_START_EVT.

Public Members

\texttt{esp\_gatt\_status\_t status}
Operation status

uint16\_t \texttt{service\_handle}
Service attribute handle

\texttt{struct gatts\_stop\_evt\_param}
#include <\texttt{esp\_gatts\_api.h}> ESP_GATTS_STOP_EVT.

Public Members

\texttt{esp\_gatt\_status\_t status}
Operation status

uint16\_t \texttt{service\_handle}
Service attribute handle

\texttt{struct gatts\_write\_evt\_param}
#include <\texttt{esp\_gatts\_api.h}> ESP_GATTS_WRITE_EVT.

Public Members

uint16\_t \texttt{conn\_id}
Connection id

uint32\_t \texttt{trans\_id}
Transfer id

\texttt{esp\_bd\_addr\_t bda}
The bluetooth device address which been written

uint16\_t \texttt{handle}
The attribute handle

uint16\_t \texttt{offset}
Offset of the value, if the value is too long
bool need_rsp
    The write operation need to do response
bool is_prep
    This write operation is prepare write
uint16_t len
    The write attribute value length
uint8_t *value
    The write attribute value

 Macros

ESP_GATT_PREP_WRITE_CANCEL
    Prepare write flag to indicate cancel prepare write
ESP_GATT_PREP_WRITE_EXEC
    Prepare write flag to indicate execute prepare write

 Type Definitions

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
                              esp_ble_gatts_cb_param_t *param)

    GATT Server callback function type.

    Parameters
    • event:: Event type
    • gatts_if: : GATT server access interface, normally different gatts_if correspond to different
      profile
    • param:: Point to callback parameter, currently is union type

 Enumerations

defined esp_gatts_cb_event_t
    GATT Server callback function events.

    Values:
    ESP_GATTS_REG_EVT = 0
        When register application id, the event comes
    ESP_GATTS_READ_EVT = 1
        When gatt client request read operation, the event comes
    ESP_GATTS_WRITE_EVT = 2
        When gatt client request write operation, the event comes
    ESP_GATTS_EXEC_WRITE_EVT = 3
        When gatt client request execute write, the event comes
    ESP_GATTS_MTU_EVT = 4
        When set mtu complete, the event comes
    ESP_GATTS_CONF_EVT = 5
        When receive confirm, the event comes
    ESP_GATTS_UNREG_EVT = 6
        When unregister application id, the event comes
    ESP_GATTS_CREATE_EVT = 7
        When create service complete, the event comes
    ESP_GATTS_ADD_INCL_SRVC_EVT = 8
        When add included service complete, the event comes
    ESP_GATTS_ADD_CHAR_EVT = 9
        When add characteristic complete, the event comes
ESP_GATT_ADD_CHAR_DESCR_EVT = 10
  When add descriptor complete, the event comes

ESP_GATT_DELETE_EVT = 11
  When delete service complete, the event comes

ESP_GATT_START_EVT = 12
  When start service complete, the event comes

ESP_GATT_STOP_EVT = 13
  When stop service complete, the event comes

ESP_GATT_CONNECT_EVT = 14
  When gatt client connect, the event comes

ESP_GATT_DISCONNECT_EVT = 15
  When gatt client disconnect, the event comes

ESP_GATT_OPEN_EVT = 16
  When connect to peer, the event comes

ESP_GATT_CANCEL_OPEN_EVT = 17
  When disconnect from peer, the event comes

ESP_GATT_CLOSE_EVT = 18
  When gatt server close, the event comes

ESP_GATT_LISTEN_EVT = 19
  When gatt listen to be connected the event comes

ESP_GATT_CONGEST_EVT = 20
  When congest happen, the event comes

ESP_GATT_RESPONSE_EVT = 21
  When gatt send response complete, the event comes

ESP_GATT_CREAT_ATTR_TAB_EVT = 22
  When gatt create table complete, the event comes

ESP_GATT_SET_ATTR_VAL_EVT = 23
  When gatt set attr value complete, the event comes

ESP_GATT_SEND_SERVICE_CHANGE_EVT = 24
  When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview  Instructions

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  – bluetooth/bluedroid/ble/gatt_client
  – GATT Client Example Walkthrough

• This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  – bluetooth/bluedroid/ble/gatte_multi_connect
  – GATT Client Multi-connection Example Walkthrough

• This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_client
API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_gattc_api.h

Functions

```c
esp_err_t esp_ble_gattc_register_callback(esp_gattc_cb_t callback)
```
This function is called to register application callbacks with GATT module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] callback: pointer to the application callback function.

```c
esp_err_t esp_ble_gattc_app_register(uint16_t app_id)
```
This function is called to register application callbacks with GATT module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] app_id: Application Identify (UUID), for different application

```c
esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)
```
This function is called to unregister an application from GATT module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, uint8_t gattc_if, esp_bd_addr_t remote_bda,
                           esp_ble_addr_type_t remote_addr_type, bool is_direct)
```
Open a direct connection or add a background auto connection.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] remote_bda: remote device bluetooth device address.
- [in] remote_addr_type: remote device bluetooth device the address type.
- [in] is_direct: direct connection or background auto connection(by now, background auto connection is not supported).

```c
esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                                 esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```c
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```
Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID to be closed.
esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.

esp_err_t esp_ble_gattc_search_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] filter_uuid: a UUID of the service application is interested in. If Null, discover for all services.

esp_gatt_status_t esp_ble_gattc_get_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)
Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service.
Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] svc_uuid: the pointer to the service uuid.
• [out] result: The pointer to the service which has been found in the gattc cache.
• [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• [in] offset: Offset of the service position to get.

esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t end_handle,
esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)
Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• [in] offset: Offset of the characteristic position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache. Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache. Note: It just get characteristic from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache. Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
Chapter 2. API Reference

- **[inout]** count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- **ESP_OK**: success
- other: failed

Parameters
- **[in]** gattc_if: Gatt client access interface.
- **[in]** conn_id: connection ID which identify the server.
- **[in]** char_handle: the characteristic handle.
- **[in]** descr_uuid: the descriptor uuid.
- **[out]** result: The pointer to the descriptor in the given characteristic.
- **[inout]** count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

Return
- **ESP_OK**: success
- other: failed

Parameters
- **[in]** gattc_if: Gatt client access interface.
- **[in]** conn_id: connection ID which identify the server.
- **[in]** start_handle: the attribute start handle
- **[in]** end_handle: the attribute end handle
- **[in]** incl_uuid: the include service uuid
- **[out]** result: The pointer to the include service in the given service.
- **[inout]** count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Return
- **ESP_OK**: success
- other: failed

Parameters
- **[in]** gattc_if: Gatt client access interface.
- **[in]** conn_id: connection ID which identify the server.
- **[in]** type: the attribute type.
- **[in]** start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **[in]** end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
• [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
• [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gatt_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] conn_id: connection ID which identify the server.
• [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
• [in] count: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: characteristic handle to read.
• [in] auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_read_by_type (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [in] uuid: The UUID of attribute which will be read.
• [in] auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_read_multiple (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] read_multi: pointer to the read multiple parameter.
• [in] auth_req: authenticate request type

esp_err_t esp_ble_gattc_read_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)

This function is called to read a characteristics descriptor.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: descriptor handle to read.
• [in] auth_req: authenticate request type

esp_err_t esp_ble_gattc_write_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)

This function is called to write characteristic value.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: characteristic handle to write.
• [in] value_len: length of the value to be written.
• [in] value: the value to be written.
• [in] write_type: the type of attribute write operation.
• [in] auth_req: authentication request.

esp_err_t esp_ble_gattc_write_char_desc (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)

This function is called to write characteristic descriptor value.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: descriptor handle to write.
• [in] value_len: length of the value to be written.
• [in] value: the value to be written.
• [in] write_type: the type of attribute write operation.
• [in] auth_req: authentication request.

esp_err_t esp_ble_gattc_prepare_write (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)

This function is called to prepare write a characteristic value.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
Chapter 2. API Reference

- [in] handle: characteristic handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic descriptor handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

Return
- ESP_OK: registration succeeds
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

Return
- ESP_OK: unregister succeeds
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Return

---

Submit Document Feedback

Espressif Systems 334 Release v5.0-dev-1712-g4a553510b7
Chapter 2. API Reference

- ESP_OK: success
- other: failed

**Parameters**

- **[in]** remote_bda: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database that the device has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **[in]** gattc_if: Gatt client access interface.
- **[in]** src_addr: the source address which provide the attribute table.
- **[in]** assoc_addr: the associated address which went to share the attribute table with the source address.
- **[in]** is_assoc: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **[in]** gattc_if: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **[in]** remote_bda: remote device BD address.

**Unions**

```c
union esp_ble_gattc_cb_param_t
```

#include <esp_gattc_api.h> Gatt client callback parameters union.

uint16_t offset
The prepare write offset, this value is valid only when prepare write
```

Type Definitions

```c
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gatc_if,
esp_ble_gattc_cb_param_t *param)
GATT Client callback function type.
```

Parameters

- `event`: Event type
- `gattc_if`: GATT client access interface, normally different gattc_if correspond to different profile
- `param`: Point to callback parameter, currently is union type

Enumerations

```c
enum esp_gattc_cb_event_t
GATT Client callback function events.
```

Values:

- `ESP_GATTC_REG_EVT = 0`: When GATT client is registered, the event comes
- `ESP_GATTC_UNREG_EVT = 1`: When GATT client is unregistered, the event comes
- `ESP_GATTC_OPEN_EVT = 2`: When GATT virtual connection is set up, the event comes
- `ESP_GATTC_READ_CHAR_EVT = 3`: When GATT characteristic is read, the event comes
- `ESP_GATTC_WRITE_CHAR_EVT = 4`: When GATT characteristic write operation completes, the event comes
- `ESP_GATTC_CLOSE_EVT = 5`: When GATT virtual connection is closed, the event comes
- `ESP_GATTC_SEARCH_CMPL_EVT = 6`: When GATT service discovery is completed, the event comes
**Chapter 2. API Reference**

- **ESP_GATTC_SEARCH_RES_EVT = 7**
  - When GATT service discovery result is got, the event comes

- **ESP_GATTC_READ_DESCR_EVT = 8**
  - When GATT characteristic descriptor read completes, the event comes

- **ESP_GATTC_WRITE_DESCR_EVT = 9**
  - When GATT characteristic descriptor write completes, the event comes

- **ESP_GATTC_NOTIFY_EVT = 10**
  - When GATT notification or indication arrives, the event comes

- **ESP_GATTC_PREP_WRITE_EVT = 11**
  - When GATT prepare-write operation completes, the event comes

- **ESP_GATTC_EXEC_EVT = 12**
  - When write execution completes, the event comes

- **ESP_GATTC_ACL_EVT = 13**
  - When ACL connection is up, the event comes

- **ESP_GATTC_CANCEL_OPEN_EVT = 14**
  - When GATT client ongoing connection is cancelled, the event comes

- **ESP_GATTC_SRVC_CHG_EVT = 15**
  - When “service changed” occurs, the event comes

- **ESP_GATTC_ENC_CMPL_CB_EVT = 17**
  - When encryption procedure completes, the event comes

- **ESP_GATTC_CFG_MTU_EVT = 18**
  - When configuration of MTU completes, the event comes

- **ESP_GATTC_ADV_DATA_EVT = 19**
  - When advertising of data, the event comes

- **ESP_GATTC_MULT_ADV_ENB_EVT = 20**
  - When multi-advertising is enabled, the event comes

- **ESP_GATTC_MULT_ADV_UPD_EVT = 21**
  - When multi-advertising parameters are updated, the event comes

- **ESP_GATTC_MULT_ADV_DATA_EVT = 22**
  - When multi-advertising data arrives, the event comes

- **ESP_GATTC_MULT_ADV_DIS_EVT = 23**
  - When multi-advertising is disabled, the event comes

- **ESP_GATTC_CONGEST_EVT = 24**
  - When GATT connection congestion comes, the event comes

- **ESP_GATTC_BTH_SCAN_ENB_EVT = 25**
  - When batch scan is enabled, the event comes

- **ESP_GATTC_BTH_SCAN_CFG_EVT = 26**
  - When batch scan storage is configured, the event comes

- **ESP_GATTC_BTH_SCAN_RD_EVT = 27**
  - When batch scan read event is reported, the event comes

- **ESP_GATTC_BTH_SCAN_THR_EVT = 28**
  - When Batch scan threshold is set, the event comes

- **ESP_GATTC_BTH_SCAN_PARAM_EVT = 29**
  - When Batch scan parameters are set, the event comes

- **ESP_GATTC_BTH_SCAN_DIS_EVT = 30**
  - When Batch scan is disabled, the event comes
Chapter 2. API Reference

ESP_GATT_SCAN_FLT_CFG_EVT = 31
When Scan filter configuration completes, the event comes

ESP_GATT_SCAN_FLT_PARAM_EVT = 32
When Scan filter parameters are set, the event comes

ESP_GATT_SCAN_FLT_STATUS_EVT = 33
When Scan filter status is reported, the event comes

ESP_GATT_ADV_VSC_EVT = 34
When advertising vendor spec content event is reported, the event comes

ESP_GATT_REG_FOR_NOTIFY_EVT = 38
When register for notification of a service completes, the event comes

ESP_GATT_UNREG_FOR_NOTIFY_EVT = 39
When unregister for notification of a service completes, the event comes

ESP_GATT_CONNECT_EVT = 40
When the ble physical connection is set up, the event comes

ESP_GATT_DISCONNECT_EVT = 41
When the ble physical connection disconnected, the event comes

ESP_GATT_READ_MULTIPLE_EVT = 42
When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATT_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

ESP_GATT_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

ESP_GATT_GET_ADDR_LIST_EVT = 45
When the ble gattc address list in cache finish, the event comes

ESP_GATT_DIS_SRVC_CMPL_EVT = 46
When the ble discover service complete, the event comes

BLUFI API

Overview  BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:
1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example  Check bluetooth folder in ESP-IDF examples, which contains the following application:
• This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

Functions

\texttt{esp_err_t \_esp\_blufi\_register\_callbacks (esp\_blufi\_callbacks\_t \*callbacks)}

This function is called to receive blufi callback event.

- \textbf{Return}: ESP_OK - success, other - failed
- \textbf{Parameters}:
  - [in] \texttt{callbacks}: callback functions

\texttt{esp_err_t \_esp\_blufi\_profile\_init (void)}

This function is called to initialize blufi_profile.

- \textbf{Return}: ESP_OK - success, other - failed

\texttt{esp_err_t \_esp\_blufi\_profile\_deinit (void)}

This function is called to de-initialize blufi_profile.

- \textbf{Return}: ESP_OK - success, other - failed

\texttt{esp_err_t \_esp\_blufi\_send\_wifi\_conn\_report (wifi\_mode\_t opmode, \_esp\_blufi\_sta\_conn\_state\_t sta\_conn\_state, uint8\_t softap\_conn\_num, \_esp\_blufi\_extra\_info\_t \*extra\_info)}

This function is called to send wifi connection report.

- \textbf{Return}: ESP_OK - success, other - failed
- \textbf{Parameters}:
  - \texttt{opmode}: wifi opmode
  - \texttt{sta\_conn\_state}: station is already in connection or not
  - \texttt{softap\_conn\_num}: softap connection number
  - \texttt{extra\_info}: extra information, such as sta\_ssid, softap\_ssid and etc.

\texttt{esp_err_t \_esp\_blufi\_send\_wifi\_list (uint16\_t apCount, \_esp\_blufi\_ap\_record\_t \*list)}

This function is called to send wifi list.

- \textbf{Return}: ESP_OK - success, other - failed
- \textbf{Parameters}:
  - \texttt{apCount}: wifi list count
  - \texttt{list}: wifi list

\texttt{uint16\_t \_esp\_blufi\_get\_version (void)}

Get BLUFI profile version.

- \textbf{Return}: Most 8bit significant is Great version, Least 8bit is Sub version

\texttt{esp_err_t \_esp\_blufi\_send\_error\_info (\_esp\_blufi\_error\_state\_t state)}

This function is called to send blufi error information.

- \textbf{Return}: ESP_OK - success, other - failed
- \textbf{Parameters}:
  - \texttt{state}: error state

\texttt{esp_err_t \_esp\_blufi\_send\_custom\_data (uint8\_t \*data, uint32\_t data\_len)}

This function is called to custom data.

- \textbf{Return}: ESP_OK - success, other - failed
- \textbf{Parameters}:
  - \texttt{data}: custom data value
  - \texttt{data\_len}: the length of custom data

Unions

Macros

ESP_BD_ADDR_LEN

Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]

Bluetooth device address.

typedef void(*esp_blufi_event_cb_t)(esp_blufi_event_t event, esp_blufi_cb_param_t *param)

BLUFI event callback function type.

Parameters

• event: : Event type
• param: : Point to callback parameter, currently is union type

typedef void(*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Parameters

• data: : data from phone
• len: : length of data from phone
• output_data: : data want to send to phone
• output_len: : length of data want to send to phone
• need_free: : output reporting if memory needs to be freed or not *

typedef int(*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Return Nonnegative number is encrypted length, if error, return negative number;

Parameters

• iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data: : plain text and encrypted data, the encrypt function must support autochthonous encrypt
• crypt_len: : length of plain text

typedef int(*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters

• iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data: : encrypted data and plain text, the encrypt function must support autochthonous decrypt
• crypt_len: : length of encrypted text

typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Parameters

• iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
• data: : data need to checksum
• len: : length of data

Enumerations

enum esp_blufi_cb_event_t

Values:

ESP_BLUFI_EVENT_INIT_FINISH = 0
ESP_BLUFI_EVENT_DEINIT_FINISH

2.3.3 CLASSIC BT

CLASSIC BLUETOOTH GAP API

Overview  Instructions

Application Example  Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

static uint32_t esp_bt_gap_get_cod_srvc (uint32_t cod)
get major service field of COD

Return major service bits
Parameters
  • [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_major_dev (uint32_t cod)
get major device field of COD

Return major device bits
Parameters
  • [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_minor_dev (uint32_t cod)
get minor service field of COD

Return minor service bits
Parameters
  • [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_format_type (uint32_t cod)
get format type of COD

Return format type
Parameters
Chapter 2. API Reference

- [in] cod: Class of Device

`static` `bool` `esp_bt_gap_is_valid_cod`(`uint32_t` `cod`)  
decide the integrity of COD

**Return**  
- true if cod is valid  
- false otherwise

**Parameters**  
- [in] cod: Class of Device

`esp_err_t` `esp_bt_gap_register_callback`(`esp_bt_gap_cb_t` `callback`)  
register callback function. This function should be called after `esp_bluedroid_enable()` completes successfully

**Return**  
- ESP_OK : Succeed  
- ESP_FAIL: others

`esp_err_t` `esp_bt_gap_set_scan_mode`(`esp_bt_connection_mode_t` `c_mode`, `esp_bt_discovery_mode_t` `d_mode`)  
Set discoverability and connectability mode for legacy bluetooth. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**  
- ESP_OK : Succeed  
- ESP_ERR_INVALID_ARG: if argument invalid  
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
- ESP_FAIL: others

**Parameters**  
- [in] c_mode: : one of the enums of `esp_bt_connection_mode_t`  
- [in] d_mode: : one of the enums of `esp_bt_discovery_mode_t`

`esp_err_t` `esp_bt_gap_start_discovery`(`esp_ft_inq_mode_t` `mode`, `uint8_t` `inq_len`, `uint8_t` `num_rsps`)  
This function starts Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_RES_EVT` each time the two types of discovery results are got.

**Return**  
- ESP_OK : Succeed  
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
- ESP_ERR_INVALID_ARG: if invalid parameters are provided  
- ESP_FAIL: others

**Parameters**  
- [in] mode: - Inquiry mode  
- [in] inq_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,  
  – when this time expires, Inquiry will be halted.  
- [in] num_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

`esp_err_t` `esp_bt_gap_cancel_discovery`(`void`)  
Cancel Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` if Inquiry or Name Discovery is cancelled by calling this function.

**Return**  
- ESP_OK : Succeed  
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
- ESP_FAIL: others
`esp_err_t esp_bt_gap_get_remote_services(esp_bd_addr_t remote_bda)`
Start SDP to get remote services. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVCVS_EVT` after service discovery ends.

**Return**
- `ESP_OK`: Succeed
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_bt_gap_get_remote_service_record(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)`
Start SDP to look up the service matching `uuid` on the remote device. This function should be called after `esp_bluedroid_enable()` completes successfully.

`esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVC_REC_EVT` after service discovery ends.

**Return**
- `ESP_OK`: Succeed
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`uint8_t *esp_bt_gap_resolve_eir_data(uint8_t *eir, esp_bt_eir_type_t type, uint8_t *length)`
This function is called to get EIR data for a specific type.

**Return**
pointer of starting position of eir data excluding eir data type, NULL if not found

**Parameters**
- `[in]` `eir`: pointer of raw eir data to be resolved
- `[in]` `type`: specific EIR data type
- `[out]` `length`: return the length of EIR data excluding fields of length and data type

`esp_err_t esp_bt_gap_config_eir_data(esp_bt_eir_data_t *eir_data)`
This function is called to configure EIR data. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_CONFIG_EIR_DATA_EVT` after config EIR ends.

**Return**
- `ESP_OK`: Succeed
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_ERR_INVALID_ARG`: if param is invalid
- `ESP_FAIL`: others

**Parameters**
- `[in]` `eir_data`: pointer of EIR data content

`esp_err_t esp_bt_gap_set_cod(esp_bt_cod_t cod, esp_bt_cod_mode_t mode)`
This function is called to set class of device. The structure `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_SET_COD_EVT` after set COD ends. Some profiles have special restrictions on class of device, changes may cause these profiles do not work.

**Return**
- `ESP_OK`: Succeed
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_ERR_INVALID_ARG`: if param is invalid
- `ESP_FAIL`: others

**Parameters**
- `[in]` `cod`: class of device
- `[in]` `mode`: setting mode

`esp_err_t esp_bt_gap_get_cod(esp_bt_cod_t *cod)`
This function is called to get class of device.

**Return**
- `ESP_OK`: Succeed
• ESP_FAIL: others

Parameters
• [out] cod: - class of device

`esp_err_t esp_bt_gap_read_rssi_delta(esp_bd_addr_t remote_addr)`

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Return
• ESP_OK : Succeed
• ESP_FAIL: others

Parameters
• [in] remote_addr : remote device address, corresponding to a certain connection handle

`esp_err_t esp_bt_gap_remove_bond_device(esp_bd_addr_t bd_addr)`

Removes a device from the security database list of peer device.

Return - ESP_OK: success
• ESP_FAIL: failed

Parameters
• [in] bd_addr : BD address of the peer device

`int esp_bt_gap_get_bond_device_num(void)`

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number
• ESP_FAIL: failed

`esp_err_t esp_bt_gap_get_bond_device_list(int *dev_num, esp_bd_addr_t *dev_list)`

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return
• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• [out] dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

`esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Set pin type and default pin code for legacy pairing.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters
• [in] pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
• [in] pin_code_len: Length of pin_code
• [in] pin_code: Pin_code

`esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
Chapter 2. API Reference

- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: Pin code reply successful or declined.
- [in] pin_code_len: Length of pin code
- [in] pin_code: Pin code

**esp_err_t esp_bt_gap_set_security_param** *(esp_bt_sp_param_t param_type, void *value, uint8_t len)*

Set a GAP security parameter value. Overrides the default value.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] param_type: the type of the param which is to be set
- [in] value: the param value
- [in] len: the length of the param value

**esp_err_t esp_bt_gap_ssp_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: passkey entry successful or declined.
- [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

**esp_err_t esp_bt_gap_ssp_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the legacy connection stage.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different

**esp_err_t esp_bt_gap_set_afh_channels** *(esp_bt_gap_afh_channels channels)*

Set the AFH channels.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] channels: The n th such field (in the range 0 to 78) contains the value for channel n: 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

**esp_err_t esp_bt_gap_read_remote_name** *(esp_bd_addr_t remote_bda)*

Read the remote device name.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] remote_bda: The remote device’s address

**esp_err_t esp_bt_gap_set_qos** *(esp_bd_addr_t remote_bda, uint32_t t_poll)*

Config Quality of service.
Return - ESP_OK: success
  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  • other: failed

Parameters
  • [in] remote_bda: The remote device’s address
  • [in] t_poll: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

#include <esp_gap_bt_api.h> ESP_BT_GAP_PIN_REQ_EVT.
```

**Public Members**

```c
esp_bd_addr_t bda
remote bluetooth device address
```

```c
bool min_16_digit
TRUE if the pin returned must be at least 16 digits
```

```
struct qos_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_QOS_CMPL_EVT.
```
Public Members

`esp_bt_status_t stat`
- QoS status

`esp_bd_addr_t bda`
- remote Bluetooth device address

`uint32_t t_poll`
- Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. Unit is 0.625ms.

```c
struct read_rmt_name_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_REMOTE_NAME_EVT.
```

Public Members

`esp_bt_status_t stat`
- Read Remote Name status

`uint8_t rmt_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]`
- Remote device name

```c
struct read_rssi_delta_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_RSSI_DELTA_EVT *.
```

Public Members

`esp_bd_addr_t bda`
- Remote Bluetooth device address

`esp_bt_status_t stat`
- Read RSSI status

`int8_t rssi_delta`
- RSSI delta value range -128 ~ 127. The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP_BT_GAP_RSSI_LOW_THRLD to ESP_BT_GAP_RSSI_HIGH_THRLD

```c
struct rmt_srvc_rec_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVC_REC_EVT.
```

Public Members

`esp_bd_addr_t bda`
- Remote Bluetooth device address

`esp_bt_status_t stat`
- Service search status

```c
struct rmt_srvcs_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVCS_EVT.
```

Public Members
int num_uuids
   number of UUID in uuid_list

class esp_bt_uuid_t
   list of service UUIDs of remote device

struct set_afh_channels_param
   #include <esp_gap_bt_api.h> ESP_BT_GAP_SET_AFH_CHANNELS_EVT.

   Public Members

      esp_bt_status_t stat
         set AFH channel status

Structures

struct esp_bt_cod_t
   Class of device.

   Public Members

      uint32_t reserved_2 : 2
         undefined
      uint32_t minor : 6
         minor class
      uint32_t major : 5
         major class
      uint32_t service : 11
         service class
      uint32_t reserved_8 : 8
         undefined

struct esp_bt_gap_dev_prop_t
   Bluetooth Device Property Descriptor.

   Public Members

      esp_bt_gap_dev_prop_type_t type
         Device property type
      int len
         Device property value length
      void *val
         Device property value

struct esp_bt_eir_data_t
   EIR data content, according to “Supplement to the Bluetooth Core Specification”.

   Public Members

      bool fec_required
         FEC is required or not, true by default
      bool include_txpower
         EIR data include TX power, false by default
bool include_uuid
    EIR data include UUID, false by default

uint8_t flag
    EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16_t manufacturer_len
    Manufacturer data length, 0 by default

uint8_t *p_manufacturer_data
    Manufacturer data point

uint16_t url_len
    URL length, 0 by default

uint8_t *p_url
    URL point

Macros
ESP_BT_GAP_RSSI_HIGH_THRLD
    RSSI threshold.
    High RSSI threshold
ESP_BT_GAP_RSSI_LOW_THRLD
    Low RSSI threshold

ESP_BT_GAP_AFH_CHANNELS_LEN
ESP_BT_GAP_MAX_BDNAME_LEN
    Maximum bytes of Bluetooth device name.
ESP_BT_GAP_EIR_DATA_LEN
    Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS
    Extended Inquiry Response data type.
    Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
    Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
    Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
    Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
    Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
    Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
    Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
    Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
    Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL
    Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL
    Uniform resource identifier
ESP_BT_EIR_TYPE_MANU_SPECIFIC
    Manufacturer specific data
ESP_BT_EIR_TYPE_MAX_NUM
    MAX number of EIR type
ESP_BT_EIR_FLAG_LIMIT_DISC
ESP_BT_EIR_FLAG_GEN_DISC
ESP_BT_EIR_FLAG_BREDR_NOT_SPT
ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT
ESP_BT_EIR_FLAG_DMT_HOST_SPT
ESP_BT_EIR_MAX_LEN
ESP_BT_PIN_CODE_LEN
    Max pin code length
ESP_BT_IO_CAP_OUT
ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE
ESP_BT_PM_MD_ACTIVE
    Active mode
ESP_BT_PM_MD_HOLD
    Hold mode
ESP_BT_PM_MD_SNIFF
    Sniff mode
ESP_BT_PM_MD_PARK
    Park state
ESP_BT_COD_SRVC_BIT_MASK
    Bits of major service class field.
    Major service bit mask
ESP_BT_COD_SRVC_BIT_OFFSET
    Major service bit offset
ESP_BT_COD_MAJOR_DEV_BIT_MASK
    Bits of major device class field.
    Major device bit mask
ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
    Major device bit offset
ESP_BT_COD_MINOR_DEV_BIT_MASK
    Bits of minor device class field.
    Minor device bit mask
ESP_BT_COD_MINOR_DEV_BIT_OFFSET
    Minor device bit offset
ESP_BT_COD_FORMAT_TYPE_BIT_MASK
    Bits of format type.
    Format type bit mask
ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
    Format type bit offset
Chapter 2. API Reference

**ESP_BT_COD_FORMAT_TYPE_1**
Class of device format type 1.

**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**Type Definitions**
- `typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]`  
- `typedef uint8_t esp_bt_eir_type_t`  
- `typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]`  
  Pin Code (upto 128 bits) MSB is 0
- `typedef uint8_t esp_bt_io_cap_t`  
  Combination of the IO Capability
- `typedef uint8_t esp_bt_pm_mode_t`  
- `typedef void(*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)`  
  bluetooth GAP callback function type
  **Parameters**
  - `event`: Event type
  - `param`: Pointer to callback parameter

**Enumerations**
- `enum esp_bt_cod_mode_t`  
  class of device settings
  **Values:**
  - `ESP_BT_SET_COD_MAJOR_MINOR = 0x01`  
    overwrite major, minor class
  - `ESP_BT_SET_COD_SERVICE_CLASS = 0x02`  
    set the bits in the input, the current bit will remain
  - `ESP_BT_CLR_COD_SERVICE_CLASS = 0x04`  
    clear the bits in the input, others will remain
  - `ESP_BT_SET_COD_ALL = 0x08`  
    overwrite major, minor, set the bits in service class
  - `ESP_BT_INIT_COD = 0x0a`  
    overwrite major, minor, and service class
- `enum esp_bt_connection_mode_t`  
  Discoverability and Connectability mode.
  **Values:**
  - `ESP_BT_NON_CONNECTABLE`  
    Non-connectable
  - `ESP_BT_CONNECTABLE`  
    Connectable
- `enum esp_bt_discovery_mode_t`  
  **Values:**
  - `ESP_BT_NON_DISCOVERABLE`  
    Non-discoverable
Chapter 2. API Reference

\texttt{ESP_BT\_LIMITED\_DISCOVERABLE}  
Limited Discoverable

\texttt{ESP_BT\_GENERAL\_DISCOVERABLE}  
General Discoverable

\texttt{enum esp\_bt\_gap\_dev\_prop\_type\_t}  
Bluetooth Device Property type.

\texttt{Values:}

\texttt{ESP_BT\_GAP\_DEV\_PROP\_BDNAME = 1}  
Bluetooth device name, value type is int8_t[]

\texttt{ESP_BT\_GAP\_DEV\_PROP\_COD}  
Class of Device, value type is uint32_t

\texttt{ESP_BT\_GAP\_DEV\_PROP\_RSSI}  
Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

\texttt{ESP_BT\_GAP\_DEV\_PROP\_EIR}  
Extended Inquiry Response, value type is uint8_t[]

\texttt{enum esp\_bt\_cord\_srvc\_t}  
Major service class field of Class of Device, mutiple bits can be set.

\texttt{Values:}

\texttt{ESP_BT\_COD\_SRVC\_NONE = 0}  
None indicates an invalid value

\texttt{ESP_BT\_COD\_SRVC\_LMTD\_DISCOVER = 0x1}  
Limited Discoverable Mode

\texttt{ESP_BT\_COD\_SRVC\_POSITIONING = 0x8}  
Positioning (Location identification)

\texttt{ESP_BT\_COD\_SRVC\_NETWORKING = 0x10}  
Networking, e.g. LAN, Ad hoc

\texttt{ESP_BT\_COD\_SRVC\_RENDERING = 0x20}  
Rendering, e.g. Printing, Speakers

\texttt{ESP_BT\_COD\_SRVC\_CAPTURING = 0x40}  
Capturing, e.g. Scanner, Microphone

\texttt{ESP_BT\_COD\_SRVC\_OBJ\_TRANSFER = 0x80}  
Object Transfer, e.g. v-Inbox, v-Folder

\texttt{ESP_BT\_COD\_SRVC\_AUDIO = 0x100}  
Audio, e.g. Speaker, Microphone, Headset service

\texttt{ESP_BT\_COD\_SRVC\_TELEPHONY = 0x200}  
Telephony, e.g. Cordless telephony, Modem, Headset service

\texttt{ESP_BT\_COD\_SRVC\_INFORMATION = 0x400}  
Information, e.g., WEB-server, WAP-server

\texttt{enum esp\_bt\_pin\_type\_t}  
\texttt{Values:}

\texttt{ESP_BT\_PIN\_TYPE\_VARIABLE = 0}  
Refer to BTM\_PIN\_TYPE\_VARIABLE

\texttt{ESP_BT\_PIN\_TYPE\_FIXED = 1}  
Refer to BTM\_PIN\_TYPE\_FIXED

\texttt{enum esp\_bt\_sp\_param\_t}  
\texttt{Values:}
ESP_BT_SP_IOCAP_MODE = 0  
Set IO mode

enum esp_bt_cod_major_dev_t  
Major device class field of Class of Device.
Values:

ESP_BT_COD_MAJOR_DEV_MISC = 0  
Miscellaneous
ESP_BT_COD_MAJOR_DEV_COMPUTER = 1  
Computer
ESP_BT_COD_MAJOR_DEV_PHONE = 2  
Phone(cellular, cordless, pay phone, modem)
ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3  
LAN, Network Access Point
ESP_BT_COD_MAJOR_DEV_AV = 4  
Audio/Video(headset, speaker, stereo, video display, VCR
ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5  
Peripheral(mouse, joystick, keyboard)
ESP_BT_COD_MAJOR_DEV_IMAGING = 6  
Imaging(printer, scanner, camera, display
ESP_BT_COD_MAJOR_DEV_WEARABLE = 7  
Wearable
ESP_BT_COD_MAJOR_DEV_TOY = 8  
Toy
ESP_BT_COD_MAJOR_DEV_HEALTH = 9  
Health
ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31  
Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t  
Bluetooth Device Discovery state
Values:

ESP_BT_GAP_DISCOVERY_STOPPED  
Device discovery stopped
ESP_BT_GAP_DISCOVERY_STARTED  
Device discovery started

enum esp_bt_gap_cb_event_t  
BT GAP callback events.
Values:

ESP_BT_GAP_DISC_RES_EVT = 0  
Device discovery result event
ESP_BT_GAP_DISC_STATE_CHANGED_EVT  
Discovery state changed event
ESP_BT_GAP_RMT_SRVCS_EVT  
Get remote services event
ESP_BT_GAP_RMT_SRVCR_REC_EVT  
Get remote service record event
Chapter 2. API Reference

ESP_BT_GAP_AUTH_CMPL_EVT
Authentication complete event

ESP_BT_GAP_PIN_REQ_EVT
Legacy Pairing Pin code request

ESP_BT_GAP_CFM_REQ_EVT
Security Simple Pairing User Confirmation request.

ESP_BT_GAP_KEY_NOTIF_EVT
Security Simple Pairing Passkey Notification

ESP_BT_GAP_KEY_REQ_EVT
Security Simple Pairing Passkey request

ESP_BT_GAP_READ_RSSI_DELTA_EVT
Read rssi event

ESP_BT_GAP_CONFIG_EIR_DATA_EVT
Config EIR data event

ESP_BT_GAP_SET_AFH_CHANNELS_EVT
Set AFH channels event

ESP_BT_GAP_READ_REMOTE_NAME_EVT
Read Remote Name event

ESP_BT_GAP_MODE_CHG_EVT

ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
remove bond device complete event

ESP_BT_GAP_QOS_CMPL_EVT
QOS complete event

ESP_BT_GAP_EVT_MAX

enum esp_bt_inq_mode_t
Inquiry Mode

Values:

ESP_BT_INQ_MODE_GENERAL_INQUIRY
General inquiry mode

ESP_BT_INQ_MODE_LIMITED_INQUIRY
Limited inquiry mode

Bluetooth A2DP API

Overview
Instructions

Application Example
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:
• This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File
• components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h
Functions

**esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)**

Register application callback function to A2DP module. This function should be called only after 
esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: A2DP event callback function

**esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)**

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. 
This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: A2DP sink data callback function

**esp_err_t esp_a2d_sink_init (void)**

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_a2d_sink_deinit (void)**

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

Return

- ESP_OK: if the deinitialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)**

Connect to remote bluetooth A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

Return

- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

**esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)**

Disconnect from the remote A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

Return

- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
Chapter 2. API Reference

- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`

Media control commands. This API can be used for both A2DP sink and source and must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

**Return**
- ESP_OK: control command is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] ctrl: control commands for A2DP data channel

`esp_err_t esp_a2d_source_init (void)`

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

**Return**
- ESP_OK: if the initialization request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_deinit (void)`

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)`

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- [in] callback: A2DP source data callback function

`esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)`

Connect to remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

**Return**
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().
Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

Unions

union esp_a2d_cb_param_t
#include <esp_a2dp_api.h> A2DP state callback parameters.

Public Members

struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat
A2DP connection status

struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat
audio stream playing state

struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg
media codec configuration information

struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat
status in acknowledgement to media control commands

struct esp_a2d_cb_param_t::a2d_prof_stat_param a2d_prof_stat
status to indicate a2d prof init or deinit

struct a2d_audio_cfg_param
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.

Public Members

esp_bd_addr_t remote_bda
remote bluetooth device address

### Type Definitions

typedef uint8_t esp_a2d_mct_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)

A2DP profile callback function type.

- **Parameters**
  - `event`: Event type
  - `param`: Pointer to callback parameter

.typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t*buf,uint32_t len)

A2DP sink data callback function.

- **Parameters**
  - `[in] buf`: Pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
  - `[in] len`: Size (in bytes) in buf

.typedef int32_t (*esp_a2d_source_data_cb_t)(uint8_t*buf,int32_t len)

A2DP source data read callback function.

- **Return**
  - Size of bytes read successfully, if the argument len is -1, this value is ignored.
- **Parameters**
  - `[in] buf`: Buffer to be filled with PCM data stream from higher layer
  - `[in] len`: Size (in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

### Enumerations

enum esp_a2d_connection_state_t

Bluetooth A2DP connection states.

- **Values**
  - `ESP_A2D_CONNECTION_STATE_DISCONNECTED = 0`
    - Connection released
  - `ESP_A2D_CONNECTION_STATE_CONNECTING`
    - Connecting remote device
  - `ESP_A2D_CONNECTION_STATE_CONNECTED`
    - Connection established
  - `ESP_A2D_CONNECTION_STATE_DISCONNECTING`
    - Disconnecting remote device

enum esp_a2d_disc_rsn_t

Bluetooth A2DP disconnection reason.

- **Values**
  - `ESP_A2D_DISC_RSN_NORMAL = 0`
    - Finished disconnection that is initiated by local or remote device
ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t
Bluetooth A2DP datapath states.

Values:

ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND = 0
audio stream datapath suspended by remote device

ESP_A2D_AUDIO_STATE_STOPPED
audio stream datapath stopped

ESP_A2D_AUDIO_STATE_STARTED
audio stream datapath started

enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.

Values:

ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
media control command is acknowledged with success

ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.

Values:

ESP_A2D_MEDIA_CTRL_NONE = 0
Not for application use, use inside stack only.

ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.

Values:

ESP_A2D_DEINIT_SUCCESS = 0
A2DP profile deinit successful event

ESP_A2D_INIT_SUCCESS
A2DP profile deinit successful event

enum esp_a2d_cb_event_t
A2DP callback events.

Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event
ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2D SINK

ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

ESP_A2D_PROF_STATE_EVT
indicate a2dp init&deinit complete

BT AVRCP APIs

Overview  Bluetooth AVRCP reference APIs.

Instructions

Application Example  Instructions

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_avrc_api.h

Functions

esp_err_t esp_avrc_ct_register_callback (esp_avrc_ct_cb_t callback)
Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] callback: AVRCP controller callback function

esp_err_t esp_avrc_ct_init (void)
Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_avrc_ct_deinit (void)
De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
esp_err_t esp_avrc_ct_send_set_player_value_cmd(uint8_t tl, uint8_t attr_id, uint8_t value_id)

Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values
• [in] attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
• [in] value_id: attribute value defined for the specific player application setting attribute

esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd(uint8_t tl)

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values

esp_err_t esp_avrc_ct_send_register_notification_cmd(uint8_t tl, uint8_t event_id, uint32_t event_parameter)

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
• [in] event_id: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• [in] event_parameter: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd(uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values
• [in] volume: volume, 0 to 0x7f, means 0% to 100%

esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
**Chapter 2. API Reference**

- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] tl**: transaction label, 0 to 15, consecutive commands should use different values.
- **[in] attr_mask**: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

```c
esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)
```

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] tl**: transaction label, 0 to 15, consecutive commands should use different values.
- **[in] key_code**: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- **[in] key_state**: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

```c
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)
```

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] callback**: AVRCP target callback function

```c
esp_err_t esp_avrc_tg_init(void)
```

Initialize the Bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_tg_deinit(void)
```

De-initialize AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_tg_get_psth_cmd_filter(esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)
```

Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().
Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

```c
esp_err_t esp_avrc_tg_set_psth_cmd_filter(esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)
```

Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

```c
bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)
```

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

Return For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

Parameters

- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code

```c
esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Get the requested event notification capabilities on local AVRCP target. The capability is returned in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

For capability type “ESP_AVRC_RN_CAP_ALLOWED_EVT”, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap().

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if cap is invalid or evt_set is NULL
- ESP_FAIL: otherwise

```c
esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in evt_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

Return

- ESP_OK: success
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if evt_set is NULL

```c
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)
```

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

**Return** For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false.

**Parameters**
- `[in] op`: operation requested on the bit mask field
- `[in] events`: pointer to event notification capability bit mask structure
- `[in] event_id`: notification event code

```c
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

**Parameters**
- `[in] event_id`: notification event ID that remote AVRCP controller registers
- `[in] rsp`: notification response code
- `[in] param`: parameters included in the specific notification

**Unions**

```c
union esp_avrc_rn_param_t
#ifdef AVRCP_API_H
#include <esp_avrc_api.h>
#endif
```

AVRCP notification parameters.

**Public Members**

```c
uint8_t volume
```
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

```c
define esp_avrc_playback_stat_t playback
```
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

```c
uint8_t elm_id[8]
```
response data for ESP_AVRC_RN_TRACK_CHANGE

```c
uint32_t play_pos
```
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond

```c
define esp_avrc_batt_stat_t batt
```
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

**Unions**

```c
union esp_avrc_ct_cb_param_t
#ifdef AVRRC_API_H
#include <esp_avrc_api.h>
#endif
```

AVRC controller callback parameters.

**Public Members**

```c
struct esp_avrc_ct_cb_param_t avrc_ct_conn_stat_param conn_stat
```
AVRC connection status

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
  pass-through command response
struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
  metadata attributes response
struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
  notifications
struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
  AVRC features discovered from remote SDP server
struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
  get supported event capabilities response from AVRCP target
struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
  set absolute volume response event
```

### Public Members

- `uint8_t event_id`
  - id of AVRC event notification
- `esp_avrc_rn_param_t event_parameter`
  - event notification parameter

### struct avrc_ct_conn_stat_param

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.
```

### Public Members

- `bool connected`
  - whether AVRC connection is set up
- `esp_bd_addr_t remote_bda`
  - remote Bluetooth device address

### struct avrc_ct_get_rn_caps_rsp_param

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.
```

### Public Members

- `uint8_t cap_count`
  - number of items provided in event or company_id according to cap_id used
- `esp_avrc_rn_evt_cap_mask_t evt_set`
  - supported event_ids represented in bit-mask

### struct avrc_ct_meta_rsp_param

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
```

### Public Members

- `uint8_t attr_id`
  - id of metadata attribute
- `uint8_t* attr_text`
  - attribute itself
```c
int attr_length
attribute character length

struct avrc_ct_psth_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.

Public Members

uint8_t tl
transaction label, 0 to 15

uint8_t keyCode
passthrough command code

uint8_t key_state
0 for PRESSED, 1 for RELEASED

struct avrc_ct_rmt_feats_param
#include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.

Public Members

uint32_t feat_mask
AVRC feature mask of remote device

uint16_t tg_feat_flag
feature flag of remote device as TG

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_ct_set_volume_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.

Public Members

uint8_t volume
the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%

union esp_avrc_tg_cb_param_t
#include <esp_avrc_api.h> AVRC target callback parameters.

Public Members

struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
AVRC connection status

struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
AVRC features discovered through SDP

struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
passthrough command

struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
set absolute volume command targeted on audio sink

struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
register notification

struct esp_avrc_tg_cb_param_t::avrc_tg_set_app_value_param set_app_value
set player application value
```
struct avrc_tg_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.

Public Members

bool connected
whether AVRC connection is set up

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_tg_psth_cmd_param
#include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.

Public Members

uint8_t key_code
passthrough command code

uint8_t key_state
0 for PRESSSED, 1 for RELEASED

struct avrc_tg_reg_ntf_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.

Public Members

uint8_t event_id
event id of AVRC RegisterNotification

uint32_t event_parameter
event notification parameter

struct avrc_tg_rmt_feats_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REMOTE_FEATURES_EVT.

Public Members

uint32_t feat_mask
AVRC feature mask of remote device

uint16_t ct_feat_flag
feature flag of remote device as CT

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_tg_set_abs_vol_param
#include <esp_avrc_api.h> ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.

Public Members

uint8_t volume
volume ranges from 0 to 127

struct avrc_tg_set_app_value_param
#include <esp_avrc_api.h> ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT.
Public Members

uint8_t num_val
attribute num

*esp_avrc_set_app_value_param_t *p_vals
point to the id and value of player application attribute

Structures

struct esp_avrc_psth_bit_mask_t
AVRC passthrough command bit mask.

Public Members

uint16_t bits[8]
bit mask representation of PASSTHROUGH commands

struct esp_avrc_rn_evt_cap_mask_t
AVRC target notification event capability bit mask.

Public Members

uint16_t bits
bit mask representation of PASSTHROUGH commands

struct esp_avrc_set_app_value_param_t
AVRCP set app value parameters.

Public Members

uint8_t attr_id
player application attribute id

uint8_t attr_val
player application attribute value

Macros

#define ESP_AVRC_TRANS_LABEL_MAX
max transaction label

Type Definitions

typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
AVRCP controller callback function type.

Parameters

• event:: Event type
• param:: Pointer to callback parameter union

typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
AVRCP target callback function type.

Parameters

• event:: Event type
• param:: Pointer to callback parameter union
Enumerations

**enum esp_avrc_features_t**
AVRC feature bit mask.

*Values:*

- **ESP_AVRC_FEAT_RCTG** = 0x0001
  - remote control target
- **ESP_AVRC_FEAT_RCCT** = 0x0002
  - remote control controller
- **ESP_AVRC_FEAT_VENDOR** = 0x0008
  - remote control vendor dependent commands
- **ESP_AVRC_FEAT_BROWSE** = 0x0010
  - use browsing channel
- **ESP_AVRC_FEAT_META_DATA** = 0x0040
  - remote control metadata transfer command/response
- **ESP_AVRC_FEAT_ADV_CTRL** = 0x0200
  - remote control advanced control command/response

**enum esp_avrc_feature_flag_t**
AVRC supported features flag retrieved in SDP record.

*Values:*

- **ESP_AVRC_FEAT_FLAG_CAT1** = 0x0001
  - category 1
- **ESP_AVRC_FEAT_FLAG_CAT2** = 0x0002
  - category 2
- **ESP_AVRC_FEAT_FLAG_CAT3** = 0x0004
  - category 3
- **ESP_AVRC_FEAT_FLAG_CAT4** = 0x0008
  - category 4
- **ESP_AVRC_FEAT_FLAG_BROWSING** = 0x0040
  - browsing
- **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE_PROP** = 0x0080
  - Cover Art GetImageProperties
- **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE** = 0x0100
  - Cover Art GetImage
- **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_LINKED_THUMBNAIL** = 0x0200
  - Cover Art GetLinkedThumbnail

**enum esp_avrc_pt_cmd_t**
AVRC passthrough command code.

*Values:*

- **ESP_AVRC_PT_CMD_SELECT** = 0x00
  - select
- **ESP_AVRC_PT_CMD_UP** = 0x01
  - up

enum esp_avrc_psth_filter_t
    AVRC passthrough command filter.

    Values:
    ESP_AVRC_PSTH_FILTER_ALLOWED_CMD = 0
        all of the PASSTHROUGH commands that can possibly be used, immutable
    ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD = 1
        PASSTHROUGH commands selectively supported according to the current configuration

enum esp_avrc_bit_mask_op_t
    Values:
    ESP_AVRC_BIT_MASK_OP_TEST = 0
        operation code to test a specific bit
    ESP_AVRC_BIT_MASK_OP_SET = 1
        operation code to set a specific bit
    ESP_AVRC_BIT_MASK_OP_CLEAR = 2
        operation code to clear a specific bit

enum esp_avrc_pt_cmd_state_t
    AVRC passthrough command state.

    Values:
    ESP_AVRC_PT_CMD_STATE_PRESSED = 0
        key pressed
    ESP_AVRC_PT_CMD_STATE_RELEASED = 1
        key released

enum esp_avrc_ct_cb_event_t
    AVRC Controller callback events.

    Values:
    ESP_AVRC_CT_CONNECTION_STATE_EVT = 0
        connection state changed event
    ESP_AVRC_CT_PASSTHROUGH_RSP_EVT = 1
        passthrough response event
    ESP_AVRC_CT_METADATA_RSP_EVT = 2
        metadata response event
Chapter 2. API Reference

ESP_AVRC_CT_PLAY_STATUS_RSP_EVT = 3
play status response event

ESP_AVRC_CT_CHANGE_NOTIFY_EVT = 4
notification event

ESP_AVRC_CT_REMOTE_FEATURES_EVT = 5
feature of remote device indication event

ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT = 6
supported notification events capability of peer device

ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT = 7
set absolute volume response event

enum esp_avrc_tg_cb_event_t
AVRC Target callback events.
Values:

ESP_AVRC_TG_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_AVRC_TG_REMOTE_FEATURES_EVT = 1
feature of remote device indication event

ESP_AVRC_TG_PASSTHROUGH_CMD_EVT = 2
passthrough command event

ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT = 3
set absolute volume command from remote device

ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT = 4
register notification event

ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT = 5
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.
Values:

ESP_AVRC_MD_ATTR_TITLE = 0x1
title of the playing track

ESP_AVRC_MD_ATTR_ARTIST = 0x2
track artist

ESP_AVRC_MD_ATTR_ALBUM = 0x4
album name

ESP_AVRC_MD_ATTR_TRACK_NUM = 0x8
track position on the album

ESP_AVRC_MD_ATTR_NUM_TRACKS = 0x10
number of tracks on the album

ESP_AVRC_MD_ATTR_GENRE = 0x20
track genre

ESP_AVRC_MD_ATTR_PLAYING_TIME = 0x40
total album playing time in miliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.
Values:
Chapter 2. API Reference

ESP_AVRC_RN_PLAY_STATUS_CHANGE = 0x01
track status change, eg. from playing to paused

ESP_AVRC_RN_TRACK_CHANGE = 0x02
new track is loaded

ESP_AVRC_RN_TRACK_REACHED_END = 0x03
current track reached end

ESP_AVRC_RN_TRACK_REACHED_START = 0x04
current track reached start position

ESP_AVRC_RN_PLAY_POS_CHANGED = 0x05
track playing position changed

ESP_AVRC_RN_BATTERY_STATUS_CHANGE = 0x06
battery status changed

ESP_AVRC_RN_SYSTEM_STATUS_CHANGE = 0x07
system status changed

ESP_AVRC_RN_APP_SETTING_CHANGE = 0x08
application settings changed

ESP_AVRC_RN_NOW_PLAYING_CHANGE = 0x09
now playing content changed

ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
available players changed

ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
the addressed player changed

ESP_AVRC_RN_UIDS_CHANGE = 0x0c
UIDs changed

ESP_AVRC_RN_VOLUME_CHANGE = 0x0d
volume changed locally on TG

ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.

Values:

ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
all of the notification events that can possibly be supported, immutable

ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
notification events selectively supported according to the current configuration

ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.

Values:

ESP_AVRC_RN_RSP_INTERIM = 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

ESP_AVRC_RN_RSP_CHANGED = 15
final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC playersetting ids.

Values:

SPP API

Overview  Instructions
Application Example  Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File

- components/bluetooth/host/bluedroid/api/include/api/esp_spp_api.h

Functions

**esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)**

This function is called to init callbacks with SPP module.

- **Return**
  - ESP_OK: success
  - other: failed

- **Parameters**
  - [in] callback: pointer to the init callback function.

**esp_err_t esp_spp_init (esp_spp_mode_t mode)**

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

- **Return**
  - ESP_OK: success
  - other: failed

- **Parameters**
  - [in] mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

**esp_err_t esp_spp_deinit (void)**

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

- **Return**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)**

This function is called to perform service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

- **Return**
  - ESP_OK: success
  - other: failed

- **Parameters**
  - [in] bd_addr: Remote device Bluetooth device address.

**esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)**

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

- **Return**
• ESP_OK: success
• other: failed

Parameters
• [in] role: Master or slave.
• [in] remote_scn: Remote device Bluetooth device SCN.
• [in] peer_bd_addr: Remote device Bluetooth device address.

esp_err_t esp_spp_disconnect (uint32_t handle)
This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
• ESP_OK: success
• other: failed

Parameters
• [in] handle: The connection handle.

esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)
This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
• ESP_OK: success
• other: failed

Parameters
• [in] role: Master or slave.
• [in] local_scn: The specific channel you want to get. If channel is 0, means get any channel.
• [in] name: Server’s name.

esp_err_t esp_spp_stop_srv (void)
This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT; and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
• ESP_OK: success
• other: failed

esp_err_t esp_spp_stop_srv_scn (uint8_t scn)
This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
• ESP_OK: success
• other: failed

Parameters
• [in] scn: Server channel number.

esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)
This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to
be called repeatedly, it is strongly recommended to call this function again after the previous event
ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event
ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when
the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be
called after an connection between initiator and acceptor has been established.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] handle: The connection handle.
• [in] len: The length of the data written.
• [in] p_data: The data written.

esp_err_t esp_spp_vfs_register (void)
This function is used to register VFS. For now, SPP only supports write, read and close.

Return
• ESP_OK: success
• other: failed

Unions
union esp_spp_cb_param_t
#include <esp_spp_api.h> SPP callback parameters union.

Public Members

struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
SPP callback param of ESP_SPP_SRV_STOP_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT
struct spp_cl_init_evt_param

Macros

ESP_SPP_SEC_NONE
- No security. relate to BTA_SEC_NONE in bta/bta_api.h

ESP_SPP_SEC_AUTHORIZE
- Authorization required (only needed for outgoing connection) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

ESP_SPP_SEC_AUTHENTICATE
- Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

ESP_SPP_SEC_ENCRYPT
- Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

ESP_SPP_SEC_MODE4_LEVEL4
- Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

ESP_SPP_SEC_MITM
- Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

ESP_SPP_SEC_IN_16_DIGITS
- Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

ESP_SPP_MAX_MTU
- SPP max MTU

ESP_SPP_MAX_SCN
- SPP max SCN

Type Definitions

typedef uint16_t esp_spp_sec_t

typedef void() esp_spp_cb_t(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)
- SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

Parameters
- event: Event type
- param: Point to callback parameter, currently is union type

Enumerations

enum esp_spp_status_t
- Values:
  - ESP_SPP_SUCCESS = 0
    - Successful operation.
  - ESP_SPP_FAILURE
    - Generic failure.
  - ESP_SPP_BUSY
    - Temporarily can not handle this request.
  - ESP_SPP_NO_DATA
    - No data
  - ESP_SPP_NORESOURCE
    - No more resource
  - ESP_SPP_NEED_INIT
    - SPP module shall init first
  - ESP_SPP_NEED_DEINIT
    - SPP module shall deinit first
Chapter 2. API Reference

ESP_SPP_NO_CONNECTION
Connection may have been closed

ESP_SPP_NO_SERVER
No SPP server

enum esp_spp_role_t
Values:

ESP_SPP_ROLE_MASTER = 0
Role: master

ESP_SPP_ROLE_SLAVE = 1
Role: slave

enum esp_spp_mode_t
Values:

ESP_SPP_MODE_CB = 0
When data is coming, a callback will come with data

ESP_SPP_MODE_VFS = 1
Use VFS to write/read data

enum esp_spp_cb_event_t
SPP callback function events.
Values:

ESP_SPP_INIT_EVT = 0
When SPP is inited, the event comes

ESP_SPP_UNINIT_EVT = 1
When SPP is uninited, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
When SPP Server connection open, the event comes

ESP_SPP_SRV_STOP_EVT = 35
When SPP server stopped, the event comes

    Callback for connection state change. state will have one of the values from BtHfConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state,
                                          esp_bd_addr_t *bd_addr)
    Callback for audio connection state change. state will have one of the values from BtHfAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state,
                                           esp_bd_addr_t *bd_addr)
    Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type,
                                           int volume,
                                           esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char *number,
                                           esp_bd_addr_t *bd_addr)
    Callback for dialing an outgoing call If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone,
                                           esp_bd_addr_t *bd_addr)
    Callback for sending DTMF tones tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec,
                                           esp_bd_addr_t *bd_addr)
    Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs,
                                    esp_bd_addr_t *bd_addr)
    Callback for AT+BCS and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld,
                                         esp_bd_addr_t *bd_addr)
    Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for indicators (CIND)
typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)
Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for keypressed (HSP) event.

Enumerations

enum esp_hf_in_band_ring_state_t
in-band ring tone state

Values:

ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0

ESP_HF_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_vr_state_t
voice recognition state

Values:

ESP_HF_VR_STATE_DISABLED = 0
voice recognition disabled

ESP_HF_VR_STATE_ENABLED
voice recognition enabled

enum esp_hf_volume_control_target_t
Bluetooth HFP audio volume control target.

Values:

ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
speaker

ESP_HF_VOLUME_CONTROL_TARGET_MIC
microphone

enum esp_hf_audio_state_t
Bluetooth HFP audio connection status.

Values:

ESP_HF_AUDIO_STATE_DISCONNECTED = 0
audio connection released

ESP_HF_AUDIO_STATE_CONNECTING
audio connection has been initiated

ESP_HF_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

enum esp_hf_volume_type_t
Values:

ESP_HF_VOLUME_TYPE_SPK = 0

ESP_HF_VOLUME_TYPE_MIC
enum esp_hf_network_state_t
  +CIND network service availability status

Values:
  ESP_HF_NETWORK_STATE_NOTAVAILABLE = 0
  ESP_HF_NETWORK_STATE_AVAILABLE

enum esp_hf_service_type_t
  +CIEV Service type

Values:
  ESP_HF_SERVICE_TYPE_HOME = 0
  ESP_HF_SERVICE_TYPE_ROAMING

enum esp_hf_call_status_t
  +CIND call status indicator values

Values:
  ESP_HF_CALL_STATUS_NO_CALLS = 0
    no call in progress
  ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
    call is present (active or held)

enum esp_hf_call_setup_status_t
  +CIND call setup status indicator values

Values:
  ESP_HF_CALL_SETUP_STATUS_IDLE = 0
    no call setup in progress
  ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
    incoming call setup in progress
  ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
    outgoing call setup in dialing state
  ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
    outgoing call setup in alerting state

enum esp_hf_roaming_status_t
  +CIND roaming status indicator values

Values:
  ESP_HF_ROAMING_STATUS_INACTIVE = 0
    roaming is not active
  ESP_HF_ROAMING_STATUS_ACTIVE
    a roaming is active

enum esp_hf_call_held_status_t
  +CIND call held indicator values

Values:
  ESP_HF_CALL_HELD_STATUS_NONE = 0
    no calls held
  ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE = 1
    both active and held call
  ESP_HF_CALL_HELD_STATUS_HELD = 2
    call on hold, no active call
enum esp_hf_current_call_status_t
+CLCC status of the call

Values:

ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
active
ESP_HF_CURRENT_CALL_STATUS_HELD = 1
held
ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
dialing (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_ALERTING = 3
alerting (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_INCOMING = 4
incoming (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
waiting (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD = 6
call held by response and hold

enum esp_hf_current_call_direction_t
+CLCC direction of the call

Values:

ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
outgoing
ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
incoming

enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag

Values:

ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
not a member of a multi-party call
ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
member of a multi-party call

enum esp_hf_current_call_mode_t
+CLCC call mode

Values:

ESP_HF_CURRENT_CALL_MODE_VOICE = 0
ESP_HF_CURRENT_CALL_MODE_DATA = 1
ESP_HF_CURRENT_CALL_MODE_FAX = 2

enum esp_hf_call_addr_type_t
+CLCC address type

Values:

ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
unknown address type
ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
international address
enum esp_hf_subscriber_service_type_t
  +CNUM service type of the phone number
  Values:
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
  unknown
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
  voice service
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
  fax service

enum esp_hf_btrh_status_t
  +BTRH response and hold result code
  Values:
  ESP_HF_BTRH_STATUS_HELD = 0
  incoming call is put on hold in AG
  ESP_HF_BTRH_STATUS_ACCEPTED
  held incoming call is accepted in AG
  ESP_HF_BTRH_STATUS_REJECTED
  held incoming call is rejected in AG

enum esp_hf_btrh_cmd_t
  AT+BTRH response and hold action code.
  Values:
  ESP_HF_BTRH_CMD_HOLD = 0
  put the incoming call on hold
  ESP_HF_BTRH_CMD_ACCEPT = 1
  accept a held incoming call
  ESP_HF_BTRH_CMD_REJECT = 2
  reject a held incoming call

enum esp_hf_nrec_t
  Values:
  ESP_HF_NREC_STOP = 0
  ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t
  +CCWA response status
  Values:
  ESP_HF_CALL_WAITING_INACTIVE
  ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t
  Values:
  ESP_HF_WBS_NONE
  ESP_HF_WBS_NO
  ESP_HF_WBS_YES

enum esp_hf_connection_state_t
  Bluetooth HFP RFCOMM connection and service level connection status.
  Values:
ESP_HF_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released

ESP_HF_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

ESP_HF_CONNECTION_STATE_CONNECTED
RFCOMM connection established

ESP_HF_CONNECTION_STATE_SLC_CONNECTED
service level connection established

ESP_HF_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t
AT+CHLD command values.

Values:

ESP_HF_CHLD_TYPE_REL = 0
<0>, Terminate all held or set UDUB ( "busy" ) to a waiting call

ESP_HF_CHLD_TYPE_REL_ACC
<1>, Terminate all active calls and accepts a waiting/held call

ESP_HF_CHLD_TYPE_HOLD_ACC
<2>, Hold all active calls and accepts a waiting/held call

ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference

ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls

ESP_HF_CHLD_TYPE_REL_X
<1x>, releases specified calls only

ESP_HF_CHLD_TYPE_PRIV_X
<2x>, request private consultation mode with specified call

enum esp_hf_at_response_code_t
Values:

ESP_HF_AT_RESPONSE_CODE_OK = 0
acknowledges execution of a command line

ESP_HF_AT_RESPONSE_CODE_ERR
command not accepted

ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
connection terminated

ESP_HF_AT_RESPONSE_CODE_BUSY
busy signal detected

ESP_HF_AT_RESPONSE_CODE_NO_ANSWER
connection completion timeout

ESP_HF_AT_RESPONSE_CODE_DELAYED
delayed

ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
blacklisted

ESP_HF_AT_RESPONSE_CODE_CME
CME error

enum esp_hf_at_response_t
Values:
ESP_HF_AT_RESPONSE_ERROR = 0
ESP_HF_AT_RESPONSE_OK

enum esp_hf_cme_err_t
Extended Audio Gateway Error Result Code Response.

Values:
ESP_HF_CME_AG_FAILURE = 0
ag failure
ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
no connection to phone
ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
operation not allowed
ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
operation not supported
ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
PH-SIM PIN Required
ESP_HF_CME_SIM_NOT_INSERTED = 10
SIM not inserted
ESP_HF_CME_SIM_PIN_REQUIRED = 11
SIM PIN required
ESP_HF_CME_SIM_PUK_REQUIRED = 12
SIM PUK required
ESP_HF_CME_SIM_FAILURE = 13
SIM failure
ESP_HF_CME_SIM_BUSY = 14
SIM busy
ESP_HF_CME_INCORRECT_PASSWORD = 16
incorrect password
ESP_HF_CME_SIM_PIN2_REQUIRED = 17
SIM PIN2 required
ESP_HF_CME_SIM_PUK2_REQUIRED = 18
SIM PUK2 required
ESP_HF_CME_MEMORY_FULL = 20
memory full
ESP_HF_CME_INVALID_INDEX = 21
invalid index
ESP_HF_CME_MEMORY_FAILURE = 23
memory failure
ESP_HF_CME_TEXT_STRING_TOO_LONG = 24
text string too long
ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING = 25
invalid characters in text string
ESP_HF_CME_DIAL_STRING_TOO_LONG = 26
dial string too long
ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING = 27
invalid characters in dial string
Chapter 2. API Reference

ESP_HF_CME_NO_NETWORK_SERVICE = 30
no network service

ESP_HF_CME_NETWORK_TIMEOUT = 31
network timeout

ESP_HF_CME_NETWORK_NOT_ALLOWED = 32
network not allowed emergency calls only

HFP CLIENT API

Overview

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h

Functions

esp_err_t esp_hf_client_register_callback (esp_hf_client_cb_t callback)
Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: HFP client event callback function

esp_err_t esp_hf_client_init (void)
Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_deinit (void)
De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)
Establish a Service Level Connection to remote bluetooth HFP audio gateway(AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address
Chapter 2. API Reference

```c
esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)
```
Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

```c
esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)
```
Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

```c
esp_err_t esp_hf_client_disconnect_audio (esp_bd_addr_t remote_bda)
```
Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

```c
esp_err_t esp_hf_client_start_voice_recognition (void)
```
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_stop_voice_recognition (void)
```
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_volume_update (esp_hf_volume_control_target_t type, int volume)
```
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15
**esp_err_t esp_hf_client_dial(const char *number)**

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] number: number string of the call. If NULL, the last number is called (aka re-dial)

**esp_err_t esp_hf_client_dial_memory(int location)**

Place a call with number specified by location (speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] location: location of the number in the memory

**esp_err_t esp_hf_client_send_chld_cmd(esp_hf_chld_type_t chld, int idx)**

Send call hold and multiparty commands, or enhanced call control commands (Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] chld: AT+CHLD call hold and multiparty handling AT command.
- [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

**esp_err_t esp_hf_client_send_btrh_cmd(esp_hf_btrh_cmd_t btrh)**

Send response and hold action command (Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] btrh: response and hold action to send

**esp_err_t esp_hf_client_answer_call(void)**

Answer an incoming call (send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_reject_call(void)**

Reject an incoming call (send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
**esp_err_t esp_hf_client_query_current_calls (void)**

Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_query_current_operator_name (void)**

Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_retrieve_subscriber_info (void)**

Get subscriber information number from AG (send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_send_dtmf (char code)**

Transmit DTMF codes during an ongoing call (use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] code: dtmf code, single ascii character in the set 0-9, #, *, A-D

**esp_err_t esp_hf_client_request_last_voice_tag_number (void)**

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_send_nrec (void)**

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv,**

* esp_hf_client_outgoing_data_cb_t send*)

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
Chapter 2. API Reference

• [in] recv: HFP client incoming data callback function
• [in] send: HFP client outgoing data callback function

void esp_hf_client_outgoing_data_ready (void)
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

Parameters
• [in] src_sps: original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
• [in] bits: number of bits per pcm sample (16)
• [in] channels: number of channels (i.e. mono(1), stereo(2)…)

void esp_hf_client_pcm_resample_deinit (void)
Deinitialize the down sampling converter.

int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)
Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

Return number of samples converted

Parameters
• [in] src: pointer to the buffer where the original sampling PCM are stored
• [in] in_bytes: length of the input PCM sample buffer in byte
• [in] dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions
union esp_hf_client_cb_param_t
#include <esp_hf_client_api.h> HFP client callback parameters.

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters

• [in] buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: size(in bytes) in buf

typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Return length of data successfully read

Parameters

• [in] buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: size(in bytes) in buf

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
HFP client callback function type.

Parameters

• event: Event type
• param: Pointer to callback parameter
## Enumerations

### `esp_hf_client_connection_state_t`

Bluetooth HFP RFCOMM connection and service level connection status.

**Values:**

- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0`
  - RFCOMM data link channel released
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING`
  - connecting remote device on the RFCOMM data link
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED`
  - RFCOMM connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED`
  - service level connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING`
  - disconnecting with remote device on the RFCOMM dat link

### `esp_hf_client_audio_state_t`

Bluetooth HFP audio connection status.

**Values:**

- `ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0`
  - audio connection released
- `ESP_HF_CLIENT_AUDIO_STATE_CONNECTING`
  - audio connection has been initiated
- `ESP_HF_CLIENT_AUDIO_STATE_CONNECTED`
  - audio connection is established
- `ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC`
  - mSBC audio connection is established

### `esp_hf_client_in_band_ring_state_t`

in-band ring tone state

**Values:**

- `ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0`
- `ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED`

### `esp_hf_client_cb_event_t`

HF CLIENT callback events.

**Values:**

- `ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0`
  - connection state changed event
- `ESP_HF_CLIENT_AUDIO_STATE_EVT`
  - audio connection state change event
- `ESP_HF_CLIENT_BVRA_EVT`
  - voice recognition state change event
- `ESP_HF_CLIENT_CIND_CALL_EVT`
  - call indication
- `ESP_HF_CLIENT_CIND_CALL_SETUP_EVT`
  - call setup indication
- `ESP_HF_CLIENT_CIND_CALL_HELD_EVT`
  - call held indication
**ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT**
network service availability indication

**ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT**
signal strength indication

**ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT**
roaming status indication

**ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT**
battery level indication

**ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT**
current operator information

**ESP_HF_CLIENT_BTRH_EVT**
call response and hold event

**ESP_HF_CLIENT_CLIP_EVT**
Calling Line Identification notification

**ESP_HF_CLIENT_CCWA_EVT**
call waiting notification

**ESP_HF_CLIENT_CLCC_EVT**
list of current calls notification

**ESP_HF_CLIENT_VOLUME_CONTROL_EVT**
audio volume control command from AG, provided by +VGM or +VGS message

**ESP_HF_CLIENT_AT_RESPONSE_EVT**
AT command response event

**ESP_HF_CLIENT_CNUM_EVT**
subscriber information response from AG

**ESP_HF_CLIENT_BSIR_EVT**
setting of in-band ring tone

**ESP_HF_CLIENT_BINP_EVT**
requested number of last voice tag from AG

**ESP_HF_CLIENT_RING_IND_EVT**
ring indication event

---

**HFP AG API**

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h

**Functions**

```c
esp_err_t esp_bt_hf_register_callback(esp_hf_cb_t callback)
```
Register application callback function to HFP AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- [in] callback: HFP AG event callback function
Chapter 2. API Reference

`esp_err_t esp_bt_hf_init (esp_bd_addr_t remote_addr)`

Initializes the Bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote Bluetooth device address

`esp_err_t esp_bt_hf_deinit (esp_bd_addr_t remote_addr)`

De-initializes the HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote Bluetooth device address

`esp_err_t esp_bt_hf_connect (esp_bd_addr_t remote_bda)`

To establish a Service Level Connection to remote Bluetooth HFP client device. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

**Return**
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote Bluetooth HFP client device address

`esp_err_t esp_bt_hf_disconnect (esp_bd_addr_t remote_bda)`

Disconnects from the remote HFP client. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_bt_hf_connect_audio (esp_bd_addr_t remote_bda)`

Creates an audio connection with the remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_bt_hf_disconnect_audio (esp_bd_addr_t remote_bda)`

Releases the existing audio connection with the remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote Bluetooth device address
Chapter 2. API Reference

- [in] remote_bda: remote bluetooth device address

**esp_err_t esp_bt_hf_vra(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)**

Response of Volume Recognition Command (AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: the device address of voice recognition initiator
- [in] value: 0 - voice recognition disabled, 1 - voice recognition enabled

**esp_err_t esp_bt_hf_volume_control(esp_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)**

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

**esp_err_t esp_hf_unat_response(esp_addr_t remote_addr, char *unat)**

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote bluetooth device address
- [in] unat: User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

**esp_err_t esp_bt_hf_cmee_response(esp_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)**

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address
- [in] response_code: AT command response code
- [in] error_code: CME error code

**esp_err_t esp bt hf ind change notification(esp_addr_t remote_addr, esp_hf_call_status_t call_status, esp_hf_call_setup_status_t call_setup_status, esp_hf_network_state_t ntk_state, int signal)**

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
API Reference

- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_addr: remote bluetooth device address
- `[in]` call_state: call state
- `[in]` call_setup_state: call setup state
- `[in]` ntk_state: network service state
- `[in]` signal: signal strength from 0 to 5

```c
esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr,
                                  esp_hf_call_status_t call_state,
                                  esp_hf_call_setup_status_t call_setup_state,
                                  esp_hf_network_state_t ntk_state,
                                  int signal,
                                  esp_hf_roaming_status_t roam,
                                  int batt_lev,
                                  esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_addr: remote bluetooth device address
- `[in]` call_state: call state
- `[in]` call_setup_state: call setup state
- `[in]` ntk_state: network service state
- `[in]` signal: signal strength from 0 to 5
- `[in]` roam: roam state
- `[in]` batt_lev: battery level from 0 to 5
- `[in]` call_held_status: call held status

```c
esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)
```

Response for AT+COPS command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_addr: remote bluetooth device address
- `[in]` name: current operator name

```c
esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index,
                                  esp_hf_current_call_direction_t dir,
                                  esp_hf_current_call_status_t current_call_state,
                                  esp_hf_current_call_mode_t mode,
                                  esp_hf_current_call_mpty_type_t mpty,
                                  char *number,
                                  esp_hf_call_addr_type_t type)
```

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_addr: remote bluetooth device address
- `[in]` index: the index of current call
- `[in]` dir: call direction (incoming/outgoing)
- `[in]` current_call_state: current call state
• [in] mode: current call mode (voice/data/fax)
• [in] mpty: single or multi type
• [in] number: current call number
• [in] type: international type or unknown

```c
esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number,
                                 esp_hf_subscriber_service_type_t type)
```

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] number: registration number
- [in] type: service type (unknown/voice/fax)

```c
esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)
```

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] state: in-band ring tone state

```c
esp_err_t esp_bt_hf_answer_call(esp_bd_addr_t remote_addr, int num_active,
                                int num_held, esp_hf_call_status_t call_state,
                                esp_hf_call_setup_status_t call_setup_state,
                                char *number, esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp_bt_hf_reject_call(esp_bd_addr_t remote_addr, int num_active,
                                int num_held, esp_hf_call_status_t call_state,
                                esp_hf_call_setup_status_t call_setup_state,
                                char *number, esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
Chapter 2. API Reference

- [in] remote_addr: remote bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

`esp_err_t esp_bt_hf_out_call (esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)`

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the outgoing call
- [in] call_addr_type: call address type

`esp_err_t esp_bt_hf_end_call (esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)`

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the call
- [in] call_addr_type: call address type

`esp_err_t esp_bt_hf_register_data_callback (esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)`

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

void `esp_hf_outgoing_data_ready (void)`

Trigger the lower-layer to fetch and send audio data.
This function is only used in the case that Voice Over HCI is enabled.
As a precondition to use this API, Service Level Connection shall exist with HFP client.
After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

### Unions

**union esp_hf_cb_param_t**

```c
#include <esp_hf_ag_api.h>
```

HFP AG callback parameters.

#### Public Members

```c
struct esp_hf_cb_param_t::hf_conn_stat_param conn_stat

Type Definitions
typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters
• [in] buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: size(in bytes) in buf

typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Return length of data successfully read

Parameters
• [in] buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: size(in bytes) in buf

typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)
HF AG callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations
enum esp_hf_cb_event_t
HF callback events.

Values:
ESP_HF_CONNECTION_STATE_EVT = 0
Connection state changed event

ESP_HF_AUDIO_STATE_EVT
Audio connection state change event

ESP_HF_BVRA_RESPONSE_EVT
Voice recognition state change event

ESP_HF_VOLUME_CONTROL_EVT
Audio volume control command from HF Client, provided by +VGM or +VGS message

ESP_HF_UNAT_RESPONSE_EVT
Unknown AT cmd Response

ESP_HF_IND_UPDATE_EVT
Indicator Update Event

ESP_HF_CIND_RESPONSE_EVT
Call And Device Indicator Response

ESP_HF_COPS_RESPONSE_EVT
Current operator information

ESP_HF_CLCC_RESPONSE_EVT
List of current calls notification

ESP_HF_CNUM_RESPONSE_EVT
Subscriber information response from HF Client

ESP_HF_VTS_RESPONSE_EVT
Enable or not DTMF

ESP_HF_NREC_RESPONSE_EVT
Enable or not NREC

ESP_HF_ATA_RESPONSE_EVT
Answer an Incoming Call

ESP_HF_CHUP_RESPONSE_EVT
Reject an Incoming Call

ESP_HF_DIAL_EVT
Origin an outgoing call with specific number or the dial the last number

ESP_HF_WBS_RESPONSE_EVT
Codec Status

ESP_HF_BCS_RESPONSE_EVT
Final Codec Choice

2.3.4 Controller && VHCI

Overview

Instructions

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.
Chapter 2. API Reference

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h

Functions

esp_err_t esp_ble_tx_power_set(esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Return  ESP_OK - success, other - failed

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc
- power_level: Power level(index) corresponding to absolute value(dbm)

esp_power_level_t esp_ble_tx_power_get(esp_ble_power_type_t power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Return  >= 0 - Power level, < 0 - Invalid

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc

esp_err_t esp_bredr_tx_power_set(esp_power_level_t min_power_level, esp_power_level_t max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bluetooth_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

Return  ESP_OK - success, other - failed

Parameters

- min_power_level: The minimum power level
- max_power_level: The maximum power level

esp_err_t esp_bredr_tx_power_get(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Return  ESP_OK - success, other - failed

Parameters

- min_power_level: The minimum power level
- max_power_level: The maximum power level

esp_err_t esp_bredr_sco_datapath_set(esp_sco_data_path_t data_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Return  ESP_OK - success, other - failed

Parameters

- data_path: SCO data path

esp_err_t esp_bt_controller_init(esp_bt_controller_config_t *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return  ESP_OK - success, other - failed

Parameters

- cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

esp_err_t esp_bt_controller_deinit(void)

De-initialize BT controller to free resource and delete task.
This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_enable(esp_mode_t mode)`
Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Return ESP_OK - success, other - failed

Parameters
- `mode`: the mode (BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

`esp_err_t esp_bt_controller_disable(void)`
Disable BT controller.

Return ESP_OK - success, other - failed

`esp_controller_status_t esp_bt_controller_get_status(void)`
Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

bool `esp_vhci_host_check_send_available(void)`
esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Return true for ready to send, false means cannot send packet

void `esp_vhci_host_send_packet(uint8_t* data, uint16_t len)`
esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
- `data`: the packet point
- `len`: the packet length

`esp_err_t esp_vhci_host_register_callback(const esp_vhci_host_callback_t *callback)`
esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return ESP_OK - success, ESP_FAIL - failed

Parameters
- `callback`: `esp_vhci_host_callback` type variable

`esp_err_t esp_bt_controller_mem_release(esp_mode_t mode)`
esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data
consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return
ESP_OK - success, other - failed

Parameters
- mode: : the mode want to release memory

```
esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
```

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation’. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

Return
ESP_OK - success, other - failed

Parameters
- mode: : the mode whose memory is to be released

```
esp_err_t esp_bt_sleep_enable (void)
```

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

Return
- ESP_OK : success
- other : failed

```
esp_err_t esp_bt_sleep_disable (void)
```

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;
If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**

- ESP_OK: success
- other: failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off

**Structures**

```c
struct esp_bt_controller_config_t
```

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

```c
uint16_t controller_task_stack_size
```

Bluetooth controller task stack size

```c
uint8_t controller_task_prio
```

Bluetooth controller task priority

```c
uint8_t hci_uart_no
```

If use UART1/2 as HCI IO interface, indicate UART number

```c
uint32_t hci_uart_baudrate
```

If use UART1/2 as HCI IO interface, indicate UART baudrate

```c
uint8_t scan_duplicate_mode
```

scan duplicate mode

```c
uint8_t scan_duplicate_type
```

scan duplicate type

```c
uint16_t normal_adv_size
```

Normal adv size for scan duplicate

```c
uint16_t mesh_adv_size
```

Mesh adv size for scan duplicate

```c
uint16_t send_adv_reserved_size
```

Controller minimum memory value

```c
uint32_t controller_debug_flag
```

Controller debug log flag

```c
uint8_t mode
```

Controller mode: BR/EDR, BLE or Dual Mode
Chapter 2. API Reference

uint8_t ble_max_conn
   BLE maximum connection numbers

uint8_t bt_max_acl_conn
   BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
   SCO data path, i.e. HCI or PCM module

bool auto_latency
   BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
   BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
   BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
   BLE low power crystal accuracy index

uint8_t pcm_role
   PCM role (master & slave)

uint8_t pcm_polar
   PCM polar trig (falling clk edge & rising clk edge)

bool hli
   Using high level interrupt or not

uint32_t magic
   Magic number

struct esp_vhci_host_callback
   esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available) (void)
   callback used to notify that the host can send packet to controller

int (*notify_host_recv) (uint8_t *data, uint16_t len)
   callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
   esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
   Bluetooth mode for controller enable/disable.
   Values:
   
   ESP_BT_MODE_IDLE = 0x00
   Bluetooth is not running

   ESP_BT_MODE_BLE = 0x01
   Run BLE mode
**Chapter 2. API Reference**

```c
ESP_BT_MODE_CLASSIC_BT = 0x02
    Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
    Run dual mode

defined [anonymous]
    BLE sleep clock accuracy (SCA), values for ble_sca field in esp_bt_controller_config_t, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
    Values:
    ESP_BLE_SCA_500PPM = 0
        BLE SCA at 500ppm
    ESP_BLE_SCA_250PPM
        BLE SCA at 250ppm
    ESP_BLE_SCA_150PPM
        BLE SCA at 150ppm
    ESP_BLE_SCA_100PPM

\begin{verbatim}
enum esp_sco_data_path_t
    Bluetooth audio data transport path.
    Values:
    ESP_SCO_DATA_PATH_HCI = 0
        data over HCI transport
    ESP_SCO_DATA_PATH_PCM = 1
        data over PCM interface
\end{verbatim}

2.3.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters
Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

```
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param
prov_register_comp
Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param
node_set_unprov_dev_name
Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param
node_prov_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param
node_prov_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param
node_prov_link_open
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param
node_prov_link_close
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param
node_prov_output_num
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param
node_prov_output_str
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param
node_prov_input
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_complete_evt_param
node_prov_complete
Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param
node_add_net_key_comp
Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param
node_add_app_key_comp
Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_comp_param
  node_bind_app_key_to_model_comp
Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param
  provisioner_recv_unprov_adv_pkt
Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param
  provisioner_prov_enable
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param
  provisioner_prov_disable
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param
  provisioner_prov_link_open
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_evt_param
  provisioner_prov_read_oob_pub_key
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_evt_param
  provisioner_prov_input
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_output_evt_param
  provisioner_prov_output
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_close_evt_param
  provisioner_prov_link_close
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_comp_param
  provisioner_prov_complete
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param
  provisioner_add_unprov_dev
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param
  provisioner_prov_dev_with_addr
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_uuid_match_comp_param
  provisioner_set_dev_uuid_match
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_prov_data_info_comp_param
  provisioner_set_prov_data_info
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param
  provisioner_set_static_oob_val
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primaryElem_addr_comp_param
  provisioner_set_primaryElem_addr
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
  provisioner_prov_read_oob_pub_key
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
  provisioner_prov_input_num
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
  provisioner_prov_input_str
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
  provisioner_set_node_name
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
  provisioner_add_app_key
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
  provisioner_update_app_key
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param

provisioner_bind_app_key_to_model_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param

provisioner_add_net_key_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param

provisioner_update_net_key_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param

provisioner_store_node_comp_data_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param

provisioner_delete_node_with_uuid_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param

provisioner_delete_node_with_addr_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable

Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t_type

Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t_op

Operation (add, remove, clean)

uint16_t hb_src

Heartbeat source address

uint16_t hb_dst

Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_info_comp

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t_init_ttl

Heartbeat InitTTL
Chapter 2. API Reference

```c
uint8_t rx_ttl
   Heartbeat RxTTL

uint8_t hops
   Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
   Bit field of currently active features of the node

int8_t rssi
   RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_recv_heartbeat
   ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_direct_erase_settings_comp
   ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
   Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_index_comp
   ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
   Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
   Provisioner settings user id

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_uid_comp
   ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_close_settings_with_index_comp
   ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
   Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_close_settings_with_uid_comp
   ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_delete_settings_with_index_comp
   ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
   Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_delete_settings_with_uid_comp
   ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_info_comp_param set_fast_prov_info_comp
   Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_action_comp_param set_fast_prov_action_comp
   Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_heartbeat_msg_recv_param heartbeat_msg_recv
   Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param lpn_enable_comp
   Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param lpn_disable_comp
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param lpn_poll_comp
Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_establish_param lpn_friendship_establish
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_terminate_param lpn_friendship_terminate
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_establish_param frnd_friendship_establish
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param frnd_friendship_terminate
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_adv_pkt_param proxy_client_recv_adv_pkt
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connected_param proxy_client_connected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnected_param proxy_client_disconnected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_filter_status_param proxy_client_recv_filter_status
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connect_comp_param proxy_client_connect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnect_comp_param proxy_client_disconnect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_set_filter_type_comp_param proxy_client_set_filter_type_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_add_filter_addr_comp_param proxy_client_add_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_remove_filter_addr_comp_param proxy_client_remove_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT

Public Members

int err_code
Indicate the result of updating server model state

esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

bool erase_flash
Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t element_addr
Element Address, assigned during provisioning.

const uint16_t location
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t sig_model_count
SIG Model count

const uint8_t vnd_model_count
Vendor Model count

esp_ble_mesh_model_t *sig_models
SIG Models

esp_ble_mesh_model_t *vnd_models
Vendor Models

struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.
```
uint16_t **publish_addr**
Publish Address.

uint16_t **app_idx** : 12
Publish AppKey Index.

uint16_t **cred** : 1
Friendship Credentials Flag.

uint16_t **send_rel** : 1
Force reliable sending (segment acks)

uint8_t **ttl**
Publish Time to Live.

uint8_t **retransmit**
Retransmit Count & Interval Steps.

uint8_t **period**
Publish Period.

uint8_t **period_div** : 4
Divisor for the Period.

uint8_t **fast_period** : 1
Use FastPeriodDivider

uint8_t **count** : 3
Retransmissions left.

uint32_t **period_start**
Start of the current period.

```
struct net_buf_simple *msg
Publication buffer, containing the publication message.
This will get correctly created when the publication context has been defined using the
ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);
```

**esp_ble_mesh_cb_t update**
Callback used to update publish message. Initialized by the stack.

```
struct k_delayed_work timer
Publish Period Timer. Initialized by the stack.
```

uint8_t **dev_role**
Role of the device that is going to publish messages

```
struct esp_ble_mesh_model_op_t
Abstraction that describes a model operation context. This structure is associated with struct
bt_mesh_model_op in mesh_access.h
```

**Public Members**

```
const uint32_t **opcode**
Message opcode

const size_t **min_len**
Message minimum length

**esp_ble_mesh_cb_t** **param_cb**
Callback used to handle message. Initialized by the stack.
struct esp_ble_mesh_model_cbs_t
Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

cnst uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]:[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h
Chapter 2. API Reference

Public Members

uint16_t net_idx  
Net Key Index of the subnet through which to send the message.

uint16_t app_idx  
App Key Index for message encryption.

uint16_t addr  
Remote address.

uint16_t recv_dst  
Destination address of a received message. Not used for sending.

int8_t recv_rssi  
RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7  
Received TTL value. Not used for sending.

uint8_t send_rel : 1  
Forces sending reliably by using segment acknowledgement

uint8_t send_ttl  
TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op  
Op code of a received message. Not used for sending message.

esp_ble_mesh_model_t *model  
Model corresponding to the message, no need to be initialized before sending message

bool srv_send  
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t  
Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t  
Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid  
16-bit SIG-assigned company identifier

uint16_t pid  
16-bit vendor-assigned product identifier

uint16_t vid  
16-bit vendor-assigned product version identifier

telement_count  
Element count

esp_ble_mesh_elem_t *elements  
A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t  
Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr  
Device address
**Chapter 2. API Reference**

*esp_ble_mesh_addr_type_t addr_type*

Device address type

uint8_t uuid[16]
Device UUID

uint16_t oob_info
Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

*esp_ble_mesh_prov_bearer_t bearer*

Provisioning Bearer

**struct esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

**Public Members**

*esp_ble_mesh_bd_addr_t addr*
Device address

*esp_ble_mesh_addr_type_t addr_type*
Device address type

uint8_t uuid[16]
Device UUID

uint8_t flag
BIT0: device address; BIT1: device UUID

**struct esp_ble_mesh_prov_data_info_t**

Information of the provisioner which is going to be updated.

**Public Members**

uint16_t net_idx
NetKey Index

uint8_t flags
Flags

uint32_t iv_index
IV Index

uint8_t flag
BIT0: net_idx; BIT1: flags; BIT2: iv_index

**struct esp_ble_mesh_node_t**

Information of the provisioned node

**Public Members**

*esp_ble_mesh_bd_addr_t addr*
Node device address

*esp_ble_mesh_addr_type_t addr_type*
Node device address type

uint8_t dev_uuid[16]
Device UUID

uint16_t oob_info
Node OOB information
uint16_t unicast_addr
   Node unicast address

uint8_t element_num
   Node element number

uint16_t net_idx
   Node NetKey Index

uint8_t flags
   Node key refresh flag and iv update flag

uint32_t iv_index
   Node IV Index

uint8_t dev_key[16]
   Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
   Node name

uint16_t comp_length
   Length of Composition Data

uint8_t *comp_data
   Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
   Minimum unicast address used for fast provisioning

uint16_t unicast_max
   Maximum unicast address used for fast provisioning

uint16_t net_idx
   Netkey index used for fast provisioning

uint8_t flags
   Flags used for fast provisioning

uint32_t iv_index
   IV Index used for fast provisioning

uint8_t offset
   Offset of the UUID to be compared

uint8_t match_len
   Length of the UUID to be compared

uint8_t match_val[16]
   Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
   Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
   Heartbeat source address (unicast address)

uint16_t hb_dst
   Heartbeat destination address (unicast address or group address)
struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t opcode
Message opcode

esp_ble_mesh_model_t *model
Pointer to the client model structure

esp_ble_mesh_msg_ctx_t ctx
The context used to send message

int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition
Public Functions

**BLE_MESH_ATOMIC_DEFINE** (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

- bool **just_started**
  Indicate if the state transition has just started
- uint8_t **trans_time**
  State transition time
- uint8_t **remain_time**
  Remaining time of state transition
- uint8_t **delay**
  Delay before starting state transition
- uint32_t **quo_tt**
  Duration of each divided transition step
- uint32_t **counter**
  Number of steps which the transition duration is divided
- uint32_t **total_duration**
  State transition total duration
- int64_t **start_timestamp**
  Time when the state transition is started
- **struct k_delayed_work timer**
  Timer used for state transition

**struct esp_ble_mesh_last_msg_info_t**
Parameters of the server model received last same set message.

Public Members

- uint8_t **tid**
  Transaction number of the last message
- uint16_t **src**
  Source address of the last message
- uint16_t **dst**
  Destination address of the last message
- int64_t **timestamp**
  Time when the last message is received

**struct esp_ble_mesh_server_rsp_ctrl_t**
Parameters of the Server Model response control
Public Members

uint8_t _get_auto_rsp : 1
BLE Mesh Server Response Option.
1. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
2. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

uint8_t _set_auto_rsp : 1
Response control for Client Set messages

uint8_t _status_auto_rsp : 1
Response control for Server Status messages

Macros
ESP_BLE_MESH_SDU_MAX_LEN
< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.
ESP_BLE_MESH_MIC_SHORT
Length of a long Mesh MIC.
ESP_BLE_MESH_MIC_LONG
The maximum length of a BLE Mesh provisioned node name
ESP_BLE_MESH_NODE_NAME_MAX_LEN
The maximum length of a BLE Mesh unprovisioned device name
ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
The maximum length of settings user id
ESP_BLE_MESH_SETTINGS_UID_SIZE
Invalid settings index
ESP_BLE_MESH_INVALID_SETTINGS_IDX
Define the BLE Mesh octet 16 bytes size
ESP_BLE_MESH_OCTET16_LEN
ESP_BLE_MESH_OCTET8_LEN
ESP_BLE_MESH_CID_NVAL
Special TTL value to request using configured default TTL
ESP_BLE_MESH_TTL_DEFAULT
Maximum allowed TTL value
ESP_BLE_MESH_TTL_MAX
ESP_BLE_MESH_ADDR_UNASSIGNED
ESP_BLE_MESH_ADDR_ALL_NODES
ESP_BLE_MESH_ADDR_PROXIES
ESP_BLE_MESH_ADDR_FRIENDS
ESP_BLE_MESH_ADDR_RELAYS
ESP_BLE_MESH_KEY_UNUSED
ESP_BLE_MESH_KEY_DEV
ESP_BLE_MESH_KEY_PRIMARY
ESP_BLE_MESH_KEY_ANY
    Primary Network Key index
ESP_BLE_MESH_NET_PRIMARY
    Relay state value
ESP_BLE_MESH_RELAY_DISABLED
ESP_BLE_MESH_RELAY_ENABLED
ESP_BLE_MESH_RELAY_NOT_SUPPORTED
    Beacon state value
ESP_BLE_MESH_BeaCON_DISABLED
ESP_BLE_MESH_BeaCON_ENABLED
    GATT Proxy state value
ESP_BLE_MESH_GATT_PROXY_DISABLED
ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
    Friend state value
ESP_BLE_MESH_FRIEND_DISABLED
ESP_BLE_MESH_FRIEND_ENABLED
ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
    Node identity state value
ESP_BLE_MESH_NODE_IDENTITY_STOPPED
ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
    Supported features
ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST (addr)
ESP_BLE_MESH_ADDR_IS_GROUP (addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)
ESP_BLE_MESH_ADDR_IS_RFU (addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT (count, int_ms)
    Encode transmission count & interval steps.

Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random de-
lay).

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
Parameters

- **count**: Number of retransmissions (first transmission is excluded).
- **int_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**ESP_BLE_MESH_GET_TRANSMIT_COUNT** (transmit)
Decode transmit count from a transmit value.

**Return** Transmission count (actual transmissions equal to N + 1).

**Parameters**

- **transmit**: Encoded transmit count & interval value.

**ESP_BLE_MESH_GET_TRANSMIT_INTERVAL** (transmit)
Decode transmit interval from a transmit value.

**Return** Transmission interval in milliseconds.

**Parameters**

- **transmit**: Encoded transmit count & interval value.

**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)
Encode Publish Retransmit count & interval steps.

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- **count**: Number of retransmissions (first transmission is excluded).
- **int_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

**Return** Retransmission count (actual transmissions equal to N + 1).

**Parameters**

- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)
Decode Publish Retransmit interval from a given value.

**Return** Transmission interval in milliseconds.

**Parameters**

- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**
Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.
Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
- _loc: Location Descriptor.
- _mods: Array of SIG models.
- _vnd.mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
- _name: Variable name given to the context.
- _msg_len: Length of the publication message.
- _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
- _opcode: Message opcode.
- _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG
DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG
PROV_DATA_FLAGS_FLAG

PROV_DATA_IV_INDEX_FLAG

ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST

ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST
Provisioner heartbeat filter operation

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint8_t esp_ble_mesh_model_t

EspressifSystems 482 Releasev5.0-dev-1712-g4a553510b7

Submit Document Feedback
typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state.
Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic
Server Model) status message.

Values:

PROXY_FILTER_WHITELIST
PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
Values:

ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
Initialize BLE Mesh provisioning capabilities and internal data information completion event

ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
Set the unprovisioned device name completion event

ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
Enable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
Disabling node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
Establishing a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
Closing a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
Generating Node input OOB public key event

ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
Generating Node Output Number event

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generating Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node setting OOB public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enabling BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enabling BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disabling BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node adding NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node adding AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node binding AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enabling provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disabling provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
Provisioner receiving unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner reading unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event
Chapter 2. API Reference

**ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**
Provisioner output value for provisioning procedure event

**ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**
Provisioner establish a BLE Mesh link event

**ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event

**ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event

**ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

**ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event

**ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

**ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event

**ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

**ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event

**ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event

**ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event

**ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

**ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

**ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

**ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

**ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

**ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event

**ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

**ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event
ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states

Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
• Reading of Local Data Information
• Low Power Operation (Updating)
• Send/Publish Messages, add Local AppKey, etc.
• ESP-BLE-MESH Node/Provisioner Provisioning
• ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note  After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

Return  ESP_OK on success or error code otherwise.

Parameters

• [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE device.
Chapter 2. API Reference

• [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

`esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)`

De-initialize BLE Mesh module.

**Note** This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] param: Pointer to the structure of BLE Mesh deinit parameters.

Reading of Local Data Information

**Header File**

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

**Functions**

`int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**

• [in] model: Model instance pointer.

`uint16_t esp_ble_mesh_get_primary_element_address(void)`

Get the address of the primary element.

**Return** Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

`uint16_t* esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**

• [in] model: Pointer to the model.

• [in] group_addr: Group address.

`esp_ble_mesh_elem_t* esp_ble_mesh_find_element(uint16_t element_addr)`

Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or NULL on failure.

**Parameters**

• [in] element_addr: Element address.

`uint8_t esp_ble_mesh_get_element_count(void)`

Get the number of elements that have been registered.

**Return** Number of elements.

`esp_ble_mesh_model_t* esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.
Parameters

- **[in] element**: Element to which the model belongs.
- **[in] company_id**: A 16-bit company identifier assigned by the Bluetooth SIG.

```c
esp_BLE_mesh_model_t *esp_BLE_mesh_find_sig_model(const esp_BLE_mesh_elem_t *element, uint16_t model_id)
```

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- **[in] element**: Element to which the model belongs.
- **[in] model_id**: SIG model identifier.

```c
const esp_BLE_mesh_comp_t *esp_BLE_mesh_get_composition_data(void)
```

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

```c
esp_err_t esp_BLE_mesh_model_subscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
```

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] element_addr**: Unicast address of the element to which the model belongs.
- **[in] company_id**: A 16-bit company identifier.
- **[in] model_id**: A 16-bit model identifier.
- **[in] group_addr**: The group address to be subscribed.

```c
esp_err_t esp_BLE_mesh_model_unsubscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
```

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] element_addr**: Unicast address of the element to which the model belongs.
- **[in] company_id**: A 16-bit company identifier.
- **[in] model_id**: A 16-bit model identifier.
- **[in] group_addr**: The subscribed group address.

```c
const uint8_t *esp_BLE_mesh_node_get_local_net_key(uint16_t net_idx)
```

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- **[in] net_idx**: NetKey index.

```c
const uint8_t *esp_BLE_mesh_node_get_local_app_key(uint16_t app_idx)
```

This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**

- **[in] app_idx**: AppKey index.

```c
esp_err_t esp_BLE_mesh_node_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.
Chapter 2. API Reference

Parameters

• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.

`esp_err_t esp_ble_mesh_node_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)`

This function is called by Node to add a local AppKey.

Note The net_idx must be an existing one. This function can only be called after the device is provisioned.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
• [in] app_idx: AppKey Index.

`esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)`

This function is called by Node to bind AppKey to model locally.

Note If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] element_addr: Node local element address
• [in] company_id: Node local company id
• [in] model_id: Node local model id
• [in] app_idx: Node local appkey index

Low Power Operation (Updating)

Header File

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

Functions

`esp_err_t esp_ble_mesh_lpn_enable(void)`

Enable BLE Mesh device LPN functionality.

Note This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_lpn_disable(bool force)`

Disable BLE Mesh device LPN functionality.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] force: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

`esp_err_t esp_ble_mesh_lpn_poll(void)`

LPN tries to poll messages from the Friend Node.

Note The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

Return ESP_OK on success or error code otherwise.
Send/Publish Messages, add Local AppKey, etc.

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

### esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

### esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** data: Pointer to the message data.
- **[in]** opcode: The message opcode.

### esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variable within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: BLE Mesh Client model to which the message belongs.

### esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)

De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: Pointer of the Client model.

### esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)

Send server model messages(such as server model status messages).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• [in] model: BLE Mesh Server Model to which the message belongs.
• [in] ctx: Message context, includes keys, TTL, etc.
• [in] length: Message length (exclude the message opcode).
• [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

\[
\text{esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp, esp_ble_mesh_dev_role_t device_role)}
\]

Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: BLE Mesh Client Model to which the message belongs.
• [in] ctx: Message context, includes keys, TTL, etc.
• [in] length: Message length (exclude the message opcode).
• [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
• [in] msg_timeout: Time to get response to the message (in milliseconds).
• [in] need_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
• [in] device_role: Role of the device (Node/Provisioner) that sends the message.

\[
\text{esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)}
\]

Send a model publication message.

Note Before calling this function, the user needs to ensure that the model publication message (\textit{esp_ble_mesh_model_pub_t::msg}) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: Mesh (client) Model publishing the message.
• [in] length: Message length (exclude the message opcode).
• [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
• [in] device_role: Role of the device (node/provisioner) publishing the message of the type \textit{esp_ble_mesh_dev_role_t}.

\[
\text{esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)}
\]

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note Currently this API is used to update bound state value, not for all server model states.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: Server model which is going to update the state.
• [in] value: Server model state value.

\[
\text{esp_err_t esp_ble_mesh_node_local_reset(void)}
\]

Reset the provisioning procedure of the local BLE Mesh node.

Note All provisioning information in this node will be deleted and the node needs to be re provisioned. The API function \textit{esp_ble_mesh_node_prov_enable()} needs to be called to start a new provisioning procedure.

Return ESP_OK on success or error code otherwise.
`esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char *name)`

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** index: Index of the node in the node queue.
- **[in]** name: Name (end by ‘\0’) to be set for the node.

`const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)`

This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**

- **[in]** index: Index of the node in the node queue.

`uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)`

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**

- **[in]** name: Name of the node (end by ‘\0’).

`esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)`

This function is called to store the Composition Data of the node.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** unicast_addr: Element address of the node
- **[in]** data: Pointer of Composition Data
- **[in]** length: Length of Composition Data

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])`

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- **[in]** uuid: Device UUID of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)`

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- **[in]** unicast_addr: Unicast address of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)`

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- **[in]** name: Name of the node (end by ‘\0’).

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)`

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

`const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)`

This function is called by Provisioner to get the entry of the node table.
Note After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) [ ... ] } ```

Return Pointer to the start of the node table.

```
esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
```

This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in]** uuid: Device UUID of the node

```
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in]** unicast_addr: Unicast address of the node

```
esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

Note app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in]** app_key: The app key to be set for the local BLE Mesh stack.
- **[in]** net_idx: The network key index.
- **[in]** app_idx: The AppKey index.

```
esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in]** app_key: Value of the AppKey.
- **[in]** net_idx: Corresponding NetKey Index.
- **[in]** app_idx: The AppKey Index

```
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters

- **[in]** net_idx: Network key index.
- **[in]** app_idx: Application key index.

```
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)
```
This function is called by Provisioner to bind own model with proper app key.

**Note** company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `element_addr`: Provisioner local element address
- [in] `app_idx`: Provisioner local appkey index
- [in] `model_id`: Provisioner local model id
- [in] `company_id`: Provisioner local company id

`esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Provisioner to add local network key.

**Note** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `net_key`: The network key to be added to the Provisioner local BLE Mesh stack.

`esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Provisioner to update a local network key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `net_key`: Value of the NetKey.

`const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)`

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

`esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)`

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty reject list by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `enable`: Enable or disable receiving heartbeat messages.

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)`

This function is called by Provisioner to set the heartbeat filter type.

**Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

1. If the previous type is reject list, and changed to accept list, then the filter will be an empty accept list, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `type`: Heartbeat filter type (accept list or reject list).

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t* info)`

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
• The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] op: Add or REMOVE
- [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] index: Settings index.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] uid: Settings user id.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note** 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid (const char *uid, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.
Chapter 2. API Reference

**Note** 1. Before closing the nvs namespace, it must be open.
   1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if it not erased.
   3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] uid`: Settings user id.
- `[in] erase`: Indicate if erasing mesh information.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] index`: Settings index.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] uid`: Settings user id.

**const char *esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

**Return** Setting user id on success or NULL on failure.

**Parameters**
- `[in] index`: Settings index.

**uint8_t esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

**Return** Settings index.

**Parameters**
- `[in] uid`: Settings user id.

**uint8_t esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

**Return** Number of free settings user id.

**const uint8_t *esp_ble_mesh_get_fast_prov_app_key** (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

**Return** Application key on success, or NULL on failure.

**Parameters**
- `[in] app_idx`: Application key index.

**Type Definitions**

**typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)**
ESP-BLE-MESH Node/Provisioner Provisioning

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)
```
Register BLE Mesh provisioning callback.

- Return ESP_OK on success or error code otherwise.
- Parameters
  - [in] callback: Pointer to the callback function.

```c
bool esp_ble_mesh_node_is_provisioned()
```
Check if a device has been provisioned.

- Return TRUE if the device is provisioned, FALSE if the device is unprovisioned.

```c
esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
```
Enable specific provisioning bearers to get the device ready for provisioning.

- Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.
- Return ESP_OK on success or error code otherwise.
- Parameters
  - bearers: Bit-wise OR of provisioning bearers.

```c
esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_meshProv_bearer_t bearers)
```
Disable specific provisioning bearers to make a device inaccessible for provisioning.

- Return ESP_OK on success or error code otherwise.
- Parameters
  - bearers: Bit-wise OR of provisioning bearers.

```c
esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])
```
Unprovisioned device set own oob public key & private key pair.

- Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
- Return ESP_OK on success or error code otherwise.
- Parameters
  - [in] pub_key_x: Unprovisioned device’s Public Key X
  - [in] pub_key_y: Unprovisioned device’s Public Key Y
  - [in] private_key: Unprovisioned device’s Private Key

```c
esp_err_t esp_ble_mesh_node_input_number(uint32_t number)
```
Provide provisioning input OOB number.

- Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.
- Return ESP_OK on success or error code otherwise.
- Parameters
  - [in] number: Number input by device.

```c
esp_err_t esp_ble_mesh_node_input_string(const char *string)
```
Provide provisioning input OOB string.

- Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.
- Return ESP_OK on success or error code otherwise.
- Parameters
Chapter 2. API Reference

- [in] `string`: String input by device.

**esp_err_t** `esp_ble_mesh_set_unprovisioned_device_name(const char *name)`

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `name`: Unprovisioned device name

**esp_err_t** `esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])`

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `link_idx`: The provisioning link index
- [in] `pub_key_x`: Unprovisioned device’s Public Key X
- [in] `pub_key_y`: Unprovisioned device’s Public Key Y

**esp_err_t** `esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)`

Provide provisioning input OOB string.

This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `string`: String input by Provisioner.
- [in] `link_idx`: The provisioning link index.

**esp_err_t** `esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)`

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `number`: Number input by Provisioner.
- [in] `link_idx`: The provisioning link index.

**esp_err_t** `esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)`

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

**esp_err_t** `esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)`

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.
Parameters

• [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev,
    esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.

Return ESP_OK on success or error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   • In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

• [in] add_dev: Pointer to a struct containing the device information
• [in] flags: Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
            esp_ble_mesh_bd_addr_t addr,
            esp_ble_mesh_addr_type_t addr_type,
            esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
            uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return Zero on success or (negative) error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT,
Chapter 2. API Reference

since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

3. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

Parameters

• [in] uuid: Device UUID of the unprovisioned device
• [in] addr: Device address of the unprovisioned device
• [in] addr_type: Device address type of the unprovisioned device
• [in] bearer: Provisioning bearer going to be used by Provisioner
• [in] oob_info: OOB info of the unprovisioned device
• [in] unicast_addr: Unicast address going to be allocated for the unprovisioned device

esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
Delete device from queue, and reset current provisioning link with the device.

Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] del_dev: Pointer to a struct containing the device information.

esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] match_val: Value to be compared with the part of the device UUID.
• [in] match_len: Length of the compared match value.
• [in] offset: Offset of the device UUID to be compared (based on zero).
• [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)
This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Return ESP_OK on success or error code otherwise.

Parameters

• [in] value: Pointer to the static oob value.
• [in] length: Length of the static oob value.

`esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)`

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] addr: Unicast address of the Primary element of Provisioner.

`esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)`

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

`esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)`

This function is called to start/suspend/exit fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] action: fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void(*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
                                      esp_ble_mesh_prov_cb_param_t *param);
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**

• [in] addr: Pointer to the unprovisioned device address.
• [in] addr_type: Unprovisioned device address type.
• [in] adv_type: Adv packet type (ADV_IND or ADV_NONCONN_IND).
• [in] oob_info: OOB information of the unprovisioned device.
• [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

```c
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h
```

**Functions**

`esp_err_t esp_ble_mesh_proxy_identity_enable(void)`

Enable advertising with Node Identity.
Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable (void)`  
Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable (void)`  
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)`  
Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] addr: Device address of the Proxy Server.
- [in] addr_type: Device address type (public or static random).

`esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)`  
Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] conn_handle: Proxy connection handle.

`esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)`  
Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] filter_type: whitelisted or blacklisted.

`esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`  
Proxy Client adds address to the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.

`esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`  
Proxy Client removes address from the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
Chapter 2. API Reference

- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

- `esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)`
  Register BLE Mesh Config Client Model callback.
  Return ESP_OK on success or error code otherwise.
  Parameters
  - [in] callback: Pointer to the callback function.

- `esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)`
  Register BLE Mesh Config Server Model callback.
  Return ESP_OK on success or error code otherwise.
  Parameters
  - [in] callback: Pointer to the callback function.

- `esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)`
  Get the value of Config Server Model states using the Config Client Model get messages.
  Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h
  Return ESP_OK on success or error code otherwise.
  Parameters
  - [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

- `esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)`
  Set the value of the Configuration Server Model states using the Config Client Model set messages.
Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

Return: ESP_OK on success or error code otherwise.

Parameters:
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions:

```c
union esp_ble_mesh_cfg_client_get_state_t
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
the get_state parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.
```

Public Members:

```c
esp_ble_mesh_cfg_model_pub_get_t model_pub_get
For ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET.

esp_ble_mesh_cfg_composition_data_get_t comp_data_get
For ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET.

esp_ble_mesh_cfg_sig_model_sub_get_t sig_model_sub_get
For ESP_BLE_MESH_MODEL_OP_SIG_MODEL_SUB_GET

esp_ble_mesh_cfg_vnd_model_sub_get_t vnd_model_sub_get
For ESP_BLE_MESH_MODEL_OP_VENDOR_MODEL_SUB_GET

esp_ble_mesh_cfg_app_key_get_t app_key_get
For ESP_BLE_MESH_MODEL_OP_APP_KEY_GET.

esp_ble_mesh_cfg_node_identity_get_t node_identity_get
For ESP_BLE_MESH_MODEL_OP_NODE_IDENTITY_GET.

esp_ble_mesh_cfg_sig_model_app_get_t sig_model_app_get
For ESP_BLE_MESH_MODEL_OP_SIG_MODEL_APP_GET

esp_ble_mesh_cfg_vnd_model_app_get_t vnd_model_app_get
For ESP_BLE_MESH_MODEL_OP_VENDOR_MODEL_APP_GET

esp_ble_mesh_cfg_kr_phase_get_t kr_phase_get
For ESP_BLE_MESH_MODEL_OP_KEY_REFRESH_PHASE_GET

esp_ble_mesh_cfg_lpn_polltimeout_get_t lpn_pollto_get
For ESP_BLE_MESH_MODEL_OP_LPN_POLLTIMEOUT_GET
```

```c
union esp_ble_mesh_cfg_client_set_state_t
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_SET
ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_SET ESP_BLE_MESH_MODEL_OP_GATT_PROXY_SET
ESP_BLE_MESH_MODEL_OP_RELAY_SET ESP_BLE_MESH_MODEL_OP_MODEL_PUB_SET

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
Structures

struct esp_ble_mesh_cfg_srv
Configuration Server Model context

Public Members

esp_ble_mesh_model_t *model
Pointer to Configuration Server Model

uint8_t net_transmit
Network Transmit state

uint8_t relay
Relay Mode state

uint8_t relay_retransmit
Relay Retransmit state

uint8_t beacon
Secure Network Beacon state

uint8_t gatt_proxy
GATT Proxy state

uint8_t friend_state
Friend state

uint8_t default_ttl
Default TTL

struct k_delayed_work timer
Heartbeat Publication timer

uint16_t dst
Destination address for Heartbeat messages

uint16_t count
Number of Heartbeat messages to be sent
Number of Heartbeat messages received

uint8_t period
Period for sending Heartbeat messages

uint8_t ttl
TTL to be used when sending Heartbeat messages

uint16_t feature
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
Heartbeat Publication

int64_t expiry
Timestamp when Heartbeat subscription period is expired

uint16_t src
Source address for Heartbeat messages

uint8_t min_hops
Minimum hops when receiving Heartbeat messages

uint8_t max_hops
Maximum hops when receiving Heartbeat messages
**Chapter 2. API Reference**

`esp_ble_mesh_cb_t heartbeat_recv_cb`
Optional heartbeat subscription tracking function

`struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub`
Heartbeat Subscription

`struct esp_ble_mesh_cfg_composition_data_get_t`
Parameters of Config Composition Data Get.

**Public Members**

`uint8_t page`
Page number of the Composition Data.

`struct esp_ble_mesh_cfg_model_pub_get_t`
Parameters of Config Model Publication Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_sig_model_sub_get_t`
Parameters of Config SIG Model Subscription Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`struct esp_ble_mesh_cfg_vnd_model_sub_get_t`
Parameters of Config Vendor Model Subscription Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_app_key_get_t`
Parameters of Config AppKey Get.
Chapter 2. API Reference

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_node_identity_get_t
Parameters of Config Node Identity Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_sig_model_app_get_t
Parameters of Config SIG Model App Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id

struct esp_ble_mesh_cfg_vnd_model_app_get_t
Parameters of Config Vendor Model App Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_get_t
Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.
Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value

uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.
Public Members

```c
uint16_t net_idx
   The network key index
uint16_t app_idx
   The app key index
uint8_t app_key[16]
   The app key value
```

```c
struct esp_ble_mesh_cfg_model_app_bind_t
   Parameters of Config Model App Bind.
```

Public Members

```c
uint16_t element_addr
   The element address
uint16_t model_app_idx
   Index of the app key to bind with the model
uint16_t model_id
   The model id
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_pub_set_t
   Parameters of Config Model Publication Set.
```

Public Members

```c
uint16_t element_addr
   The element address
uint16_t publish_addr
   Value of the publish address
uint16_t publish_app_idx
   Index of the application key
bool cred_flag
   Value of the Friendship Credential Flag
uint8_t publish_ttl
   Default TTL value for the publishing messages
uint8_t publish_period
   Period for periodic status publishing
uint8_t publish_retransmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions
uint16_t model_id
   The model id
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_add_t
   Parameters of Config Model Subscription Add.
```
Public Members

uint16_t element_addr
   The element address

uint16_t sub_addr
   The address to be added to the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.

Public Members

uint16_t element_addr
   The element address

uint16_t sub_addr
   The address to be removed from the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t element_addr
   The element address

uint16_t sub_addr
   The address to be added to the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t element_addr
   The element address

uint8_t label_uuid[16]
   The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
   The model id
uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_delete_t**
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

uint16_t **element_addr**
   The element address

uint8_t **label_uuid**[16]
   The Label UUID of the virtual address to be removed from the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_overwrite_t**
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

uint16_t **element_addr**
   The element address

uint8_t **label_uuid**[16]
   The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_pub_va_set_t**
Parameters of Config Model Publication Virtual Address Set.

**Public Members**

uint16_t **element_addr**
   The element address

uint8_t **label_uuid**[16]
   Value of the Label UUID publish address

uint16_t **publish_app_idx**
   Index of the application key

bool **cred_flag**
   Value of the Friendship Credential Flag

uint8_t **publish_ttl**
   Default TTL value for the publishing messages

uint8_t **publish_period**
   Period for periodic status publishing

uint8_t **publish_retransmit**
   Number of retransmissions and number of 50-millisecond steps between retransmissions
Chapter 2. API Reference

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
   Parameters of Config Model Subscription Delete All.

Public Members

uint16_t element_addr
   The element address

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
   The network key index

uint8_t net_key[16]
   The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.

Public Members

uint16_t net_idx
   The network key index

uint16_t app_idx
   The app key index

uint8_t app_key[16]
   The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
   Parameters of Config AppKey Delete.
Public Members

```c
uint16_t net_idx
The network key index
```

```c
uint16_t app_idx
The app key index
```

```c
struct esp_ble_mesh_cfg_node_identity_set_t
Parameters of Config Node Identity Set.
```

```c
uint16_t net_idx
The network key index
```

```c
uint8_t identity
New Node Identity state
```

```c
struct esp_ble_mesh_cfg_model_app_unbind_t
Parameters of Config Model App Unbind.
```

Public Members

```c
uint16_t element_addr
The element address
```

```c
uint16_t model_app_idx
Index of the app key to bind with the model
```

```c
uint16_t model_id
The model id
```

```c
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set.
```

Public Members

```c
uint16_t net_idx
The network key index
```

```c
uint8_t transition
New Key Refresh Phase Transition
```

```c
struct esp_ble_mesh_cfg_net_transmit_set_t
Parameters of Config Network Transmit Set.
```

Public Members

```c
uint8_t net_transmit
Network Transmit State
```

```c
struct esp_ble_mesh_cfg_heartbeat_pub_set_t
Parameters of Config Model Heartbeat Publication Set.
```
Chapter 2. API Reference

Public Members

uint16_t dst
    Destination address for Heartbeat messages

uint8_t count
    Number of Heartbeat messages to be sent

uint8_t period
    Period for sending Heartbeat messages

    TTL to be used when sending Heartbeat messages

uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
    NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
    Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
    Parameter of Config Beacon Status

Public Members

uint8_t beacon
    Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
    Parameters of Config Composition Data Status

Public Members

uint8_t page
    Page number of the Composition Data

struct net_buf_simple *composition_data
    Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
    Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
    Default TTL state value
struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status
Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID

uint16_t model_id
Model ID
struct esp_ble_mesh_cfg_friend_status_cb_t

Parameter of Config Friend Status

Public Members

uint8_t friend_state
Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t

Parameters of Config Heartbeat Publication Status

Public Members

uint8_t status
Status Code for the request message
uint16_t dst
Destination address for Heartbeat messages
uint8_t count
Number of Heartbeat messages remaining to be sent
uint8_t period
Period for sending Heartbeat messages
uint8_t ttl
TTL to be used when sending Heartbeat messages
uint16_t features
Features that trigger Heartbeat messages when changed
uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t

Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
Status Code for the request message
uint16_t src
Source address for Heartbeat messages
uint16_t dst
Destination address for Heartbeat messages
uint8_t period
Remaining Period for processing Heartbeat messages
uint8_t count
Number of Heartbeat messages received
uint8_t min_hops
Minimum hops when receiving Heartbeat messages
uint8_t max_hops
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t

Parameters of Config Network Transmit Status
### Public Members

`uint8_t net_trans_count : 3`
Number of transmissions for each Network PDU originating from the node

`uint8_t net_trans_step : 5`
Maximum hops when receiving Heartbeat messages

**struct esp_ble_mesh_cfg_model_sub_list_cb_t**
Parameters of Config SIG/Vendor Subscription List

### Public Members

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

**struct net_buf_simple *sub_addr**
A block of all addresses from the Subscription List

**struct esp_ble_mesh_cfg_net_key_list_cb_t**
Parameters of Config NetKey List

### Public Members

**struct net_buf_simple *net_idx**
A list of NetKey Indexes known to the node

**struct esp_ble_mesh_cfg_app_key_list_cb_t**
Parameters of Config AppKey List

### Public Members

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
NetKey Index of the NetKey that the AppKeys are bound to

**struct net_buf_simple *app_idx**
A list of AppKey indexes that are bound to the NetKey identified by NetKeyId

**struct esp_ble_mesh_cfg_node_id_status_cb_t**
Parameters of Config Node Identity Status

### Public Members

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
Index of the NetKey
Chapter 2. API Reference

`uint8_t identity`  
Node Identity state

**struct esp_ble_mesh_cfg_model_app_list_cb_t**  
Parameters of Config SIG/Vendor Model App List

**Public Members**

`uint8_t status`  
Status Code for the request message

`uint16_t element_addr`  
Address of the element

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

`struct net_buf_simple *app_idx`  
All AppKey indexes bound to the Model

**struct esp_ble_mesh_cfg_kr_phase_status_cb_t**  
Parameters of Config Key Refresh Phase Status

**Public Members**

`uint8_t status`  
Status Code for the request message

`uint16_t net_idx`  
Index of the NetKey

`uint8_t phase`  
Key Refresh Phase state

**struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t**  
Parameters of Config Low Power Node PollTimeout Status

**Public Members**

`uint16_t lpn_addr`  
The unicast address of the Low Power node

`int32_t poll_timeout`  
The current value of the PollTimeout timer of the Low Power node

**struct esp_ble_mesh_cfg_client_cb_param_t**  
Configuration Client Model callback parameters

**Public Members**

`int error_code`  
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters

`esp_ble_mesh_cfg_client_common_cb_param_t status_cb`  
The config status message callback values
**struct esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

**Public Members**

- `uint16_t element_addr`
  Element Address
- `uint16_t pub_addr`
  Publish Address
- `uint16_t app_idx`
  AppKey Index
- `bool cred_flag`
  Friendship Credential Flag
- `uint8_t pub_ttl`
  Publish TTL
- `uint8_t pub_period`
  Publish Period
- `uint8_t pub_retransmit`
  Publish Retransmit
- `uint16_t company_id`
  Company ID
- `uint16_t model_id`
  Model ID

**struct esp_ble_mesh_state_change_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add

**Public Members**

- `uint16_t element_addr`
  Element Address
- `uint16_t sub_addr`
  Subscription Address
- `uint16_t company_id`
  Company ID
- `uint16_t model_id`
  Model ID

**struct esp_ble_mesh_state_change_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete

**Public Members**

- `uint16_t element_addr`
  Element Address
- `uint16_t sub_addr`
  Subscription Address
- `uint16_t company_id`
  Company ID
Chapter 2. API Reference

```
uint16_t model_id
    Model ID

struct esp_ble_mesh_state_changeCfg_netkey_add_t
    Parameters of Config NetKey Add

    Public Members

    uint16_t net_idx
        NetKey Index
    uint8_t net_key[16]
        NetKey

struct esp_ble_mesh_state_changeCfg_netkey_update_t
    Parameters of Config NetKey Update

    Public Members

    uint16_t net_idx
        NetKey Index
    uint8_t net_key[16]
        NetKey

struct esp_ble_mesh_state_changeCfg_netkey_delete_t
    Parameter of Config NetKey Delete

    Public Members

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_state_changeCfg_appkey_add_t
    Parameters of Config AppKey Add

    Public Members

    uint16_t net_idx
        NetKey Index
    uint16_t app_idx
        AppKey Index
    uint8_t app_key[16]
        AppKey

struct esp_ble_mesh_state_changeCfg_appkey_update_t
    Parameters of Config AppKey Update

    Public Members

    uint16_t net_idx
        NetKey Index
    uint16_t app_idx
        AppKey Index
    uint8_t app_key[16]
        AppKey
```
struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
NetKey Index

uint8_t kr_phase
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the server model structure

```c
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received message

```c
esp_ble_mesh_cfg_server_cb_value_t value
```
Value of the received configuration messages

Macros

```c
ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
```
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

**Parameters**
- `srv_data`: Pointer to a unique Config Server Model user_data.

```c
ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
```
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

**Parameters**
- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

Type Definitions

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```
Configuration Server Model context

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event, esp_ble_mesh_cfg_client_cb_param_t *param)
```
Bluetooth Mesh Config Client and Server Model functions.

**Configuration Client Model callback function type**

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)
```
Configuration Server Model callback function type.

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```c
enum esp_ble_mesh_cfg_client_cb_event_t
```
This enum value is the event of Configuration Client Model

**Values:**

- `ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT`
Chapter 2. API Reference

ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
enum esp_ble_mesh_cfg_server_cb_event_t
This enum value is the event of Configuration Server model

Values:
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)
Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)
Register BLE Mesh Health Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_health_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside.
  Shall not be set to NULL.

esp_err_t esp_ble_mesh_health_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
This function is called to set the Health Server states using the Health Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside.
  Shall not be set to NULL.

esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)
This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] element: The element to which the Health Server Model belongs.

Unions

union esp_ble_mesh_health_client_get_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t fault_get
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT/wp
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t attention_set
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t period_set
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t fault_test
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t fault_clear
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp出血_mesh_health_current_status_cb_t current_status
The health current status value

esp出血_mesh_health_fault_status_cb_t fault_status
The health fault status value

esp出血_mesh_health_period_status_cb_t period_status
The health period status value

esp出血_mesh_health_attention_status_cb_t attention_status
The health attention status value

union esp_ble_mesh_health_server_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.
Public Members

`esp_ble_mesh_health_fault_update_comp_cb_t fault_update_comp`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

`esp_ble_mesh_health_fault_clear_cb_t fault_clear`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT

`esp_ble_mesh_health_fault_test_cb_t fault_test`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

`esp_ble_mesh_health_attention_on_cb_t attention_on`
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

`esp_ble_mesh_health_attention_off_cb_t attention_off`
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

`struct esp_ble_mesh_health_srv_cb_t`
ESP BLE Mesh Health Server callback

Public Members

`esp_ble_mesh_cb_t fault_clear`
Clear health registered faults. Initialized by the stack.

`esp_ble_mesh_cb_t fault_test`
Run a specific health test. Initialized by the stack.

`esp_ble_mesh_cb_t attention_on`
Health attention on callback. Initialized by the stack.

`esp_ble_mesh_cb_t attention_off`
Health attention off callback. Initialized by the stack.

`struct esp_ble_mesh_health_test_t`
ESP BLE Mesh Health Server test Context

Public Members

`uint8_t id_count`
Number of Health self-test ID

`const uint8_t *test_ids`
Array of Health self-test IDs

`uint16_t company_id`
Company ID used to identify the Health Fault state

`uint8_t prev_test_id`
Current test ID of the health fault test

`uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of current faults

`uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of registered faults

`struct esp_ble_mesh_health_srv_t`
ESP BLE Mesh Health Server Model Context
Public Members

*esp_ble_mesh_model_t* model
Pointer to Health Server Model

*esp_ble_mesh_health_srv_cb_t* health_cb
Health callback struct

*struct k_delayed_work* attention_timer
Attention Timer state

*bool* attention_timer_start
Attention Timer start flag

*esp_ble_mesh_health_test_t* health_test
Health Server fault test

*struct esp_ble_mesh_health_fault_get_t*
Parameter of Health Fault Get

Public Members

*uint16_t* company_id
Bluetooth assigned 16-bit Company ID

*struct esp_ble_mesh_health_attention_set_t*
Parameter of Health Attention Set

Public Members

*uint8_t* attention
Value of the Attention Timer state

*struct esp_ble_mesh_health_period_set_t*
Parameter of Health Period Set

Public Members

*uint8_t* fast_period_divisor
Divider for the Publish Period

*struct esp_ble_mesh_health_fault_test_t*
Parameter of Health Fault Test

Public Members

*uint16_t* company_id
Bluetooth assigned 16-bit Company ID

*uint8_t* test_id
ID of a specific test to be performed

*struct esp_ble_mesh_health_fault_clear_t*
Parameter of Health Fault Clear
Chapter 2. API Reference

Public Members

```c
uint16_t company_id
  Bluetooth assigned 16-bit Company ID
```

```c
struct esp_ble_mesh_health_current_status_cb_t
  Parameters of Health Current Status
```

Public Members

```c
uint8_t test_id
  ID of a most recently performed test
```

```c
uint16_t company_id
  Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
  Fault Array field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_fault_status_cb_t
  Parameters of Health Fault Status
```

Public Members

```c
uint8_t test_id
  ID of a most recently performed test
```

```c
uint16_t company_id
  Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
  Fault Array field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_period_status_cb_t
  Parameter of Health Period Status
```

Public Members

```c
uint8_t fast_period_divisor
  Divider for the Publish Period
```

```c
struct esp_ble_mesh_health_attention_status_cb_t
  Parameter of Health Attention Status
```

Public Members

```c
uint8_t attention
  Value of the Attention Timer state
```

```c
struct esp_ble_mesh_health_client_cb_param_t
  Health Client Model callback parameters
```

Public Members

```c
int error_code
  Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
  The client common parameters.
```
esp_ble_mesh_health_client_common_cb_param_t status_cb
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int error_code
The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint8_t test_id
ID of a specific test to be performed

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint8_t time
Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model
Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
Define a new Health Server Model.

Note The Health Server Model can only be included by a Primary Element.

Return New Health Server Model instance.

Parameters
- srv: Pointer to the unique struct esp_ble_mesh_health_srv_t.
- pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.

ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
Define a new Health Client Model.

Note This API needs to be called for each element on which the application needs to have a Health Client Model.

Return New Health Client Model instance.

Parameters
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
A helper to define a health publication context

Parameters
- _name: Name given to the publication context variable.
- _max: Maximum number of faults the element can have.
- _role: Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST
SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT
Fault values of Health Fault Test. 0x33~0x7F: Reserved for Future Use. 0x80~0xFF: Vendor Specific Warning/Error.

Type Definitions
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_clientCb_event_t event, esp_ble_mesh_health_clientCb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.
Health Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(
    esp_ble_mesh_health_server_cb_event_t event,
    esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations
enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model
Values:

- ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model
Values:

- ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
- ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
- ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
- ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
- ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
- ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File
• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)

Register BLE Mesh Generic Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params,
    esp_ble_mesh_generic_client_get_state_t *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_messageOpcode_t in esp_ble_mesh_defs.h
Return  ESP_OK on success or error code otherwise.

Parameters

- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(
    esp_ble_mesh_client_common_param_t *params,
    esp_ble_mesh_client_common_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return  ESP_OK on success or error code otherwise.

Parameters

- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(
    esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

Return  ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_generic_client_get_state_t
#include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

Public Members

```c

Structures

struct esp_ble_mesh_gen_onoff_set_t
  Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

Public Members

bool op_en
  Indicate if optional parameters are included

uint8_t onoff
  Target value of Generic OnOff state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
  Parameters of Generic Level Set.

Public Members

bool op_en
  Indicate if optional parameters are included

int16_t level
  Target value of Generic Level state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)
```
**public Members**

```c
bool op_en
  Indicate if optional parameters are included
```

```c
int32_t level
  Delta change of Generic Level state
```

```c
uint8_t tid
  Transaction ID
```

```c
uint8_t trans_time
  Time to complete state transition (optional)
```

```c
uint8_t delay
  Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_gen_move_set_t**

Parameters of Generic Move Set.

**Public Members**

```c
bool op_en
  Indicate if optional parameters are included
```

```c
int16_t delta_level
  Delta Level step to calculate Move speed for Generic Level state
```

```c
uint8_t tid
  Transaction ID
```

```c
uint8_t trans_time
  Time to complete state transition (optional)
```

```c
uint8_t delay
  Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set.

**Public Members**

```c
uint8_t trans_time
  The value of the Generic Default Transition Time state
```

**struct esp_ble_mesh_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set.

**Public Members**

```c
uint8_t onpowerup
  The value of the Generic OnPowerUp state
```

**struct esp_ble_mesh_gen_power_level_set_t**

Parameters of Generic Power Level Set.
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t power
   Target value of Generic Power Actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
   Parameter of Generic Power Default Set.

Public Members

uint16_t power
   The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
   Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
   Value of Range Min field of Generic Power Range state

uint16_t range_max
   Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
   Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
   Global Coordinates (Latitude)

int32_t global_longitude
   Global Coordinates (Longitude)

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
   Parameters of Generic Location Local Set.

Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)
int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

**struct esp_ble_mesh_gen_user_property_get_t**
Parameter of Generic User Property Get.

**Public Members**

uint16_t property_id
Property ID identifying a Generic User Property

**struct esp_ble_mesh_gen_user_property_set_t**
Parameters of Generic User Property Set.

**Public Members**

uint16_t property_id
Property ID identifying a Generic User Property

**struct net_buf_simple**
Raw value for the User Property

**struct esp_ble_mesh_gen_admin_property_get_t**
Parameter of Generic Admin Property Get.

**Public Members**

uint16_t property_id
Property ID identifying a Generic Admin Property

**struct esp_ble_mesh_gen_admin_property_set_t**
Parameters of Generic Admin Property Set.

**Public Members**

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

**struct net_buf_simple**
Raw value for the Admin Property

**struct esp_ble_mesh_gen_manufacturer_property_get_t**
Parameter of Generic Manufacturer Property Get.

**Public Members**

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

**struct esp_ble_mesh_gen_manufacturer_property_set_t**
Parameters of Generic Manufacturer Property Set.
Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
   Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
   A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
   Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
   Parameters of Generic OnOff Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t present_onoff
   Current value of Generic OnOff state

uint8_t target_onoff
   Target value of Generic OnOff state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
   Parameters of Generic Level Status.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t present_level
   Current value of Generic Level state

int16_t target_level
   Target value of the Generic Level state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
   Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t
Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_power
Current value of Generic Power Actual state

uint16_t target_power
Target value of Generic Power Actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.
Public Members

uint32_t\texttt{battery\_level}: 8
\hspace{1em}Value of Generic Battery Level state

uint32_t\texttt{time\_to\_discharge}: 24
\hspace{1em}Value of Generic Battery Time to Discharge state

uint32_t\texttt{time\_to\_charge}: 24
\hspace{1em}Value of Generic Battery Time to Charge state

uint32_t\texttt{flags}: 8
\hspace{1em}Value of Generic Battery Flags state

\texttt{struct esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t}
Parameters of Generic Location Global Status.

Public Members

int32_t\texttt{global\_latitude}
\hspace{1em}Global Coordinates (Latitude)

int32_t\texttt{global\_longitude}
\hspace{1em}Global Coordinates (Longitude)

int16_t\texttt{global\_altitude}
\hspace{1em}Global Altitude

\texttt{struct esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t}
Parameters of Generic Location Local Status.

Public Members

int16_t\texttt{local\_north}
\hspace{1em}Local Coordinates (North)

int16_t\texttt{local\_east}
\hspace{1em}Local Coordinates (East)

int16_t\texttt{local\_altitude}
\hspace{1em}Local Altitude

uint8_t\texttt{floor\_number}
\hspace{1em}Floor Number

uint16_t\texttt{uncertainty}
\hspace{1em}Uncertainty

\texttt{struct esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t}
Parameter of Generic User Properties Status.

Public Members

\texttt{struct net\_buf\_simple *property\_ids}
\hspace{1em}Buffer contains a sequence of N User Property IDs

\texttt{struct esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t}
Parameters of Generic User Property Status.
**Public Members**

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t property_id
   Property ID identifying a Generic User Property
```

```c
uint8_t user_access
   Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
   Raw value for the User Property (C.1)
```

**struct esp_ble_mesh_gen_admin_properties_status_cb_t**

Parameter of Generic Admin Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
   Buffer contains a sequence of N Admin Property IDs
```

**struct esp_ble_mesh_gen_admin_property_status_cb_t**

Parameters of Generic Admin Property Status.

**Public Members**

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t property_id
   Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
   Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
   Raw value for the Admin Property (C.1)
```

**struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t**

Parameter of Generic Manufacturer Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
   Buffer contains a sequence of N Manufacturer Property IDs
```

**struct esp_ble_mesh_gen_manufacturer_property_status_cb_t**

Parameters of Generic Manufacturer Property Status.

**Public Members**

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t property_id
   Property ID identifying a Generic Manufacturer Property
```

```c
uint8_t user_access
   Enumeration indicating user access (optional)
```
**struct net_buf_simple *property_value**
Raw value for the Manufacturer Property (C.1)

**struct esp_ble_mesh_gen_client_properties_status_cb_t**
Parameter of Generic Client Properties Status.

### Public Members

**struct net_buf_simple *property_ids**
Buffer contains a sequence of N Client Property IDs

**struct esp_ble_mesh_generic_client_cb_param_t**
Generic Client Model callback parameters

### Public Members

**int error_code**
Appropriate error code

**esp_ble_mesh_client_common_param_t *params**
The client common parameters.

**esp_ble_mesh_gen_client_status_cb_t status_cb**
The generic status message callback values

**struct esp_ble_mesh_gen_onoff_state_t**
Parameters of Generic OnOff state

### Public Members

**uint8_t onoff**
The present value of the Generic OnOff state

**uint8_t target_onoff**
The target value of the Generic OnOff state

**struct esp_ble_mesh_gen_onoff_srv_t**
User data of Generic OnOff Server Model

### Public Members

**esp_ble_mesh_model_t *model**
Pointer to the Generic OnOff Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_gen_onoff_state_t state**
Parameters of the Generic OnOff state

**esp_ble_mesh_last_msg_info_t last**
Parameters of the last received set message

**esp_ble_mesh_state_transition_t transition**
Parameters of state transition

**struct esp_ble_mesh_gen_level_state_t**
Parameters of Generic Level state
Public Members

```c
int16_t level
    The present value of the Generic Level state

int16_t target_level
    The target value of the Generic Level state

int16_t last_level
    When a new transaction starts, level should be set to last_last, and use "level + incoming delta" to calculate the target level. In another word, “last_level” is used to record "level" of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
    The last delta change of the Generic Level state

bool move_start
    Indicate if the transition of the Generic Level state has been started

bool positive
    Indicate if the transition is positive or negative
```

```c
struct esp_ble_mesh_gen_level_srv_t
    User data of Generic Level Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_level_state_t *state
    Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_level
    Delta change value of level state transition
```

```c
struct esp_ble_mesh_gen_def_trans_time_state_t
    Parameter of Generic Default Transition Time state
```

Public Members

```c
uint8_t trans_time
    The value of the Generic Default Transition Time state
```

```c
struct esp_ble_mesh_gen_def_trans_time_srv_t
    User data of Generic Default Transition Time Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to the Generic Default Transition Time Server Model. Initialized internally.
```
**esp_ble_mesh_server_rsp_ctrl_t**

Response control of the server model received messages

**esp_ble_mesh_gen_def_trans_time_state_t**

Parameters of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

**Public Members**

- `uint8_t onpowerup`
  The value of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power OnOff Server Model. Initialized internally.

**struct esp_ble_mesh_server_rsp_ctrl_t**

Response control of the server model received messages

**esp_ble_mesh_gen_onpowerup_state_t**

Parameters of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_setup_srv_t**

User data of Generic Power OnOff Setup Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

**struct esp_ble_mesh_gen_power_level_state_t**

Parameters of Generic Power Level state

**Public Members**

- `uint16_t power_actual`
  The present value of the Generic Power Actual state

- `target_power_actual`
  The target value of the Generic Power Actual state

- `power_last`
  The value of the Generic Power Last state

- `power_default`
  The value of the Generic Power Default state

- `status_code`
  The status code of setting Generic Power Range state
Chapter 2. API Reference

uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t
Parameters of Generic Battery state

Public Members

uint32_t battery_level : 8
The value of the Generic Battery Level state

uint32_t time_to_discharge : 24
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
The value of the Generic Battery Time to Charge state

uint32_t battery_flags : 8
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
**Public Members**

*esp_ble_mesh_model_t* `model`
- Pointer to the Generic Battery Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
- Response control of the server model received messages

*esp_ble_mesh_gen_battery_state_t* `state`
- Parameters of the Generic Battery state

**struct esp_ble_mesh_gen_location_state_t**
- Parameters of Generic Location state

**Public Members**

`int32_t global_latitude`
- The value of the Global Latitude field

`int32_t global_longitude`
- The value of the Global Longitude field

`int16_t global_altitude`
- The value of the Global Altitude field

`int16_t local_north`
- The value of the Local North field

`int16_t local_east`
- The value of the Local East field

`int16_t local_altitude`
- The value of the Local Altitude field

`uint8_t floor_number`
- The value of the Floor Number field

`uint16_t uncertainty`
- The value of the Uncertainty field

**struct esp_ble_mesh_gen_location_srv_t**
- User data of Generic Location Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`
- Pointer to the Generic Location Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
- Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* `state`
- Parameters of the Generic Location state

**struct esp_ble_mesh_gen_location_setup_srv_t**
- User data of Generic Location Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`
- Pointer to the Generic Location Setup Server Model. Initialized internally.
### Public Members

**uint16_t id**
- The value of User/Admin/Manufacturer Property ID

**uint8_t user_access**
- The value of User Access field

**uint8_t admin_access**
- The value of Admin Access field

**uint8_t manu_access**
- The value of Manufacturer Access field

**struct net_buf_simple *val**
- The value of User/Admin/Manufacturer Property

### Public Members

**esp_ble_mesh_model_t *model**
- Pointer to the Generic User Property Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
- Response control of the server model received messages

**uint8_t property_count**
- Generic User Property count

**struct esp_ble_mesh_generic_property_t *properties**
- Parameters of the Generic User Property state

### Public Members

**esp_ble_mesh_model_t *model**
- Pointer to the Generic Admin Property Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
- Response control of the server model received messages

**uint8_t property_count**
- Generic Admin Property count

**struct esp_ble_mesh_generic_property_t *properties**
- Parameters of the Generic Admin Property state

### Public Members

**esp_ble_mesh_model_t *model**
- Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
- Response control of the server model received messages

**uint8_t property_count**
- Generic Manufacturer Property count

**struct esp_ble_mesh_generic_property_t *properties**
- Parameters of the Generic Manufacturer Property state

### User data of Generic User Property Server Model

**struct esp_ble_mesh_gen_user_prop_srv_t**

### User data of Generic Admin Property Server Model

**struct esp_ble_mesh_gen_admin_prop_srv_t**

### User data of Generic Manufacturer Property Server Model

**struct esp_ble_mesh_gen_manu_prop_srv_t**
Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

uint8_t `property_count`
Generic Manufacturer Property count

*esp_ble_mesh_generic_property_t* `properties`
Parameters of the Generic Manufacturer Property state

`struct esp_ble_mesh_gen_client_prop_srv_t`
User data of Generic Client Property Server Model

Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Client Property Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

uint8_t `id_count`
Generic Client Property ID count

uint16_t `property_ids`
Parameters of the Generic Client Property state

`struct esp_ble_mesh_state_change_gen_onoff_set_t`
Parameter of Generic OnOff Set state change event

Public Members

uint8_t `onoff`
The value of Generic OnOff state

`struct esp_ble_mesh_state_change_gen_level_set_t`
Parameter of Generic Level Set state change event

Public Members

int16_t `level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_delta_set_t`
Parameter of Generic Delta Set state change event

Public Members

int16_t `level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_move_set_t`
Parameter of Generic Move Set state change event
Chapter 2. API Reference

Public Members

`int16_t level`

The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_def_trans_time_set_t`

Parameter of Generic Default Transition Time Set state change event

Public Members

`uint8_t trans_time`

The value of Generic Default Transition Time state

`struct esp_ble_mesh_state_change_gen_onpowerup_set_t`

Parameter of Generic OnPowerUp Set state change event

Public Members

`uint8_t onpowerup`

The value of Generic OnPowerUp state

`struct esp_ble_mesh_state_change_gen_power_level_set_t`

Parameter of Generic Power Level Set state change event

Public Members

`uint16_t power`

The value of Generic Power Actual state

`struct esp_ble_mesh_state_change_gen_power_default_set_t`

Parameter of Generic Power Default Set state change event

Public Members

`uint16_t power`

The value of Generic Power Default state

`struct esp_ble_mesh_state_change_gen_power_range_set_t`

Parameters of Generic Power Range Set state change event

Public Members

`uint16_t range_min`

The minimum value of Generic Power Range state

`uint16_t range_max`

The maximum value of Generic Power Range state

`struct esp_ble_mesh_state_change_gen_loc_global_set_t`

Parameters of Generic Location Global Set state change event

Public Members

`int32_t latitude`

The Global Latitude value of Generic Location state
int32_t longitude
  The Global Longitude value of Generic Location state
int16_t altitude
  The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
  The Local North value of Generic Location state
int16_t east
  The Local East value of Generic Location state
int16_t altitude
  The Local Altitude value of Generic Location state
uint8_t floor_number
  The Floor Number value of Generic Location state
uint16_t uncertainty
  The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
  The property id of Generic User Property state
struct net_buf_simple *value
  The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
  The property id of Generic Admin Property state
uint8_t access
  The property access of Generic Admin Property state
struct net_buf_simple *value
  The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
  The property id of Generic Manufacturer Property state
uint8_t access
  The property value of Generic Manufacturer Property state

```c
struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message
```
Public Members

bool op_en
    Indicate if optional parameters are included

int16_t level
    Target value of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
    Context of the received Generic Delta Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int32_t delta_level
    Delta change of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
    Context of the received Generic Move Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
    Context of the received Generic Default Transition Time Set message
**Public Members**

`uint8_t trans_time`
- The value of the Generic Default Transition Time state

**struct esp_ble_mesh_server_recv_gen_onpowerup_set_t**
- Context of the received Generic OnPowerUp Set message

**Public Members**

`uint8_t onpowerup`
- The value of the Generic OnPowerUp state

**struct esp_ble_mesh_server_recv_gen_power_level_set_t**
- Context of the received Generic Power Level Set message

**Public Members**

`bool op_en`
- Indicate if optional parameters are included

`uint16_t power`
- Target value of Generic Power Actual state

`uint8_t tid`
- Transaction ID

`uint8_t trans_time`
- Time to complete state transition (optional)

`uint8_t delay`
- Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_power_default_set_t**
- Context of the received Generic Power Default Set message

**Public Members**

`uint16_t power`
- The value of theGeneric Power Default state

**struct esp_ble_mesh_server_recv_gen_power_range_set_t**
- Context of the received Generic Power Range Set message

**Public Members**

`uint16_t range_min`
- Value of Range Min field of Generic Power Range state

`uint16_t range_max`
- Value of Range Max field of Generic Power Range state

**struct esp_ble_mesh_server_recv_gen_loc_global_set_t**
- Context of the received Generic Location Global Set message
Chapter 2. API Reference

Public Members

```c
int32_t global_latitude
Global Coordinates (Latitude)
```

```c
int32_t global_longitude
Global Coordinates (Longitude)
```

```c
int16_t global_altitude
Global Altitude
```

```c
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message
```

Public Members

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
Raw value for the Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message
```
Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
   Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
   Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
   Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
   Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
   Define a new Generic OnOff Client Model.

   Note This API needs to be called for each element on which the application needs to have a Generic OnOff
   Client Model.

   Return New Generic OnOff Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
   Define a new Generic Level Client Model.

   Note This API needs to be called for each element on which the application needs to have a Generic Level
   Client Model.

   Return New Generic Level Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)
   Define a new Generic Default Transition Time Client Model.

   Note This API needs to be called for each element on which the application needs to have a Generic Default
   Transition Time Client Model.

   Return New Generic Default Transition Time Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)
   Define a new Generic Power OnOff Client Model.

   Note This API needs to be called for each element on which the application needs to have a Generic Power
   OnOff Client Model.

   Return New Generic Power OnOff Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.
Note 1. The Generic Default Transition Time Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

1. This model shall support model subscription.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
Return New Generic Power Level Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV** (srv_pub, srv_data)

Define a new Generic Location Server Model.

**Note**
1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be used to represent an element that knows its location (global or local).

**Return**
New Generic Location Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV** (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

**Note**
1. The Generic Location Setup Server model extends the Generic Location Server model.
2. This model shall support model subscription.

**Return**
New Generic Location Setup Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV** (srv_pub, srv_data)

Define a new Generic User Property Server Model.

**Note**
1. The Generic User Property Server model is a root model.
2. This model shall support model publication and model subscription.

**Return**
New Generic User Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV** (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

**Note**
1. The Generic Admin Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Admin Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV** (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Manufacturer Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV** (srv_pub, srv_data)

Define a new Generic Client Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Client Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.
**Type Definitions**

typedef void (*esp_ble_mesh_generic_client_cb_t)(
  esp_ble_mesh_generic_client_cb_event_t event,
  esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(
  esp_ble_mesh_generic_server_cb_event_t event,
  esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_generic_client_cb_event_t

This enum value is the event of Generic Client Model

*Values:*

ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t

This enum value is the access value of Generic User Property

*Values:*

ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t

This enum value is the access value of Generic Admin Property

*Values:*

ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t

This enum value is the access value of Generic Manufacturer Property

*Values:*

...
Chapter 2. API Reference

**ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

**ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

**enum esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

**Values:**

**ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

**ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

**Sensor Client/Server Models**

**Header File**

* components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

**Functions**

**esp_err_t esp_ble_mesh_register_sensor_client_callback** *(esp_ble_mesh_sensor_client_cb_t callback)*

Register BLE Mesh Sensor Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

  * [in] callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_sensor_client_get_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)*

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

  * [in] params: Pointer to BLE Mesh common client parameters.
  * [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_sensor_client_set_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)*

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

  * [in] params: Pointer to BLE Mesh common client parameters.
  * [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.
**esp_err_t esp_ble_mesh_register_sensor_server_callback** (esp_ble_mesh_sensor_server_cb_t callback)

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] callback: Pointer to the callback function.

**Unions**

**union esp_ble_mesh_sensor_client_get_state_t**

```c
#include <esp_ble_mesh_sensor_model_api.h>
```

Sensor Client Model get message union.

Structures

```c
struct esp_ble_mesh_sensor_descriptor_get_t
    Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
    Parameters of Sensor Descriptor Get

    Public Members

    bool op_en
        Indicate if optional parameters are included
    uint16_t property_id
        Property ID of a sensor (optional)

struct esp_ble_mesh_sensor_cadence_get_t
    Parameter of Sensor Cadence Get

    Public Members

    uint16_t property_id
        Property ID of a sensor

struct esp_ble_mesh_sensor_cadence_set_t
    Parameters of Sensor Cadence Set

    Public Members

    uint16_t property_id
        Property ID for the sensor
    uint8_t fast_cadence_period_divisor
        Divisor for the publish period
    uint8_t status_trigger_type
        The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message

    uint8_t status_min_interval
        Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range
```
Chapter 2. API Reference

**struct esp_ble_mesh_sensor_settings_get_t**
Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

**struct esp_ble_mesh_sensor_setting_get_t**
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

**struct esp_ble_mesh_sensor_setting_set_t**
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple * sensor_setting_raw
Raw value for the setting

**struct esp_ble_mesh_sensor_get_t**
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

**struct esp_ble_mesh_sensor_column_get_t**
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple * raw_value_x
Raw value identifying a column

**struct esp_ble_mesh_sensor_series_get_t**
Parameters of Sensor Series Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple * raw_value_x
Raw value identifying a column
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
   Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
   A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
   Parameters of Sensor Setting Status

Public Members

bool op_en
   Indicate id optional parameters are included

uint16_t sensor_property_id
   Property ID identifying a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor
uint8_t `sensor_setting_access`
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`
Parameter of Sensor Status

**Public Members**

`struct net_buf_simple *marshalled_sensor_data`
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`
Parameters of Sensor Column Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`
Parameters of Sensor Series Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`
Sensor Client Model callback parameters

**Public Members**

`int error_code`
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_sensor_client_status_cb_t *status_cb`
The sensor status message callback values

`struct esp_ble_mesh_sensor Descriptor_t`
Parameters of Sensor Descriptor state

**Public Members**

`uint32_t positive_tolerance`
The value of Sensor Positive Tolerance field
Chapter 2. API Reference

uint32_t `negative_tolerance`: 12
The value of Sensor Negative Tolerance field

uint32_t `sampling_function`: 8
The value of Sensor Sampling Function field

uint8_t `measure_period`
The value of Sensor Measurement Period field

uint8_t `update_interval`
The value of Sensor Update Interval field

`struct esp_ble_mesh_sensor_setting_t`
Parameters of Sensor Setting state

**Public Members**

uint16_t `property_id`
The value of Sensor Setting Property ID field

uint8_t `access`
The value of Sensor Setting Access field

`struct net_buf_simple *raw`
The value of Sensor Setting Raw field

`struct esp_ble_mesh_sensor_cadence_t`
Parameters of Sensor Cadence state

**Public Members**

uint8_t `period_divisor`: 7
The value of Fast Cadence Period Divisor field

uint8_t `trigger_type`: 1
The value of Status Trigger Type field

`struct net_buf_simple *trigger_delta_down`
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

`struct net_buf_simple *trigger_delta_up`
The value of Status Trigger Delta Up field

uint8_t `min_interval`
The value of Status Min Interval field

`struct net_buf_simple *fast_cadence_low`
The value of Fast Cadence Low field

`struct net_buf_simple *fast_cadence_high`
The value of Fast Cadence High field

`struct esp_ble_mesh_sensor_data_t`
Parameters of Sensor Data state

**Public Members**

uint8_t `format`: 1
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Chapter 2. API Reference

Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

```c
uint8_t length: 7
The value of the Sensor Data length
```

```c
struct net_buf_simple *raw_value
The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state
```

Public Members

```c
struct net_buf_simple *raw_value_x
The value of Sensor Raw Value X field
```

```c
struct net_buf_simple *column_width
The value of Sensor Column Width field
```

```c
struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field
```

```c
struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states
```

Public Members

```c
uint16_t sensor_property_id
The value of Sensor Property ID field
```

```c
esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state
```

```c
const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.
```

```c
esp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state
```

```c
esp_ble_mesh_sensor_cadence_t *cadence
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state
```

```c
esp_ble_mesh_sensor_data_t sensor_data
Parameters of the Sensor Data state
```

```c
esp_ble_mesh_sensor_series_column_t *series_column
Parameters of the Sensor Series Column state
```

```c
struct esp_ble_mesh_sensor_srv_t
User data of Sensor Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Sensor Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```
```c
const uint8_t state_count
Sensor state count

`esp_ble_mesh_sensor_state_t *states`
Parameters of the Sensor states

`struct esp_ble_mesh_sensor_setup_srv_t`
User data of Sensor Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Sensor Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`const uint8_t state_count`
Sensor state count

`esp_ble_mesh_sensor_state_t *states`
Parameters of the Sensor states

`struct esp_ble_mesh_state_change_sensor_cadence_set_t`
Parameters of Sensor Cadence Set state change event

**Public Members**

`uint16_t property_id`
The value of Sensor Property ID state

`uint8_t period_divisor : 7`
The value of Fast Cadence Period Divisor state

`uint8_t trigger_type : 1`
The value of Status Trigger Type state

`struct net_buf_simple *trigger_delta_down`
The value of Status Trigger Delta Down state

`struct net_buf_simple *trigger_delta_up`
The value of Status Trigger Delta Up state

`uint8_t min_interval`
The value of Status Min Interval state

`struct net_buf_simple *fast_cadence_low`
The value of Fast Cadence Low state

`struct net_buf_simple *fast_cadence_high`
The value of Fast Cadence High state

`struct esp_ble_mesh_state_change_sensor_setting_set_t`
Parameters of Sensor Setting Set state change event

**Public Members**

`uint16_t property_id`
The value of Sensor Property ID state

`uint16_t setting_property_id`
The value of Sensor Setting Property ID state
struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
   Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
   Property ID of a sensor

uint16_t setting_property_id
   Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
Context of the received Sensor Setting Get message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
Context of the received Sensor Column Get message
Public Members

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
    Raw value identifying a column
```

**struct esp_ble_mesh_server_recv_sensor_series_get_t**
Context of the received Sensor Series Get message

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value
    Raw value containing X1 and X2 (optional)
```

**struct esp_ble_mesh_server_recv_sensor_cadence_set_t**
Context of the received Sensor Cadence Set message

Public Members

```c
uint16_t property_id
    Property ID for the sensor
```

```c
struct net_buf_simple *cadence
    Value of Sensor Cadence state
```

**struct esp_ble_mesh_server_recv_sensor_setting_set_t**
Context of the received Sensor Setting Set message

Public Members

```c
uint16_t property_id
    Property ID identifying a sensor
```

```c
uint16_t setting_property_id
    Setting ID identifying a setting within a sensor
```

```c
struct net_buf_simple *setting_raw
    Raw value for the setting
```

**struct esp_ble_mesh_sensor_server_cb_param_t**
Sensor Server Model callback parameters

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Sensor Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_sensor_server_cb_value_t value
    Value of the received Sensor Messages
```
Chapter 2. API Reference

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

Note  This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return  New Sensor Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)
Sensor Server Models related context.

Define a new Sensor Server Model.

Note  1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
    1. This model shall support model publication and model subscription.

Return  New Sensor Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

Note  1. The Sensor Setup Server model extends the Sensor Server model.
    1. This model shall support model publication and model subscription.

Return  New Sensor Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_setup_srv_t.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)
Get format of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.
Chapter 2. API Reference

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)
Generate a MPID value for sensor data with Format A.

Note 1. The Format field is 0b0 and indicates that Format A is used.
   1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)
Generate a MPID value for sensor data with Format B.

Note 1. The Format field is 0b1 and indicates Format B is used.
   1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
   2. The Property ID is a 16-bit bit field representing a Property ID.
   3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
   4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Return 3-octet MPID value for sensor data with Format B.

Parameters
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

Type Definitions
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)
Bluetooth Mesh Sensor Client Model function.
Sensor Client Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)
Bluetooth Mesh Sensor Server Model function.
Sensor Server Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

Enumerations
enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model

Values:
- ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT

Submit Document Feedback
**Chapter 2. API Reference**

**ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX**

enum esp_ble_mesh_sensor_sample_func

This enum value is value of Sensor Sampling Function

Values:

- ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
- ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
- ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
- ESP_BLE_MESH_SAMPLE_FUNC_RMS
- ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
- ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
- ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
- ESP_BLE_MESH_SAMPLE_FUNC_COUNT

**ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

- ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
  
  1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
  
  2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

- ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
  
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

- ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
  
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**Time and Scenes Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

**Functions**

`esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)`

Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

`esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)`

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters
- **params**: Pointer to BLE Mesh common client parameters.
- **get_state**: Pointer to time scene get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                  esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- **params**: Pointer to BLE Mesh common client parameters.
- **set_state**: Pointer to time scene set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- **callback**: Pointer to the callback function.

Unions
```c
union esp_ble_mesh_time_scene_client_get_state_t

Strucures

**struct esp_ble_mesh_time_set_t**
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

**Public Members**

```c
uint8_t tai_seconds[5]
The current TAI time in seconds
```

```c
uint8_t sub_second
The sub-second time in units of 1/256 second
```

```c
uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds
```

```c
uint8_t time_zone_offset
The local time zone offset in 15-minute increments
```

**struct esp_ble_mesh_time_zone_set_t**
Parameters of Time Zone Set

**Public Members**

```c
uint8_t time_zone_offset_new
Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change
```

**struct esp_ble_mesh_tai_utc_delta_set_t**
Parameters of TAI-UTC Delta Set

**Public Members**

```c
uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t padding : 1
Always 0b0. Other values are Prohibited.
```

```c
uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change
```

**struct esp_ble_mesh_time_role_set_t**
Parameter of Time Role Set

**Public Members**

```c
uint8_t time_role
The Time Role for the element
```

**struct esp_ble_mesh_scene_store_t**
Parameter of Scene Store
**Public Members**

```c
uint16_t scene_number
```

The number of scenes to be stored

```c
struct esp_ble_mesh_scene_recall_t
```

Parameters of Scene Recall

**Public Members**

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint16_t scene_number
```

The number of scenes to be recalled

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_scene_delete_t
```

Parameter of Scene Delete

**Public Members**

```c
uint16_t scene_number
```

The number of scenes to be deleted

```c
struct esp_ble_mesh_scheduler_act_get_t
```

Parameter of Scheduler Action Get

**Public Members**

```c
uint8_t index
```

Index of the Schedule Register entry to get

```c
struct esp_ble_mesh_scheduler_act_set_t
```

Parameters of Scheduler Action Set

**Public Members**

```c
uint64_t index : 4
```

Index of the Schedule Register entry to set

```c
uint64_t year : 7
```

Scheduled year for the action

```c
uint64_t month : 12
```

Scheduled month for the action

```c
uint64_t day : 5
```

Scheduled day of the month for the action

```c
uint64_t hour : 5
```

Scheduled hour for the action
Chapter 2. API Reference

```c
uint64_t minute : 6
    Scheduled minute for the action
uint64_t second : 6
    Scheduled second for the action
uint64_t day_of_week : 7
    Schedule days of the week for the action
uint64_t action : 4
    Action to be performed at the scheduled time
uint64_t trans_time : 8
    Transition time for this action
uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_status_cb_t
    Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds
uint8_t sub_second
    The sub-second time in units of 1/256 second
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps
uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority
uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds
uint8_t time_zone_offset
    The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
    Current local time zone offset
uint8_t time_zone_offset_new
    Upcoming local time zone offset
uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr : 15
    Current difference between TAI and UTC in seconds
```
**uint16_t** padding_1 : 1
Always 0b0. Other values are Prohibited.

**uint16_t** tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

**uint16_t** padding_2 : 1
Always 0b0. Other values are Prohibited.

**uint8_t** tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_time_role_status_cb_t**
Parameter of Time Role Status

**Public Members**

**uint8_t** time_role
The Time Role for the element

**struct esp_ble_mesh_scene_status_cb_t**
Parameters of Scene Status

**Public Members**

**bool** op_en
Indicate if optional parameters are included

**uint8_t** status_code
Status code of the last operation

**uint16_t** current_scene
Scene Number of the current scene

**uint16_t** target_scene
Scene Number of the target scene (optional)

**uint8_t** remain_time
Time to complete state transition (C.1)

**struct esp_ble_mesh_scene_register_status_cb_t**
Parameters of Scene Register Status

**Public Members**

**uint8_t** status_code
Status code for the previous operation

**uint16_t** current_scene
Scene Number of the current scene

**struct net_buf_simple** *scenes
A list of scenes stored within an element

**struct esp_ble_mesh_scheduler_status_cb_t**
Parameter of Scheduler Status

**Public Members**

**uint16_t** schedules
Bit field indicating defined Actions in the Schedule Register

**struct esp_ble_mesh_scheduler_act_status_cb_t**

Parameters of Scheduler Action Status

**Public Members**

- `uint64_t index`: 4
  - Enumerates (selects) a Schedule Register entry

- `uint64_t year`: 7
  - Scheduled year for the action

- `uint64_t month`: 12
  - Scheduled month for the action

- `uint64_t day`: 5
  - Scheduled day of the month for the action

- `uint64_t hour`: 5
  - Scheduled hour for the action

- `uint64_t minute`: 6
  - Scheduled minute for the action

- `uint64_t second`: 6
  - Scheduled second for the action

- `uint64_t day_of_week`: 7
  - Scheduled days of the week for the action

- `uint64_t action`: 4
  - Action to be performed at the scheduled time

- `uint64_t trans_time`: 8
  - Transition time for this action

- `uint16_t scene_number`
  - Transition time for this action

**struct esp_ble_mesh_time_scene_client_cb_param_t**

Time Scene Client Model callback parameters

**Public Members**

- `int error_code`
  - Appropriate error code

  - `esp_ble_mesh_client_common_param_t *params`
    - The client common parameters.

  - `esp_ble_mesh_time_scene_client_status_cb_t status_cb`
    - The scene status message callback values

**struct esp_ble_mesh_time_state_t**

Parameters of Time state

**Public Members**

- `uint8_t tai_seconds[5]`
  - The value of the TAI Seconds state

- `uint8_t subsecond`
  - The value of the Subsecond field
Chapter 2. API Reference

```
uint8_t uncertainty
  The value of the Uncertainty field

uint8_t time_zone_offset_curr
  The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
  The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
  The value of the TAI of Zone Change field

uint16_t time_authority : 1
  The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
  The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
  The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
  The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
  Parameters of the Time state

uint8_t time_role
  The value of the Time Role state

struct esp_ble_mesh_time_state_t
  User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
  User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_scene_register_t
  1. Scene Store is an operation of storing values of a present state of an element.
  2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
  3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
```
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

```c
uint16_t scene_number
    The value of the Scene Number

uint8_t scene_type
    The value of the Scene Type
```

```c
struct net_buf_simple *scene_value
    Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value
```

```c
struct esp_ble_mesh_scenes_state_t
    Parameters of Scenes state.
```

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

```c
const uint16_t scene_count
    The Scenes state’s scene count
```

```c
esp_ble_mesh_scene_register_t *scenes
    Parameters of the Scenes state
```

```c
uint16_t current_scene
    The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

    When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

    When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

    When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

    When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state
```

```c
uint16_t target_scene
    The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

    When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

    When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.
```
When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000.

The value of the Target Scene state

```c
uint8_t status_code
```

The status code of the last scene operation

```c
bool in_progress
```

Indicate if the scene transition is in progress

**struct esp_ble_mesh_scene_srv_t**

User data of Scene Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```

Pointer to the Scene Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```c
esp_ble_mesh_scenes_state_t *state
```

Parameters of the Scenes state

```c
esp_ble_mesh_last_msg_info_t last
```

Parameters of the last received set message

```c
esp_ble_mesh_state_transition_t transition
```

Parameters of state transition

**struct esp_ble_mesh_scene_setup_srv_t**

User data of Scene Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```

Pointer to the Scene Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```c
esp_ble_mesh_scenes_state_t *state
```

Parameters of the Scenes state

**struct esp_ble_mesh_schedule_register_t**

Parameters of Scheduler Register state

**Public Members**

```c
bool in_use
```

Indicate if the registered schedule is in use

```c
uint64_t year : 7
```

The value of Scheduled year for the action

```c
uint64_t month : 12
```

The value of Scheduled month for the action

```c
uint64_t day : 5
```

The value of Scheduled day of the month for the action

```c
uint64_t hour : 5
```

The value of Scheduled hour for the action
Chapter 2. API Reference

```c
uint64_t minute : 6
    The value of Scheduled minute for the action

uint64_t second : 6
    The value of Scheduled second for the action

uint64_t day_of_week : 7
    The value of Schedule days of the week for the action

uint64_t action : 4
    The value of Action to be performed at the scheduled time

uint64_t trans_time : 8
    The value of Transition time for this action

uint16_t scene_number
    The value of Scene Number to be used for some actions
```

`struct esp_ble_mesh_scheduler_state_t`
Parameters of Scheduler state

**Public Members**

```c
const uint8_t schedule_count
    Scheduler count
```

```c
esp_ble_mesh_schedule_register_t *schedules
    Up to 16 scheduled entries
```

`struct esp_ble_mesh_scheduler_srv_t`
User data of Scheduler Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Scheduler Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```

```c
esp_ble_mesh_scheduler_state_t *state
    Parameters of the Scheduler state
```

`struct esp_ble_mesh_scheduler_setup_srv_t`
User data of Scheduler Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Scheduler Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```

```c
esp_ble_mesh_scheduler_state_t *state
    Parameters of the Scheduler state
```

`struct esp_ble_mesh_state_change_time_set_t`
Parameters of Time Set state change event
Public Members

uint8_t *tai_seconds[5]
The current TAI time in seconds

uint8_t *subsecond
The sub-second time in units of 1/256 second

uint8_t *uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t *time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t *tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t *time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t *tai_seconds[5]
The current TAI time in seconds

uint8_t *subsecond
The sub-second time in units of 1/256 second

uint8_t *uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t *time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t *tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t *time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t *time_zone_offset_new
Upcoming local time zone offset

uint8_t *tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t *tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
    Parameter of Time Role Set state change event

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event

Public Members

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
    Parameter of Scheduler Action Set state change event

Public Members

uint64_t index: 4
    Index of the Schedule Register entry to set

uint64_t year: 7
    Scheduled year for the action

uint64_t month: 12
    Scheduled month for the action

uint64_t day: 5
    Scheduled day of the month for the action

uint64_t hour: 5
    Scheduled hour for the action

uint64_t minute: 6
    Scheduled minute for the action

uint64_t second: 6
    Scheduled second for the action
Chapter 2. API Reference

```c
uint64_t day_of_week : 7
    Schedule days of the week for the action

uint64_t action : 4
    Action to be performed at the scheduled time

uint64_t trans_time : 8
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions
```

```c
struct esp_ble_mesh_server_recv_scheduler_act_get_t
    Context of the received Scheduler Action Get message
```

**Public Members**

```c
uint8_t index
    Index of the Schedule Register entry to get
```

```c
struct esp_ble_mesh_server_recv_time_set_t
    Context of the received Time Set message
```

**Public Members**

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_server_recv_time_zone_set_t
    Context of the received Time Zone Set message
```

**Public Members**

```c
uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
    Context of the received TAI UTC Delta Set message
```

**Public Members**

```c
uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
```
uint16_t padding: 1
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
    Context of the received Time Role Set message

**Public Members**

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
    Context of the received Scene Store message

**Public Members**

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
    Context of the received Scene Recall message

**Public Members**

bool op_en
    Indicate if optional parameters are included

uint16_t scene_number
    The number of scenes to be recalled

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
    Context of the received Scene Delete message

**Public Members**

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
    Context of the received Scheduler Action Set message

**Public Members**

uint64_t index: 4
    Index of the Schedule Register entry to set

uint64_t year: 7
    Scheduled year for the action
\begin{verbatim}
uint64_t month: 12
    Scheduled month for the action
uint64_t day: 5
    Scheduled day of the month for the action
uint64_t hour: 5
    Scheduled hour for the action
uint64_t minute: 6
    Scheduled minute for the action
uint64_t second: 6
    Scheduled second for the action
uint64_t day_of_week: 7
    Schedule days of the week for the action
uint64_t action: 4
    Action to be performed at the scheduled time
uint64_t trans_time: 8
    Transition time for this action
uint16_t scene_number
    Scene number to be used for some actions
\end{verbatim}

\textbf{struct esp_ble_mesh_server_recv_time_status_t}

Context of the received Time Status message

\textbf{Public Members}

\begin{verbatim}
uint8_t tai_seconds[5]
    The current TAI time in seconds
uint8_t subsecond
    The sub-second time in units of 1/256 second
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps
uint16_t time_authority: 1
    0 = No Time Authority, 1 = Time Authority
uint16_t tai_utc_delta: 15
    Current difference between TAI and UTC in seconds
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
\end{verbatim}

\textbf{struct esp_ble_mesh_time_scene_server_cb_param_t}

Time Scene Server Model callback parameters

\textbf{Public Members}

\begin{verbatim}
esp_ble_mesh_model_t *model
    Pointer to Time and Scenes Server Models
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
esp_ble_mesh_time_scene_server_cb_value_t value
    Value of the received Time and Scenes Messages
\end{verbatim}
Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Time Client Model.

Return New Time Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.

Note This API needs to be called for each element on which the application needs to have a Scene Client Model.

Return New Scene Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

Note This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Return New Scheduler Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Define a new Time Server Model.

Note 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
2. This model does not support subscribing nor publishing.

Parameters
• srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.
Parameters
• \texttt{srv\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
• \texttt{srv\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_scene\_srv\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV} (\texttt{srv\_pub}, \texttt{srv\_data})
Define a new Scene Setup Server Model.

\textbf{Note} 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
2. This model may be present only on the Primary element of a node.

\textbf{Return} New Scene Setup Server Model instance.

Parameters
• \texttt{srv\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
• \texttt{srv\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_scene\_setup\_srv\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV} (\texttt{srv\_pub}, \texttt{srv\_data})
Define a new Scheduler Server Model.

\textbf{Note} 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model requires the Time Server model shall be present on the element.

\textbf{Return} New Scheduler Server Model instance.

Parameters
• \texttt{srv\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
• \texttt{srv\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_scheduler\_srv\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV} (\texttt{srv\_pub}, \texttt{srv\_data})
Define a new Scheduler Setup Server Model.

\textbf{Note} 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

\textbf{Return} New Scheduler Setup Server Model instance.

Parameters
• \texttt{srv\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
• \texttt{srv\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_scheduler\_setup\_srv\_t}.

\texttt{ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS}
Unknown TAI Seconds

\texttt{ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE}
Unknown TAI of Zone Change

\texttt{ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE}
Unknown TAI of Delta Change

\texttt{ESP\_BLE\_MESH\_TAI\_UTC\_DELTA\_MAX\_VALUE}
Maximum TAI-UTC Delta value

\texttt{ESP\_BLE\_MESH\_TAI\_SECONDS\_LEN}
Length of TAI Seconds

\texttt{ESP\_BLE\_MESH\_TAI\_OF\_ZONE\_CHANGE\_LEN}
Length of TAI of Zone Change

\texttt{ESP\_BLE\_MESH\_TAI\_OF\_DELTA\_CHANGE\_LEN}
Length of TAI of Delta Change

\texttt{ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER}
Invalid Scene Number

\texttt{ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN}
Length of the Scene Number
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success
**ESP_BLE_MESH_SCENE_REG_FULL**
Scene operation - Scene Register Full

**ESP_BLE_MESH_SCENE_NOT_FOUND**
Scene operation - Scene Not Found

**Type Definitions**

```c
typedef void(*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

**Values:**

- `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE.EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE.EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

**Values:**

- `ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT`

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

- `esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)`
  Register BLE Mesh Light Client Model callback.
  
  **Return** ESP_OK on success or error code otherwise.
  
  **Parameters**
  - [in] callback: pointer to the callback function.

- `esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)`
  Get the value of Light Server Model states using the Light Client Model get messages.
  
  **Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
  
  **Return** ESP_OK on success or error code otherwise.
  
  **Parameters**
  - [in] get_state: Pointer of light get message value. Shall not be set to NULL.

- `esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)`
  Set the value of Light Server Model states using the Light Client Model set messages.
  
  **Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
  
  **Return** ESP_OK on success or error code otherwise.
  
  **Parameters**
  - [in] set_state: Pointer of light set message value. Shall not be set to NULL.

- `esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)`
  Register BLE Mesh Lighting Server Model callback.
  
  **Return** ESP_OK on success or error code otherwise.
  
  **Parameters**
  - [in] callback: Pointer to the callback function.

Unions

- `union esp_ble_mesh_light_client_get_state_t`

Parameters of Light Lightness Set
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```
uint16_t lightness
    Target value of light lightness actual state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_linear_set_t
Parameters of Light Lightness Linear Set

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light lightness linear state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t
Parameter of Light Lightness Default Set

Public Members

uint16_t lightness
    The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t
Parameters of Light Lightness Range Set

Public Members

uint16_t range_min
    Value of range min field of light lightness range state

uint16_t range_max
    Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_set_t
Parameters of Light CTL Set

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t ctl_lightness
    Target value of light ctl lightness state
Chapter 2. API Reference

### struct esp_ble_mesh_light_ctl_temperature_set_t
Parameters of Light CTL Temperature Set

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint16_t ctl_temperatrue`
  Target value of lightctl temperature state
- `int16_t ctl_delta_uv`
  Target value of lightctl delta UV state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

### struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set

**Public Members**

- `uint16_t range_min`
  Value of temperature range min field of lightctl temperature range state
- `uint16_t range_max`
  Value of temperature range max field of lightctl temperature range state

### struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set

**Public Members**

- `uint16_t lightness`
  Value of light lightness default state
- `uint16_t temperature`
  Value of light temperature default state
- `int16_t delta_uv`
  Value of light delta UV default state
struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Target value of light hsl lightness state

uint16_t hsl_hue
Target value of light hsl hue state

uint16_t hsl_saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t
Parameters of Light HSL Hue Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hue
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
Parameters of Light HSL Saturation Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
Parameters of Light HSL Default Set

Public Members

uint16_t lightness
  Value of light lightness default state

uint16_t hue
  Value of light hue default state

uint16_t saturation
  Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
  Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
  Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
  Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
  Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
  Indicate whether optional parameters included

uint16_t xyl_lightness
  The target value of the Light xyL Lightness state

uint16_t xyl_x
  The target value of the Light xyL x state

uint16_t xyl_y
  The target value of the Light xyL y state

uint8_t tid
  Transaction Identifier

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set
Public Members

`uint16_t lightness`
The value of the Light Lightness Default state

`uint16_t xyl_x`
The value of the Light xyL x Default state

`uint16_t xyl_y`
The value of the Light xyL y Default state

`struct esp_ble_mesh_light_xyl_range_set_t`
Parameters of Light xyL Range Set

Public Members

`uint16_t xyl_x_range_min`
The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t xyl_x_range_max`
The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t xyl_y_range_min`
The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t xyl_y_range_max`
The value of the xyL y Range Max field of the Light xyL y Range state

`struct esp_ble_mesh_light_lc_mode_set_t`
Parameter of Light LC Mode Set

Public Members

`uint8_t mode`
The target value of the Light LC Mode state

`struct esp_ble_mesh_light_lc_om_set_t`
Parameter of Light LC OM Set

Public Members

`uint8_t mode`
The target value of the Light LC Occupancy Mode state

`struct esp_ble_mesh_light_lc_light_onoff_set_t`
Parameters of Light LC Light OnOff Set

Public Members

`bool op_en`
Indicate whether optional parameters included

`uint8_t light_onoff`
The target value of the Light LC Light OnOff state

`uint8_t tid`
Transaction Identifier

`uint8_t trans_time`
Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
    Parameter of Light LC Property Get

Public Members

    uint16_t property_id
        Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set

Public Members

    uint16_t property_id
        Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
    Parameters of Light Lightness Status

Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_lightness
        Current value of light lightness actual state

    uint16_t target_lightness
        Target value of light lightness actual state (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
    Parameters of Light Lightness Linear Status

Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_lightness
        Current value of light lightness linear state

    uint16_t target_lightness
        Target value of light lightness linear state (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
    Parameter of Light Lightness Last Status
Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state
Chapter 2. API Reference

uint16_t `present_ctl_delta_uv`
Current value of light ctl delta UV state

uint16_t `target_ctl_temperature`
Target value of light ctl temperature state (optional)

uint16_t `target_ctl_delta_uv`
Target value of light ctl delta UV state (C.1)

uint8_t `remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t`
Parameters of Light CTL Temperature Range Status

**Public Members**

uint8_t `status_code`
Status code for the request message

uint16_t `range_min`
Value of temperature range min field of light ctl temperature range state

uint16_t `range_max`
Value of temperature range max field of light ctl temperature range state

`struct esp_ble_mesh_light_ctl_default_status_cb_t`
Parameters of Light CTL Default Status

**Public Members**

uint16_t `lightness`
Value of light lightness default state

uint16_t `temperature`
Value of light temperature default state

int16_t `delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

**Public Members**

bool `op_en`
Indicate if optional parameters are included

uint16_t `hsl_lightness`
Current value of light hsl lightness state

uint16_t `hsl_hue`
Current value of light hsl hue state

uint16_t `hsl_saturation`
Current value of light hsl saturation state

uint8_t `remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

**Public Members**

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hsl_lightness_target
   Target value of light hsl lightness state

uint16_t hsl_hue_target
   Target value of light hsl hue state

uint16_t hsl_saturation_target
   Target value of light hsl saturation state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
   Parameters of Light HSL Hue Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_hue
   Current value of light hsl hue state

uint16_t target_hue
   Target value of light hsl hue state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
   Parameters of Light HSL Saturation Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_saturation
   Current value of light hsl saturation state

uint16_t target_saturation
   Target value of light hsl saturation state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
   Parameters of Light HSL Default Status

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state
```c
uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
Parameters of Light HSL Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
Parameters of Light xyL Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The present value of the Light xyL Lightness state

uint16_t xyl_x
The present value of the Light xyL x state

uint16_t xyl_y
The present value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)
```
struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xYL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xYL x Default state

uint16_t xyl_y
The value of the Light xYL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xYL Range Status

Public Members

uint8_t status_code
Status Code for the requesting message

uint16_t xyl_x_range_min
The value of the xYL x Range Min field of the Light xYL x Range state

uint16_t xyl_x_range_max
The value of the xYL x Range Max field of the Light xYL x Range state

uint16_t xyl_y_range_min
The value of the xYL y Range Min field of the Light xYL y Range state

uint16_t xyl_y_range_max
The value of the xYL y Range Max field of the Light xYL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t mode
The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t mode
The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t present_light_onoff
The present value of the Light LC Light OnOff state
Chapter 2. API Reference

uint8_t target_light_onoff
The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
The present value of Light Lightness Linear state

uint16_t target_lightness_linear
The target value of Light Lightness Linear state

uint16_t lightness_actual
The present value of Light Lightness Actual state

uint16_t target_lightness_actual
The target value of Light Lightness Actual state

uint16_t lightness_last
The value of Light Lightness Last state

uint16_t lightness_default
The value of Light default state

uint8_t status_code
The status code of setting Light Lightness Range state

uint16_t lightness_range_min
The minimum value of Light Lightness Range state

uint16_t lightness_range_max
The maximum value of Light Lightness Range state
struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
The present value of Light CTL Lightness state

uint16_t target_lightness
The target value of Light CTL Lightness state

uint16_t temperature
The present value of Light CTL Temperature state

uint16_t target_temperature
The target value of Light CTL Temperature state

int16_t delta_uv
The present value of Light CTL Delta UV state
int16_t target_delta_uv
The target value of Light CTL Delta UV state

uint8_t status_code
The statue code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t temperature_default
The value of Light CTL Temperature Default state

int16_t delta_uv_default
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model

Public Members

disp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Server Model. Initialized internally.

disp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

disp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

disp_ble_mesh_last_msg_info_t *last
    Parameters of the last received set message

disp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_temperature
    Delta change value of temperature state transition

int32_t tt_delta_delta_uv
    Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
User data of Light CTL Setup Server Model

Public Members

disp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Setup Server Model. Initialized internally.

disp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

disp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
User data of Light CTL Temperature Server Model
Public Members

`esp_ble_mesh_model_t *model`
  Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
  Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition

`int32_t tt_delta_temperature`
  Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
  Delta change value of delta uv state transition

`struct esp_ble_mesh_light_hsl_state_t` Parameters of Light HSL state

Public Members

`uint16_t lightness`
  The present value of Light HSL Lightness state

`uint16_t target_lightness`
  The target value of Light HSL Lightness state

`uint16_t hue`
  The present value of Light HSL Hue state

`uint16_t target_hue`
  The target value of Light HSL Hue state

`uint16_t saturation`
  The present value of Light HSL Saturation state

`uint16_t target_saturation`
  The target value of Light HSL Saturation state

`uint16_t lightness_default`
  The value of Light Lightness Default state

`uint16_t hue_default`
  The value of Light HSL Hue Default state

`uint16_t saturation_default`
  The value of Light HSL Saturation Default state

`uint8_t status_code`
  The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
  The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
  The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
  The minimum value of Light HSL Saturation state
uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

**struct esp_ble_mesh_light_hsl_srv_t**
User data of Light HSL Server Model

**Public Members**

*esp_ble_mesh_model_t* model
Pointer to the Lighting HSL Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_hsl_state_t* state
Parameters of the Light HSL state

*esp_ble_mesh_last_msg_info_t* last
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_hue
Delta change value of hue state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

**struct esp_ble_mesh_light_hsl_setup_srv_t**
User data of Light HSL Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* model
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_hsl_state_t* state
Parameters of the Light HSL state

**struct esp_ble_mesh_light_hsl_hue_srv_t**
User data of Light HSL Hue Server Model

**Public Members**

*esp_ble_mesh_model_t* model
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_hsl_state_t* state
Parameters of the Light HSL state

*esp_ble_mesh_last_msg_info_t* last
Parameters of the last received set message

Espressif Systems 627 Release v5.0-dev-1712-g4a553510b7
Submit Document Feedback
**Chapter 2. API Reference**

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

*int32_t* `tt_delta_hue`
Delta change value of hue state transition

*struct esp_ble_mesh_light_hsl_sat_srv_t*
User data of Light HSL Saturation Server Model

**Public Members**

*esp_ble_mesh_model_t* `*model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `*rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_light_hsl_state_t* `*state`
Parameters of the Light HSL state

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

*int32_t* `tt_delta_saturation`
Delta change value of saturation state transition

*struct esp_ble_mesh_light_xyl_state_t*
Parameters of Light xyL state

**Public Members**

*uint16_t* `lightness`
The present value of Light xyL Lightness state

*uint16_t* `target_lightness`
The target value of Light xyL Lightness state

*uint16_t* `x`
The present value of Light xyL x state

*uint16_t* `target_x`
The target value of Light xyL x state

*uint16_t* `y`
The present value of Light xyL y state

*uint16_t* `target_y`
The target value of Light xyL y state

*uint16_t* `lightness_default`
The value of Light Lightness Default state

*uint16_t* `x_default`
The value of Light xyL x Default state

*uint16_t* `y_default`
The value of Light xyL y Default state

*uint8_t* `status_code`
The status code of setting Light xyL x & y Range state

*uint16_t* `x_range_min`
The minimum value of Light xyL x Range state
**Chapter 2. API Reference**

**Public Members**

```c
uint16_t x_range_max
The maximum value of Light xyL x Range state
```

```c
uint16_t y_range_min
The minimum value of Light xyL y Range state
```

```c
uint16_t y_range_max
The maximum value of Light xyL y Range state
```

```c
struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model
```

### Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state
```

```c
esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```

```c
esp_ble_mesh_state_transition_t *transition
Parameters of state transition
```

```c
int32_t tt_delta_lightness
Delta change value of lightness state transition
```

```c
int32_t tt_delta_x
Delta change value of x state transition
```

```c
int32_t tt_delta_y
Delta change value of y state transition
```

### Public Members

```c
struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model
```

### Public Members

```c
uint32_t mode
0b0 The controller is turned off.
• The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
• The binding with the Light Lightness state is enabled. The value of Light LC Mode state
```

uint32_t **occupancy_mode**: 1  
The value of Light LC Occupancy Mode state

uint32_t **light_onoff**: 1  
The present value of Light LC Light OnOff state

uint32_t **target_light_onoff**: 1  
The target value of Light LC Light OnOff state

uint32_t **occupancy**: 1  
The value of Light LC Occupancy state

uint32_t **ambient_luxlevel**: 24  
The value of Light LC Ambient LuxLevel state

uint16_t **linear_output**

1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**

uint32_t **time_occupancy_delay**
A timing state that determines the delay for changing the Light LC Occupation state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t **time_fade_on**
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t **time_run_on**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t **time_fade**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t **time_prolong**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t **time_fade_standby_auto**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t **time_fade_standby_manual**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state
**Chapter 2. API Reference**

```c
uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine
```
Public Members

```c
uint8_t fade_on
   The value of transition time of Light LC Time Fade On
uint8_t fade
   The value of transition time of Light LC Time Fade
uint8_t fade_standby_auto
   The value of transition time of Light LC Time Fade Standby Auto
uint8_t fade_standby_manual
   The value of transition time of Light LC Time Fade Standby Manual
```

```c
struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
   The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time
```

```c
esp_ble_mesh_lc_state_t state
   The value of Light LC state machine state
```

```c
struct k_delayed_work timer
   Timer of Light LC state machine
```

```c
struct esp_ble_mesh_light_control_t
   Parameters of Light Lightness controller
```

Public Members

```c
esp_ble_mesh_light_lc_state_t state
   Parameters of Light LC state
esp_ble_mesh_light_lc_property_state_t prop_state
   Parameters of Light LC Property state
esp_ble_mesh_light_lc_state_machine_t state_machine
   Parameters of Light LC state machine
```

```c
struct esp_ble_mesh_light_lc_srv_t
   User data of Light LC Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
   Pointer to the Lighting LC Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages
esp_ble_mesh_light_control_t *lc
   Parameters of the Light controller
esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message
esp_ble_mesh_state_transition_t transition
   Parameters of state transition
```

```c
struct esp_ble_mesh_light_lc_setup_srv_t
   User data of Light LC Setup Server Model
```
Public Members

*esp_ble_mesh_model_t* model

Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl

Response control of the server model received messages

*esp_ble_mesh_light_control_t* lc

Parameters of the Light controller

struct esp_ble_mesh_state_change_light_lightness_set_t

Parameter of Light Lightness Actual state change event

Public Members

uint16_t lightness

The value of Light Lightness Actual state

struct esp_ble_mesh_state_change_light_lightness_linear_set_t

Parameter of Light Lightness Linear state change event

Public Members

uint16_t lightness

The value of Light Lightness Linear state

struct esp_ble_mesh_state_change_light_lightness_default_set_t

Parameter of Light Lightness Default state change event

Public Members

uint16_t lightness

The value of Light Lightness Default state

struct esp_ble_mesh_state_change_light_lightness_range_set_t

Parameters of Light Lightness Range state change event

Public Members

uint16_t range_min

The minimum value of Light Lightness Range state

uint16_t range_max

The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t

Parameters of Light CTL state change event

Public Members

uint16_t lightness

The value of Light CTL Lightness state

uint16_t temperature

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event
**Public Members**

`uint16_t saturation`

The value of Light HSL Saturation state

*struct esp_ble_mesh_state_change_light_hsl_default_set_t*

Parameters of Light HSL Default state change event

**Public Members**

`uint16_t lightness`

The value of Light HSL Lightness Default state

`uint16_t hue`

The value of Light HSL Hue Default state

`uint16_t saturation`

The value of Light HSL Saturation Default state

*struct esp_ble_mesh_state_change_light_hsl_range_set_t*

Parameters of Light HSL Range state change event

**Public Members**

`uint16_t hue_range_min`

The minimum hue value of Light HSL Range state

`uint16_t hue_range_max`

The maximum hue value of Light HSL Range state

`uint16_t saturation_range_min`

The minimum saturation value of Light HSL Range state

`uint16_t saturation_range_max`

The maximum saturation value of Light HSL Range state

*struct esp_ble_mesh_state_change_light_xyl_set_t*

Parameters of Light xyL state change event

**Public Members**

`uint16_t lightness`

The value of Light xyL Lightness state

`uint16_t x`

The value of Light xyL x state

`uint16_t y`

The value of Light xyL y state

*struct esp_ble_mesh_state_change_light_xyl_default_set_t*

Parameters of Light xyL Default state change event

**Public Members**

`uint16_t lightness`

The value of Light Lightness Default state

`uint16_t x`

The value of Light xyL x Default state
uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state
uint16_t x_range_max
The maximum value of Light xyL x Range state
uint16_t y_range_min
The minimum value of Light xyL y Range state
uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event
### Public Members

**uint16_t property_id**
- The value of Sensor Property ID

**uint8_t occupancy**
- The value of Light LC Occupancy state

**uint32_t set_occupancy_to_1_delay**
- The value of Light LC Set Occupancy to 1 Delay state

**uint32_t ambient_luxlevel**
- The value of Light LC Ambient Luxlevel state

**union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state**
- Parameters of Sensor Status related state

**struct esp_ble_mesh_server_recv_light_lc_property_get_t**
- Context of the received Light LC Property Get message

### Public Members

**uint16_t property_id**
- Property ID identifying a Light LC Property

**struct esp_ble_mesh_server_recv_light_lightness_set_t**
- Context of the received Light Lightness Set message

### Public Members

**bool op_en**
- Indicate if optional parameters are included

**uint16_t lightness**
- Target value of light lightness actual state

**uint8_t tid**
- Transaction ID

**uint8_t trans_time**
- Time to complete state transition (optional)

**uint8_t delay**
- Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_lightness_linear_set_t**
- Context of the received Light Lightness Linear Set message

### Public Members

**bool op_en**
- Indicate if optional parameters are included

**uint16_t lightness**
- Target value of light lightness linear state

**uint8_t tid**
- Transaction ID

**uint8_t trans_time**
- Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
    Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
    The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
    Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
    Value of range min field of light lightness range state

uint16_t range_max
    Value of range max field of light lightness range state

struct esp_ble_mesh_server_recv_light_ctl_set_t
    Context of the received Light CTL Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light ctl lightness state

uint16_t temperature
    Target value of light ctl temperature state

int16_t delta_uv
    Target value of light ctl delta UV state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
    Context of the received Light CTL Temperature Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t temperature
    Target value of light ctl temperature state

int16_t delta_uv
    Target value of light ctl delta UV state
uint8_t _tid
Transaction ID

uint8_t _trans_time
Time to complete state transition (optional)

uint8_t _delay
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message
```

**Public Members**

uint16_t _range_min
Value of temperature range min field of light ctl temperature range state

uint16_t _range_max
Value of temperature range max field of light ctl temperature range state

```c
struct esp_ble_mesh_server_recv_light_ctl_default_set_t
Context of the received Light CTL Default Set message
```

**Public Members**

uint16_t _lightness
Value of light lightness default state

uint16_t _temperature
Value of light temperature default state

int16_t _delta_uv
Value of light delta UV default state

```c
struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message
```

**Public Members**

bool _op_en
Indicate if optional parameters are included

uint16_t _lightness
Target value of light hsl lightness state

uint16_t _hue
Target value of light hsl hue state

uint16_t _saturation
Target value of light hsl saturation state

uint8_t _tid
Transaction ID

uint8_t _trans_time
Time to complete state transition (optional)

uint8_t _delay
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
Context of the received Light HSL Hue Set message
```
Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t hue
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
  Context of the received Light HSL Saturation Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t saturation
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
  Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
  Value of light lightness default state

uint16_t hue
  Value of light hue default state

uint16_t saturation
  Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
  Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
  Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
  Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

**struct esp_ble_mesh_server_recv_light_xyl_set_t**
Context of the received Light xyL Set message

**Public Members**

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyL Lightness state

uint16_t x
The target value of the Light xyL x state

uint16_t y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_xyl_default_set_t**
Context of the received Light xyL Default Set message

**Public Members**

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyL x Default state

uint16_t y
The value of the Light xyL y Default state

**struct esp_ble_mesh_server_recv_light_xyl_range_set_t**
Context of the received Light xyL Range Set message

**Public Members**

uint16_t x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state
struct esp_ble_mesh_server_recv_light_lc_mode_set_t
  Context of the received Light LC Mode Set message

Public Members

uint8_t mode
  The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
  Context of the received Light OM Set message

Public Members

uint8_t mode
  The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
  Context of the received Light LC Light OnOff Set message

Public Members

bool op_en
  Indicate whether optional parameters included

uint8_t light_onoff
  The target value of the Light LC Light OnOff state

uint8_t tid
  Transaction Identifier

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
  Context of the received Light LC Property Set message

Public Members

uint16_t property_id
  Property ID identifying a Light LC Property

struct net_buf_simple *property_value
  Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
  Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
  Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
  Lighting Server Model callback parameters
Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Lighting Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_lighting_server_cb_value_t value
    Value of the received Lighting Messages
```

Macros

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
    Define a new Light Lightness Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)
    Define a new Light CTL Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)
    Define a new Light HSL Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)
    Define a new Light xyL Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)
    Define a new Light LC Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)
    Lighting Server Models related context.
```
Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
2. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
2. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (srv_pub, srv_data)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
2. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.
2. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (srv_pub, srv_data)

Define a new Light HSL Server Model.
Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)`
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light HSL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)`
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)`
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)`
Define a new Light xyL Server Model.

Note 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Light xyL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)`
Define a new Light xyL Setup Server Model.
**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyL_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LC_SRV` (srv_pub, srv_data)

Define a new Light LC Server Model.

**Note** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV` (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

**Note** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

**Return** New Light LC Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Type Definitions**

```c
typedef void(*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param
)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param
)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

**Values:**

- `ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
 enum esp_ble_mesh_lc_state_t
 This enum value is the Light LC State Machine states

 Values:
 ESP_BLE_MESH_LC_OFF
 ESP_BLE_MESH_LC_STANDBY
 ESP_BLE_MESH_LC_FADE_ON
 ESP_BLE_MESH_LC_RUN
 ESP_BLE_MESH_LC_FADE
 ESP_BLE_MESH_LC_PROLONG
 ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
 When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
 the application layer when Sensor Status message is received.
 ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
 When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
 the application layer when Lighting Get messages are received.

 2.3.6 NimBLE-based host APIs

 Overview

 Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and con-
troller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and
FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to
NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features
of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all
the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the
application developers.
Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 3: ESP NimBLE Stack](image)

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*. Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions

`esp_err_t esp_nimble_hci_init(void)`

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.
Return

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_init(void)`

Initialize ESP Bluetooth controller (link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); // This function will return only when nimble_port_stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();
// Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

Return

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_deinit(void)`

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit(void)`

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with error: %d", ret);
    }
}
```

(continues on next page)
If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**Macros**

BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO
BLE_HCI_UART_H4_EVT

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF)

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

## 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

- **ESP_FAIL** (-1): Generic esp_err_t code indicating failure
- **ESP_OK** (0): esp_err_t value indicating success (no error)
- **ESP_ERR_NO_MEM** (0x101): Out of memory
- **ESP_ERR_INVALID_ARG** (0x102): Invalid argument
- **ESP_ERR_INVALID_STATE** (0x103): Invalid state
- **ESP_ERR_INVALID_SIZE** (0x104): Invalid size
- **ESP_ERR_NOT_FOUND** (0x105): Requested resource not found
- **ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported
- **ESP_ERR_TIMEOUT** (0x107): Operation timed out
**ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid

**ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid

**ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (0x10c): There are items remained to retrieve

**ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** (0x1116): NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes
Chapter 2. API Reference

ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn’t fit into RTC memory reserved for the ULP
ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)
ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVS (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
Chapter 2. API Reference

ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Acked
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
ESP_ERR_MESH_WIFI_NOT_START (0x4001)

2.5 Networking APIs

2.5.1 Wi-Fi

**ESP-NOW**

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

```
-----------------------------------
     | MAC Header | Category Code | Organization Identifier | Random Values | Vendor Specific Content | FCS |
-----------------------------------

24 bytes 1 byte 3 bytes 4 bytes 7~
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

- Category Code: The Category Code field is set to the value(127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value filed is used to prevents relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

Add Paired Device Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set.

You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.
If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once at a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Application Examples**
- Example of sending and receiving ESP-NOW data between two devices: `wifi/espnow`.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**

**Header File**
- `components/esp_wifi/include/esp_now.h`

**Functions**

```c
esp_err_t esp_now_init(void)
```
Initialize ESPNOW function.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

```c
esp_err_t esp_now_deinit(void)
```
De-initialize ESPNOW function.

**Return**
- ESP_OK : succeed

```c
esp_err_t esp_now_get_version(uint32_t* version)
```
Get the version of ESPNOW.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

**Parameters**
- `version`: ESPNOW version

```c
esp_err_t esp_now_register_recv_cb(esp_now_recv_cb_t cb)
```
Register callback function of receiving ESPNOW data.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

**Parameters**
- `cb`: callback function of receiving ESPNOW data

```c
esp_err_t esp_now_unregister_recv_cb(void)
```
Unregister callback function of receiving ESPNOW data.

**Return**
- ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
Register callback function of sending ESPNOW data.
```

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters
- cb : callback function of sending ESPNOW data

```c
esp_err_t esp_now_unregister_send_cb (void)
Unregister callback function of sending ESPNOW data.
```

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t* peer_addr, const uint8_t* data, size_t len)
Send ESPNOW data.
```

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

Parameters
- peer_addr : peer MAC address
- data : data to send
- len : length of data

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t* peer)
Add a peer to peer list.
```

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

Parameters
- peer : peer information

```c
esp_err_t esp_now_del_peer (const uint8_t* peer_addr)
Delete a peer from peer list.
```

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
- peer_addr : peer MAC address
esp_err_t esp_now_mod_peer(const esp_now_peer_info_t *peer)

Modify a peer.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full

Parameters
• peer: peer information

esp_err_t esp_now_get_peer(const uint8_t *peer_addr, esp_now_peer_info_t *peer)

Get a peer whose MAC address matches peer_addr from peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
• peer_addr: peer MAC address
• peer: peer information

esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
• from_head: fetch from head of list or not
• peer: peer information

bool esp_now_is_peer_exist(const uint8_t *peer_addr)

Peer exists or not.

Return
• true : peer exists
• false : peer not exists

Parameters
• peer_addr: peer MAC address

esp_err_t esp_now_get_peer_num(esp_now_peer_num_t *num)

Get the number of peers.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• num: number of peers

esp_err_t esp_now_set_pmk(const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
pmk: primary master key

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
```

Set esp_now wake window for sta_disconnected power management.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
**Attention** 2. This configuration only work for station mode and disconnected status
**Attention** 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked
**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time
**Attention** 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**Parameters**
- window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

```c
struct esp_now_peer_info
```

ESPNOW peer information parameters.

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
```

ESPNOW peer MAC address that is also the MAC address of station or softap

```c
uint8_t lmk[ESP_NOW_KEY_LEN]
```

ESPNOW peer local master key that is used to encrypt data

```c
uint8_t channel
```

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

```c
wifi_interface_t ifidx
```

Wi-Fi interface that peer uses to send/receive ESPNOW data

```c
bool encrypt
```

ESPNOW data that this peer sends/receives is encrypted or not

```c
void *priv
```

ESPNOW peer private data

```c
struct esp_now_peer_num
```

Number of ESPNOW peers which exist currently.

**Public Members**

```c
int total_num
```

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

```c
int encrypt_num
```

Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

**Macros**

```c
ESP_ERR_ESPNOW_BASE
```

ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT
    ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG
    Invalid argument
ESP_ERR_ESPNOW_NO_MEM
    Out of memory
ESP_ERR_ESPNOW_FULL
    ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND
    ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL
    Internal error
ESP_ERR_ESPNOW_EXIST
    ESPNOW peer has existed
ESP_ERR_ESPNOW_IF
    Interface error
ESP_NOW_ETH_ALEN
    Length of ESPNOW peer MAC address
ESP_NOW_KEY_LEN
    Length of ESPNOW peer local master key
ESP_NOW_MAX_TOTAL_PEER_NUM
    Maximum number of ESPNOW total peers
ESP_NOW_MAX_ENCRYPT_PEER_NUM
    Maximum number of ESPNOW encrypted peers
ESP_NOW_MAX_DATA_LEN
    Maximum length of ESPNOW data which is sent very time

Type Definitions
typedef struct esp_now_peer_info esp_now_peer_info_t
    ESPNOW peer information parameters.
typedef struct esp_now_peer_num esp_now_peer_num_t
    Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
    Callback function of receiving ESPNOW data.

    Parameters
    • mac_addr: peer MAC address
    • data: received data
    • data_len: length of received data
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
    Callback function of sending ESPNOW data.

    Parameters
    • mac_addr: peer MAC address
    • status: status of sending ESPNOW data (succeed or fail)

Enumerations
enum esp_now_send_status_t
    Status of sending ESPNOW data .
Chapter 2. API Reference

Values:

**ESP_NOW_SEND_SUCCESS** = 0
Send ESPNOW data successfully

**ESP_NOW_SEND_FAIL**
Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![ESP-WIFI-MESH Software Stack Diagram](image)

**System Events** An application interfaces with ESP-WIFI-MESH via ESP-WIFI-MESH Events. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The **mesh_event_id_t** defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as **MESH_EVENT_PARENT_CONNECTED** and **MESH_EVENT_CHILD_CONNECTED** to indicate when a node can begin transmitting data upstream and down-
Chapter 2. API Reference

stream respectively. Likewise, IP_EVENT_STA_GOT_IP and IP_EVENT_STA_LOST_IP can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, user’s should not call Wi-Fi APIs after esp_mesh_start() is called, and before esp_mesh_stop() is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling tcpip_adapter_init(). In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.
After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

**Initialize Mesh**  The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_,
                                         event_handler, NULL));
```

**Configuring an ESP-WIFI-MESH Network**  ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
```
Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking  Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

```
<table>
<thead>
<tr>
<th>Node Type</th>
<th>Effect of Enabling Self Organized Networking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mesh Router</td>
<td>Maintain current Wi-Fi state.</td>
</tr>
<tr>
<td>Soft AP</td>
<td>Maintain current Wi-Fi state.</td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Maintain current Wi-Fi state.</td>
</tr>
<tr>
<td>Mesh Client</td>
<td>Maintain current Wi-Fi state.</td>
</tr>
<tr>
<td>Mesh Router</td>
<td>Maintain current Wi-Fi state.</td>
</tr>
</tbody>
</table>
```
Chapter 2. API Reference

### Select Parent

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
                |              | • Nodes previously scanning for a parent nodes will stop scanning. Call \textit{esp\_mesh\_connect()} to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
                |              | • A root node disconnected from router will need to call \textit{esp\_mesh\_connect()} to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
                |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of \textit{esp\_mesh\_set\_self\_organized()} which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call \textit{esp\_wifi\_scan\_start()} whilst using...
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router

Application Examples   ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

```c
esp_err_t esp_mesh_init (void)
```
Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Return**

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_deinit (void)
```
Mesh de-initialization.

- Release resources and stop the mesh

Return
Chapter 2. API Reference

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_start (void)
```

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention**
This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

```c
esp_err_t esp_mesh_stop (void)
```

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention**
This API is not reentrant.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

**Parameters**
- [in] to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination.
  This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
• [in] data: pointer to a sending mesh packet
  – Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  – Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  – Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
• [in] flag: bitmap for data sent
  – Speed up the route search
    ∗ If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    ∗ If the packet is to an internal device, MESH_DATA_P2P should be set.
    ∗ If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    ∗ If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  – Specify whether this API is block or non-block, block by default
    ∗ If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
    – In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
• [in] opt: options
  – In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  – Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
• [in] opt_count: option count
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)
```
Set blocking time of esp_mesh_send()

**Attention**
This API shall be called before mesh is started.

**Return**
- ESP_OK

**Parameters**
- [in] time_ms: blocking time of esp_mesh_send(), unit:ms

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```
Receive a packet targeted to self over the mesh network.

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention**
Mesh RX queue should be checked regularly to avoid running out of memory.
- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

**Parameters**
- [out] from: the address of the original source of the packet
- [out] data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters
• [out] opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address
• [in] opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int* flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending into DS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() hasn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention  This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters
• [out] from: the address of the original source of the packet
• [out] to: the address contains remote IP address and port (IPv4:PORT)
• [out] data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
• [out] opt: options desired to receive
• [in] opt_count: option count desired to receive

esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)

Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots
than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- [in] config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

Get mesh stack configuration.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [out] config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [in] router: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```

Get router configuration.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [out] router: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**

- [in] id: pointer to mesh network ID

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

Get mesh network ID.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [out] id: pointer to mesh network ID
**esp_err_t esp_mesh_set_type(mesh_type_t type)**

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] type: device type

**mesh_type_t esp_mesh_get_type(void)**

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** mesh type

**esp_err_t esp_mesh_set_max_layer(int max_layer)**

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] max_layer: max layer value

**int esp_mesh_get_max_layer(void)**

Get max layer value.

**Return** max layer value

**esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)**

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] pwd: pointer to the password
- [in] len: password length

**esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)**

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] authmode: authentication mode
Chapter 2. API Reference

```c
wifi_auth_mode_t esp_mesh_get_ap_authmode (void)
Get mesh softAP authentication mode.

Return authentication mode

esp_err_t esp_mesh_set_ap_connections (int connections)
Set mesh max connection value.

• Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [in] connections: the number of max connections

int esp_mesh_get_ap_connections (void)
Get mesh max connection configuration.

Return the number of mesh max connections

int esp_mesh_get_non_mesh_connections (void)
Get non-mesh max connection configuration.

Return the number of non-mesh max connections

int esp_mesh_get_layer (void)
Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return layer value

esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)
Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] bssid: pointer to parent BSSID

bool esp_mesh_is_root (void)
Return whether the device is the root node of the network.

Return true/false

esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)
Enable/disable self-organized networking.

• Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
• Self-organized networking is enabled by default.
• If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] enable: enable or disable self-organized networking
• [in] select_parent: Only valid when self-organized networking is enabled.
  – if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.
```
Chapter 2. API Reference

bool esp_mesh_get_self_organized(void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root(const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

Parameters
• [in] vote: vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is_rc_specified shall be false.
  – Field attempts shall be at least 15 times.
• [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage(float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage(void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)
Set mesh softAP associate expired time (default:10 seconds)

• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] seconds: the expired time
Chapter 2. API Reference

int esp_mesh_get_ap_assoc_expire (void)
Get mesh softAP associate expired time.

Return seconds

int esp_mesh_get_total_node_num (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.
Return total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
Get routing table of this device’s sub-network (including itself)

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] mac: pointer to routing table
• [in] len: routing table size(in bytes)
• [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
Post the toDS state to the mesh stack.

Attention This API is only for the root.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the TX pending

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the RX pending

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.

Return the number of upQ for a certain address

Parameters
• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize (int qsize)
Set the number of queue.

Attention This API shall be called before mesh is started.
Return
  • ESP_OK
  • ESP_FAIL

Parameters
  • [in] qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize (void)
  Get queue size.

Return the number of queue

esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
  Set whether allow more than one root existing in one network.

Return
  • ESP_OK
  • ESP_WIFI_ERR_NOT_INIT
  • ESP_WIFI_ERR_NOT_START

Parameters
  • [in] allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed (void)
  Check whether allow more than one root to exist in one network.

Return true/false

esp_err_t esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
  Set group ID addresses.

Return
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

Parameters
  • [in] addr: pointer to new group ID addresses
  • [in] num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
  Delete group ID addresses.

Return
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

Parameters
  • [in] addr: pointer to deleted group ID address
  • [in] num: the number of group ID addresses

int esp_mesh_get_group_num (void)
  Get the number of group ID addresses.

Return the number of group ID addresses

esp_err_t esp_mesh_get_group_list (mesh_addr_t *addr, int num)
  Get group ID addresses.

Return
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

Parameters
  • [out] addr: pointer to group ID addresses
  • [in] num: the number of group ID addresses

bool esp_mesh_is_my_group (const mesh_addr_t *addr)
  Check whether the specified group address is my group.

Return true/false
**`esp_err_t esp_mesh_set_capacity_num (int num)`**
Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- `[in]` **num**: mesh network capacity

**`int esp_mesh_get_capacity_num (void)`**
Get mesh network capacity.

**Return** mesh network capacity

**`esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)`**
Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return** ESP_OK

**Parameters**
- `[in]` **crypto_funcs**: crypto functions for mesh IE
  - If `crypto_funcs` is set to NULL, mesh IE is no longer encrypted.

**`esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)`**
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return** ESP_OK

**Parameters**
- `[in]` **key**: ASCII crypto key
- `[in]` **len**: length in bytes, range:8~64

**`esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)`**
Get mesh IE crypto key.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- `[out]` **key**: ASCII crypto key
- `[in]` **len**: length in bytes, range:8~64

**`esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)`**
Set delay time before starting root healing.

**Return** ESP_OK

**Parameters**
- `[in]` **delay_ms**: delay time in milliseconds

**`int esp_mesh_get_root_healing_delay (void)`**
Get delay time before network starts root healing.

**Return** delay time in milliseconds

**`esp_err_t esp_mesh_fix_root (bool enable)`**
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.
Chapter 2. API Reference

Return
- ESP_OK

Parameters
- [in] enable: enable or not

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.
- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

Parameters
- [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise
    the device will never find this specified parent.
- [in] parent_mesh_id: parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- [in] my_type: mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then
    my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- [in] my_layer: mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer
    has the ability to extend the network.

esp_err_t esp_mesh_scan_get_ap_ie_len (int *len)
Get mesh networking IE length of one AP.

Return
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters
- [out] len: mesh networking IE length

esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)
Get AP record.

Attention Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time.
See “manual_networking” example.

Return
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters
- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP
Chapter 2. API Reference

`esp_err_t esp_mesh_flush_upstream_packets(void)`
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Return

- ESP_OK

`esp_err_t esp_mesh_get_subnet_nodes_num(const mesh_addr_t *child_mac, int *nodes_num)`
Get the number of nodes in the subnet of a specific child.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_get_subnet_nodes_list(const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)`
Get nodes in the subnet of a specific child.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_disconnect(void)`
Disconnect from current parent.

Return

- ESP_OK

`esp_err_t esp_mesh_connect(void)`
Connect to current parent.

Return

- ESP_OK

`esp_err_t esp_mesh_flush_scan_result(void)`
Flush scan result.

Return

- ESP_OK

`esp_err_t esp_mesh_switch_channel(const uint8_t *new_bssid, int csa_newchan, int csa_count)`
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

Return

- ESP_OK

Parameters

- [in] new_bssid: the new router BSSID if the router changes
- [in] csa_newchan: the new channel number to which the whole network is moving
- [in] csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

`esp_err_t esp_mesh_get_router_bssid(uint8_t *router_bssid)`
Get the router BSSID.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

Parameters

- [out] router_bssid: pointer to the router BSSID

int64_t esp_mesh_get_tsf_time (void)
Get the TSF time.

Return

- the TSF time

esp_err_t esp_mesh_set_topology (esp_mesh_topology_t topo)
Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_mesh_topology_t esp_mesh_get_topology (void)
Get mesh topology.

Return

- MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t esp_mesh_enable_ps (void)
Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t esp_mesh_disable_ps (void)
Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool esp_mesh_is_ps_enabled (void)
Check whether the mesh Power Save function is enabled.

Return true/false

bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)
Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.

If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.

If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention  This API can be called at any time after mesh is started.

Return
  • ESP_OK
  • ESP_FAIL

Parameters
  • [in] dev_duty: device duty cycle
  • [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Return
  • ESP_OK

Parameters
  • [out] dev_duty: device duty cycle
  • [out] dev_duty_type: device PS duty cycle type

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

• The range of nwk_duty values is 1 to 100. The default value is 10.
• nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
• duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
• duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
• Only the root can set duration_mins to (-1).
• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
• The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
• A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention  This API can be called at any time after mesh is started.

• In self-organized network, if this API is called before mesh is started in all devices, (1) nwk_duty shall be set to the same value for all devices; (2) duration_mins shall be set to (-1); (3) applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
• If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
• After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
  • ESP_OK
  • ESP_FAIL

Parameters
  • [in] nwk_duty: network duty cycle
  • [in] duration_mins: duration (unit: minutes)
• [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**Return**
- ESP_OK

**Parameters**
- [out] nwk_duty: current network duty cycle
- [out] duration_mins: the duration of current nwk_duty
- [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
int esp_mesh_get_running_active_duty_cycle()
```

Get the running active duty cycle.

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

**Return**
- ESP_OK

**Parameters**
- [in] fwd_times: the times of forwarding duty signaling packets

**Unions**

```c
union mesh_addr_t
```

> #include <esp_mesh.h> Mesh address.

**Public Members**

- `uint8_t addr[6]`
  - mac address

```c
union mesh_event_info_t
```

> #include <esp_mesh.h> Mesh event information.

**Public Members**

- `mesh_event_channel_switch_t channel_switch`
  - channel switch

- `mesh_event_child_connected_t child_connected`
  - child connected
Chapter 2. API Reference

mesh_event_child_disconnected_t  
child_disconnected

mesh_event_routing_table_change_t  
routing_table

mesh_event_connected_t  
connected

mesh_event_disconnected_t  
disconnected

mesh_event_no_parent_found_t  
no_parent

mesh_event_layer_change_t  
layer_change

mesh_event_toDS_state_t  
toDS_state

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to MESH_TODS_REACHABLE.

mesh_event_vote_started_t  
vote_started

mesh_event_root_address_t  
root_addr

mesh_event_root_switch_req_t  
switch_req

mesh_event_root_conflict_t  
root_conflict

mesh_event_root_fixed_t  
root_fixed

mesh_event_scan_done_t  
scan_done

mesh_event_network_state_t  
network_state

network state, such as whether current mesh network has a root.

mesh_event_find_network_t  
find_network

network found that can join

mesh_event_router_switch_t  
router_switch

new router information

mesh_event_ps_duty_t  
ps_duty

PS duty information

union mesh_rc_config_t

#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr

a new root address specified by users for API esp_mesh_waive_root()
Chapter 2. API Reference

Structures

struct mip_t
  IP address and port.

Public Members

ip4_addr_t ip4
  IP address

uint16_t port
  port

struct mesh_event_channel_switch_t
  Channel switch information.

Public Members

uint8_t channel
  new channel

struct mesh_event_connected_t
  Parent connected information.

Public Members

wifi_event_sta_connected_t connected
  parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
  layer

uint8_t duty
  parent duty

struct mesh_event_no_parent_found_t
  No parent found information.

Public Members

int scan_times
  scan times being through

struct mesh_event_layer_change_t
  Layer change information.

Public Members

uint16_t new_layer
  new layer

struct mesh_event_vote_started_t
  vote started information

Public Members

int reason
  vote reason, vote could be initiated by children or by the root itself
Chapter 2. API Reference

int attempts
max vote attempts before stopped

mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
find a mesh network that this device can join

Public Members

uint8_t channel
channel number of the new found network

uint8_t router_bssid[6]
router BSSID

struct mesh_event_root_switch_req_t
Root switch request information.

Public Members

int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
the address of root switch requester

struct mesh_event_root_conflict_t
Other powerful root address.

Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value

struct mesh_event_root_fixed_t
Root fixed.
Public Members

bool is_fixed
status

struct mesh_event_scan_done_t
Scan done event information.

Public Members

uint8_t number
the number of APs scanned

struct mesh_event_network_state_t
Network state information.

Public Members

bool is_rootless
whether current mesh network has a root

struct mesh_event_ps_duty_t
PS duty information.

Public Members

uint8_t duty
parent or child duty

mesh_event_child_connected_t child_connected
child info

struct mesh_opt_t
Mesh option.

Public Members

uint8_t type
option type

uint16_t len
option length

uint8_t* val
option value

struct mesh_data_t
Mesh data for esp_mesh_send() and esp_mesh_recv()
Chapter 2. API Reference

`mesh_tos_f`  
data type of service

**struct mesh_router_t**  
Router configuration.

**Public Members**

- `uint8_t ssid[32]`  
  SSID
- `uint8_t ssid_len`  
  length of SSID
- `uint8_t bssid[6]`  
  BSSID, if this value is specified, users should also specify “allow_router_switch”.
- `uint8_t password[64]`  
  password
- `bool allow_router_switch`  
  if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**  
Mesh softAP configuration.

**Public Members**

- `uint8_t password[64]`  
  mesh softAP password
- `uint8_t max_connection`  
  max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections
- `uint8_t nonmesh_max_connection`  
  max non-mesh connections

**struct mesh_cfg_t**  
Mesh initialization configuration.

**Public Members**

- `uint8_t channel`  
  channel, the mesh network on
- `bool allow_channel_switch`  
  if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

- `mesh_addr_t mesh_id`  
  mesh network identification
- `mesh_router_t router`  
  router configuration
- `mesh_ap_cfg_t mesh_ap`  
  mesh softAP configuration
**const** mesh_crypto_funcs_t *crypto_funcs

crypto functions

**struct** mesh_vote_t

Vote.

**Public Members**

float **percentage**
volunteer percentage threshold for approval of being a root

bool **is_rc_specified**
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make

**struct** mesh_rc_config_t **config**
vote address configuration

**struct** mesh_tx_pending_t

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

int **to_parent**
to parent queue

int **to_parent_p2p**
to parent (P2P) queue

int **to_child**
to child queue

int **to_child_p2p**
to child (P2P) queue

int **mgmt**
management queue

int **broadcast**
broadcast and multicast queue

**struct** mesh_rx_pending_t

The number of packets available in the queue waiting to be received by applications.

**Public Members**

int **toDS**
to external DS

int **toSelf**
to self

**Macros**

**MESH_ROOT_LAYER**
root layer value

**MESH_MTU**
max transmit unit(in bytes)

**MESH_MPS**
max payload size(in bytes)
ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured

ESP_ERR_MESH_NOT_START
    mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
    not supported yet

ESP_ERR_MESH_NOT_ALLOWED
    operation is not allowed

ESP_ERR_MESH_NO_MEMORY
    out of memory

ESP_ERR_MESH_ARGUMENT
    illegal argument

ESP_ERR_MESH_EXCEED_MTU
    packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
    timeout

ESP_ERR_MESH_DISCONNECTED
    disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
    queue fail

ESP_ERR_MESH_QUEUE_FULL
    queue full

ESP_ERR_MESH_NO_PARENT_FOUND
    no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
    no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
    no option found

ESP_ERR_MESH_OPTION_UNKNOWN
    unknown option

ESP_ERR_MESH_XON_NO_WINDOW
    no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
    low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
    discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
    discard the packet

ESP_ERR_MESH_VOTING
    vote in progress

ESP_ERR_MESH_XMIT
    XMIT
Chapter 2. API Reference

**ESP_ERR_MESH_QUEUE_READ**
error in reading queue

**ESP_ERR_MESH_PS**
mesh PS is not specified as enable or disable

**ESP_ERR_MESH_RECV_RELEASE**
release esp_mesh_recv_toDS

**MESH_DATA_ENC**
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

**MESH_DATA_P2P**
point-to-point delivery over the mesh network

**MESH_DATA_FROMDS**
receive from external IP network

**MESH_DATA_TODS**
identify this packet is target to external IP network

**MESH_DATA_NONBLOCK**
esp_mesh_send() non-block

**MESH_DATA_DROP**
in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH_DATA_GROUP**
identify this packet is target to a group address

**MESH_OPT_SEND_GROUP**
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

**MESH_OPT_RECV_DS_ADDR**
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

**MESH_ASSOC_FLAG_VOTE_IN_PROGRESS**
Flag of mesh networking IE.
vote in progress

**MESH_ASSOC_FLAG_NETWORK_FREE**
no root in current network

**MESH_ASSOC_FLAG_ROOTS_FOUND**
root conflict is found

**MESH_ASSOC_FLAG_ROOT_FIXED**
fixed root

**MESH_PS_DEVICE_DUTY_REQUEST**
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a
network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**
MESH_INIT_CONFIG_DEFAULT()

**Type Definitions**

typedef mesh_addr_t mesh_event_root_address_t
Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
New router information.

**Enumerations**

enum mesh_event_id_t
Enumerated list of mesh event id.

Values:

- MESH_EVENT_STARTED
  mesh is started
- MESH_EVENT_STOPPED
  mesh is stopped
- MESH_EVENT_CHANNEL_SWITCH
  channel switch
- MESH_EVENT_CHILD_CONNECTED
  a child is connected on softAP interface
- MESH_EVENT_CHILD_DISCONNECTED
  a child is disconnected on softAP interface
- MESH_EVENT_ROUTING_TABLE_ADD
  routing table is changed by adding newly joined children
- MESH_EVENT_ROUTING_TABLE_REMOVE
  routing table is changed by removing leave children
- MESH_EVENT_PARENT_CONNECTED
  parent is connected on station interface
- MESH_EVENT_PARENT_DISCONNECTED
  parent is disconnected on station interface
- MESH_EVENT_NO_PARENT_FOUND
  no parent found
- MESH_EVENT_LAYER_CHANGE
  layer changes over the mesh network
- MESH_EVENT_TODS_STATE
  state represents whether the root is able to access external IP network
- MESH_EVENT_VOTE_STARTED
  the process of voting a new root is started either by children or by the root
- MESH_EVENT_VOTE_STOPPED
  the process of voting a new root is stopped
Chapter 2. API Reference

**MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

**MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

**MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

**MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

**MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

**MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH_EVENT_PS_PARENT_DUTY**
parent duty

**MESH_EVENT_PS_CHILD_DUTY**
child duty

**MESH_EVENT_PS_DEVICE_DUTY**
device duty

**MESH_EVENT_MAX**
enum mesh_type_t
Device type.

*Values:*

**MESH_IDLE**
hasn’t joined the mesh network yet

**MESH_ROOT**
the only sink of the mesh network. Has the ability to access external IP network

**MESH_NODE**
intermediate device. Has the ability to forward packets over the mesh network

**MESH_LEAF**
has no forwarding ability

**MESH_STA**
connect to router with a standalone Wi-Fi station mode, no network expansion capability
enum mesh_proto_t
    Protocol of transmitted application data.
    Values:
    MESH_PROTO_BIN
        binary
    MESH_PROTO_HTTP
        HTTP protocol
    MESH_PROTO_JSON
        JSON format
    MESH_PROTO_MQTT
        MQTT protocol
    MESH_PROTO_AP
        IP network mesh communication of node’s AP interface
    MESH_PROTO_STA
        IP network mesh communication of node’s STA interface

enum mesh_tos_t
    For reliable transmission, mesh stack provides three type of services.
    Values:
    MESH_TOS_P2P
        provide P2P (point-to-point) retransmission on mesh stack by default
    MESH_TOS_E2E
        provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
    MESH_TOS_DEF
        no retransmission on mesh stack

enum mesh_vote_reason_t
    Vote reason.
    Values:
    MESH_VOTE_REASON_ROOT_INITIATED = 1
        vote is initiated by the root
    MESH_VOTE_REASON_CHILD_INITIATED
        vote is initiated by children

enum mesh_disconnect_reason_t
    Mesh disconnect reason code.
    Values:
    MESH_REASON_CYCLIC = 100
        cyclic is detected
    MESH_REASON_PARENT_IDLE
        parent is idle
    MESH_REASON_LEAF
        the connected device is changed to a leaf
    MESH_REASON_DIFF_ID
        in different mesh ID
    MESH_REASON_ROOTS
        root conflict is detected
    MESH_REASON_PARENT_STOPPED
        parent has stopped the mesh
MESH_REASON_SCAN_FAIL
scan fail
MESH_REASON_IE_UNKNOWN
unknown IE
MESH_REASON_WAIVE_ROOT
waive root
MESH_REASON_PARENT_WORSE
parent with very poor RSSI
MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent
MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
Mesh topology.
Values:
MESH_TOPO_TREE
tree topology
MESH_TOPO_CHAIN
chain topology

enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)
Values:
MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network
MESH_TODS_REACHABLE
the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check Provisioning API.

Application Example  Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File
- components/esp_wifi/include/esp_smartconfig.h
Chapter 2. API Reference

Functions

**const char* esp_smartconfig_get_version (void)**
Get the version of SmartConfig.

Return
- SmartConfig version const char.

**esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)**
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device
sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
- ESP_OK: succeed
- others: fail

Parameters
- config: pointer to smartconfig start configure structure

**esp_err_t esp_smartconfig_stop (void)**
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

**esp_err_t esp_esptouch_set_timeout (uint8_t time_s)**
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return
- ESP_OK: succeed
- others: fail

Parameters
- time_s: range 15s~255s, offset:45s.

**esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)**
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

Parameters
- type: Choose from the smartconfig_type_t.

**esp_err_t esp_smartconfig_fast_mode (bool enable)**
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
- ESP_OK: succeed
- others: fail

Parameters
- enable: false-disable(default); true-enable;

**esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)**
Get reserved data of ESPTouch v2.

Return
- ESP_OK: succeed
Chapter 2. API Reference

- others: fail

**Parameters**

- `rvd_data`: reserved data
- `len`: length of reserved data

**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
```

Argument structure for `SC_EVENT_GOT_SSID_PSWD` event

**Public Members**

- `uint8_t ssid[32]`
  SSID of the AP. Null terminated string.
- `uint8_t password[64]`
  Password of the AP. Null terminated string.
- `bool bssid_set`
  Whether set MAC address of target AP or not.
- `uint8_t bssid[6]`
  MAC address of target AP.
- `smartconfig_type_t type`
  Type of smartconfig (ESPTouch or AirKiss).
- `uint8_t token`
  Token from cellphone which is used to send ACK to cellphone.
- `char *esp_touch_v2_key`
  ESPTouch v2 crypt key, len should be 16.

**Macros**

`SMARTCONFIG_START_CONFIG_DEFAULT()`

**Enumerations**

```c
enum smartconfig_type_t
```

**Values**:

- `SC_TYPE_ESPTOUCH = 0`
  protocol: ESPTouch
- `SC_TYPE_AIRKISS`
  protocol: AirKiss
- `SC_TYPE_ESPTOUCH_AIRKISS`
  protocol: ESPTouch and AirKiss

Espressif Systems

Release v5.0-dev-1712-g4a553510b7

Submit Document Feedback
Chapter 2. API Reference

**SC_TYPE_ESPTOUCH_V2**
protocol: ESPTouch v2

enum smartconfig_event_t
Smartconfig event declarations

Values:

**SC_EVENT_SCAN_DONE**
ESP32 station smartconfig has finished to scan for APs

**SC_EVENT_FOUND_CHANNEL**
ESP32 station smartconfig has found the channel of the target AP

**SC_EVENT_GOT_SSID_PSWD**
ESP32 station smartconfig got the SSID and password

**SC_EVENT_SEND_ACK_DONE**
ESP32 station smartconfig has sent ACK to cellphone

---

**Wi-Fi**

**Introduction**  The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Station/AP-coexistence mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples**  The \texttt{wifi} directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple \texttt{esp-idf-template} application to demonstrate a minimal IDF project structure.

**API Reference**

**Header File**

- components/esp_wifi/include/esp_wifi.h

**Functions**

\texttt{esp_err_t esp_wifi_init(const wifi_init_config_t *config)}
Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention**  1. This API must be called before all other WiFi API can be called
2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into \texttt{wifi_init_config_t} in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of \texttt{wifi_init_config_t} should always be WIFI_INIT_CONFIG_MAGIC!

**Return**

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

**Parameters**
• config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

```
esp_err_t esp_wifi_deinit(void)
```

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```
esp_err_t esp_wifi_set_mode(wifi_mode_t mode)
```

Set the WiFi operating mode.

| Set the WiFi operating mode as **station**, **soft-AP** or **station+soft-AP**, The default mode is **station** mode. |

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

**Parameters**
- mode: WiFi operating mode

```
esp_err_t esp_wifi_get_mode(wifi_mode_t *mode)
```

Get current operating mode of WiFi.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] mode: store current WiFi mode

```
esp_err_t esp_wifi_start(void)
```

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

```
esp_err_t esp_wifi_stop(void)
```

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```
esp_err_t esp_wifi_restore(void)
```

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth
- esp_wifi_set_protocol
- esp_wifi_set_config related
- esp_wifi_set_mode
API Reference

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_connect (void)
```
Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between
ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort
scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-
connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise
the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnc-
tion after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

```c
esp_err_t esp_wifi_disconnect (void)
```
Disconnect the ESP32 WiFi station from the AP.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_clear_fast_connect (void)
```
Currently this API is just an stub API.

Return
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_wifi_deauth_sta (uint16_t aid)
```
deauthenticate all stations or associated id equals to aid

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id
  is aid

```c
esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)
```
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the
will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause
the memory to be freed once the scan is done
Attention The values of maximum active scan time and passive scan time per channel are limited to 1500
milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
Chapter 2. API Reference

- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters
- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

```c
esp_err_t esp_wifi_scan_stop (void)
```

Stop the scan in process.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

```c
esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)
```

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- [out] number: store number of APIs found in last scan

```c
esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
```

Get AP list found in last scan.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

Parameters
- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: wifi_ap_record_t array to hold the found APs

```c
esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

Parameters
- ap_info: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1r in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

```c
esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)
```

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Return ESP_OK: succeed

Parameters
- type: power save type
**Chapter 2. API Reference**

```c
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.
**Return** ESP_OK: succeed

**Parameters**
- [out] type: store current power save type
```

```c
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode
**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap
```

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx
```

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth
```

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)

Set primary/secondary channel of ESP32.

**Attention**
1. This API should be called after esp_wifi_start()
2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

esp_err_t esp_wifi_get_channel(uint8_t* primary, wifi_second_chan_t* second)

Get the primary/secondary channel of ESP32.

**Attention**
1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: store current primary channel
- [out] second: store current second channel

esp_err_t esp_wifi_set_country(const wifi_country_t* country)

Configure country info

**Attention**
1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.
2. The default country is CHINA {.cc=" CN" , .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}
3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=" USA" , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=" JP" , .schan=1, .nchan=14} then the country info that will be used is {.cc=" JP" , .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=" US" , .schan=1, .nchan=11} in the example.
4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.
5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
6. The country configuration is stored into flash.
7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- country: the configured country info

esp_err_t esp_wifi_get_country(wifi_country_t* country)

Get the current country info

**Return**
**Chapter 2: API Reference**

**ESP_OK**: succeed

**ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

**ESP_ERR_INVALID_ARG**: invalid argument

### Parameters

- `country`: country info

**esp_err_t esp_wifi_set_mac**(wifi_interface_t ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by esp_wifi_init
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `others`: refer to error codes in esp_err.h

### Parameters

- `ifx`: interface
- `mac`: the MAC address

**esp_err_t esp_wifi_get_mac**(wifi_interface_t ifx, uint8_t mac[6])

Get mac of specified interface.

### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by esp_wifi_init
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface

### Parameters

- `ifx`: interface
- `[out] mac`: store mac of the interface ifx

**esp_err_t esp_wifi_set_promiscuous_rx_cb**(wifi_promiscuous_cb_t cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by esp_wifi_init

### Parameters

- `cb`: callback

**esp_err_t esp_wifi_set_promiscuous**(bool en)

Enable the promiscuous mode.

### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by esp_wifi_init

### Parameters

- `en`: false - disable, true - enable

**esp_err_t esp_wifi_get_promiscuous**(bool *en)

Get the promiscuous mode.

### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by esp_wifi_init
- `ESP_ERR_INVALID_ARG`: invalid argument
Parameters

- [out] en: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```
Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**

- filter: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)
```
Get the promiscuous filter.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
```
Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**

- filter: the subtype of the control packet filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
```
Get the subtype filter of the control packet in promiscuous mode.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

```c
esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```
Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

**Parameters**

- interface: interface
conf: station or soft-AP configuration

```c
esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)
```

Get configuration of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters

- interface: interface
- [out] conf: station or soft-AP configuration

```c
esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)
```

Get STAs associated with soft-AP.

Attention

SSC only API

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters

- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```

Get AID of STA connected with soft-AP.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters

- mac: STA’s mac address
- [out] aid: Store the AID corresponding to STA mac

```c
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

Attention

1. The default value is WIFI_STORAGE_FLASH

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- storage: storage type

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
• ESP_ERR_NO_MEM: Out of memory

Parameters
• enable: If true, specified IE is enabled. If false, specified IE is removed.
• type: Information Element type. Determines the frame type to associate with the IE.
• idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
• vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```
Register Vendor-Specific Information Element monitoring callback.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• cb: Callback function
• ctx: Context argument, passed to callback function.

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```
Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.
Attention 2. The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.
Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
Attention 5. Relationship between set value and actual value. As follows: [set value range, actual value] = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

Parameters
• power: Maximum WiFi transmitting power.

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```
Get maximum transmitting power after WiFi start.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument

Parameters
• power: Maximum WiFi transmitting power, unit is 0.25dBm.

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```
Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
Attention 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• power: Maximum WiFi transmitting power, unit is 0.25dBm.
• mask: WiFi event mask.

```c
esp_err_t esp_wifi_get_event_mask(uint32_t *mask)
```

Get mask of WiFi events.

**Return**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

• mask: WiFi event mask.

```c
esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**

• ESP_OK: success
• ESP_ERR_WIFI_IF: Invalid interface
• ESP_ERR_INVALID_ARG: Invalid parameter
• ESP_ERR_WIFI_NO_MEM: out of memory

**Parameters**

• ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
• buffer: raw ieee80211 buffer
• len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
• en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb(wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

**Return**

• ESP_OK: succeed

**Parameters**

• cb: callback
• ctx: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Return**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
• ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

• config: configuration

```c
esp_err_t esp_wifi_set_csi(bool en)
```

Enable or disable CSI.
return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- `en`: true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)`

Set antenna GPIO configuration.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

**Parameters**

- `config`: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)`

Get current antenna GPIO configuration.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**Parameters**

- `config`: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`

Set antenna configuration.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

**Parameters**

- `config`: Antenna configuration.

`esp_err_t esp_wifi_get_ant(const wifi_ant_config_t *config)`

Get current antenna configuration.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**Parameters**

- `config`: Antenna configuration.

`int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)`

Get the TSF time in Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention**

Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Return**

0 or the TSF time

**Parameters**

- `interface`: The interface whose tsf_time is to be retrieved.

`esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)`

Set the inactive time of the ESP32 STA or AP.
Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

```c
int esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t *sec)
```
Get inactive time of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

```c
int esp_wifi_statis_dump(uint32_t modules)
```
Dump WiFi statistics.

Return
- ESP_OK: succeed
- others: failed

Parameters
- modules: statistic modules to be dumped

```c
int esp_wifi_set_rssi_threshold(int32_t rssi)
```
Set RSSI threshold below which APP will get an event.

Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- rssi: threshold value in dbm between -100 to 0

```c
int esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```
Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention Use this API only in Station mode

Return
- ESP_OK: succeed
- others: failed

Parameters
- cfg: FTM Initiator session configuration

```c
int esp_wifi_ftm_end_session(void)
```
End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Return
• ESP_OK: succeed
• others: failed

`esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)`
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Return**
• ESP_OK: succeed
• others: failed

**Parameters**
• offset_cm: T1 Offset to be added in centimeters

`esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)`
Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**
• ESP_OK: succeed
• others: failed

**Parameters**
• ifx: Interface to be configured.
• disable: true means disable 11b rate while false means enable 11b rate.

`esp_err_t esp_wifi_config_espnnow_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)`
Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
• ESP_OK: succeed
• others: failed

**Parameters**
• ifx: Interface to be configured.
• rate: Phy rate to be configured.

`esp_err_t esp_wifi_set_connectionless_wake_interval(uint16_t interval)`
Set interval for station to wake up periodically at disconnected.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
**Attention** 2. This configuration only work for station mode and disconnected status
**Attention** 3. This configuration would influence nothing until some module configure wake_window
**Attention** 4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**
• interval: how much microsecond would the chip wake up, from 1 to 65535.

`esp_err_t esp_wifi_set_country_code(const char* country, bool ieee80211d_enabled)`
Configure country

**Attention** 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
**Attention** 2. When ieee80211d_enabled is disabled, then the configured country info is used always.
**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
**Attention** 4. The country configuration is stored into flash.
**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
Chapter 2. API Reference

"GR","HK","HR","HU","IE","IN","IS","IT","JP","KR","LI","LT","LU","LV","MT","MX","NL","NO","NZ","PL","PT","RO","SE","SI","SK","TW","US"

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.

Attention 8. The default country is “CN” and iee80211d_enabled is TRUE.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: the configured country ISO code
- iee80211d_enabled: 802.11d is enabled or not

esp_err_t esp_wifi_get_country_code(char *country)
get the current country code

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: country code

esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Return
- ESP_OK: succeed
- others: failed

Parameters
- ifx: Interface to be configured.
- rate: Phy rate to be configured.

Structures

struct wifi_init_config_t
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

system_event_handler_t event_handler
WiFi event handler

wifi_osi_funcs_t *osi_funcs
WiFi OS functions

wpa_crypto_funcs_t wpa_crypto_funcs
WiFi station crypto functions when connect

int static_rx_buf_num
WiFi static RX buffer number

int dynamic_rx_buf_num
WiFi dynamic RX buffer number

int tx_buf_type
WiFi TX buffer type

int static_tx_buf_num
WiFi static TX buffer number
int `dynamic_tx_buf_num`
   WiFi dynamic TX buffer number

int `cache_tx_buf_num`
   WiFi TX cache buffer number

int `csi_enable`
   WiFi channel state information enable flag

int `ampdu_rx_enable`
   WiFi AMPDU RX feature enable flag

int `ampdu_tx_enable`
   WiFi AMPDU TX feature enable flag

int `amsdu_tx_enable`
   WiFi AMSDU TX feature enable flag

int `nvs_enable`
   WiFi NVS flash enable flag

int `nano_enable`
   Nano option for printf/scan family enable flag

int `rx_ba_win`
   WiFi Block Ack RX window size

int `wifi_task_core_id`
   WiFi Task Core ID

int `beacon_max_len`
   WiFi softAP maximum length of the beacon

int `mgmt_sbuf_num`
   WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t `feature_caps`
   Enables additional WiFi features and capabilities

bool `sta_disconnected_pm`
   WiFi Power Management for station at disconnected status

int `magic`
   WiFi init magic number, it should be the last field

**Macros**

`ESP_ERR_WIFI_NOT_INIT`
   WiFi driver was not installed by esp_wifi_init

`ESP_ERR_WIFI_NOT_STARTED`
   WiFi driver was not started by esp_wifi_start

`ESP_ERR_WIFI_NOT_STOPPED`
   WiFi driver was not stopped by esp_wifi_stop

`ESP_ERR_WIFI_IF`
   WiFi interface error

`ESP_ERR_WIFI_MODE`
   WiFi mode error

`ESP_ERR_WIFI_STATE`
   WiFi internal state error

`ESP_ERR_WIFI_CONN`
   WiFi internal control block of station or soft-AP error
Chapter 2. API Reference

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state (RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

WIFI_STATIC_TX_BUFFER_NUM
WIFI_CACHE_TX_BUFFER_NUM
WIFI_DYNAMIC_TX_BUFFER_NUM
WIFI_CSI_ENABLED
WIFI_AMPDU_RX_ENABLED

CONFIGFEATURE_WPA3_SAE_BIT
CONFIGFEATURE_CACHE_TX_BUF_BIT
Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
• buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
• type: promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Parameters
• ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
• type: Information element type, based on frame type received.
• sa: Source 802.11 address.
• vnd_ie: Pointer to the vendor specific element data received.
• rssi: Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information (CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters
• ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
• data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

• components/esp_wifi/include/esp_wifi_types.h

Unions

union wifi_config_t
#include <esp_wifi_types.h>
Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

Structures

struct wifi_country_t
Structure describing WiFi country-based regional restrictions.
Public Members

char cc[3]
    country code string

uint8_t schan
    start channel

uint8_t nchan
    total channel number

int8_t max_tx_power
    This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
    country policy

struct wifi_active_scan_time_t
    Range of active scan times per channel.

Public Members

uint32_t min
    minimum active scan time per channel, units: millisecond

uint32_t max
    maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
    Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t active
    active scan time per channel, units: millisecond.

uint32_t passive
    passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_config_t
    Parameters for an SSID scan.

Public Members

uint8_t *ssid
    SSID of AP

uint8_t *bssid
    MAC address of AP

uint8_t _t channel
    channel, scan the specific channel

bool show_hidden
    enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
    scan type, active or passive
Chapter 2. API Reference

`wifi_scan_time_t`  
scan time per channel

`struct wifi_ap_record_t`  
Description of a WiFi AP.

**Public Members**

- `uint8_t bssid[6]`  
  MAC address of AP
- `uint8_t ssid[33]`  
  SSID of AP
- `uint8_t primary`  
  channel of AP
- `wifi_second_chan_t second`  
  secondary channel of AP
- `int8_t rssi`  
  signal strength of AP
- `wifi_auth_mode_t authmode`  
  authmode of AP
- `wifi_cipher_type_t pairwise_cipher`  
  pairwise cipher of AP
- `wifi_cipher_type_t group_cipher`  
  group cipher of AP
- `wifi_ant_t ant`  
  antenna used to receive beacon from AP
- `uint32_t phy_11b : 1`  
  bit: 0 flag to identify if 11b mode is enabled or not
- `uint32_t phy_11g : 1`  
  bit: 1 flag to identify if 11g mode is enabled or not
- `uint32_t phy_11n : 1`  
  bit: 2 flag to identify if 11n mode is enabled or not
- `uint32_t phy_lr : 1`  
  bit: 3 flag to identify if low rate is enabled or not
- `uint32_t wps : 1`  
  bit: 4 flag to identify if WPS is supported or not
- `uint32_t ftm_responder : 1`  
  bit: 5 flag to identify if FTM is supported in responder mode
- `uint32_t ftm_initiator : 1`  
  bit: 6 flag to identify if FTM is supported in initiator mode
- `uint32_t reserved : 25`  
  bit: 7..31 reserved
- `wifi_country_t country`  
  country information of AP

`struct wifi_scan_threshold_t`  
Structure describing parameters for a WiFi fast scan.
Public Members

`int8_t rssi`
The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`
The weakest authmode to accept in the fast scan mode

`struct wifi_pmf_config_t`
Configuration structure for Protected Management Frame

Public Members

`bool capable`
Device will always connect in PMF mode if other device also advertizes PMF capability.

`bool required`
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

`struct wifi_ap_config_t`
Soft-AP configuration settings for the ESP32.

Public Members

`uint8_t ssid[32]`
SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

`uint8_t password[64]`
Password of ESP32 soft-AP.

`uint8_t ssid_len`
Optional length of SSID field.

`uint8_t channel`
Channel of ESP32 soft-AP

`wifi_auth_mode_t authmode`
Authmode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

`uint8_t ssid_hidden`
Broadcast SSID or not, default 0, broadcast the SSID

`uint8_t max_connection`
Max number of stations allowed to connect in, default 4, max 10

`uint16_t beacon_interval`
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

`wifi_cipher_type_t pairwise_cipher`
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

`bool ftm_responder`
Enable FTM Responder mode

`wifi_pmf_config_t pmf_cfg`
Configuration for Protected Management Frame
**struct wifi_sta_config_t**

STA configuration settings for the ESP32.

**Public Members**

- `uint8_t ssid[32]`
  
  SSID of target AP.

- `uint8_t password[64]`
  
  Password of target AP.

- `wifi_scan_method_t scan_method`
  
  do all channel scan or fast scan

- `bool bssid_set`
  
  whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

- `uint8_t bssid[6]`
  
  MAC address of target AP

- `uint8_t channel`
  
  channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

- `uint16_t listen_interval`
  
  Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

- `wifi_sort_method_t sort_method`
  
  sort the connect AP in the list by rssi or security mode

- `wifi_scan_threshold_t threshold`
  
  When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

- `wifi_pmf_config_t pmf_cfg`
  
  Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

  - `uint32_t rm_enabled`: 1
    
    Whether Radio Measurements are enabled for the connection

  - `uint32_t btm_enabled`: 1
    
    Whether BSS Transition Management is enabled for the connection

  - `uint32_t mbo_enabled`: 1
    
    Whether MBO is enabled for the connection

  - `uint32_t reserved`: 29
    
    Reserved for future feature set

**struct wifi_sta_info_t**

Description of STA associated with AP.

**Public Members**

- `uint8_t mac[6]`
  
  mac address

- `int8_t rssi`
  
  current average rssi of sta connected

- `uint32_t phy_11b`: 1
  
  bit: 0 flag to identify if 11b mode is enabled or not
**Chapter 2. API Reference**

```c
uint32_t phy_11g : 1
   bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
   bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
   bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child : 1
   bit: 4 flag to identify mesh child

uint32_t reserved : 27
   bit: 5..31 reserved
```

**struct wifi_sta_list_t**

List of stations associated with the ESP32 Soft-AP.

**Public Members**

```c
wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
   station list

int num
   number of stations in the list (other entries are invalid)
```

**struct vendor_ie_data_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

```c
uint8_t element_id
   Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
   Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
   Vendor identifier (OUI).

uint8_t vendor_oui_type
   Vendor-specific OUI type.

uint8_t payload[0]
   Payload. Length is equal to value in ‘length’ field, minus 4.
```

**struct wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

```c
signed rssi : 8
   Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned rate : 5
   PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__ : 1
   reserved
```
unsigned **sig_mode** : 2
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__** : 16
reserved

unsigned **mcs** : 7
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb** : 1
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__** : 16
reserved

unsigned **smoothing** : 1
reserved

unsigned **not_sounding** : 1
reserved

unsigned **__pad3__** : 1
reserved

unsigned **aggregation** : 1
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc** : 2
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding** : 1
Flag is set for 11n packets which are LDPC

unsigned **sgi** : 1
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed **noise_floor** : 8
noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned **ampdu_cnt** : 8
ampdu cnt

unsigned **channel** : 4
primary channel on which this packet is received

unsigned **secondary_channel** : 4
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad4__** : 8
reserved

unsigned **timestamp** : 32
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad5__** : 32
reserved

unsigned **__pad6__** : 31
reserved

unsigned **ant** : 1
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig_len** : 12
length of packet including Frame Check Sequence(FCS)
**Chapter 2. API Reference**

**unsigned __pad7__ : 12**

reserved

**unsigned rx_state : 8**

state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

**Public Members**

`wifi_pkt_rx_ctrl_t rx_ctrl`

metadata header

`uint8_t payload[0]`

Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

**Public Members**

`uint32_t filter_mask`

OR of one or more filter values WIFI_PROMIS_FILTER_*

**struct wifi_csi_config_t**

Channel state information(CSI) configuration type.

**Public Members**

`bool lltf_en`

enable to receive legacy long training field(lltf) data. Default enabled

`bool htltf_en`

enable to receive HT long training field(htltf) data. Default enabled

`bool stbc_htltf2_en`

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

`bool ltf_merge_en`

enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

`bool channel_filter_en`

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

`bool manu_scale`

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

`uint8_t shift`

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi_csi_info_t**

CSI data type.
Public Members

`wifi_pkt_rx_ctrl_t rx_ctrl`
received packet radio metadata header of the CSI data

`uint8_t[6] mac`
source MAC address of the CSI data

`bool first_word_invalid`
first four bytes of the CSI data is invalid or not

`int8_t* buf`
buffer of CSI data

`uint16_t len`
length of CSI data

`struct wifi_ant_gpio_t`
WiFi GPIO configuration for antenna selection.

Public Members

`uint8_t gpio_select : 1`
Whether this GPIO is connected to external antenna switch

`uint8_t gpio_num : 7`
The GPIO number that connects to external antenna switch

`struct wifi_ant_gpio_config_t`
WiFi GPIOs configuration for antenna selection.

Public Members

`wifi_ant_gpio_t gpio_cfg[4]`
The configurations of GPIOs that connect to external antenna switch

`struct wifi_ant_config_t`
WiFi antenna configuration.

Public Members

`wifi_ant_mode_t rx_ant_mode`
WiFi antenna mode for receiving

`wifi_ant_t rx_ant_default`
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

`wifi_ant_mode_t tx_ant_mode`
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

`uint8_t enabled_ant0 : 4`
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

`uint8_t enabled_ant1 : 4`
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

`struct wifi_action_tx_req_t`
Action Frame Tx Request.
Public Members

`wifi_interface_t ifx`
- WiFi interface to send request to

`uint8_t dest_mac[6]`
- Destination MAC address

`bool no_ack`
- Indicates no ack required

`wifi_action_rx_cb_t rx_cb`
- Rx Callback to receive any response

`uint32_t data_len`
- Length of the appended Data

`uint8_t data[0]`
- Appended Data payload

`struct wifi_ftm_initiator_cfg_t`
- FTM Initiator configuration.

Public Members

`uint8_t resp_mac[6]`
- MAC address of the FTM Responder

`uint8_t channel`
- Primary channel of the FTM Responder

`uint8_t frm_count`
- No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0 (No pref), 16, 24, 32, 64)

`uint16_t burst_period`
- Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

`struct wifi_event_sta_scan_done_t`
- Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

`uint32_t status`
- status of scanning APs: 0 — success, 1 - failure

`uint8_t number`
- number of scan results

`uint8_t scan_id`
- scan sequence number, used for block scan

`struct wifi_event_sta_connected_t`
- Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

`uint8_t ssid[32]`
- SSID of connected AP

`uint8_t ssid_len`
- SSID length of connected AP
Chapter 2. API Reference

```
uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP

wifi_auth_mode_t authmode
    authentication mode used by AP

struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
    SSID of disconnected AP

uint8_t ssid_len
    SSID length of disconnected AP

uint8_t bssid[6]
    BSSID of disconnected AP

uint8_t reason
    reason of disconnection

struct wifi_event_sta_authmode_change_t
    Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
    the old auth mode of AP

wifi_auth_mode_t new_mode
    the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
    PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
    Number of AP credentials received

uint8_t ssid[MAX_SSID_LEN]
    SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
    All AP credentials received from WPS handshake
```
struct wifi_event_ap_staconnected_t
Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t * mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t * aid
the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t * mac[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t * aid
the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t * mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t * dlog_token
Dialog Token of the FTM frame

int8_t * rssi
RSSI of the FTM frame received

uint32_t * rtt
Round Trip Time in pSec with a peer
Chapter 2. API Reference

uint64_t \( t_1 \)
Time of departure of FTM frame from FTM Responder in pSec

uint64_t \( t_2 \)
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t \( t_3 \)
Time of departure of ACK from FTM Initiator in pSec

uint64_t \( t_4 \)
Time of arrival of ACK at FTM Responder in pSec

\textbf{struct wifi_event_ftm_report_t}
Argument structure for WIFIEVENT_FTM_REPORT event

\textbf{Public Members}

\texttt{uint8_t peer_mac[6]}
MAC address of the FTM Peer

\texttt{wifi_ftm_status_t status}
Status of the FTM operation

\texttt{uint32_t rtt_raw}
Raw average Round-Trip-Time with peer in Nano-Seconds

\texttt{uint32_t rtt_est}
Estimated Round-Trip-Time with peer in Nano-Seconds

\texttt{uint32_t dist_est}
Estimated one-way distance in Centi-Meters

\texttt{wifi_ftm_report_entry_t *ftm_report_data}
Pointer to FTM Report with multiple entries, should be freed after use

\texttt{uint8_t ftm_report_num_entries}
Number of entries in the FTM Report data

\textbf{struct wifi_event_action_tx_status_t}
Argument structure for WIFIEVENT_ACTION_TX_STATUS event

\textbf{Public Members}

\texttt{wifi_interface_t ifx}
WiFi interface to send request to

\texttt{uint32_t context}
Context to identify the request

\texttt{uint8_t da[6]}
Destination MAC address

\texttt{uint8_t status}
Status of the operation

\textbf{struct wifi_event_roc_done_t}
Argument structure for WIFIEVENT_ROC_DONE event

\textbf{Public Members}

\texttt{uint32_t context}
Context to identify the request
Chapter 2. API Reference

**Macros**

- WIFI_OFFCHAN_TX_REQ
- WIFI_OFFCHAN_TX_CANCEL
- WIFI_ROC_REQ
- WIFI_ROC_CANCEL
- WIFI_PROTOCOL_11B
- WIFI_PROTOCOL_11G
- WIFI_PROTOCOL_11N
- WIFI_PROTOCOL_LR

**ESP_WIFI_MAX_CONN_NUM**
- max number of stations which can connect to ESP32 soft-AP

**WIFI_VENDO_IE_ELEMENT_ID**

- **WIFI_PROMIS_FILTER_MASK_ALL**
  - filter all packets
- **WIFI_PROMIS_FILTER_MASK_MGMT**
  - filter the packets with type of WIFI_PKT_MGMT
- **WIFI_PROMIS_FILTER_MASK_CTRL**
  - filter the packets with type of WIFI_PKT_CTRL
- **WIFI_PROMIS_FILTER_MASK_DATA**
  - filter the packets with type of WIFI_PKT_DATA
- **WIFI_PROMIS_FILTER_MASK_MISC**
  - filter the packets with type of WIFI_PKT_MISC
- **WIFI_PROMIS_FILTER_MASK_DATA_MPDU**
  - filter the MPDU which is a kind of WIFI_PKT_DATA
- **WIFI_PROMIS_FILTER_MASK_DATA_AMPDU**
  - filter the AMPDU which is a kind of WIFI_PKT_DATA
- **WIFI_PROMIS_FILTER_MASK_FCSFAIL**
  - filter the FCS failed packets, do not open it in general

**WIFI_PROMIS_CTRL_FILTER_MASK_ALL**
- filter all control packets
- **WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER**
  - filter the control packets with subtype of Control Wrapper
- **WIFI_PROMIS_CTRL_FILTER_MASK_BAR**
  - filter the control packets with subtype of Block Ack Request
- **WIFI_PROMIS_CTRL_FILTER_MASK_BA**
  - filter the control packets with subtype of Block Ack
- **WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL**
  - filter the control packets with subtype of PS-Poll
- **WIFI_PROMIS_CTRL_FILTER_MASK_RTS**
  - filter the control packets with subtype of RTS
- **WIFI_PROMIS_CTRL_FILTER_MASK_CTS**
  - filter the control packets with subtype of CTS
- **WIFI_PROMIS_CTRL_FILTER_MASK_ACK**
  - filter the control packets with subtype of ACK
- **WIFI_PROMIS_CTRL_FILTER_MASK_CFEND**
  - filter the control packets with subtype of CF-END
**WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK**  
filter the control packets with subtype of CF-END+CF-ACK

**WIFI_EVENT_MASK_ALL**  
mask all WiFi events

**WIFI_EVENT_MASK_NONE**  
mask none of the WiFi events

**WIFI_EVENT_MASK_AP_PROBEREQRECVED**  
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

**MAX_SSID_LEN**

**MAX_PASSPHRASE_LEN**

**MAX_WPS_AP_CRED**

**WIFI_STATIS_BUFFER**

**WIFI_STATIS_RXTX**

**WIFI_STATIS_HW**

**WIFI_STATIS_DIAG**

**WIFI_STATIS_PS**

**WIFI_STATIS_ALL**

**Type Definitions**

typedef int (*_wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)  
The Rx callback function of Action Tx operations.

**Parameters**

- *hdr*: pointer to the IEEE 802.11 Header structure
- *payload*: pointer to the Payload following 802.11 Header
- *len*: length of the Payload
- *channel*: channel number the frame is received on

**Enumerations**

defined enum wifi_mode_t

**Values:**

- **WIFI_MODE_NULL** = 0  
  null mode
- **WIFI_MODE_STA**  
  WiFi station mode
- **WIFI_MODE_AP**  
  WiFi soft-AP mode
- **WIFI_MODE_APSTA**  
  WiFi station + soft-AP mode
- **WIFI_MODE_MAX**

defined enum wifi_interface_t

**Values:**

- **WIFI_IF_STA** = ESP_IF_WIFI_STA
- **WIFI_IF_AP** = ESP_IF_WIFI_AP

defined enum wifi_country_policy_t

**Values:**
WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

defined wifi_auth_mode_t

Values:

WIFI_AUTH_OPEN = 0
authenticate mode : open

WIFI_AUTH_WEP
authenticate mode : WEP

WIFI_AUTH_WPA_PSK
authenticate mode : WPA_PSK

WIFI_AUTH_WPA2_PSK
authenticate mode : WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
authenticate mode : WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode : WPA2.ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode : WPA3.PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode : WPA2_WPA3.PSK

WIFI_AUTH_WAPI_PSK
authenticate mode : WAPI.PSK

WIFI_AUTH_MAX

defined wifi_err_reason_t

Values:

WIFI_REASON_UNSPECIFIED = 1
WIFI_REASON_AUTH_EXPIRE = 2
WIFI_REASON_AUTH_LEAVE = 3
WIFI_REASON_ASSOC_EXPIRE = 4
WIFI_REASON_ASSOC_TOOMANY = 5
WIFI_REASON_NOT_AUTHED = 6
WIFI_REASON_NOT_ASSOCED = 7
WIFI_REASON_ASSOC_LEAVE = 8
WIFI_REASON_ASSOC_NOT_AUTHED = 9
WIFI_REASON_DISASSOC_PWRCAP_BAD = 10
WIFI_REASON_DISASSOC_SUPCHAN_BAD = 11
WIFI_REASON_BSS_TRANSITION_DISASSOC = 12
WIFI_REASON_IE_INVALID = 13
WIFI_REASON_MIC_FAILURE = 14
WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT = 15
WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT = 16
WIFI_REASON_IE_IN_4WAY_DIFFERS = 17
WIFI_REASON_GROUP_CIPHER_INVALID = 18
WIFI_REASON_PAIRWISE_CIPHER_INVALID = 19
WIFI_REASON_AKMP_INVALID = 20
WIFI_REASON_UNSUPP_RSN_IE_VERSION = 21
WIFI_REASON_INVALID_RSN_IE_CAP = 22
WIFI_REASON_802_1X_AUTH_FAILED = 23
WIFI_REASON_CIPHER_SUITE_REJECTED = 24
WIFI_REASON_INVALID_PMKID = 53
WIFI_REASON_BEACON_TIMEOUT = 200
WIFI_REASON_NO_AP_FOUND = 201
WIFI_REASON_AUTH_FAIL = 202
WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t
  Values:
  WiFi_SECOND_CHAN_NONE = 0
    the channel width is HT20
  WiFi_SECOND_CHAN_ABOVE
    the channel width is HT40 and the secondary channel is above the primary channel
  WiFi_SECOND_CHAN_BELOW
    the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
  Values:
  WiFi_SCAN_TYPE_ACTIVE = 0
    active scan
  WiFi_SCAN_TYPE_PASSIVE
    passive scan

enum wifi_cipher_type_t
  Values:
  WiFi_CIPHER_TYPE_NONE = 0
    the cipher type is none
  WiFi_CIPHER_TYPE_WEP40
    the cipher type is WEP40
  WiFi_CIPHER_TYPE_WEP104
    the cipher type is WEP104
  WiFi_CIPHER_TYPE_TKIP
    the cipher type is TKIP
  WiFi_CIPHER_TYPE_CCMP
    the cipher type is CCMP
**WIFI_CIPHER_TYPE_TKIP_CCMP**
the cipher type is TKIP and CCMP

**WIFI_CIPHER_TYPE_AES_CMAC128**
the cipher type is AES-CMAC-128

**WIFI_CIPHER_TYPE_SMS4**
the cipher type is SMS4

**WIFI_CIPHER_TYPE_GCMP**
the cipher type is GCMP

**WIFI_CIPHER_TYPE_GCMP256**
the cipher type is GCMP-256

**WIFI_CIPHER_TYPE_AES_GMAC128**
the cipher type is AES-GMAC-128

**WIFI_CIPHER_TYPE_AES_GMAC256**
the cipher type is AES-GMAC-256

**WIFI_CIPHER_TYPE_UNKNOWN**
the cipher type is unknown

---

**enum wifi_ant_t**

WiFi antenna.

*Values:*

**WIFI_ANT_ANT0**
WiFi antenna 0

**WIFI_ANT_ANT1**
WiFi antenna 1

**WIFI_ANT_MAX**
Invalid WiFi antenna

**enum wifi_scan_method_t**

*Values:*

**WIFI_FAST_SCAN** = 0
Do fast scan, scan will end after find SSID match AP

**WIFI_ALL_CHANNEL_SCAN**
All channel scan, scan will end after scan all the channel

**enum wifi_sort_method_t**

*Values:*

**WIFI_CONNECT_AP_BY_SIGNAL** = 0
Sort match AP in scan list by RSSI

**WIFI_CONNECT_AP_BY_SECURITY**
Sort match AP in scan list by security mode

**enum wifi_ps_type_t**

*Values:*

**WIFI_PS_NONE**
No power save

**WIFI_PS_MIN_MODEM**
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

**WIFI_PS_MAX_MODEM**
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in *wifi_sta_config_t*
enum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:

WIFI_STORAGE_FLASH
  all configuration will store in both memory and flash
WIFI_STORAGE_RAM
  all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:

WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:

WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:

WIFI_PKT_MGMT
  Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
  Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
  Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
  Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
WiFi antenna mode.
Values:

WIFI_ANT_MODE_ANT0
  Enable WiFi antenna 0 only
WIFI_ANT_MODE_ANT1
  Enable WiFi antenna 1 only
**Chapter 2. API Reference**

- **WIFI_ANT_MODE_AUTO**
  Enable WiFi antenna 0 and 1, automatically select an antenna

- **WIFI_ANT_MODE_MAX**
  Invalid WiFi enabled antenna

- **enum wifi_phy_rate_t**
  WiFi PHY rate encodings.

  **Values:**

  - **WIFI_PHY_RATE_1M_L = 0x00**
    1 Mbps with long preamble
  - **WIFI_PHY_RATE_2M_L = 0x01**
    2 Mbps with long preamble
  - **WIFI_PHY_RATE_5M_L = 0x02**
    5.5 Mbps with long preamble
  - **WIFI_PHY_RATE_11M_L = 0x03**
    11 Mbps with long preamble
  - **WIFI_PHY_RATE_2M_S = 0x05**
    2 Mbps with short preamble
  - **WIFI_PHY_RATE_5M_S = 0x06**
    5.5 Mbps with short preamble
  - **WIFI_PHY_RATE_11M_S = 0x07**
    11 Mbps with short preamble
  - **WIFI_PHY_RATE_48M = 0x08**
    48 Mbps
  - **WIFI_PHY_RATE_24M = 0x09**
    24 Mbps
  - **WIFI_PHY_RATE_12M = 0x0A**
    12 Mbps
  - **WIFI_PHY_RATE_6M = 0x0B**
    6 Mbps
  - **WIFI_PHY_RATE_54M = 0x0C**
    54 Mbps
  - **WIFI_PHY_RATE_36M = 0x0D**
    36 Mbps
  - **WIFI_PHY_RATE_18M = 0x0E**
    18 Mbps
  - **WIFI_PHY_RATE_9M = 0x0F**
    9 Mbps
  - **WIFI_PHY_RATE_MCS0_LGI = 0x10**
    MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
  - **WIFI_PHY_RATE_MCS1_LGI = 0x11**
    MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz
  - **WIFI_PHY_RATE_MCS2_LGI = 0x12**
    MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz
  - **WIFI_PHY_RATE_MCS3_LGI = 0x13**
    MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz
  - **WIFI_PHY_RATE_MCS4_LGI = 0x14**
    MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz
WIFI_PHY_RATE_MCS5_LGI = 0x15
    MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz
WIFI_PHY_RATE_MCS6_LGI = 0x16
    MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz
WIFI_PHY_RATE_MCS7_LGI = 0x17
    MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS0_SGI = 0x18
    MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz
WIFI_PHY_RATE_MCS1_SGI = 0x19
    MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz
WIFI_PHY_RATE_MCS2_SGI = 0x1A
    MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz
WIFI_PHY_RATE_MCS3_SGI = 0x1B
    MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz
WIFI_PHY_RATE_MCS4_SGI = 0x1C
    MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz
WIFI_PHY_RATE_MCS5_SGI = 0x1D
    MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz
WIFI_PHY_RATE_MCS6_SGI = 0x1E
    MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS7_SGI = 0x1F
    MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz
WIFI_PHY_RATE_LORA_250K = 0x29
    250 Kbps
WIFI_PHY_RATE_LORA_500K = 0x2A
    500 Kbps
WIFI_PHY_RATE_MAX

enum wifi_event_t
    WiFi event declarations
    Values:
WIFI_EVENT_WIFI_READY = 0
    ESP32 WiFi ready
WIFI_EVENT_SCAN_DONE
    ESP32 finish scanning AP
WIFI_EVENT_STA_START
    ESP32 station start
WIFI_EVENT_STA_STOP
    ESP32 station stop
WIFI_EVENT_STA_CONNECTED
    ESP32 station connected to AP
WIFI_EVENT_STA_DISCONNECTED
    ESP32 station disconnected from AP
WIFI_EVENT_STA_AUTHMODE_CHANGE
    the auth mode of AP connected by ESP32 station changed
WIFI_EVENT_STA_WPS_ER_SUCCESS
    ESP32 station wps succeeds in enrollee mode
WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STA_DISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX

enum wifi_ftm_status_t
FTM operation status types.

Values:

FTM_STATUS_SUCCESS = 0
FTM exchange is successful

FTM_STATUS_UNSUPPORTED
Peer does not support FTM
**FTM_STATUS_CONF_REJECTED**
Peer rejected FTM configuration in FTM Request

**FTM_STATUS_NO_RESPONSE**
Peer did not respond to FTM Requests

**FTM_STATUS_FAIL**
Unknown error during FTM exchange

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone:

```
wifi/wifi_easy_connect/dpp-enrollee
```

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init(esp_supp_dpp_event_cb_t evt_cb)
```

Initialize DPP Supplicant.

- Starts DPP Supplicant and initializes related Data Structures.

**Parameters**

- `evt_cb`: Callback function to receive DPP related events

```c
void esp_supp_dpp_deinit()
```

De-initialize DPP Supplicant.
Frees memory from DPP Supplicant Data Structures.

```c
esp_err_t esp_supp_dpp_bootstrap_gen(const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
```

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Return**
- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**
- `chan_list`: List of channels device will be available on for listening
- `type`: Bootstrap method type, only QR Code method is supported for now.
- `key`: (Optional) Private Key used to generate a Bootstrapping Public Key
- `info`: (Optional) Ancilliary Device Information like Serial Number

```c
esp_err_t esp_supp_dpp_start_listen(void)
```

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

**Return**
- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
void esp_supp_dpp_stop_listen(void)
```

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

**Macros**

- `ESP_ERR_DPP_FAILURE` Generic failure during DPP Operation
- `ESP_ERR_DPP_TX_FAILURE` DPP Frame Tx failed OR not Acked
- `ESP_ERR_DPP_INVALID_ATTR` Encountered invalid DPP Attribute

**Type Definitions**

```c
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
```

Types of Bootstrap Methods for DPP.

```c
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
```

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

**Parameters**
- `evt`: DPP event ID
- `data`: Event data payload

**Enumerations**
enum dpp_bootstrap_type
    Types of Bootstrap Methods for DPP.
    Values:
        DPP_BOOTSTRAP_QR_CODE
            QR Code Method
        DPP_BOOTSTRAP_PKEX
            Proof of Knowledge Method
        DPP_BOOTSTRAP_NFC_URI
            NFC URI record Method

enum esp_supp_dpp_event_t
    Types of Callback Events received from DPP Supplicant.
    Values:
        ESP_SUPP_DPP_URI_READY
            URI is ready through Bootstrapping
        ESP_SUPP_DPP_CFG_RECVD
            Config received via DPP Authentication
        ESP_SUPP_DPP_FAIL
            DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

2.5.2 Ethernet

Overview
    ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:
    1. Basic Ethernet Concepts
    2. Configure MAC and PHY
    3. Connect Driver to TCP/IP Stack
    4. Misc control of Ethernet driver

Basic Ethernet Concepts
    Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

Preamble and Start-of-Frame Delimiter
    The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.
When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation].

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length**  The type/length field is a 2-byte field, if the value in this field is $\leq 1500$ (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is $\geq 1536$, ...

it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:**  Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

**Configure MAC and PHY**  Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface) and etc.

One of the obvious difference between MII and RMII is the signal consumption. For MII, it usually costs up to 18 signals. Instead, RMII interface can reduce the consumption to 9.

In RMII mode, both the receiver and transmitter signals are referenced to the REF_CLK. **REF_CLK must be stable during any access to PHY and MAC.** Generally there’re three ways to generate the REF_CLK depending on the PHY device in your design:

- Some PHY chip can derive the REF_CLK from its external connected 25MHz crystal oscillator (as seen the option a in the picture). In this case, you should select CONFIG_ETH_RMII_CLK_INPUT in `CONFIG_ETH_RMII_CLK_MODE`.
- Some PHY chip uses an external connected 50MHz crystal oscillator or other clock source, which can also be used as the REF_CLK for MAC side (as seen the option b in the picture). In this case, you still need to select `CONFIG_ETH_RMII_CLK_INPUT` in `CONFIG_ETH_RMII_CLK_MODE`.
- Some EMAC controller can generate the REF_CLK using its internal high precision PLL (as seen the option c in the picture). In this case, you should select `CONFIG_ETH_RMII_CLK_OUTPUT` in `CONFIG_ETH_RMII_CLK_MODE`.

**Note:**  REF_CLK is configured via Project Configuration as described above by default. However, it can be overwritten from user application code by appropriately setting `interface` and `clock_config` members of...
Fig. 7: Ethernet RMII Interface
**eth_mac_config_t** structure. See **emac_rmii_clock_mode_t** and **emac_rmii_clock_gpio_t** for more details.

**Warning:** If the RMII clock mode is selected to **CONFIG_ETH_RMII_CLK_OUTPUT**, then GPIO0 can be used to output the **REF_CLK** signal. See **CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0** for more information. What’s more, if you’re not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock. See **CONFIG_ETH_RMII_CLK_OUT_GPIO** for more information.

If the RMII clock mode is selected to **CONFIG_ETH_RMII_CLK_INPUT**, then GPIO0 is the only choice to input the **REF_CLK** signal. Please note that, GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround of this issue is disabling the **REF_CLK** in hardware by default, so that the strapping pin won’t be interfered by other signals in boot stage. Then re-enable the **REF_CLK** in Ethernet driver installation stage. The ways to disable the **REF_CLK** signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
- Force the PHY device in reset status (as the case a in the picture). **This could fail for some PHY device**
  (i.e. it still outputs signal to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of **REF_CLK** in your hardware design! Keep the trace as short as possible. Keep it away from RF devices. Keep it away from inductor elements.

**Note:** ESP-IDF only supports the RMII interface (i.e. always select **CONFIG_ETH_PHY_INTERFACE_RMII** in Kconfig option **CONFIG_ETH_PHY_INTERFACE**).

Signals used in data plane are fixed to specific GPIOs via MUX, they can’t be modified to other GPIOs. Signals used in control plane can be routed to any free GPIOs via Matrix. Please refer to **ESP32-Ethernet-Kit** for hardware design example.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in **eth_mac_config_t**, including:

- **sw_reset_timeout_ms**: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- **rx_task_stack_size** and **rx_task_prio**: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- **flags**: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with **ETH_MAC_FLAG_**. For example, if the MAC driver should work when cache is disabled, then you should configure this field with **ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**.
- **smi_mdc_gpio_num** and **smi_mdio_gpio_num**: the GPIO number used to connect the SMI signals.
- **interface**: configuration of MAC Data interface to PHY (MII/RMII).
- **clock_config**: configuration of EMAC Interface clock (**REF_CLK** mode and GPIO number in case of RMII).

Configuration for PHY is described in **eth_phy_config_t**, including:

- **phy_addr**: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- **reset_timeout_ms**: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- **autonego_timeout_ms**: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually
depends on the ability of the PHY device on your board.

- `reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

**Internal EMAC + External PHY**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
mac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO used for MDC signal
mac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // alter the GPIO used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance
```

```c
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
```

**Optional Runtime MAC Clock Configuration** EMAC REF_CLK can be optionally configured from user application code.

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
// ...
mac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
mac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
mac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number used to input/output EMAC REF_CLK
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance
```

**SPI-Ethernet Module**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
```

(continues on next page)
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));

// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_,
                                   handle));

/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(dm9051_config, &phy_config);

Note:

• When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function
  must have the same suffix (e.g. esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051). This is because
  we don’t have other choices but the integrated PHY.
• We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instruc-
  tions on creating SPI device handle, please refer to SPI Master.
• The SPI device configuration (i.e. spi_device_interface_config_t) can be different for other Ethernet modules.
  Please check out your module’s spec and the examples in esp-idf.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some
additional high-level configurations (i.e. not specific to either MAC or PHY) in esp_eth_config_t:

• mac: instance that created from MAC generator (e.g. esp_eth_mac_new_esp32()).
• phy: instance that created from PHY generator (e.g. esp_eth_phy_new_ip101()).
• check_link_period_ms: Ethernet driver starts an OS timer to check the link status periodically, this
  field is used to set the interval, in milliseconds.
• stack_input: In most of Ethernet IoT applications, any Ethernet frame that received by driver
  should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is re-
  sponsible to deal with the incoming frames. You can even update this field at runtime via function
  esp_eth_update_input_path() after driver installation.
• on_lowlevel_init_done and on_lowlevel_deinit_done: These two fields are used to specify
  the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro ETH_DEFAULT_CONFIG.

esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver-
configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the_
handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;
    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
```

```
esp_event_loop_create_default(); // create a default event loop that running in background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL); // register Ethernet event handler (to deal with user specific stuffs when event like link up/down happened)
```

**Start Ethernet Driver**  After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to Network Interface.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
    int32_t event_id, void *event_data)
```
{ ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
  const esp_netif_ip_info_t *ip_info = &event->ip_info;

  ESP_LOGI(TAG, "Ethernet Got IP Address");
  ESP_LOGI(TAG, "~~~~~~~~~~~~");
  ESP_LOGI(TAG, "ETHIP: %s", IPSTR(ip_info->ip));
  ESP_LOGI(TAG, "ETHMASK: %s", IPSTR(ip_info->netmask));
  ESP_LOGI(TAG, "ETHGW: %s", IPSTR(ip_info->gw));
  ESP_LOGI(TAG, "~~~~~~~~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
                     once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
                     interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
                     Ethernet driver
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
                     Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
                           NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering users Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing users handlers.

**Misc control of Ethernet driver**   The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
         mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control**   Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with
the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Example

- Ethernet basic example: ethernet/basic.
- Ethernet iperf example: ethernet/iperf.
- Ethernet to Wi-Fi AP “router” : ethernet/eth2ap.
- Most of protocol examples should also work for Ethernet: protocols.

API Reference

Header File

- components/esp_eth/include/esp_eth.h

Functions

```c
esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
Install Ethernet driver.
```

**Return**

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**

- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)
Uninstall Ethernet driver.
```

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_start(esp_eth_handle_t hdl)
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)
```

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- ESP_OK: start esp_eth driver successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

### Parameters
- `[in] hdl`: handle of Ethernet driver

```c
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```
Stop Ethernet driver.

**Note** This function does the opposite operation of `esp_eth_start`.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

### Parameters
- `[in] hdl`: handle of Ethernet driver

```c
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input) (esp_eth_handle_t hdll, uint8_t *buffer, uint32_t length, void *priv)) void *priv
```
Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

### Parameters
- `[in] hdl`: handle of Ethernet driver
- `[in] stack_input`: function pointer, which does the actual process on incoming packets
- `[in] priv`: private resource, which gets passed to `stack_input` callback without any modification

```c
esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void *buf, size_t length)
```
General Transmit.

**Return**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

### Parameters
- `[in] hdl`: handle of Ethernet driver
- `[in] buf`: buffer of the packet to transfer
- `[in] length`: length of the buffer to transfer

```c
esp_err_t esp_eth_receive (esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)
```
General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Note** This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

**Return**
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

### Parameters
Chapter 2. API Reference

- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

```c
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. `data` argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. `data` argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of bool datatype to which the current configuration is read.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. `data` argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. `data` argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. `data` argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. `data` argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. `data` argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of bool datatype from which the configuration option is read.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

Parameters

- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
- [inout] data: address of data for set command or address where to store the data when used with get command

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```

Increase Ethernet driver reference.

Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument
Chapter 2. API Reference

Parameters
  • [in] hdl: handle of Ethernet driver

\texttt{esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)}
Decrease Ethernet driver reference.

Return
  • ESP_OK: increase reference successfully
  • ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
  • [in] hdl: handle of Ethernet driver

Structures
\texttt{struct esp_eth_config_t}
Configuration of Ethernet driver.

Public Members

\texttt{esp_eth_mac_t *mac}
Ethernet MAC object.

\texttt{esp_eth_phy_t *phy}
Ethernet PHY object.

\texttt{uint32_t check_link_period_ms}
Period time of checking Ethernet link status.

\texttt{esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)}
Input frame buffer to user’s stack.

Return
  • ESP_OK: input frame buffer to upper stack successfully
  • ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters
  • [in] eth_handle: handle of Ethernet driver
  • [in] buffer: frame buffer that will get input to upper stack
  • [in] length: length of the frame buffer

\texttt{esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)}
Callback function invoked when lowlevel initialization is finished.

Return
  • ESP_OK: process extra lowlevel initialization successfully
  • ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
  • [in] eth_handle: handle of Ethernet driver

\texttt{esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)}
Callback function invoked when lowlevel deinitialization is finished.

Return
  • ESP_OK: process extra lowlevel deinitialization successfully
  • ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
  • [in] eth_handle: handle of Ethernet driver

\texttt{esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)}
Read PHY register.
Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g., I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Return:
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

Parameters:
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg,
                          uint32_t reg_value)
```

Write PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g., I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Return:
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters:
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

Macros

```
ETH_DEFAULT_CONFIG (emac, ephy)
```

Default configuration for Ethernet driver.

Type Definitions

```
typedef void *esp_eth_handle_t
```

Handle of Ethernet driver.

Enumerations

```
enum esp_eth_io_cmd_t
```
Command list for ioctl API.

Values:

```
ETH_CMD_G_MAC_ADDR
Get MAC address

ETH_CMD_S_MAC_ADDR
Set MAC address

ETH_CMD_G_PHY_ADDR
Get PHY address

ETH_CMD_S_PHY_ADDR
Set PHY address

ETH_CMD_G_AUTONEGO
Get PHY Auto Negotiation
```
Chapter 2. API Reference

ETH_CMD_S_AUTONEGO
Set PHY Auto Negotiation

ETH_CMD_G_SPEED
Get Speed

ETH_CMD_S_SPEED
Set Speed

ETH_CMD_S_PROMISCUOUS
Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
Set flow control

ETH_CMD_G_DUPLEX_MODE
Get Duplex mode

ETH_CMD_S_DUPLEX_MODE
Set Duplex mode

ETH_CMD_S_PHY_LOOPBACK
Set PHY loopback

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)
Detect PHY address.

Return
- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [out] detected_addr: a valid address after detection

Structures

struct esp_eth_mediator_s
Ethernet mediator.

Public Members

esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
Read PHY register.

Return
- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value
Chapter 2. API Reference

```c
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg,
uint32_t reg_value)

Write PHY register.

Return
• ESP_OK: write PHY register successfully
• ESP_FAIL: write PHY register failed because some error occurred

Parameters
• [in] eth: mediator of Ethernet driver
• [in] phy_addr: PHY Chip address (0~31)
• [in] phy_reg: PHY register index code
• [in] reg_value: PHY register value
```

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t*buffer, uint32_t length)

Deliver packet to upper stack.

Return
• ESP_OK: deliver packet to upper stack successfully
• ESP_FAIL: deliver packet failed because some error occurred

Parameters
• [in] eth: mediator of Ethernet driver
• [in] buffer: packet buffer
• [in] length: length of the packet
```

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)

Callback on Ethernet state changed.

Return
• ESP_OK: process the new state successfully
• ESP_FAIL: process the new state failed because some error occurred

Parameters
• [in] eth: mediator of Ethernet driver
• [in] state: new state
• [in] args: optional argument for the new state
```

**Type Definitions**

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t

Ethernet mediator.
```

**Enumerations**

```c
enum esp_eth_state_t

Ethernet driver state.

Values:

ETH_STATE_LLINIT
Lowlevel init done

ETH_STATE_DEINIT
Deinit done

ETH_STATE_LINK
Link status changed

ETH_STATE_SPEED
Speed updated

ETH_STATE_DUPLEX
Duplex updated

ETH_STATE_PAUSE
Pause ability updated
```
enum eth_event_t
Ethernet event declarations.

Values:

ETHERNET_EVENT_START
  Ethernet driver start
ETHERNET_EVENT_STOP
  Ethernet driver stop
ETHERNET_EVENT_CONNECTED
  Ethernet got a valid link
ETHERNET_EVENT_DISCONNECTED
  Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h

Functions

esp_eth_mac_t *esp_eth_mac_new_esp32 (const eth_esp32_emac_config_t *esp32_config, const eth_mac_config_t *config)

Create ESP32 Ethernet MAC instance.

Return

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

Parameters

- config: Ethernet MAC configuration

Unions

union eth_mac_clock_config_t
  #include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

Public Members

struct eth_mac_clock_config_t::[anonymous] mii
  EMAC MII Clock Configuration

emac_rmii_clock_mode_t clock_mode
  RMII Clock Mode Configuration

emac_rmii_clock_gpio_t clock_gpio
  RMII Clock GPIO Configuration

struct eth_mac_clock_config_t::[anonymous] rmii
  EMAC RMII Clock Configuration

Structures

struct esp_eth_mac_s
  Ethernet MAC.

Public Members

esp_err_t (*set_mediator) (esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
  Set mediator for Ethernet MAC.
Return
• ESP_OK: set mediator for Ethernet MAC successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters
• [in] mac: Ethernet MAC instance
• [in] eth: Ethernet mediator

`esp_err_t (*init)(esp_eth_mac_t *mac)`
Initialize Ethernet MAC.

Return
• ESP_OK: initialize Ethernet MAC successfully
• ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
• ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

`esp_err_t (*deinit)(esp_eth_mac_t *mac)`
Deinitialize Ethernet MAC.

Return
• ESP_OK: deinitialize Ethernet MAC successfully
• ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance

`esp_err_t (*start)(esp_eth_mac_t *mac)`
Start Ethernet MAC.

Return
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

`esp_err_t (*stop)(esp_eth_mac_t *mac)`
Stop Ethernet MAC.

Return
• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

`esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t*buf, uint32_t length)`
Transmit packet from Ethernet MAC.

Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
• ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
• ESP_FAIL: transmit packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] buf: packet buffer to transmit
• [in] length: length of packet

`esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t*buf, uint32_t *length)`
Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.
Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.
### Return
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. In this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

### Parameters
- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

### Return
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

### Parameters
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

### Return
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

### Parameters
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```c
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

### Return
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

### Parameters
- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Get MAC address.

### Return
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

### Parameters
- [in] mac: Ethernet MAC instance
**Chapter 2. API Reference**

- [out] addr: MAC address

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```

Set speed of MAC.

**Return**
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```

Set link status of MAC.

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] link: Link status

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```

Set promiscuous of MAC.

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```

Enable flow control on MAC layer or not.

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```

Set the PAUSE ability of peer node.

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
* [in] ability: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

```c
esp_err_t (*del)(esp_eth_mac_t *mac)
```
Free memory of Ethernet MAC.

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance

```c
struct eth_mac_config_t
```
Configuration of Ethernet MAC object.

### Public Members

```c
uint32_t sw_reset_timeout_ms
```
Software reset timeout value (Unit: ms)

```c
uint32_t rx_task_stack_size
```
Stack size of the receive task

```c
uint32_t rx_task_prio
```
Priority of the receive task

```c
uint32_t flags
```
Flags that specify extra capability for mac driver

```c
struct eth_es32_emac_config_t
```
EMAC specific configuration.

### Public Members

```c
int smi_mdc_gpio_num
```
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

```c
int smi_mdio_gpio_num
```
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

```c
eth_data_interface_t interface
```
EMAC Data interface to PHY (MII/RMII)

```c
eth_mac_clock_config_t clock_config
```
EMAC Interface clock configuration

```c
eth_mac_dma_burst_len_t dma_burst_len
```
EMAC DMA burst length for both Tx and Rx

### Macros

**ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**
MAC driver can work when cache is disabled

**ETH_MAC_FLAG_PIN_TO_CORE**
Pin MAC task to the CPU core where driver installation happened

**ETH_MAC_DEFAULT_CONFIG()**
Default configuration for Ethernet MAC object.

**ETH_ESP32_EMAC_DEFAULT_CONFIG()**
Default ESP32’s EMAC specific configuration.
Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.

Enumerations

enum emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    Values:
    
    \texttt{EMAC\_CLK\_DEFAULT}
    Default values configured using Kconfig are going to be used when “Default” selected.

    \texttt{EMAC\_CLK\_EXT\_IN}
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

    \texttt{Note} MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

    \texttt{EMAC\_CLK\_OUT}
    Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum emac_rmii_clock_gpio_t
    RMII Clock GPIO number Options.
    Values:
    
    \texttt{EMAC\_CLK\_IN\_GPIO} = 0
    MAC will get RMII clock from outside at this GPIO.

    \texttt{Note} ESP32 only supports GPIO0 to input the RMII clock.

    \texttt{EMAC\_APPL\_CLK\_OUT\_GPIO} = 0
    Output RMII Clock from internal APLL Clock available at GPIO0.

    \texttt{Note} GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

    \texttt{EMAC\_CLK\_OUT\_GPIO} = 16
    Output RMII Clock from internal APLL Clock available at GPIO16.

    \texttt{EMAC\_CLK\_OUT\_180\_GPIO} = 17
    Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

\textit{esp_eth_phy_t*\ esp_eth_phy_new_ip101(const eth_phy_config_t *config)}
Create a PHY instance of IP101.

\textbf{Return}
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

\textbf{Parameters}
- [in] config: configuration of PHY
Chapter 2. API Reference

`esp_eth_phy_t* esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)`
Create a PHY instance of RTL8201.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

`esp_eth Phy_t* esp_eth_phy_new_lan87xx(const eth phy_config_t *config)`
Create a PHY instance of LAN87xx.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_dp83848(const eth_phy config_t *config)`
Create a PHY instance of DP83848.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_ksz80xx(const eth phy config_t *config)`
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

**Structures**

`struct esp_eth_phy_s`
 Ethernet PHY.

**Public Members**

`esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)`
Set mediator for PHY.

**Return**
- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

`esp_err_t (*reset)(esp_eth_phy_t *phy)`
Software Reset Ethernet PHY.

**Return**
Chapter 2. API Reference

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**
- **[in]** phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```

*Hardware Reset Ethernet PHY.*

**Note** Hardware reset is mostly done by pull down and up PHY’s nRST pin

**Return**
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**
- **[in]** phy: Ethernet PHY instance

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```

*Initialize Ethernet PHY.*

**Return**
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

**Parameters**
- **[in]** phy: Ethernet PHY instance

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```

*Deinitialize Ethernet PHY.*

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

**Parameters**
- **[in]** phy: Ethernet PHY instance

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```

*Configure autonegotiation.*

**Return**
- ESP_OK: restart autonegotiation successfully
- ESP_FAIL: restart autonegotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

**Parameters**
- **[in]** phy: Ethernet PHY instance
- **[in]** cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY autonegotiation
- **[out]** autonego_en_stat: Address where to store current status of autonegotiation configuration

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```

*Get Ethernet PHY link status.*

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

**Parameters**
- **[in]** phy: Ethernet PHY instance

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```

*Power control of Ethernet PHY.*

**Return**
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**
Chapter 2. API Reference

- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

`esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)`
Set PHY chip address.

Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

`esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)`
Get PHY chip address.

Return
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)`
Advertise pause function supported by MAC layer.

Return
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

Parameters
- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)`
Sets the PHY to loopback mode.

Return
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance
- [in] enable: enables or disables PHY loopback

`esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)`
Sets PHY speed mode.

Note Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Return
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance
- [in] speed: Speed mode to be set

`esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)`
Sets PHY duplex mode.

Note Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Return
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

Parameters
Chapter 2. API Reference

- [in] `phy`: Ethernet PHY instance
- [in] `duplex`: Duplex mode to be set

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```
Free memory of Ethernet PHY instance.

- **Return**
  - ESP_OK: free PHY instance successfully
  - ESP_FAIL: free PHY instance failed because some error occurred

- **Parameters**
  - [in] `phy`: Ethernet PHY instance

```c
struct eth_phy_config_t
```
Ethernet PHY configuration.

### Public Members

- `int32_t phy_addr`
  PHY address, set -1 to enable PHY address detection at initialization stage

- `uint32_t reset_timeout_ms`
  Reset timeout value (Unit: ms)

- `uint32_t autonego_timeout_ms`
  Auto-negotiation timeout value (Unit: ms)

- `int reset_gpio_num`
  Reset GPIO number, -1 means no hardware reset

### Macros

- `ESP_ETH_PHY_ADDR_AUTO`
- `ETH_PHY_DEFAULT_CONFIG()`
  Default configuration for Ethernet PHY object.

### Type Definitions

```c
typedef struct esp_eth_phy_s esp_eth_phy_t
```
Ethernet PHY.

### Enumerations

```c
enum eth_phy_autoneg_cmd_t
```
Auto-negotiation control commands.

- `ESP_ETH_PHY_AUTONEGO_RESTART`
- `ESP_ETH_PHY_AUTONEGO_EN`
- `ESP_ETH_PHY_AUTONEGO_DIS`
- `ESP_ETH_PHY_AUTONEGO_G_STAT`

### Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`
Chapter 2. API Reference

Functions

```c
esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
```
Create a netif glue for Ethernet driver.

**Note** netif glue is used to attach io driver to TCP/IP netif

**Return** glue object, which inherits esp_netif_driver_base_t

**Parameters**
- `eth_hdl`: Ethernet driver handle

```c
esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
```
Delete netif glue of Ethernet driver.

**Return** -ESP_OK: delete netif glue successfully

**Parameters**
- `eth_netif_glue`: netif glue

Type Definitions

```c
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```
Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

2.5.3 Thread

Thread

**Introduction** Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples** The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

**Header File**

- `components/openthread/include/esp_openthread.h`

Functions

```c
esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)
```
Initializes the full OpenThread stack.

**Note** The OpenThread instance will also be initialized in this function.

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**Parameters**
- `init_config`: The initialization configuration.

```c
esp_err_t esp_openthread_launch_mainloop(void)
```
Launches the OpenThread main loop.
Note This function will not return unless error happens when running the OpenThread stack.

Return
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

def esp_err_t esp_openthread_deinit (void)
This function performs OpenThread stack and platform driver deinitialization.

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance *esp_openthread_get_instance (void)
This function acquires the underlying OpenThread instance.

Note This function can be called on other tasks without lock.

Return The OpenThread instance pointer

Header File
- components/openthread/include/esp_openthread_types.h

Structures

struct esp_openthread_mainloop_context_t
This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t
The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

int rx_pin
UART RX pin

int tx_pin
UART TX pin

struct esp_openthread_radio_config_t
The OpenThread radio configuration.
Public Members

`esp_openthread_radio_mode_t radio_mode`
The radio mode

`esp_openthread_uart_config_t radio_uart_config`
The uart configuration to RCP

`struct esp_openthread_host_connection_config_t`
The OpenThread host connection configuration.

Public Members

`esp_openthread_host_connection_mode_t host_connection_mode`
The host connection mode

`esp_openthread_uart_config_t host_uart_config`
The uart configuration to host

`struct esp_openthread_port_config_t`
The OpenThread port specific configuration.

Public Members

`const char *storage_partition_name`
The partition for storing OpenThread dataset

`uint8_t netif_queue_size`
The packet queue size for the network interface

`uint8_t task_queue_size`
The task queue size

`struct esp_openthread_platform_config_t`
The OpenThread platform configuration.

Public Members

`esp_openthread_radio_config_t radio_config`
The radio configuration

`esp_openthread_host_connection_config_t host_config`
The host connection configuration

`esp_openthread_port_config_t port_config`
The port configuration

Enumerations

`enum esp_openthread_event_t`  
OpenThread event declarations.

Values:

`OPENTHREAD_EVENT_START`
OpenThread stack start

`OPENTHREAD_EVENT_STOP`
OpenThread stack stop

`OPENTHREAD_EVENT_IF_UP`
OpenThread network interface up
Chapter 2. API Reference

openThread_event_if_down
OpenThread network interface down

openThread_event_got_ip6
OpenThread stack added IPv6 address

openThread_event_lost_ip6
OpenThread stack removed IPv6 address

openThread_event_multicast_group_join
OpenThread stack joined IPv6 multicast group

openThread_event_multicast_group_leave
OpenThread stack left IPv6 multicast group

openThread_event_trel_add_ip6
OpenThread stack added TREL IPv6 address

openThread_event_trel_remove_ip6
OpenThread stack removed TREL IPv6 address

openThread_event_trel_multicast_group_join
OpenThread stack joined TREL IPv6 multicast group

enum esp_openthread_radio_mode_t
The radio mode of OpenThread.

Values:

RADIO_MODE_NATIVE = 0x0
Use the native 15.4 radio

RADIO_MODE_UART_RCP = 0x1
UART connection to a 15.4 capable radio co-processor (RCP)

RADIO_MODE_SPI_RCP = 0x2
SPI connection to a 15.4 capable radio co-processor (RCP)

enum esp_openthread_host_connection_mode_t
How OpenThread connects to the host.

Values:

HOST_CONNECTION_MODE_NONE = 0x0
Disable host connection

HOST_CONNECTION_MODE_CLI_UART = 0x1
CLI UART connection to the host

HOST_CONNECTION_MODE_RCP_UART = 0x2
RCP UART connection to the host

Header File

- components/openthread/include/esp_openthread_lock.h

Functions

esp_err_t esp_openthread_lock_init (void)
This function initializes the OpenThread API lock.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void esp_openthread_lock_deinit (void)
This function deinitializes the OpenThread API lock.
bool esp_openthread_lock_acquire (TickType_t block_ticks)
    This function acquires the OpenThread API lock.
    
    Note Every OT API that takes an otInstance argument MUST be protected with this API lock except that
    the call site is in OT callbacks.
    
    Return
    • True on lock acquired
    • False on failing to acquire the lock with the timeout.
    
    Parameters
    • [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.

void esp_openthread_lock_release (void)
    This function releases the OpenThread API lock.

Header File
    • components/openthread/include/esp_openthread_netif_glue.h

Functions

void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
    This function initializes the OpenThread network interface glue.
    
    Return
    • glue pointer on success
    • NULL on failure
    
    Parameters
    • [in] config: The platform configuration.

void esp_openthread_netif_glue_deinit (void)
    This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
    This function acquires the OpenThread netif.
    
    Return The OpenThread netif or NULL if not initialized.

Header File
    • components/openthread/include/esp_openthread_border_router.h

Functions

void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
    Sets the backbone interface used for border routing.
    
    Note This function must be called before esp_openthread_init
    
    Parameters
    • [in] backbone_netif: The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
    Initializes the border router features of OpenThread.
    
    Note Calling this function will make the device behave as an OpenThread border router. Kconfig option
    CONFIG_OPENTHREAD_BORDER_ROUTER is required.
    
    Return
    • ESP_OK on success
    • ESP_ERR_NOT_SUPPORTED if feature not supported
    • ESP_ERR_INVALID_STATE if already initialized
    • ESP_FAIL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
    Deinitializes the border router features of OpenThread.
    
    Return
2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

**A) User code, boiler plate**  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver**  Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls `esp_netif_receive()` to pass incoming data to network stack
C) ESP-NETIF, former tcpip_adapter

ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack

Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface

The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by if_key (e.g. ETH_DEF) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization

To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by CONFIG_ESP_NETIF_L2_TAP first and then registered by esp_vfs_l2tap_intf_register() prior usage of any VFS function.

open() Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path path name can be opened multiple times up to CONFIG_ESP_NETIF_L2_TAP_MAX_FDS and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with O_NONBLOCK file status flag to the read() does not block. Note that the write() may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using fcntl().
On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

`ioctl()` The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`’s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

Note: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- `EBADF` - not a valid file descriptor.
- `EINVAL` - invalid configuration argument. Ethernet type filter is already used by other file descriptor.
- `ENODEV` - no such Network Interface which is tried to be assigned to the file descriptor exists.
- `ENOSPC` - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.
- `ENOSYS` - unsupported operation, passed configuration option does not exists.

`read()` Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

- `EBADF` - not a valid file descriptor.
- `EAGAIN` - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

`write()` A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.
In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.
- **EIO** - Network interface not available or busy.

`close()` Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.

`select()` Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**ESP-NETIF programmer’s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`  
- `esp_netif_create_default_wifi_ap()`  

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These `default` interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
When using WiFi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- components/esp_netif/include/esp_netif.h

### Functions

#### `esp_netif_init (void)`

Initialize the underlying TCP/IP stack.

**Return**

- ESP_OK on success
- ESP_INSTALL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

#### `esp_netif_deinit (void)`

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Return**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

#### `esp_netif_new (const esp_netif_config_t *esp_netif_config)`

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- [in] esp_netif_config: pointer esp-netif configuration

#### `esp_netif_destroy (esp_netif_t *esp_netif)`

Destroys the esp_netif object.

**Parameters**

- [in] esp_netif: pointer to the object to be deleted

#### `esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`

Configures driver related options of esp_netif object.

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**

- [inout] esp_netif: pointer to the object to be configured
- [in] driver_config: pointer esp-netif io driver related configuration

#### `esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**

...
Chapter 2. API Reference

- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

**esp_err_t esp_netif_receive**(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Return
- ESP_OK

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

**esp_err_t esp_netif_transmit_hook_attach**(esp_netif_t *esp_netif, void *hook_fn)

Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.

Return
- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to transmit hook call-back function

**esp_err_t esp_netif_post_transmit_hook_attach**(esp_netif_t *esp_netif, void *hook_fn)

Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

Note Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

Return
- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to post transmit hook call-back function

**esp_err_t esp_netif_recv_hook_attach**(esp_netif_t *esp_netif, void *hook_fn)

Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

Return
- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to receive hook callback function

**esp_err_t esp_netif_transmit_hook_detach**(esp_netif_t *esp_netif)

Removes reference to previously attached transmit hook callback function.

Return
- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_post_transmit_hook_detach**(esp_netif_t *esp_netif)

Removes reference to previously attached post transmit hook callback function.

Return
Chapter 2. API Reference

- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_recv_hook_detach (esp_netif_t *esp_netif)`
Removes reference to previously attached receive hook callback function.

Return
- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters
- [in] esp_netif: Handle to esp-netif instance

`void esp_netif_action_start (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`
Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_stop (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`
Default building block for network interface action upon IO driver stop event.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_connected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`
Default building block for network interface action upon IO driver connected event.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`
Default building block for network interface action upon IO driver disconnected event.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`
Default building block for network interface action upon network got IP event.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
• event_id:
• data:

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_add_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_remove_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

**esp_err_t** **esp_netif_set_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] mac: Desired mac address for the related network interface

**esp_err_t** **esp_netif_get_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface
Chapter 2. API Reference

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] mac: Resultant mac address for the related network interface

\texttt{esp_err_t esp_netif_set_hostname(esp_netif_t* esp_netif, const char *hostname)}

Set the hostname of an interface.

The configured hostname overrides the default configuration value \texttt{CONFIG_LWIP_LOCAL_HOSTNAME}. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

Return
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
• [in] esp_netif: Handle to esp-netif instance

\texttt{esp_err_t esp_netif_get_hostname(esp_netif_t* esp_netif, const char** hostname)}

Get interface hostname.

Return
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] hostname: Returns a pointer to the hostname. Maybe NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool \texttt{esp_netif_is_netif_up(esp_netif_t* esp_netif)}

Test if supplied interface is up or down.

Return
• true - Interface is up
• false - Interface is down

Parameters
• [in] esp_netif: Handle to esp-netif instance

\texttt{esp_err_t esp_netif_get_ip_info(esp_netif_t* esp_netif, esp_netif_ip_info_t* ip_info)}

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] ip_info: If successful, IP information will be returned in this argument.

\texttt{esp_err_t esp_netif_get_old_ip_info(esp_netif_t* esp_netif, esp_netif_ip_info_t* ip_info)}

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] ip_info: If successful, IP information will be returned in this argument.

`esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**
• [in] esp_netif: Handle to esp-netif instance
• [in] ip_info: IP information to set on the specified interface

`esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
• [in] esp_netif: Handle to esp-netif instance
• [in] ip_info: Store the old IP information for the specified interface

`int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)`

Get net interface index from network stack implementation.

**Note** This index could be used in `setsockopt()` to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied esp_netif

**Parameters**
• [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)`

Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
• [in] esp_netif: Handle to esp-netif instance
• [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)
```c
esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP server option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

```c
esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP client option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

```c
esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)
```

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHPC_START_FAILED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)
```

Stop DHCP client (only if enabled in interface object)

**Note** Calling action_netif_stop() will also stop the DHCP Client if it is running.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP client status.

**Return**
Chapter 2. API Reference

• ESP_OK

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] status: If successful, the status of DHCP client will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP server status.

Return
• ESP_OK

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] status: If successful, the status of the DHCP server will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)
```

Start DHCP server (only if enabled in interface object)

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters
• [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)
```

Stop DHCP server (only if enabled in interface object)

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
• [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
• This function can override it by setting server type ESP_NETIF_DNS_MAIN.
• Other DNS Server types are not supported for the Wi-Fi AP interface.

Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [in] dns: DNS Server address to set

```c
esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.
Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [out] dns: DNS Server result is written here on success

```c
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Causes the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
```

Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: Array of IPv6 addresses will be copied to the argument

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```

Sets IPv4 address to the specified octets.
Parameters
- [out] addr: IP address to be set
- a: the first octet (127 for IP 127.0.0.1)
- b:
- c:
- d:

char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
Converts numeric IP address into decimal dotted ASCII representation.

Return
- either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

Parameters
- addr: ip address in network order to convert
- buf: target buffer where the string is stored
- buflen: length of buf

uint32_t esp_ip4addr_aton (const char *addr)
Ascii internet address interpretation routine The value returned is in network order.

Return
- ip address in network order

Parameters
- addr: IP address in ascii representation (e.g. “127.0.0.1”)

esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst)
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
- [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
- [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst)
Converts Ascii internet IPv6 address into esp_ip4_addr_t.Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

Return
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
- [in] src: IPv6 address in ascii representation (e.g. “2001:0db8:85a3::0000:0000:0000:0002:0001”)
- [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address

esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
Gets media driver handle for this esp-netif instance.

Return
- opaque pointer of related IO driver

Parameters
- [in] esp_netif: Handle to esp-netif instance

esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)
Searches over a list of created objects to find an instance with supplied if key.

Return
- Handle to esp-netif instance

Parameters
- if_key: Textual description of network interface

esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)
Returns configured flags for this interface.

Return
- Configuration flags
### Parameters

- **esp_netif**: Handle to esp-netif instance

#### `const char* esp_netif_get_ifkey(esp_netif_t *esp_netif)`

Returns configured interface key for this esp-netif instance.

- **Return**: Textual description of related interface

#### `const char* esp_netif_get_desc(esp_netif_t *esp_netif)`

Returns configured interface type for this esp-netif instance.

- **Parameters**: 
  - **in** esp_netif: Handle to esp-netif instance

#### `int esp_netif_get_route_prio(esp_netif_t *esp_netif)`

Returns configured routing priority number.

- **Return**: Integer representing the instance’s route-prio, or -1 if invalid parameters

#### `int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)`

Returns configured event for this esp-netif instance and supplied event type.

- **Return**: Specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

#### `esp_netif_t* esp_netif_next(esp_netif_t *esp_netif)`

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

- **Return**: First netif from the list if supplied parameter is NULL, next one otherwise

#### `size_t esp_netif_get_nr_of_ifs(void)`

Returns number of registered esp_netif objects.

- **Return**: Number of esp_netifs

#### `void esp_netif_netstack_buf_ref(void *netstack_buf)`

Increase the reference counter of net stack buffer

- **Parameters**: 
  - **in** netstack_buf: the net stack buffer

#### `void esp_netif_netstack_buf_free(void *netstack_buf)`

Free the netstack buffer

- **Parameters**: 
  - **in** netstack_buf: the net stack buffer

### Macros

- **_ESP_NETIF_SUPPRESS_LEGACY_WARNING_**

### WiFi default API reference
Chapter 2. API Reference

Header File

- components/esp_wifi/include/esp_wifi_default.h

Functions

**esp_err_t esp_netif_attach_wifi_station** (esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.

**Return**
- ESP_OK on success
- ESP_FAIL if attach failed

**Parameters**
- esp_netif: instance to attach the wifi station to

**esp_err_t esp_netif_attach_wifi_ap** (esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.

**Return**
- ESP_OK on success
- ESP_FAIL if attach failed

**Parameters**
- esp_netif: instance to attach the wifi AP to

**esp_err_t esp_wifi_set_default_wifi_sta_handlers** (void)
Sets default wifi event handlers for STA interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_ap_handlers** (void)
Sets default wifi event handlers for AP interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers** (void *esp_netif)
Clears default wifi event handlers for supplied network interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**Parameters**
- esp_netif: instance of corresponding if object

**esp_netif_t *esp_netif_create_default_wifi_ap** (void)
Creates default WIFI AP. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and
registers default wifi handlers.

**Return** pointer to esp-netif instance

**esp_netif_t *esp_netif_create_default_wifi_sta** (void)
Creates default WIFI STA. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers
default wifi handlers.

**Return** pointer to esp-netif instance

**void esp_netif_destroy_default_wifi** (void *esp_netif)
Destroys default WIFI netif created with esp_netif_create_default_wifi_…() API.

**Note** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a
no-operation if esp_netif is NULL)

**Parameters**
- [in] esp_netif: object to detach from WiFi and destroy
**`esp_netif_t* esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)`**

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return** pointer to esp-netif instance

**Parameters**
- [in] `wifi_if`: type of wifi interface
- [in] `esp_netif_config`: inherent esp-netif configuration pointer

**`esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)`**

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** ESP_OK on success

**Parameters**
- [out] `p_netif_sta`: pointer where the resultant STA interface is saved (if non NULL)
- [out] `p_netif_ap`: pointer where the resultant AP interface is saved (if non NULL)

## 2.5.5 IP Network Layer

### TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor **ESP-NETIF**.

### Updating network connection code

**Network stack initialization** Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the **ESP-NETIF** initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

**Network interface creation** TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the **ESP-NETIF** to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta()`; or `esp_netif_create_default_wifi_ap()`; after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
Replacing other tcpip_adapter API  All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:
- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers  Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip:", IPSTR(event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s", ip4addr_ntoa(event->ip_info.ip));
```

Since ip4addr_ntoa() is a LwIP API, the esp-netif provides esp_ip4addr_ntoa() as a replacement, but the above method is generally preferred.

IP addresses  It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

Next steps  Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver  This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t *driver_handle);
```
Chapter 2. API Reference

It is assumed that the esp_netif_iodriver_handle is a pointer to driver’s object, a struct derived from struct esp_netif_driver_base_s, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*< base structure reserved as...
    esp_netif_driver */
    driver_impl *h; /*< handle of driver...
    implementation */
} my_netif_driver_t;
```

with actual values of my_netif_driver_t::base.post_attach and the actual drivers handle my_netif_driver_t::h. So when the esp_netif_attach() gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static __attribute__((no strdup)) esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example driver start -> network start, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

**Header File**

- components/esp_netif/include/esp_netif_net_stack.h
Functions

```c
esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)
```

Return handle to related esp-netif instance

Parameters

- [in] dev: opaque ptr to network interface of specific TCP/IP stack

```c
type esp_netif_get_netif_impl (esp_netif_t *esp_netif)
```

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Return handle to related network stack netif handle

Parameters

- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

```c
esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame
- [in] netstack_buf: net stack buffer

```c
void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols.Sockets directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

2.6 Peripherals API
2.6.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 18 measurement channels (analog enabled pins).

These channels are supported:

ADC1:
- 8 channels: GPIO32 - GPIO39

ADC2:
- 10 channels: GPIO0, GPIO2, GPIO4, GPIO12 - GPIO15, GOIO25 - GPIO27

ADC Attenuation

Vref is the reference voltage used internally by ESP32 ADCs for measuring the input voltage. The ESP32 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>100 mV ~ 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>100 mV ~ 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>150 mV ~ 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>150 mV ~ 2450 mV</td>
</tr>
</tbody>
</table>

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
\text{Vout} = \text{Dout} \times \frac{\text{Vmax}}{\text{Dmax}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vout</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see ADC Attenuation.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See ADC Calibration.

ADC Limitations

Note:

Espressif Systems 791 Release v5.0-dev-1712-g4a553510b7

Submit Document Feedback
Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:

- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.
- Since the ADC2 module is also used by the Wi-Fi, only one of them could get the preemption when using together, which means the \texttt{adc2\_get\_raw()} may get blocked until Wi-Fi stops, and vice versa.

**Driver Usage**

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

**Note:** ADC readings from a pin not connected to any signal are random.

**ADC Single Read mode**  The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions \texttt{adc1\_config\_width()} and \texttt{adc1\_config\_channel\_atten()}.
- For ADC2, configure the attenuation by \texttt{adc2\_config\_channel\_atten()}.

The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see \texttt{adc1\_channel\_t} and \texttt{adc2\_channel\_t}, set as a parameter of above functions.

Then it is possible to read ADC conversion result with \texttt{adc1\_get\_raw()} and \texttt{adc2\_get\_raw()}. Reading width of ADC2 should be set as a parameter of \texttt{adc2\_get\_raw()} instead of in the configuration functions.

Single Read mode ADC example can be found in \texttt{peripherals/adc/single\_read} directory of ESP-IDF examples.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function \texttt{hall\_sensor\_read()}. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function \texttt{adc1\_ulp\_enable()} and then set precision and attenuation as discussed above.

There is another specific function \texttt{adc\_vref\_to\_gpio()} used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section **ADC Calibration**.

**Note:** See **ADC Limitations** for the limitation of using ADC single read mode.

**Minimizing Noise**

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

**ADC Calibration**

The \texttt{esp\_adc\_cal/include/esp\_adc\_cal.h} API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The
Fig. 8: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

Fig. 9: Graph illustrating effect of differing reference voltages on the ADC voltage curve.
Chapter 2. API Reference

The characteristics curve is in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \) and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values** Calibration values are used to generate characteristic curves that account for the variation of ADC reference voltage of a particular ESP32 chip. There are currently 3 source(s) of calibration values on ESP32. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150 mV and 850 mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

![ESP32 Chip Surface Marking](image)

Fig. 10: ESP32 Chip Surface Marking

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif (sales@espressif.com) directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running the `espefuse.py` tool with `adc_info` parameter

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board’s port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093 mV) will be reported as follows:

```
ADC VRef calibration: 1093 mV
```

In another example below the **eFuse Vref** is not programmed:

```
ADC VRef calibration: None (1100 mV nominal)
```

For a chip with two point calibration the message will look similar to:
ADC VRef calibration: 1149 mV
ADC readings stored in efuse BLK3:
   ADC1 Low reading (150 mV): 306
   ADC1 High reading (850 mV): 3153
   ADC2 Low reading (150 mV): 389
   ADC2 High reading (850 mV): 3206

Application Extensions

For a full example see esp-idf: peripherals/adc/single_read

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

//Characterize ADC at particular attenuation
esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
//Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
} else {
    printf("Default");
}
```

Reading an ADC then converting the reading to a voltage:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

```c
#include "driver/adc.h"
...

esp_err_t status = adc_vref_to_gpio(ADC_UNIT_1, GPIO_NUM_25);
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}
```

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0.
2. ADC1_GPIO0_CHANNEL is the ADC1 channel number of GPIO n.
Chapter 2. API Reference

API Reference

This reference covers three components:

- ADC driver
- ADC Calibration
- GPIO Lookup Macros

ADC driver

Header File

- components/driver/include/driver/adc.h

Functions

- void adc_power_on (void)
  Enable ADC power.
- void adc_power_off (void)
  Power off SAR ADC.
- void adc_power_acquire (void)
  Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
  Call adc_power_release when done using the ADC.
- void adc_power_release (void)
  Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
  Call this function when done using the ADC.

```c
esp_err_t adc1_pad_get_io_num (adc1_channel_t channel, gpio_num_t *gpio_num)
```

Get the GPIO number of a specific ADC1 channel.

Return

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters

- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

```c
esp_err_t adc1_config_channel_atten (adc1_channel_t channel, adc_atten_t atten)
```

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

```
+----------+-------------+-----------------+
| SoC      | attenuation | suggested range |
|          | (dB)        | (mV)            |
+----------+-------------+-----------------+
|          | 0           | 100 ~ 950       |
|          | 2.5         | 100 ~ 1250      |
| ESP32    | 6           | 150 ~ 1750      |
|          | 11          | 150 ~ 2450      |
+----------+-------------+-----------------+
|          | 0           | 0 ~ 750         |
+----------+-------------+-----------------+
```

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc1_config_width(adc_bits_width_t width_bit)
```
Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- `width_bit`: Bit capture width for ADC1

```c
int adc1_get_raw(adc1_channel_t channel)
```
Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

### Return
- -1: Parameter error
- Other: ADC1 channel reading.

### Parameters
- `channel`: ADC1 channel to read

```c
esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- `adc_unit`: ADC unit index
- `inv_en`: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```
Set ADC source clock.

Return
- ESP_OK success

Parameters
- clk_div: ADC clock divider, ADC clock is divided from APB clock

```c
esp_err_t adc_set_data_width (adc_unit_t adc_unit, adc_bits_width_t width_bit)
```
Configure ADC capture width.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- width_bit: Bit capture width for ADC unit.

```c
void adc1_ulp_enable (void)
```
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten`, `adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

```c
esp_err_t adc2_pad_get_io_num (adc2_channel_t channel, gpio_num_t *gpio_num)
```
Get the GPIO number of a specific ADC2 channel.

Return
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters
- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

```c
esp_err_t adc2_config_channel_atten (adc2_channel_t channel, adc_atten_t atten)
```
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation</th>
<th>suggested range</th>
</tr>
</thead>
<tbody>

</table>
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of *ECO_and_Workarounds_for_Bugs_in_ESP32* for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)
```

Output ADC1 or ADC2’s reference voltage to ADC2’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `adc_unit`: ADC unit index
- `[in]` `gpio`: GPIO number (Only ADC2’s channels IO are supported)

```c
esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)
```

Output ADC2 reference voltage to ADC2’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `gpio`: GPIO number (ADC2’s channels are supported)

```c
esp_err_t adc_digi_initialize(const adc_digi_init_config_t *init_config)
```

Initialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

**Parameters**
- init_config: Pointer to Digital ADC initialization config. Refer to `adc_digi_init_config_t`.

```c
esp_err_t adc_digi_read_bytes(uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)
```

Read bytes from Digital ADC through DMA.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

**Parameters**
- [out] buf: Buffer to read from ADC.
- [in] length_max: Expected length of data read from the ADC.
- [out] out_length: Real length of data read from the ADC via this API.
- [in] timeout_ms: Time to wait for data via this API, in millisecond.

```c
esp_err_t adc_digi_start(void)
```

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_digi_stop(void)
```

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_digi_deinit(void)
```

Deinitialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_digi_controller_configure(const adc_digi_configuration_t *config)
```

Setting the digital controller.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

**Parameters**
- config: Pointer to digital controller parameter. Refer to `adc_digi_config_t`.

```c
int hall_sensor_read(void)
```

Read Hall Sensor.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.
**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

Return The hall sensor reading.

```c
esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)
```
Set I2S data source.

**Return**
- ESP_OK success

**Parameters**
- `src`: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

```c
esp_err_t adc_i2s_mode_init(adc_unit_t adc_unit, adc_channel_t channel)
```
Initialize I2S ADC mode.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit index
- `channel`: ADC channel index

### Structures

```c
struct adc_digi_init_config_s
```
ADC DMA driver configuration.

**Public Members**

- `uint32_t max_store_buf_size`
  Max length of the converted data that driver can store before they are processed.

- `uint32_t conv_num_each_intr`
  Bytes of data that can be converted in 1 interrupt.

- `uint32_t adc1_chan_mask`
  Channel list of ADC1 to be initialized.

- `uint32_t adc2_chan_mask`
  Channel list of ADC2 to be initialized.

```c
struct adc_digi_configuration_t
```
ADC digital controller settings.

**Public Members**

- `bool conv_limit_en`
  To limit ADC conversion times. Conversion stops after finishing `conv_limit_num` times conversion.

- `uint32_t conv_limit_num`
  Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

- `uint32_t pattern_num`
  Number of ADC channels that will be used.

- `adc_digi_pattern_config_t *adc_pattern`
  List of configs for each ADC channel that will be used.

- `uint32_t sample_freq_hz`
  The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs:
sampling frequency; \( F_d \): digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

\[ \text{adc_digi_convert_mode_t / conv_mode} \]
ADC DMA conversion mode, see \( \text{adc_digi_convert_mode_t} \).

\[ \text{adc_digi_output_format_t / format} \]
ADC DMA conversion output format, see \( \text{adc_digi_output_format_t} \).

**Macros**

**ADC_ATTEN_0db**
ADC rtc controller attenuation option.

*Note* This definitions are only for being back-compatible

**ADC_ATTEN_2_5db**

**ADC_ATTEN_6db**

**ADC_ATTEN_11db**

**ADC_WIDTH_BIT_DEFAULT**
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by \( \text{SOC_ADC_MAX_BITWIDTH} \) defined in \( \text{soc_caps.h} \).

**ADC_WIDTH_9Bit**

**ADC_WIDTH_10Bit**

**ADC_WIDTH_11Bit**

**ADC_WIDTH_12Bit**

**ADC_MAX_DELAY**
Digital ADC DMA read max timeout value, it may make the \( \text{adc_digi_read_bytes} \) block forever if the OS supports.

**Type Definitions**

typedef struct \( \text{adc_digi_init_config_s} \) \( \text{adc_digi_init_config_t} \)
ADC DMA driver configuration.

**Enumerations**

type \( \text{adc1_channel_t} \)

*Values:*

ADC1_CHANNEL_0 = 0  
ADC1 channel 0 is GPIO36

ADC1_CHANNEL_1  
ADC1 channel 1 is GPIO37

ADC1_CHANNEL_2  
ADC1 channel 2 is GPIO38

ADC1_CHANNEL_3  
ADC1 channel 3 is GPIO39

ADC1_CHANNEL_4  
ADC1 channel 4 is GPIO32

ADC1_CHANNEL_5  
ADC1 channel 5 is GPIO33

ADC1_CHANNEL_6  
ADC1 channel 6 is GPIO34
Chapter 2. API Reference

ADC1_CHANNEL_7
ADC1 channel 7 is GPIO35

ADC1_CHANNEL_MAX

enum adc2_channel_t
Values:

ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)

ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)

ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)

ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)

ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)

ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)

ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)

ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

ADC2_CHANNEL_MAX

enum adc_i2s_encode_t
ADC digital controller encode option.
Values:

ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data

ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

ADC_ENCODE_MAX

Header File
- components/hal/include/hal/adc_types.h

Structures
struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members

uint8_t atten
Attenuation of this ADC channel.
uint8_t channel
ADC channel.

uint8_t unit
ADC unit.

uint8_t bit_width
ADC output bit width.

struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Note ESP32: Only type1 is valid. ADC2 does not support DMA mode.

Note ESP32-S2: Member channel can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

Public Members

uint16_t data: 12
ADC real output data info. Resolution: 12 bit.
ADC real output data info. Resolution: 11 bit.

uint16_t channel: 4
ADC channel index info.
ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint16_t unit: 1
ADC unit index info. 0: ADC1; 1: ADC2.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
When the configured output format is 11bit. ADC_DIGI_FORMAT_11BIT

uint16_t val
Raw data value

Enumerations

enum adc_unit_t
ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 does not support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

Values:

ADC_UNIT_1 = 1
SAR ADC 1.

ADC_UNIT_2 = 2
SAR ADC 2.

ADC_UNIT_BOTH = 3
SAR ADC 1 and 2.

ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode.

ADC_UNIT_MAX

enum adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.

Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

Values:
ADC_CHANNEL_0
ADC channel

ADC_CHANNEL_1
ADC channel

ADC_CHANNEL_2
ADC channel

ADC_CHANNEL_3
ADC channel

ADC_CHANNEL_4
ADC channel

ADC_CHANNEL_5
ADC channel

ADC_CHANNEL_6
ADC channel

ADC_CHANNEL_7
ADC channel

ADC_CHANNEL_8
ADC channel

ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See
adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t
ADC resolution setting option.

Note Only used in single read mode

Values:

ADC_WIDTH_BIT_9 = 0
ADC capture width is 9Bit.

ADC_WIDTH_BIT_10 = 1
ADC capture width is 10Bit.

ADC_WIDTH_BIT_11 = 2
ADC capture width is 11Bit.
**ADC_WIDTH_BIT_12 = 3**
ADC capture width is 12Bit.

**ADC_WIDTH_MAX**

```c
enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.
Values:
ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.
ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.
ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.
ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ....
```

**ADC_CONV_UNIT_MAX**

```c
enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.
Values:
ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.
ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.
ADC_DIGI_FORMAT_MAX
ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1
ADC_DIGI_OUTPUT_FORMAT_TYPE2
See adc_digi_output_data_t.type2
```

**ADC_DIGI_OUTPUT_FORMAT_MAX**

```c
enum adc_i2s_source_t
ESP32 ADC DMA source selection.
Values:
ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal
ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC
ADC_I2S_DATA_SRC_MAX
```

**ADC Calibration**

**Header File**

- components/esp_adc_cal/include/esp_adc_cal.h
**Functions**

**esp_err_t esp_adc_cal_check_efuse**(esp_adc_cal_value_t value_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

**Note** in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

**Return**
- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

**Parameters**
- **value_type**: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

**esp_adc_cal_characterize**(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \([y = coeff_a \times x + coeff_b]\). Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32S2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

**Return**
- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

**Parameters**
- **[in]** adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- **[in]** atten: Attenuation to characterize
- **[in]** bit_width: Bit width configuration of ADC
- **[in]** default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- **[out]** chars: Pointer to empty structure used to store ADC characteristics

**uint32_t esp_adc_cal_raw_to_voltage**(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**
- **[in]** adc_reading: ADC reading
- **[in]** chars: Pointer to initialized structure containing ADC characteristics

**esp_err_t esp_adc_cal_get_voltage**(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())
Return
- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Parameters
- `[in] channel`: ADC Channel to read
- `[in] chars`: Pointer to initialized ADC characteristics structure
- `[out] voltage`: Pointer to store converted voltage

Structures
`struct esp_adc_cal_characteristics_t`
Structure storing characteristics of an ADC.

Note Call `esp_adc_cal_charaterize()` to initialize the structure

Public Members

```
dc_unit_t adc_num
  ADC number
```

Enumerations
`enum esp_adc_cal_value_t`
Type of calibration value used in characterization.

Values:

```
ESP_ADC_CAL_VAL_EFUSE_VREF = 0
  Characterization based on reference voltage stored in eFuse
```
```
ESP_ADC_CAL_VAL_EFUSE_TP = 1
  Characterization based on Two Point values stored in eFuse
```
```
ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
  Characterization based on default reference voltage
```
```
ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
  Characterization based on Two Point values and fitting curve coefficients stored in eFuse
```
```
ESP_ADC_CAL_VAL_MAX

2.6.2 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>

...  
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

API Reference

Header File

- components/driver/esp32/include/driver/dac.h

Functions

```c
esp_err_t dac_i2s_enable (void)

Enable DAC output data from I2S.
```

Return

- ESP_OK success

```c
esp_err_t dac_i2s_disable (void)

Disable DAC output data from I2S.
```

Return

- ESP_OK success

Header File

- components/driver/include/driver/dac_common.h
Chapter 2. API Reference

Functions

esp_err_t dac_pad_get_io_num(dac_channel_t channel, gpio_num_t *gpio_num)
Get the GPIO number of a specific DAC channel.

- **Return**
  - ESP_OK if success

- **Parameters**
  - channel: Channel to get the gpio number
  - gpio_num: output buffer to hold the gpio number

esp_err_t dac_output_voltage(dac_channel_t channel, uint8_t dac_value)
Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

- **Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

- **Return**
  - ESP_OK success

- **Parameters**
  - channel: DAC channel
  - dac_value: DAC output value

esp_err_t dac_output_enable(dac_channel_t channel)
DAC pad output enable.

- **Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

- **Parameters**
  - channel: DAC channel

esp_err_t dac_output_disable(dac_channel_t channel)
DAC pad output disable.

- **Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

- **Return**
  - ESP_OK success

- **Parameters**
  - channel: DAC channel

esp_err_t dac_cw_generator_enable(void)
Enable cosine wave generator output.

- **Return**
  - ESP_OK success

esp_err_t dac_cw_generator_disable(void)
Disable cosine wave generator output.

- **Return**
  - ESP_OK success

esp_err_t dac_cw_generator_config(dac_cw_config_t *cw)
Config the cosine wave generator function in DAC module.

- **Return**
  - ESP_OK success

  - ESP_ERR_INVALID_ARG The parameter is NULL.

- **Parameters**
  - cw: Configuration.

GPIO Lookup Macros  Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC_CHANNEL_1_GPIO_NUM is the GPIO number of channel 1 (GPIO25);
2. DAC_GPIO26_CHANNEL is the channel number of GPIO 26 (channel 2).
Header File

- components/soc/esp32/include/soc/dac_channel.h

Macros

DAC_GPIO25_CHANNEL
DAC_CHANNEL_1_GPIO_NUM
DAC_GPIO26_CHANNEL
DAC_CHANNEL_2_GPIO_NUM

Header File

- components/hal/include/hal/dac_types.h

Structures

struct dac_cw_config_t
Config the cosine wave generator function in DAC module.

Public Members

dac_channel_t en_ch
Enable the cosine wave generator of DAC channel.
dac_cw_scale_t scale
Set the amplitude of the cosine wave generator output.
dac_cw_phase_t phase
Set the phase of the cosine wave generator output.

uint32_t freq
Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8_t offset
Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations

enum dac_channel_t
Values:

DAC_CHANNEL_1 = 0
DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)

DAC_CHANNEL_2 = 1
DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

DAC_CHANNEL_MAX

enum dac_cw_scale_t
The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.
Values:

DAC_CW_SCALE_1 = 0x0
1/1. Default.

DAC_CW_SCALE_2 = 0x1
1/2.

DAC_CW_SCALE_4 = 0x2
1/4.

\[ \text{DAC\_CW\_SCALE\_8} = 0x3 \]
\[ 1/8. \]

**enum dac_cw_phase_t**

Set the phase of the cosine wave generator output.

*Values:*

\[ \text{DAC\_CW\_PHASE\_0} = 0x2 \]  
Phase shift +0°

\[ \text{DAC\_CW\_PHASE\_180} = 0x3 \]  
Phase shift +180°

### 2.6.3 GPIO & RTC GPIO

#### Overview

The ESP32 chip features 35 physical GPIO pads (GPIO0 ~ GPIO23, GPIO25 ~ GPIO27, and GPIO32 ~ GPIO39). Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal. The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

Note:

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to ESP32 datasheet.
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you’re using Wi-Fi and you’re having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead, that should solve your problem. For more details, please refer to ADC limitations.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

API Reference - Normal GPIO

Header File

- components/driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)

Configure GPIO's Mode, pull-up, pull-down, IntrType
```

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin(gpio_num_t gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).
```

Note: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Return Always return ESP_OK.

Parameters
**gpio_num**: GPIO number.

```c
esp_err_t gpio_set_intr_type (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

GPIO set interrupt trigger type.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to set the trigger type of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- **intr_type**: Interrupt type, select from `gpio_int_type_t`.

```c
esp_err_t gpio_intr_enable (gpio_num_t gpio_num)
```

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to section 3.11 of ECO_and_Workarounds_for_Bugs_in_ESP32 for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

```c
esp_err_t gpio_intr_disable (gpio_num_t gpio_num)
```

Disable GPIO module interrupt signal.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

```c
esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)
```

GPIO set output level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
- **gpio_num**: GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- **level**: Output level. 0: low; 1: high

```c
int gpio_get_level (gpio_num_t gpio_num)
```

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- **gpio_num**: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

```c
esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
```

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input
Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

Parameters
- gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- mode: GPIO direction

esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

Parameters
- gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- pull: GPIO pull up/down mode.

esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
Enable GPIO wake-up function.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

Parameters
- gpio_num: GPIO number
- intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)
Disable GPIO wake-up function.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

Parameters
- gpio_num: GPIO number

esp_err_t gpio_isr_register (void (*fn) (void *)) void *
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

Parameters
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t gpio_pullup_en (gpio_num_t gpio_num)
Enable pull-up on GPIO.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)`
Disable pull-up on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)`
Enable pull-down on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)`
Disable pull-down on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_install_isr_service(int intr_alloc_flags)`
Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM No memory to install this service
• ESP_ERR_INVALID_STATE ISR service already installed.
• ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

`void gpio_uninstall_isr_service(void)`
Uninstall the driver’s GPIO ISR service, freeing related resources.

`esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)`
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
  • gpio_num: GPIO number
  • isr_handler: ISR handler function for the corresponding GPIO number.
  • args: parameter for ISR handler.

\texttt{esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)}
Remove ISR handler for the corresponding GPIO pin.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • gpio_num: GPIO number

\texttt{esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)}
Set GPIO pad drive capability.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • gpio_num: GPIO number, only support output GPIOs
  • strength: Drive capability of the pad

\texttt{esp_err_t gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)}
Get GPIO pad drive capability.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • gpio_num: GPIO number, only support output GPIOs
  • strength: Pointer to accept drive capability of the pad

\texttt{esp_err_t gpio_hold_en(gpio_num_t gpio_num)}
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, \texttt{gpio_deep_sleep_hold_en} should also be called.

Power down or call \texttt{gpio_hold_dis} will disable this function.

Return
  • ESP_OK Success
  • ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
  • gpio_num: GPIO number, only support output-capable GPIOs

\texttt{esp_err_t gpio_hold_dis(gpio_num_t gpio_num)}
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and \texttt{gpio_hold_dis} is called, gpio18 will output low level (because gpio18 is input mode by
default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**
- gpio_num: GPIO number, only support output-capable GPIOs

```c
void gpio_deep_sleep_hold_en (void)
```
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

```c
void gpio_deep_sleep_hold_dis (void)
```
Disable all digital gpio pad hold function during Deep-sleep.

```c
void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
```
Set pad input to a peripheral signal through the IOMUX.

**Parameters**
- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *
  IN_IDX signals in soc/gpio_sig_map.h.

```c
void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
```
Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**
- gpio_num: gpio_num GPIO number of the pad.
- func: The function number of the peripheral pin to output pin. One of the FUNC_X_ of specified pin (X) in soc/io_mux_reg.h.
- oen_inv: True if the output enable needs to be inverted, otherwise False.

```c
esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
```
Enable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**
- ESP_OK Success

**Parameters**
- gpio_num: GPIO number of the pad.

```c
esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
```
Disable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**
- ESP_OK Success

**Parameters**
- gpio_num: GPIO number of the pad.

```c
gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
```
GPIO set direction at sleep.
Configure GPIO direction, such as output_only,input_only,output_and_input

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
• **gpio_num**: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **mode**: GPIO direction

```c
esp_err_t gpio_sleep_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)
```

Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull**: GPIO pull up/down mode.

**Macros**
- **GPIO_PIN_COUNT**
- **GPIO_IS_VALID_GPIO**(gpio_num)
  Check whether it is a valid GPIO number.
- **GPIO_IS_VALID_OUTPUT_GPIO**(gpio_num)
  Check whether it can be a valid GPIO number of output mode.

**Type Definitions**
- `typedef intr_handler_t gpio_isr_handle_t`

**Header File**
- `components/hal/include/hal/gpio_types.h`

**Structures**
- `struct gpio_config_t`
  Configuration parameters of GPIO pad for gpio_config function.

**Public Members**
- `uint64_t pin_bit_mask`
  GPIO pin: set with bit mask, each bit maps to a GPIO
- `gpio_mode_t mode`
  GPIO mode: set input/output mode
- `gpio_pullup_t pull_up_en`
  GPIO pull-up
- `gpio_pulldown_t pull_down_en`
  GPIO pull-down
- `gpio_int_type_t intr_type`
  GPIO interrupt type

### API Reference - RTC GPIO

#### Header File

- components/driver/include/driver/rtc_io.h

#### Functions

- **bool rtc_gpio_is_valid_gpio(gpio_num_t gpio_num)**
  Determine if the specified GPIO is a valid RTC GPIO.
  
  **Return** true if GPIO is valid for RTC GPIO use. false otherwise.
  
  **Parameters**
  - gpio_num: GPIO number

- **int rtc_io_number_get(gpio_num_t gpio_num)**
  Get RTC IO index number by gpio number.
  
  **Return** >=0: Index of rtcio. -1: The gpio is not rtcio.
  
  **Parameters**
  - gpio_num: GPIO number

- **esp_err_t rtc_gpio_init(gpio_num_t gpio_num)**
  Init a GPIO as RTC GPIO.
  
  This function must be called when initializing a pad for an analog function.
  
  **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO
  
  **Parameters**
  - gpio_num: GPIO number (e.g. GPIO_NUM_12)

- **esp_err_t rtc_gpio_deinit(gpio_num_t gpio_num)**
  Init a GPIO as digital GPIO.
  
  **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO
  
  **Parameters**
  - gpio_num: GPIO number (e.g. GPIO_NUM_12)

- **uint32_t rtc_gpio_get_level(gpio_num_t gpio_num)**
  Get the RTC IO input level.
  
  **Return**
  - 1 High level
  - 0 Low level
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO
Chapter 2. API Reference

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_set_level(gpio_num_t gpio_num, uint32_t level)`
Set the RTC IO output level.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- level: output level

`esp_err_t rtc_gpio_set_direction(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction.
Configure RTC GPIO direction, such as output only, input only, output and input.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

`esp_err_t rtc_gpio_set_direction_in_sleep(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUTONLY mode. ESP32S2 support INPUTONLY, OUTPUTONLY, INPUTOUTPUT mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

`esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)`
RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)`
RTC GPIO pulldown enable.
This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)`
RTC GPIO pullup disable.
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

### `rtc_gpio_pulldown_dis(gpio_num_t gpio_num)`

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

### `rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)`

Set RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

### `rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)`

Get RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

### `rtc_gpio_hold_en(gpio_num_t gpio_num)`

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

### `rtc_gpio_hold_dis(gpio_num_t gpio_num)`

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

---

**Notes:**
- The GPIO number format used is `GPIO_NUM_n`, where `n` is a number.
- The `gpio_pulldown_dis` function is used for pulldown disable.
- The `gpio_set_drive_capability` function allows setting the drive capability of the GPIO pad.
- The `gpio_hold_en` function enables hold function, locking the current values of the GPIO pad.
- The `gpio_hold_dis` function disables the hold function, allowing the GPIO pad to receive new values.
**esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)**
Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12).

**esp_err_t rtc_gpio_force_hold_all(void)**
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all(void)**
Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)**
Enable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**
- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)**
Disable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Parameters**
- gpio_num: GPIO number

**Macros**

**RTC_GPIO_IS_VALID_GPIO(gpio_num)**

**Header File**

- components/hal/include/hal/rtc_io_types.h

**Enumerations**

**enum rtc_gpio_mode_t**
RTCIO output/input mode type.

**Values:**
- **RTC_GPIO_MODE_INPUT_ONLY**
  - Pad input
- **RTC_GPIO_MODE_OUTPUT_ONLY**
  - Pad output
**Chapter 2. API Reference**

---

**RTC_GPIO_MODE_INPUT_OUTPUT**
Pad input + output

**RTC_GPIO_MODE_DISABLED**
Pad (output + input) disable

**RTC_GPIO_MODE_OUTPUT_OD**
Pad open-drain output

**RTC_GPIO_MODE_INPUT_OUTPUT_OD**
Pad input + open-drain output

### 2.6.4 General Purpose Timer (GPTimer)

**Introduction**

A general purpose timer is a hardware timer with high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution time stamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

**Functional Overview**

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get count value** - covers how to force the timer counting from a start point and how to get the count value at anytime.
- **Set Up Alarm Action** - covers the parameters that should be set up to enable the alarm event.
- **Register Event Callbacks** - covers how to hook user specific code to the alarm event callback function.
- **Start and Stop timer** - shows some typical use cases that start the timer with different alarm behavior.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation**

Different ESP chip might have different number of independent timer groups, and within each group, there could also be several independent timers. Refer to the datasheet to find out how many hardware timers exist (usually described in the “General Purpose Timer” chapter).

From driver’s point of view, a GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that users don’t need to care about which timer and which group it belongs to.

To install a timer instance, there’s a configuration structure that needs to be given in advance: `gptimer_config_t`:

- **clk_src** selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to **Power management** section.
- **direction** sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.

Some ESP chip might only support a sub-set of the clocks, if an unsupported clock source is specified, you will get a runtime error during timer installation.
• `resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to `1 / resolution_hz` seconds.
  • Optional `intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to **Interrupt Handling**.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, you should stop it by `gptimer_stop()` in advance or make sure it has not started yet by `gptimer_start()`.

### Creating a GPTimer Handle with Resolution of 1MHz

```c
#define GPTIMER_CLK_SRC_APB
#define GPTIMER_COUNT_UP

// 1MHz, 1 tick = 1us
static gptimer_config_t timer_config = {
  .clk_src = GPTIMER_CLK_SRC_APB,
  .direction = GPTIMER_COUNT_UP,
  .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};

ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

#### Set and Get Count Value

When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the hardware timer’s bit-width, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at anytime.

#### Set Up Alarm Action

Most of the use cases of GPTimer should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, one should configure several members of `gptimer_alarm_config_t` based on how he takes use of the alarm event:

• `alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `alarm_count` and `reload_count` can’t be set to the same value when `auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.

• `reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `auto_reload_on_alarm` is set to true.

To make the alarm configurations take effect, one should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

#### Note:

• If an alarm value is set and the timer has already crossed this value, the alarm will be triggered immediately.
Register Event Callbacks  After the timer starts up, it can generate specific event (e.g. the “Alarm Event”) dynamically. If you have some function that should be called when event happens, you should hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in the `gptimer_event_callbacks_t`:

- `on_alarm` sets callback function for alarm event. As this function is called within the ISR context, user must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

One can save his own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback functions.

Start and Stop Timer  To start a timer means to enable its internal counter, it can only be achieved by calling `gptimer_start()`. The timer can be stopped at any time (even in the interrupt context) by `gptimer_stop()`. One thing should be kept in mind, calling of `gptimer_start()` should have the same times of calling `gptimer_stop()` before you delete the timer, otherwise the driver might be put in an undetermined state. For example, the timer might keep a Power Management lock, which in return increase the power consumption. Also see Power management section.

Start Timer As a Wall Clock

```
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks.
    // Suggest dealing with event data in the main loop, instead of in this
    // callback.
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

```

```
gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
```

(continues on next page)
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Trigger One-Shot Event

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken = pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing the alarm_value of gptimer_alarm_event_data_t. Then the alarm value will be updated after the callback function returns.

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        (continues on next page)
.alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
};
gptimer_set_alarm_action(timer, &alarm_config);
// return whether we need to yield at the end of ISR
return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

Power Management When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the driver creates a GPTimer instance that has selected GPTIMER_CLK_SRC_APB as its clock source, the driver will guarantee that the power management lock is acquired when the timer is started by gptimer_start(). Likewise, the driver releases the lock when gptimer_stop() is called for that timer. This requires that the gptimer_start() and gptimer_stop() should appear in pairs.

IRAM Safe By default, the GPTimer interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option CONFIG_GPTIMER_ISR_IRAM_SAFE that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- gptimer_start()
- gptimer_stop()
- gptimer_get_raw_count()
- gptimer_set_raw_count()
- gptimer_set_alarm_action()

Thread Safety The factory function gptimer_new_timer() is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. Other functions that take the gptimer_handle_t as the first positional parameter, are not thread safe. The lifecycle of the gptimer handle is maintained by the user. So user should avoid calling them concurrently. If it has to, then one should introduce another mutex to prevent the gptimer handle being accessed concurrently.

on_alarm callback and the functions invoked by itself should also be placed in IRAM, users need to take care of them by themselves.
Chapter 2. API Reference

Application Examples

Typical use cases of GPTimer are listed in the example: peripherals/timer_group/gptimer.

API Reference

Header File

- components/driver/include/driver/gptimer.h

Functions

`esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)`
Create a new General Purpose Timer, and return the handle.

**Note** Once a timer is created, it is placed in the stopped state and will not start until `gptimer_start()` is called.

**Return**
- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

**Parameters**
- **[in]** config: GPTimer configuration
- **[out]** ret_timer: Returned timer handle

`esp_err_t gptimer_del_timer(gptimer_handle_t timer)`
Delete the GPTimer handle.

**Note** A timer must be in a stop state before it can be deleted.

**Return**
- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer has not stopped
- ESP_FAIL: Delete GPTimer failed because of other error

**Parameters**
- **[in]** timer: Timer handle created by `gptimer_new_timer()`

`esp_err_t gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value)`
Set GPTimer raw count value.

**Note** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

**Parameters**
- **[in]** timer: Timer handle created by `gptimer_new_timer()`
- **[in]** value: Count value to be set

`esp_err_t gptimer_get_raw_count(gptimer_handle_t timer, uint64_t *value)`
Get GPTimer raw count value.

**Note** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

**Note** This function is allowed to run within ISR context
Chapter 2. API Reference

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [out] `value`: Returned GPTimer count value

```c
esp_err_t gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for GPTimer.

**Note** The user registered callbacks are expected to be runnable within ISR context

**Return**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [in] `cbs`: Group of callback functions
- [in] `user_data`: User data, which will be passed to callback functions directly

```c
esp_err_t gptimer_set_alarm_action(gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [in] `config`: Alarm configuration, especially, set config to NULL means disabling the alarm function

```c
esp_err_t gptimer_start(gptimer_handle_t timer)
```

Start GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not in stop state
- ESP_FAIL: Start GPTimer failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`

```c
esp_err_t gptimer_stop(gptimer_handle_t timer)
```

Stop GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Stop GPTimer successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in start state
- ESP_FAIL: Stop GPTimer failed because of other error

**Parameters**
- `[in] timer`: Timer handle created by `gptimer_new_timer()`

**Structures**

- `struct gptimer_alarm_event_data_t`
  GPTimer alarm event data.

  **Public Members**
  
  - `uint64_t count_value`
    Current count value
  
  - `uint64_t alarm_value`
    Current alarm value

- `struct gptimer_event_callbacks_t`
  Group of supported GPTimer callbacks.

  **Note** The callbacks are all running under ISR environment

  **Public Members**
  
  - `gptimer_alarm_cb_t on_alarm`
    Timer alarm callback

- `struct gptimer_config_t`
  General Purpose Timer configuration.

  **Public Members**
  
  - `gptimer_clock_source_t clk_src`
    GPTimer clock source
  
  - `gptimer_count_direction_t direction`
    Count direction
  
  - `uint32_t resolution_hz`
    Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 /
    resolution_hz) seconds
  
  - `uint32_t intr_shared`: 1
    Set true, the timer interrupt number can be shared with other peripherals

- `struct gptimer_alarm_config_t`
  General Purpose Timer alarm configuration.

  **Public Members**
  
  - `uint64_t alarm_count`
    Alarm target count value
  
  - `uint64_t reload_count`
    Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true
  
  - `uint32_t auto_reload_on_alarm`: 1
    Reload the count value by hardware, immediately at the alarm event
**Type Definitions**

```c
typedef struct gptimer_t *gptimer_handle_t
```

Type of General Purpose Timer handle.

```c
typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
```

Timer alarm callback prototype.

**Return** Whether a high priority task has been waken up by this function

**Parameters**

- `[in] timer`: Timer handle created by `gptimer_new_timer()`
- `[in] edata`: Alarm event data, fed by driver
- `[in] user_ctx`: User data, passed from `gptimer_register_event_callbacks()`

**Header File**

- `components/hal/include/hal/timer_types.h`

**Enumerations**

```c
enum gptimer_clock_source_t
```

GPTimer clock source.

**Note** The clock source listed here is not supported on all targets

**Note** User should select the clock source based on real requirements:

<table>
<thead>
<tr>
<th>GPTimer clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPTIMER_CLK_SRC_APB</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>GPTIMER_CLK_SRC_XTAL</td>
<td>Medium resolution, high accuracy</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

**Values:**

- **GPTIMER_CLK_SRC_APB**
  Select APB as the source clock

```c
enum gptimer_count_direction_t
```

GPTimer count direction.

**Values:**

- **GPTIMER_COUNT_DOWN**
  Decrease count value

- **GPTIMER_COUNT_UP**
  Increase count value

**2.6.5 Inter-Integrated Circuit (I2C)**

**Overview**

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has 2 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.
Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

**Configuration**

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,  // select GPIO specific to your...
    //project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,  // select GPIO specific to your...
    //project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,  // select frequency specific to your...
    //project
    .clk_flags = 0,  //Optional, you can use I2C_SCLK_SRC_FLAG_*
    //flags to choose i2c source clock here. */
};
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your...
    //project
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
.sda_pullup_en = GPIO_PULLUP_ENABLE,      
.scl_io_num = I2C_SLAVE_SCL_IO,            
// select GPIO specific to your
~project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,    
 .mode = I2C_MODE_SLAVE,                 
 .slave.addr_10bit_en = 0,               
 .slave.slave_addr = ESP_SLAVE_ADDR,     
 // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

**Source Clock Configuration** Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB clock</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock’s baud rate will not change while APB clock is changing.  
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.  
3. Some flags may not be supported on ESP32, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in esp_hw_support/include/esp_intr_alloc.h)
**Communication as Master** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send a bytes to a slave.

![Fig. 11: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.
   - Then, populate it with the series of data to be sent to the slave:
     a) **Start bit** - `i2c_master_start()`
     b) **Slave address** - `i2c_master_write_byte()`.
     c) **Data** - One or more bytes as an argument of `i2c_master_write()`
     d) **Stop bit** - `i2c_master_stop()`
   - Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`.
   - Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read n bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.
Fig. 12: I2C command link - master read example

For this reason, the command link sent by the master to write data to the slave contains the address (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. The API provides the following functions for slaves

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section **Configuration**, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.
Table 9: Other Configurable I2C Communication Parameters

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples,</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>as well as when master toggles</td>
<td></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose</td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
<tr>
<td>one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see **Interrupt Handling**.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C master and slave example: `peripherals/i2c`.

**API Reference**

**Header File**

- `components/driver/include/driver/i2c.h`
Chapter 2. API Reference

**Functions**

*esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)*

Install an I2C driver.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in `i2c` read and write function, because we cannot access the `psram` (if `psram` is enabled) in interrupt handle function when cache is disabled.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**Parameters**
- i2c_num: I2C port number
- mode: I2C mode (either master or slave)
- slv_rx_buf_len: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- slv_tx_buf_len: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

*esp_err_t i2c_driver_delete (i2c_port_t i2c_num)*

Delete I2C driver.

**Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port to delete

*esp_err_t i2c_param_config (i2c_port_t i2c_num, const i2c_config_t *i2c_conf)*

Configure an I2C bus with the given configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port to configure
- i2c_conf: Pointer to the I2C configuration

*esp_err_t i2c_reset_tx_fifo (i2c_port_t i2c_num)*

Reset I2C tx hardware fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

*esp_err_t i2c_reset_rx_fifo (i2c_port_t i2c_num)*

Reset I2C rx fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

*esp_err_t i2c_set_pin (i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)*

Configure GPIO pins for I2C SCK and SDA signals.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number
- `sda_io_num`: GPIO number for I2C SDA signal
- `scl_io_num`: GPIO number for I2C SCL signal
- `sda_pullup_en`: Enable the internal pullup for SDA pin
- `scl_pullup_en`: Enable the internal pullup for SCL pin
- `mode`: I2C mode

```c
esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
```

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

void i2c_cmd_link_create(void)
Create and initialize an I2C commands list. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete() to release and return the resources. The required bytes will be dynamically allocated.

Parameters
- cmd_handle: I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)
Free the I2C commands list.

Parameters
- cmd_handle: I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)
Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

Parameters
- cmd_handle: I2C commands list
**Chapter 2. API Reference**

**esp_err_t i2c_master_write_byte**

`i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)`

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**

- `cmd_handle`: I2C commands list
- `data`: Byte to send on the port
- `ack_en`: Enable ACK signal

**esp_err_t i2c_master_write**

`i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t * data, size_t data_len, bool ack_en)`

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**

- `cmd_handle`: I2C commands list
- `data`: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to ESP_INTR_FLAG_IRAM, `data` should be allocated from internal RAM.
- `data_len`: Length, in bytes, of the data buffer
- `ack_en`: Enable ACK signal

**esp_err_t i2c_master_read_byte**

`i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t* data, i2c_ack_type_t ack)`

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**

- `cmd_handle`: I2C commands list
- `data`: Pointer where the received byte will the stored. This buffer shall remain valid until the transaction is finished.
- `ack`: ACK signal

**esp_err_t i2c_master_read**

`i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t * data, size_t data_len, i2c_ack_type_t ack)`

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**

- `cmd_handle`: I2C commands list
- `data`: Pointer where the received bytes will the stored. This buffer shall remain valid until the transaction is finished.
• `data_len`: Size, in bytes, of the data buffer
• `ack`: ACK signal

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`
Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return
• `ESP_OK`: Success
• `ESP_ERR_INVALID_ARG`: Parameter error
• `ESP_ERR_NO_MEM`: The static buffer used to create `cmd_handler` is too small
• `ESP_FAIL`: No more memory left on the heap

Parameters
• `cmd_handle`: I2C commands list

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`
Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return
• `ESP_OK`: Success
• `ESP_ERR_INVALID_ARG`: Parameter error
• `ESP_FAIL`: Sending command error, slave hasn’t ACK the transfer.
• `ESP_ERR_INVALID_STATE`: I2C driver not installed or not in master mode.
• `ESP_ERR_TIMEOUT`: Operation timeout because the bus is busy.

Parameters
• `i2c_num`: I2C port number
• `cmd_handle`: I2C commands list
• `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`
Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note
This function shall only be called in I2C slave mode.

Return
• `ESP_FAIL` (-1): Parameter error
• Other (>=0): The number of data bytes pushed to the I2C slave buffer.

Parameters
• `i2c_num`: I2C port number
• `data`: Bytes to write into internal buffer
• `size`: Size, in bytes, of data buffer
• `ticks_to_wait`: Maximum ticks to wait.

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`
Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note
This function shall only be called in I2C slave mode.

Return
• `ESP_FAIL` (-1): Parameter error
• Others (>=0): The number of data bytes read from I2C slave buffer.

Parameters
• `i2c_num`: I2C port number
• `data`: Buffer to fill with ringbuffer’s bytes
• `max_size`: Maximum bytes to read
• `ticks_to_wait`: Maximum waiting ticks
**esp_err_t** i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)

Set I2C master clock period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
- low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

**esp_err_t** i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**esp_err_t** i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow down the SCL clock.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number to filter
- cyc_num: the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**esp_err_t** i2c_filter_disable(i2c_port_t i2c_num)

Disable filter on I2C bus.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

**esp_err_t** i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)

Set I2C master start signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**esp_err_t** i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)

Get I2C master start signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters
- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```
set I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- `hold_time`: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int* setup_time, int* hold_time)
```
get I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time.
- `hold_time`: pointer to get hold time.

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```
set I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `sample_time`: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
- `hold_time`: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int* sample_time, int* hold_time)
```
get I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `sample_time`: pointer to get sample time
- `hold_time`: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```
set I2C timeout value

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `timeout`: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int* timeout)
```
get I2C timeout value
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

Structures

```c
struct i2c_config_t
```

I2C initialization parameters.

Public Members

```c
i2c_mode_t mode
```

I2C mode

```c
int sda_io_num
```

GPIO number for I2C sda signal

```c
int scl_io_num
```

GPIO number for I2C scl signal

```c
bool sda_pullup_en
```

Internal GPIO pull mode for I2C sda signal

```c
bool scl_pullup_en
```

Internal GPIO pull mode for I2C scl signal

```c
uint32_t clk_speed
```

I2C clock frequency for master mode, (no higher than 1MHz for now)

```c
struct i2c_config_t::{anonymous}::{anonymous} master
```

I2C master config

```c
uint8_t addr_10bit_en
```

I2C 10bit address mode enable for slave mode

```c
uint16_t slave_addr
```

I2C address for slave mode
```c
uint32_t maximum_speed
I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]::[anonymous] slave
I2C slave config

uint32_t clk_flags
Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros
I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz
I2C_NUM_MAX
I2C port max
I2C_NUM_0
I2C port 0
I2C_NUM_1
I2C port 1
I2C_SCLK_SRC_FLAG_FOR_NORMAL
Any one clock source that is available for the specified frequency may be chosen
I2C_SCLK_SRC_FLAG_AWARE_DFS
For REF tick clock, it won’t change with APB.
I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
For light sleep mode.
I2C_INTERNAL_STRUCT_SIZE
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.
I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to
i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, de-
scribing the number of transactions intended to be performed on the I2C port. For example, if one wants
to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands
required are the following:
• write device register
• read register content
 Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions
typedef void *i2c_cmd_handle_t
I2C command handle

Header File
• components/hal/include/hal/i2c_types.h

Macros
I2C_CLK_FREQ_MAX
Use the highest speed that is available for the clock source picked by clk_flags.

Type Definitions
typedef int i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```
Enumerations

enum i2c_mode_t
Values:

I2C_MODE_SLAVE = 0
I2C slave mode

I2C_MODE_MASTER
I2C master mode

I2C_MODE_MAX

enum i2c_rw_t
Values:

I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data

enum i2c_trans_mode_t
Values:

I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first

I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:

I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode

I2C_ADDR_BIT_10
I2C 10bit address for slave mode

I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:

I2C_MASTER_ACK = 0x0
I2C ack for each byte read

I2C_MASTER_NACK = 0x1
I2C nack for each byte read

I2C_MASTER_LAST_NACK = 0x2
I2C nack for the last byte

I2C_MASTER_ACK_MAX

enum i2c_sclk_t
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.
Values:

I2C_SCLK_DEFAULT = 0
I2C source clock not selected

I2C_SCLK_APB
I2C source clock from APB, 80M

I2C_SCLK_MAX

```c
enum i2c_opmode_t
{
    I2C_CMD_RESTART = 0,
    I2C_CMD_WRITE,
    I2C_CMD_READ,
    I2C_CMD_STOP,
    I2C_CMD_END
};
```

### 2.6.6 Inter-IC Sound (I2S)

#### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

**Note:** For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll` = TRUE and `i2s_config_t::fixed_mclk` > 0, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.
Chapter 2. API Reference

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: $0 < \frac{MCLK}{LRCK/\text{channels/bits\_per\_sample}} < 64$.

Functional Overview

**Installing the Driver**  Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `i2s_driver_install` returns ESP_OK, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};
i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins**  Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

**Note:** MCK only takes effect in `I2S_MODE_MASTER` mode.

```
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication**  To perform a transmission:
• Prepare the data for sending
• Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```c
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read, -100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver**  If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

**Application Example**

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there are two short configuration examples for the I2S driver.

In addition, there is a short configuration examples for the I2S driver.

**I2S configuration**  Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
  .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
  .communication_format = I2S_COMM_FORMAT_STAND_I2S,
  .tx_desc_auto_clear = false,
  .dma_desc_num = 8,
  .dma_frame_num = 64,
  .use_apll = false,
  .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

static const i2s_pin_config_t pin_config = {
  .bck_io_num = 4,
  .ws_io_num = 5,
  .data_out_num = 18,
  .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);
...
/* You can reset parameters by calling 'i2s_set_clk'

(continues on next page)*/
The low 16 bits are the valid data bits in one channel and the high 16 bits are the total bits in one channel. If the high 16 bits is smaller than low 16 bits, it will be set to the same value as low 16 bits.

```c
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

### Configuring I2S to use internal DAC for analog output

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
   .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
   .sample_rate = 44100,
   .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
   .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
   .intr_alloc_flags = 0, /* default interrupt priority */
   .dma_desc_num = 8,
   .dma_frame_num = 64,
   .use_apll = false
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s...
i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode. //i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);
i2s_set_sample_rates(i2s_num, 22050); //set sample rates
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

### Application Notes

If you are using a high sample rate like more than 48 kHz or see the data being lost, the following information might help.

Considering different applications have different requirements, `dma_desc_num` and `dma_frame_num` are made public. Here is the detailed explanation to these two fields:

- **dma_desc_num**: The total number of descriptors used by I2S DMA to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, `dma_desc_num` can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to `i2s_read()` and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

- **dma_frame_num**: The number of frames for one-time sampling. The frame here means the total data from all the channels in one WS cycle. For example, if two channels in stereo mode (i.e., `channel_format` is set to `I2S_CHANNEL_FMT_RIGHT_LEFT`) are active, and each channel transfers 32 bits (i.e., `bits_per_sample` is set to `I2S_BITS_PER_CHAN_32BIT`), then the total number of bytes...
of a frame is \( \text{channel\_format} \times \text{bits\_per\_sample} = 2 \times 32 / 8 = 8 \) bytes. For example, we assume that the current \( \text{dma\_frame\_num} \) is 100, then the length of the DMA buffer is \( 8 \times 100 = 800 \) bytes. Note that the length of an internal DMA buffer shouldn’t be greater than 4092.

When the data received by DMA reach the size of internal DMA buffer, a receive interrupt is triggered, and an internal message queue will transport this buffer to \( \text{i2s\_read()} \). The main task of \( \text{i2s\_read()} \) is to copy the data in the internal DMA buffer into the user given buffer. Since the internal DMA buffer is usually not equal to the user given buffer size, there are two cases:

- If the size of internal DMA buffers is smaller than the user given buffer size, \( \text{i2s\_read()} \) will consume several internal DMA buffers to fill up the user given buffer. If the message queue of DMA buffer is not long enough, \( \text{i2s\_read()} \) will be blocked on receive message queue until getting enough data. You can estimate the time \( \text{i2s\_read()} \) function is blocked by the formula \( \text{block\_time (sec) = (given\_bufer\_size) / (sample\_rate \times \text{channel\_num} \times \text{channel\_bytes})} \). If we place \( \text{i2s\_read()} \) in a while together with other functions we should also consider the time the loop execution is blocked by the other functions before \( \text{i2s\_read()} \) is executed again. It is not allowed to exceed the max\_wait\_time (sec) = \( ((\text{dma\_desc\_num} - 1) \times \text{dma\_buffer\_size}) / \text{sample\_rate} \), otherwise the internal message queue will overflow and in consequence some data will be lost.

- If the DMA buffer size is greater than the user given buffer size, it means \( \text{i2s\_read()} \) would need to be called in a loop several times to take all the data, the max\_wait\_time may be exceeded, and the message queue overflow is likely to happen. Therefore it is quite risky to use a small user buffer for data receiving.

Here are a couple of tips when the sample rate is high:

1. Increasing \( \text{dma\_frame\_num} \) can help to reduce the I2S DMA interrupt frequency;
2. Increasing \( \text{dma\_desc\_num} \) can help to allow a longer max\_wait\_time to be spent by the other functions in the loop containing \( \text{i2s\_read()} \);
3. Increasing the size of the buffer internal to \( \text{i2s\_read()} \) can help to increase the max\_wait\_time. When you process I2S data (like storing the data to an SD card) in another thread, the time spent in processing thread for one loop should not exceed the max\_wait\_time otherwise some data will be lost. So if the processing of the received data received is rather slow, please allow \( \text{i2s\_read()} \) a big internal buffer for storing the read data;
4. Allocating at least two user given buffers can improve the data receipt efficiency. One buffer can continue to receive data while the other one is under processing. But we have to guarantee the buffer that is going to read data is not under processing in the other thread. We can use a semaphore or another lock to avoid overwriting the data in the buffer while it is still under processing;

```c
uint8_t **user\_given\_buffers = (uint8_t **)calloc(buffer\_num, __sizeof(uint8_t \*));
// Don’t forget to check if user\_given\_buffers is NULL here
for (int i = 0; i < buffer\_num; i++) {
    user\_given\_buffers[i] = (uint8_t **)calloc(user\_given\_buffer\_size, __sizeof(uint8_t \*));
    // Don’t forget to check if user\_given\_buffers[i] is NULL here
}
int cnt = 0;
while (1) {
    ... // Other operations (e.g. Waiting on a semaphore)
    i2s\_read(I2S\_NUM, user\_given\_buffer[cnt], user\_given\_buffer\_size, &
        i2s\_bytes\_read, 100);
    ... // Other operations (e.g. Sending the data to another thread...)
    // Avoid any data processing here.)
    cnt++;
}
```

(continues on next page)
5. Increasing the priority of the thread that contains `i2s_read()` can help the data in the message queue to be taken more timely.

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```c
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive `I2S_EVENT_RX_Q_OVF` event when there are data lost.

### API Reference

#### Header File

- `components/driver/include/driver/i2s.h`

#### Functions

**esp_err_t i2s_set_pin** *(i2s_port_t i2s_num, const i2s_pin_config_t *pin)*

Set I2S pin number.

Inside the pin configuration structure, set `I2S_PIN_NO_CHANGE` for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**

- `i2s_num`: I2S port number
- `pin`: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if `*pin` is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` IO error

**esp_err_t i2s_set_pdm_rx_down_sample** *(i2s_port_t i2s_num, i2s_pdm_dsr_t downsample)*

Set PDM mode down-sample rate. In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be `(fpcm * 64)` or `(fpcm * 128)` accordingly.

**Note** After calling this function, it would call `i2s_set_clk` inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` Out of memory

**Parameters**

- `i2s_num`: I2S port number
- `downsample`: I2S RX down sample rate for PDM mode.

**esp_err_t i2s_set_pdm_tx_up_sample** *(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)*

Set TX PDM mode up-sample rate.
Note If you have set PDM mode while calling ‘i2s_driver_install’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- upsample_cfg: Set I2S PDM up-sample rate configuration

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters
- i2s_num: I2S port number
- i2s_config: I2S configurations - see i2s_config_t struct
- queue_size: I2S event queue size/depth.
- i2s_queue: I2S event queue handle, if set NULL, driver will not use an event queue.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.

Parameters
- i2s_num: I2S port number

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).
Parameters

- **i2s_num**: I2S port number
- **src**: Source address to write from
- **size**: Size of data in bytes
- **src_bits**: Source audio bit
- **aim_bits**: Bit wanted, no more than 32, and must be greater than src_bits
- **[out]** bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks_to_wait**: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call i2s_adc_enable and i2s_adc_disable around the whole reading process, to prevent the data getting corrupted.

Parameters

- **i2s_num**: I2S port number
- **dest**: Destination address to read into
- **size**: Size of data in bytes
- **[out]** bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- **ticks_to_wait**: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

bit_clock = rate * (number of channels) * bits_per_sample

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- **i2s_num**: I2S port number
- **rate**: I2S sample rate (ex: 8000, 44100…)

```c
esp_err_t i2s_stop(i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall(). Disables I2S TX/RX, until i2s_start() is called.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
Chapter 2. API Reference

- `i2s_num`: I2S port number

`esp_err_t i2s_start(i2s_port_t i2s_num)`

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2s_num`: I2S port number

`esp_err_t i2s_zero_dma_buffer(i2s_port_t i2s_num)`

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2s_num`: I2S port number

`esp_err_t i2s_set_clk(i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)`

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- `i2s_num`: I2S port number
- `rate`: I2S sample rate (ex: 8000, 44100⋯)
- `bits_cfg`: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see `i2s_bits_per_sample_t`) the high 16 bits is for total bits in one channel (see `i2s_bits_per_chan_t`) high 16 bits = 0 means same as the bits per sample.
- `ch`: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

`float i2s_get_clk(i2s_port_t i2s_num)`

Get clock set on particular port number.

Return
- actual clock set by i2s driver

Parameters
- `i2s_num`: I2S port number

`esp_err_t i2s_set_adc_mode(adc_unit_t adc_unit, adc1_channel_t adc1_channel)`

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

Note In this mode, the ADC maximum sampling rate is 150KHz. Set the sampling rate through `i2s_config_t`.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `adc_unit`: ADC unit
- `adc1_channel`: ADC channel
• `adc_unit`: SAR ADC unit index
• `adc_channel`: ADC channel index

```c
esp_err_t i2s_adc_enable(i2s_port_t i2s_num)
```
Start to use I2S built-in ADC mode.

**Note** This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

**Parameters**
• `i2s_num`: i2s port index

```c
esp_err_t i2s_adc_disable(i2s_port_t i2s_num)
```
Stop to use I2S built-in ADC mode.

**Note** This function would release the lock of ADC so that other tasks can use ADC.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

**Parameters**
• `i2s_num`: i2s port index

```c
esp_err_t i2s_set_dac_mode(i2s_dac_mode_t dac_mode)
```
Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one cannot be used as RTC DAC function at the same time.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• `dac_mode`: DAC mode configurations - see `i2s_dac_mode_t`

**Structures**

```c
struct i2s_pdm_tx_upsample_cfg_t
```
I2S PDM up-sample rate configuration.

**Note** TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.

**Public Members**

```c
int sample_rate
```
I2S PDM sample rate

```c
int fp
```
I2S PDM TX upsampling paramater. Normally it should be set to 960

```c
int fs
```
I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency Fpdm = 128 * sample_rate, when it is set to sample_rate / 100, Fpdm will be fixed to 128*48000

```c
struct i2s_pin_config_t
```
I2S pin number for `i2s_set_pin`. 
Public Members

```c
int mck_io_num
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/1/31 only

int bck_io_num
BCK in out pin

int ws_io_num
WS in out pin

int data_out_num
DATA out pin

int data_in_num
DATA in pin
```

```c
struct i2s_driver_config_t
I2S driver configuration parameters.
```

Public Members

```c
i2s_mode_t mode
I2S work mode

uint32_t sample_rate
I2S sample rate

i2s_bits_per_sample_t bits_per_sample
I2S sample bits in one channel

i2s_channel_fmt_t channel_format
I2S channel format.

i2s_comm_format_t communication_format
I2S communication format

int intr_alloc_flags
Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int dma_desc_num
The total number of descriptors used by I2S DMA to receive/transmit data

int dma_buf_count
This is an alias to ‘dma_desc_num’ for backward compatibility

int dma_frame_num
Number of frames for one-time sampling. The frame here means the total data from all the channels in a WS cycle

int dma_buf_len
This is an alias to ‘dma_frame_num’ for backward compatibility

bool use_apll
I2S using APPLL as main I2S clock, enable it to get accurate clock

bool tx_desc_auto_clear
I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int fixed_mclk
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect
**Chapter 2. API Reference**

### i2s_mclk_multiple_t

The multiple of I2S master clock (MCLK) to sample rate

### i2s_bits_per_chan_t

I2S total bits in one channel, only take effect when larger than `bits_per_sample`, default ‘0’ means equal to `bits_per_sample`

### struct i2s_event_t

Event structure used in I2S event queue.

#### Public Members

- **i2s_event_type_t type**
  
  I2S event type

- **size_t size**
  
  I2S data size for I2S_DATA event

#### Macros

- **I2S_PIN_NO_CHANGE**
  
  Use in `i2s_pin_config_t` for pins which should not be changed

- **I2S_PDM_DEFAULT_UPSAMPLE_CONFIG(rate)**
  
  Default I2S PDM Up-Sampling Rate configuration.

#### Type Definitions

- **typedef i2s_driver_config_t i2s_config_t**

- **typedef intr_handle_t i2s_isr_handle_t**

#### Enumerations

- **enum i2s_port_t**
  
  I2S port number, the max port number is (I2S_NUM_MAX -1).

  **Values**:

  - **I2S_NUM_0 = 0**
    
    I2S port 0

  - **I2S_NUM_1 = 1**
    
    I2S port 1

  - **I2S_NUM_MAX**
    
    I2S port max

- **enum i2s_event_type_t**

  I2S event queue types.

  **Values**:

  - **I2S_EVENT_DMA_ERROR**

  - **I2S_EVENT_TX_DONE**
    
    I2S DMA finish sent 1 buffer

  - **I2S_EVENT_RX_DONE**
    
    I2S DMA finish received 1 buffer

  - **I2S_EVENT_TX_Q_OVF**
    
    I2S DMA sent queue overflow

  - **I2S_EVENT_RX_Q_OVF**
    
    I2S DMA receive queue overflow
I2S_EVENT_MAX
I2S event max index

Header File

- components/hal/include/hal/i2s_types.h

Enumerations

enum i2s_bits_per_sample_t
I2S bit width per sample.

Values:

I2S_BITS_PER_SAMPLE_8BIT = 8
data bit-width: 8
I2S_BITS_PER_SAMPLE_16BIT = 16
data bit-width: 16
I2S_BITS_PER_SAMPLE_24BIT = 24
data bit-width: 24
I2S_BITS_PER_SAMPLE_32BIT = 32
data bit-width: 32

enum i2s_bits_per_chan_t
I2S bit width per chan.

Values:

I2S_BITS_PER_CHAN_DEFAULT = (0)
channel bit-width equals to data bit-width
I2S_BITS_PER_CHAN_8BIT = (8)
channel bit-width: 8
I2S_BITS_PER_CHAN_16BIT = (16)
channel bit-width: 16
I2S_BITS_PER_CHAN_24BIT = (24)
channel bit-width: 24
I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32

enum i2s_channel_t
I2S channel.

Values:

I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels
I2S_CHANNEL_STEREO = 0x03
I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.

enum i2s_comm_format_t
I2S communication standard format.

Values:

I2S_COMM_FORMAT_STAND_I2S = 0X01
I2S communication I2S Philips standard, data launch at second BCK
I2S_COMM_FORMAT_STAND_MSB = 0X02
I2S communication MSB alignment standard, data launch at first BCK
I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
   PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
   PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_STAND_MAX
   standard max

I2S_COMM_FORMAT_I2S = 0x01
   I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01
   I2S format MSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02
   I2S format LSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04
   I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04
   PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08
   PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t
   I2S channel format type.
   Values:

   I2S_CHANNEL_FMT_RIGHT_LEFT
      Separated left and right channel

   I2S_CHANNEL_FMT_ALL_RIGHT
      Load right channel data in both two channels

   I2S_CHANNEL_FMT_ALL_LEFT
      Load left channel data in both two channels

   I2S_CHANNEL_FMT_ONLY_RIGHT
      Only load data in right channel (mono mode)

   I2S_CHANNEL_FMT_ONLY_LEFT
      Only load data in left channel (mono mode)

enum i2s_mode_t
   I2S Mode.
   Values:

   I2S_MODE_MASTER = (0x1 << 0)
      Master mode

   I2S_MODE_SLAVE = (0x1 << 1)
      Slave mode

   I2S_MODE_TX = (0x1 << 2)
      TX mode

   I2S_MODE_RX = (0x1 << 3)
      RX mode
I2S_MODE_DAC_BUILT_IN = (0x1 << 4)
Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

I2S_MODE_ADC_BUILT_IN = (0x1 << 5)
Input I2S data from built-in ADC, each data can be 12-bit width at most

I2S_MODE_PDM = (0x1 << 6)
I2S PDM mode

enum i2s_clock_src_t
I2S source clock.

Values:

I2S_CLK_D2CLK = 0
Clock from PLL_D2_CLK(160M)

I2S_CLK_APLL
Clock from APPLL

enum i2s_mclk_multiple_t
The multiple of mclk to sample rate.

Values:

I2S_MCLK_MULTIPLE_DEFAULT = 0
Default value. mclk = sample_rate * 256

I2S_MCLK_MULTIPLE_128 = 128
mclk = sample_rate * 128

I2S_MCLK_MULTIPLE_256 = 256
mclk = sample_rate * 256

I2S_MCLK_MULTIPLE_384 = 384
mclk = sample_rate * 384

enum i2s_dac_mode_t
I2S DAC mode for i2s_set_dac_mode.
Note: Built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:

I2S_DAC_CHANNEL_DISABLE = 0
Disable I2S built-in DAC signals

I2S_DAC_CHANNEL_RIGHT_EN = 1
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

I2S_DAC_CHANNEL_LEFT_EN = 2
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

I2S_DAC_CHANNEL_BOTH_EN = 0x3
Enable both of the I2S built-in DAC channels.

I2S_DAC_CHANNEL_MAX = 0x4
I2S built-in DAC mode max index

enum i2s_pdm_dsr_t
I2S PDM RX downsample mode.

Values:

I2S_PDM_DSR_8S = 0
downsampling number is 8 for PDM RX mode

I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode
Chapter 2. API Reference

I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t

Values:

I2S_PDM_SIG_SCALING_DIV_2 = 0
I2S TX PDM sigmadelta signal scaling: /2

I2S_PDM_SIG_SCALING_MUL_1 = 1
I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2
I2S TX PDM sigmadelta signal scaling: x2

I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4

2.6.7 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- i80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- GC9A01 user customized driver and dash board UI - peripherals/lcd/gc9a01
- RGB panel example with scatter chart UI - peripherals/lcd/rgb_panel
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

API Reference

Header File

- components/hal/include/hal/lcd_types.h
**Enumerations**

```c
enum lcd_clock_source_t
{  
    LCD_CLOCK_SOURCE_PLL160M,  
    LCD_CLOCK_SOURCE_PLL240M,  
    LCD_CLOCK_SOURCE_APLL,  
    LCD_CLOCK_SOURCE_XTAL,  
};
```

**Note**  
User should select the clock source based on the real requirement:

<table>
<thead>
<tr>
<th>LCD clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_CLOCK_SOURCE_PLL160M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLOCK_SOURCE_PLL240M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLOCK_SOURCE_APLL</td>
<td>Configurable resolution</td>
<td>ESP_PM_NO_LIGHT_SLEEP lock</td>
</tr>
<tr>
<td>LCD_CLOCK_SOURCE_XTAL</td>
<td>Medium resolution</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

**Values:**

- **LCD_CLOCK_SOURCE_PLL160M**  
  Select PLL160M as the source clock

- **LCD_CLOCK_SOURCE_PLL240M**  
  Select PLL240M as the source clock

- **LCD_CLOCK_SOURCE_APLL**  
  Select APLL as the source clock

- **LCD_CLOCK_SOURCE_XTAL**  
  Select XTAL as the source clock

**Header File**

- `components/esp_lcd/include/esp_lcd_types.h`

**Type Definitions**

```c
define typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t  
Type of LCD panel IO handle
```

```c
define typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t  
Type of LCD panel handle
```

**Enumerations**

```c
enum esp_lcd_color_space_t
{  
    ESP_LCD_COLOR_SPACE_RGB,  
    ESP_LCD_COLOR_SPACE_BGR,  
    ESP_LCD_COLOR_SPACE_MONOCHROME,  
};
```

**Values:**

- **ESP_LCD_COLOR_SPACE_RGB**  
  Color space: RGB

- **ESP_LCD_COLOR_SPACE_BGR**  
  Color space: BGR

- **ESP_LCD_COLOR_SPACE_MONOCHROME**  
  Color space: monochrome

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_io.h`

**Functions**

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.
Chapter 2. API Reference

Note Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- `[in] io`: LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- `[in] lcd_cmd`: The specific LCD command
- `[in] param`: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- `[in] param_size`: Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

Note This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- `[in] io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- `[in] lcd_cmd`: The specific LCD command
- `[in] color`: Buffer that holds the RGB color data
- `[in] color_size`: Size of `color` in memory, in bytes

```c
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- `[in] io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

```c
esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for SPI interface.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- `[in] bus`: SPI bus handle
- `[in] io_config`: IO configuration, for SPI interface
- `[out] ret_io`: Returned IO handle

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.
Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: I2C bus handle
• [in] io_config: IO configuration, for I2C interface
• [out] ret_io: Returned IO handle

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config,
                              esp_lcd_i80_bus_handle_t *ret_bus)
```
Create Intel 8080 bus handle.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_ERR_NOT_FOUND if no free bus is available
• ESP_OK on success

Parameters
• [in] bus_config: Bus configuration
• [out] ret_bus: Returned bus handle

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```
Destory Intel 8080 bus handle.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if there still be some device attached to the bus
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

```c
esp_err_t esp_lcd_new_panel_io_i80 (esp_lcd_i80_bus_handle_t bus,
                                   const esp_lcd_panel_io_i80_config_t *io_config,
                                   esp_lcd_panel_io_handle_t *ret_io)
```
Create LCD panel IO, for Intel 8080 interface.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
• [in] io_config: IO configuration, for i80 interface
• [out] ret_io: Returned panel IO handle

Structures

```c
struct esp_lcd_panel_io_event_data_t
```
Type of LCD panel IO event data.

```c
struct esp_lcd_panel_io_spi_config_t
```
Panel IO configuration structure, for SPI interface.

Public Members

```c
int cs_gpio_num
```
GPIO used for CS line
int `dc_gpio_num`
   GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int `spi_mode`
   Traditional SPI mode (0-3)

unsigned int `pclk_hz`
   Frequency of pixel clock

size_t `trans_queue_depth`
   Size of internal transaction queue

`esp_lcd_panel_io_color_trans_done_cb_t` `on_color_trans_done`
   Callback invoked when color data transfer has finished

void *`user_ctx`
   User private data, passed directly to `on_color_trans_done`’s user_ctx

int `lcd_cmd_bits`
   Bit-width of LCD command

int `lcd_param_bits`
   Bit-width of LCD parameter

unsigned int `dc_as_cmd_phase`
   D/C line value is encoded into SPI transaction command phase

unsigned int `dc_low_on_data`
   If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `octal_mode`
   transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

struct `esp_lcd_panel_io_i2c_config_t`

Public Members

uint32_t `dev_addr`
   I2C device address

`esp_lcd_panel_io_color_trans_done_cb_t` `on_color_trans_done`
   Callback invoked when color data transfer has finished

void *`user_ctx`
   User private data, passed directly to `on_color_trans_done`’s user_ctx

size_t `control_phase_bytes`
   I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int `dc_bit_offset`
   Offset of the D/C selection bit in control phase

int `lcd_cmd_bits`
   Bit-width of LCD command

int `lcd_param_bits`
   Bit-width of LCD parameter

unsigned int `dc_low_on_data`
   If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

struct `esp_lcd_i80_bus_config_t`
   LCD Intel 8080 bus configuration structure.
Public Members

```c
int dc_gpio_num
    GPIO used for D/C line

int wr_gpio_num
    GPIO used for WR line

lcd_clock_source_t clk_src
    Clock source for the I80 LCD peripheral

int data_gpio_nums[(24)]
    GPIOs used for data lines

size_t bus_width
    Number of data lines, 8 or 16

size_t max_transfer_bytes
    Maximum transfer size, this determines the length of internal DMA link

size_t psram_trans_align
    DMA transfer alignment for data allocated from PSRAM

size_t sram_trans_align
    DMA transfer alignment for data allocated from SRAM
```

```c
struct esp_lcd_panel_io_i80_config_t
    Panel IO configuration structure, for intel 8080 interface.
```

Public Members

```c
int cs_gpio_num
    GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
    Frequency of pixel clock

size_t trans_queue_depth
    Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data was transferred done

void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_idle_level : 1
    Level of DC line in IDLE phase

unsigned int dc_cmd_level : 1
    Level of DC line in CMD phase

unsigned int dc_dummy_level : 1
    Level of DC line in DUMMY phase

unsigned int dc_data_level : 1
    Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
    Each i80 device might have its own D/C control logic
```
unsigned int **cs_active_high**: 1
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse_color_bits**: 1
Reverse the data bits, D[0:N] -> D[N:0]

unsigned int **swap_color_bytes**: 1
Swap adjacent two color bytes

unsigned int **pclk_active_neg**: 1
The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk_idle_low**: 1
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

**Type Definitions**

typedef void *esp_lcd_spi_bus_handle_t
Type of LCD SPI bus handle
typedef void *esp_lcd_i2c_bus_handle_t
Type of LCD I2C bus handle
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
Type of LCD intel 8080 bus handle
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
    esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Return**
Whether a high priority task has been waken up by this function

**Parameters**

- [in] panel_io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- [in] edata: Panel IO event data, fed by driver
- [in] user_ctx: User data, passed from esp_lcd_panel_io_xxx_config_t

**Header File**

- components/esp_lcd/include/esp_lcd_panel_ops.h

**Functions**

*esp_err_t* **esp_lcd_panel_reset**(esp_lcd_panel_handle_t panel)
Reset LCD panel.

**Note**
Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

*esp_err_t* **esp_lcd_panel_init**(esp_lcd_panel_handle_t panel)
Initialize LCD panel.

**Note**
Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
Chapter 2. API Reference

```c
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.
Return
  • ESP_OK on success
Parameters
  • [in] panel: LCD panel handle, which is created by other factory API like
    esp_lcd_new_panel_st7789()

esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)
Draw bitmap on LCD panel.
Return
  • ESP_OK on success
Parameters
  • [in] panel: LCD panel handle, which is created by other factory API like
    esp_lcd_new_panel_st7789()
  • [in] x_start: Start index on x-axis (x_start included)
  • [in] y_start: Start index on y-axis (y_start included)
  • [in] x_end: End index on x-axis (x_end not included)
  • [in] y_end: End index on y-axis (y_end not included)
  • [in] color_data: RGB color data that will be dumped to the specific window range

esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
Mirror the LCD panel on specific axis.
Note Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation
Return
  • ESP_OK on success
  • ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel
Parameters
  • [in] panel: LCD panel handle, which is created by other factory API like
    esp_lcd_new_panel_st7789()
  • [in] mirror_x: Whether the panel will be mirrored about the x axis
  • [in] mirror_y: Whether the panel will be mirrored about the y axis

esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)
Swap/Exchange x and y axis.
Note Combined with esp_lcd_panel_mirror(), one can realize screen rotation
Return
  • ESP_OK on success
  • ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel
Parameters
  • [in] panel: LCD panel handle, which is created by other factory API like
    esp_lcd_new_panel_st7789()
  • [in] swap_axes: Whether to swap the x and y axis

esp_err_t esp_lcd_panel_set_gap (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
Set extra gap in x and y axis.
The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively
of the actual contents displayed.
Note Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.
Return
  • ESP_OK on success
Parameters
  • [in] panel: LCD panel handle, which is created by other factory API like
    esp_lcd_new_panel_st7789()
  • [in] x_gap: Extra gap on x axis, in pixels
  • [in] y_gap: Extra gap on y axis, in pixels
```
**esp_err_t esp_lcd_panel_invert_color** (esp_lcd_panel_handle_t panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] invert_color_data: Whether to invert the color data

**esp_err_t esp_lcd_panel_disp_off** (esp_lcd_panel_handle_t panel, bool off)

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] off: Whether to turn off the screen

**Header File**

- components/esp_lcd/include/esp_lcd_panel_rgb.h

**Header File**

- components/esp_lcd/include/esp_lcd_panel_vendor.h

**Functions**

**esp_err_t esp_lcd_new_panel_st7789** (const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)

Create LCD panel for model ST7789.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_nt35510** (const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)

Create LCD panel for model NT35510.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_ssd1306** (const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)

Create LCD panel for model SSD1306.
Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters

• [in] io: LCD panel IO handle
• [in] panel_dev_config: general panel device configuration
• [out] ret_panel: Returned LCD panel handle

Structures

struct esp_lcd_panel_dev_config_t
Configuration structure for panel device.

Public Members

int reset_gpio_num
GPIO used to reset the LCD panel, set to -1 if it’s not used

esp_lcd_color_space_t color_space
Set the color space used by the LCD panel

unsigned int bits_per_pixel
Color depth, in bpp

unsigned int reset_active_high: 1
Setting this if the panel reset is high level active

2.6.8 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. Timer Configuration by specifying the PWM signal’s frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.
Chapter 2. API Reference

Timer Configuration  Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Channel Configuration  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle
is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.

The range of the duty cycle values passed to functions depends on selected duty_resolution and should be from 0 to \((2^{**\text{duty\_resolution}}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes. Due to hardware limitations, there is no way to stop a fade before it reaches its target duty.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.
LED High and Low Speed Mode

High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF].

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try--
  reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try--
  increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

Application Example

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.
The LEDC basic example: peripherals/ledc/ledc_basic.

API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

```c
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• ledc_conf: Pointer of LEDC channel configure struct

\texttt{esp_err_t ledc_timer_config (const ledc_timer_config_t *timer_conf)}
LEDCC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current
  duty_resolution.

Parameters
• timer_conf: Pointer of LEDC timer configure struct

\texttt{esp_err_t ledc_update_duty (ledc_mode_t speed_mode, ledc_channel_t channel)}
LEDCC update channel parameters.

Note Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this
function to update the settings. And the new LEDC parameters don’t take effect until the next PWM
  cycle.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these
functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API
is ledc_set_duty_and_update

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

\texttt{esp_err_t ledc_set_pin (int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)}
Set LEDC output gpio.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: The LEDC output gpio
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
• ledc_channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

\texttt{esp_err_t ledc_stop (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)}
LEDCC stop. Disable LEDC output, and set idle level.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• idle_level: Set output idle level after LEDC stops.

\texttt{esp_err_t ledc_set_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)}
LEDCC set channel frequency (Hz)

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t
- freq_hz: Set the LEDC frequency

`uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)`

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- hpoint: Set the LEDC hpoint value(max: 0xfffff)

`int ledc_get_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

`esp_err_t ledc_set_duty(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)`

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
Chapter 2. API Reference

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is \([0, (2^{\text{duty_resolution}}) - 1]\)

```c
uint32_t ledc_get_duty(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.

**Return**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, 
ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, 
uint32_t duty_scale)
```

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the start of the gradient duty, the range of duty setting is \([0, (2^{\text{duty_resolution}}) - 1]\)
- **fade_direction**: Set the direction of the gradient
- **step_num**: Set the number of the gradient
- **duty_cycle_num**: Set how many LEDC tick each time the gradient lasts
- **duty_scale**: Set gradient change amplitude

```c
esp_err_t ledc_isr_register(void (*fn)) void *
```

, void *arg, int intr_alloc_flags, ledc_isr_handle_t *handleRegister LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- **fn**: Interrupt handler function.
- **arg**: User-supplied argument passed to the handler function.
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set(ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, 
uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Return**
- (-1) Parameter error
- Others Current LEDC duty

**Parameters**
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• timer_sel: Timer index (0-3), there are 4 timers in LEDC module
• clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
• duty_resolution: Resolution of duty setting in number of bits. The range of duty values is \([0, (2^{**\text{duty_resolution}})]\)
• clk_src: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Reset LEDC timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_timer_pause(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Pause LEDC timer counter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_timer_resume(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Resume LEDC timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)
```
Bind LEDC channel with the selected timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)
```
Set LEDC fade function.

**Note** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version...
Chapter 2. API Reference

of API is `ledc_set_fade_step_and_start`

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**duty_resolution) - 1]
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every cycle_num cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**duty_resolution) - 1]
- `max_fade_time_ms`: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall(void)
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** Starting fade operation with this API is not thread-safe, use with care.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_ERR_INVALID_ARG Parameter error.

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel number
• fade_mode: Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

`esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
• hpoint: Set the LEDC hpoint value(max: 0xffff)

`esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)`

A thread-safe API to set and start LEDC fade function, with a limited time.

Note Call ledc_fade_func_install() once, before calling this function.
Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_FAIL Fade function init error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
• max_fade_time_ms: The maximum time of the fading (ms).
• fade_mode: choose blocking or non-blocking mode

`esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)`

A thread-safe API to set and start LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function.
Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_FAIL Fade function init error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• **target_duty**: Target duty of fading \([0, (2**\text{duty_resolution}) - 1]\)
• **scale**: Controls the increase or decrease step scale.
• **cycle_num**: increase or decrease the duty every cycle_num cycles
• **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note**: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Return**
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success
- **ESP_ERR_INVALID_STATE**: Fadefunction not installed.
- **ESP_FAIL**: Fadefunction init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs**: Group of LEDC callback functions
- **user_arg**: user registered data for the callback function

**Structures**

```c
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for ledc_channel_config function.

**Public Members**

```c
int gpio_num
```

`the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16`

- **speed_mode**: LEDC speed speed_mode, high-speed mode or low-speed mode
- **channel**: LEDC channel (0 - 7)
- **intr_type**: configure interrupt, Fade interrupt enable or Fade interrupt disable
- **timer_sel**: Select the timer source of channel (0 - 3)
- **duty**: LEDC channel duty, the range of duty setting is \([0, (2**\text{duty_resolution})]\)
- **hpoint**: LEDC channel hpoint value, the max value is 0xffffffff
- **output_invert**: Enable (1) or disable (0) gpio output invert

```c
struct ledc_channel_config_t::[anonymous] flags
```

LEDC flags

```c
struct ledc_timer_config_t
```

Configuration parameters of LEDC Timer timer for ledc_timer_config function.
Public Members

```c
ledc_mode_t speed_mode
   LEDC speed speed_mode, high-speed mode or low-speed mode
```

```c
ledc_timer_bit_t duty_resolution
   LEDC channel duty resolution
```

```c
ledc_timer_bit_t bit_num
   Deprecated in ESP-IDF 3.0. This is an alias to `duty_resolution` for backward compatibility with ESP-IDF 2.1
```

```c
ledc_timer_t timer_num
   The timer source of channel (0 - 3)
```

```c
uint32_t freq_hz
   LEDC timer frequency (Hz)
```

```c
ledc_clk_cfg_t clk_cfg
   Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK
```

```c
struct ledc_cb_param_t
   LEDC callback parameter.
```

Public Members

```c
ledc_cb_event_t event
   Event name
```

```c
uint32_t speed_mode
   Speed mode of the LEDC channel group
```

```c
uint32_t channel
   LEDC channel (0 - LEDC_CHANNEL_MAX-1)
```

```c
uint32_t duty
   LEDC current duty of the channel, the range of duty is [0, (2\(^{duty\_resolution}\) - 1]
```

```c
struct ledc_cbs_t
   Group of supported LEDC callbacks.
```

Note The callbacks are all running under ISR environment

Public Members

```c
ledc_cb_t fade_cb
   LEDC fade_end callback function
```

Macros

```c
LEDC_APB_CLK_HZ
LEDC_REF_CLK_HZ
LEDC_ERR_DUTY
LEDC_ERR_VAL
```
Type Definitions

```c
typedef intr_handle_t ledc_isr_handle_t

typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
```

Type of LEDC event callback.

**Parameters**
- `param`: LEDC callback parameter
- `user_arg`: User registered data

Enumerations

```c
enum ledc_cb_event_t
{
    LEDC_FADE_END_EVT

    LEDC_FADE_END_EVT
        LEDC fade end event
}
```

**Header File**
- `components/hal/include/hal/ledc_types.h`

Enumerations

```c
enum ledc_mode_t
{
    LEDC_HIGH_SPEED_MODE = 0
        LEDC high speed speed_mode

    LEDC_LOW_SPEED_MODE
        LEDC low speed speed_mode

    LEDC_SPEED_MODE_MAX
        LEDC speed limit

    LEDC_DUTY_DIR_MAX
        LEDC duty increase direction

    LEDC_DUTY_DIR_INCREASE = 1

    LEDC_DUTY_DIR_DECREASE = 0
        LEDC duty decrease direction

    LEDC_DUTY_DIR_MAX
```

**Values:**
- `LEDC_HIGH_SPEED_MODE`: LEDC high speed speed_mode
- `LEDC_LOW_SPEED_MODE`: LEDC low speed speed_mode
- `LEDC_SPEED_MODE_MAX`: LEDC speed limit
- `LEDC_DUTY_DIR_MAX`: LEDC duty increase direction
- `LEDC_DUTY_DIR_INCREASE`: LEDC duty increase direction
- `LEDC_DUTY_DIR_DECREASE`: LEDC duty decrease direction

```c
enum ledc_intr_type_t
{
    LEDC_INTR_DISABLE = 0
        Disable LEDC interrupt

    LEDC_INTR_FADE_END
        Enable LEDC interrupt

    LEDC_INTR_MAX
```

**Values:**
- `LEDC_INTR_DISABLE`: Disable LEDC interrupt
- `LEDC_INTR_FADE_END`: Enable LEDC interrupt

```c
enum ledc_duty_direction_t
{
    LEDC_DUTY_DIR_MAX
```

**Values:**
- `LEDC_DUTY_DIR_MAX`: LEDC duty increase direction

```c
enum ledc_slow_clk_sel_t
{
    LEDC_SLOW_CLK_RTC8M = 0
        LEDC low speed timer clock source is 8MHz RTC clock

    LEDC_SLOW_CLK_APB
        LEDC low speed timer clock source is 80MHz APB clock
```

**Values:**
- `LEDC_SLOW_CLK_RTC8M`: LEDC low speed timer clock source is 8MHz RTC clock
- `LEDC_SLOW_CLK_APB`: LEDC low speed timer clock source is 80MHz APB clock
enum ledc_clk_cfg_t
In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

LEDC_AUTO_CLK = 0
The driver will automatically select the source clock (REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_APB_CLK
LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

LEDC_USE_REF_TICK
LEDC timer select REF_TICK clock as source clock

enum ledc_clk_src_t
Values:

LEDC_REF_TICK = LEDC_USE_REF_TICK
LEDC timer clock divided from reference tick (1Mhz)

LEDC_APB_CLK = LEDC_USE_APB_CLK
LEDC timer clock divided from APB clock (80Mhz)

LEDC_SCLK = LEDC_USE_APB_CLK
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0
LEDC timer 0

LEDC_TIMER_1
LEDC timer 1

LEDC_TIMER_2
LEDC timer 2

LEDC_TIMER_3
LEDC timer 3

LEDC_TIMER_MAX

enum ledc_channel_t
Values:

LEDC_CHANNEL_0 = 0
LEDC channel 0

LEDC_CHANNEL_1
LEDC channel 1

LEDC_CHANNEL_2
LEDC channel 2

LEDC_CHANNEL_3
LEDC channel 3

LEDC_CHANNEL_4
LEDC channel 4
LED Channel 5
   LEDC channel 5

LED Channel 6
   LEDC channel 6

LED Channel 7
   LEDC channel 7

LED Channel Max

enum ledc_timer_bit_t

Values:

LED_TIMER_1_BIT = 1
   LEDC PWM duty resolution of 1 bits

LED_TIMER_2_BIT
   LEDC PWM duty resolution of 2 bits

LED_TIMER_3_BIT
   LEDC PWM duty resolution of 3 bits

LED_TIMER_4_BIT
   LEDC PWM duty resolution of 4 bits

LED_TIMER_5_BIT
   LEDC PWM duty resolution of 5 bits

LED_TIMER_6_BIT
   LEDC PWM duty resolution of 6 bits

LED_TIMER_7_BIT
   LEDC PWM duty resolution of 7 bits

LED_TIMER_8_BIT
   LEDC PWM duty resolution of 8 bits

LED_TIMER_9_BIT
   LEDC PWM duty resolution of 9 bits

LED_TIMER_10_BIT
   LEDC PWM duty resolution of 10 bits

LED_TIMER_11_BIT
   LEDC PWM duty resolution of 11 bits

LED_TIMER_12_BIT
   LEDC PWM duty resolution of 12 bits

LED_TIMER_13_BIT
   LEDC PWM duty resolution of 13 bits

LED_TIMER_14_BIT
   LEDC PWM duty resolution of 14 bits

LED_TIMER_15_BIT
   LEDC PWM duty resolution of 15 bits

LED_TIMER_16_BIT
   LEDC PWM duty resolution of 16 bits

LED_TIMER_17_BIT
   LEDC PWM duty resolution of 17 bits

LED_TIMER_18_BIT
   LEDC PWM duty resolution of 18 bits

LED_TIMER_19_BIT
   LEDC PWM duty resolution of 19 bits
LEDC_TIMER_20_BIT
LEDC PWM duty resolution of 20 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t
Values:

LEDC_FADE_NO_WAIT = 0
LEDC fade function will return immediately

LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

LEDC_FADE_MAX

2.6.9 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

![MCPWM Overview](image)

Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture and Carrier.

Contents

- Configure a basic functionality of the outputs
- Operate the outputs to drive a motor
- Adjust how the motor is driven
- Synchronize sync timers to work together
- Capture external signals to provide additional control over the outputs
- Use Fault Handler to detect and manage faults
Add a higher frequency Carrier, if output signals are passed through an isolation transformer

Extra configuration of Resolution.

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in mcpwm_unit_t.
2. Initialization of two GPIOs as output signals within selected unit by calling mcpwm_gpio_init(). The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in mcpwm_io_signals_t. To set more than a single pin at a time, use function mcpwm_set_pin() together with mcpwm_pin_config_t.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in mcpwm_timer_t.
4. Setting of the timer frequency and initial duty within mcpwm_config_t structure.
5. Setting timer resolution if necessary, by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution()
6. Calling of mcpwm_init() with the above parameters to make the configuration effective.
To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

• We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.

• Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.

• To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

Note: Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

• Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.

• Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options...
Chapter 2. API Reference

are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.

- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].

**Synchronize**

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

**Capture**

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware
is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

![Diagram of MCPWM](image)

**Fig. 17: Example of Brushless DC Motor Control with MCPWM**

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:
lock current state of the output
set the output low
set the output high
toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

**Carrier**

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

**Interrupts**

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

**Resolution**

The default resolution for MCPWM group and MCPWM timer are configured to **10MHz** and **1MHz** in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
Chapter 2. API Reference

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

Application Example

MCPWM example are located under: peripherals/mcpwm:

- Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_bldc_hall_control
- Brushed DC motor control - peripherals/mcpwm/mcpwm_bdc_speed_control
- Servo motor control - peripherals/mcpwm/mcpwm_servo_control
- HC-SR04 sensor with capture - peripherals/mcpwm/mcpwm_capture_hc_sr04

Functions

esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
This function initializes each gpio signal for MCPWM.

Note This function initializes one gpio at a time.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
• gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
Initialize MCPWM gpio structure.

Note This function initialize a group of MCPWM GPIOs at a time.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• mcpwm_pin: MCPWM pin structure
**esp_err_t mcpwm_init** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)

Initialize MCPWM parameters.

**Note** The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm_conf: configure structure mcpwm_config_t

**esp_err_t mcpwm_group_set_resolution** (mcpwm_unit_t mcpwm_num, unsigned long int resolution)

Set resolution of the MCPWM group.

**Note** This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- resolution: set expected frequency resolution

**esp_err_t mcpwm_timer_set_resolution** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)

Set resolution of each timer.

**Note** This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

**esp_err_t mcpwm_set_frequency** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)

Set frequency(in Hz) of MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

**esp_err_t mcpwm_set_duty** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
Chapter 2. API Reference

- **gen**: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- **duty**: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- duty_in_us: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```

Set duty either active high or active low(out of phase/inverted)

**Note** Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- duty_type: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Get frequency of timer.

**Return**
- frequency of timer

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
float mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```

Get duty cycle of each operator.

**Return**
- duty cycle in % of each operator(56.7 means duty is 56.7%)

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
uint32_t mcpwm_get_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```

Get duty cycle of each operator in us.

**Return**
- duty cycle in us of each operator

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Espressif Systems 903 Release v5.0-dev-1712-g4a553510b7

Submit Document Feedback
Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_high(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num, esp_mcpwm_generator_t gen)
```

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_low(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num, esp_mcpwm_generator_t gen)
```

Use this function to start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_start(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num)
```

Initialize carrier configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

```c
esp_err_t mcpwm_carrier_init(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```

Enable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_enable(esp_mcpwm_unit_t mcpwm_num, esp_mcpwm_timer_t timer_num)
```
**esp_err_t mcpwm_carrier_disable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable MCPWM carrier submodule, for respective timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_carrier_set_period** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)

Set period of carrier.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_period: set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

**esp_err_t mcpwm_carrier_set_duty_cycle** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)

Set duty_cycle of carrier.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_duty: set duty_cycle of carrier, carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

**esp_err_t mcpwm_carrier_oneshot_mode_enable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)

Enable and set width of first pulse in carrier oneshot mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- pulse_width: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width + 1) (pulse_width <= 15)

**esp_err_t mcpwm_carrier_oneshot_mode_disable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable oneshot mode, width of first pulse = carrier period.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_carrier_output_invert** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)

Enable or disable carrier output inversion.
Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_inv_mode: enable or disable carrier output inversion

```c
esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                                mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)
```
Enable and initialize deadtime for each MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- red: set rising edge delay = red*100ns
- fed: set rising edge delay = fed*100ns

```c
esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Disable deadtime on MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```
esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level,
                           mcpwm_fault_signal_t fault_sig)
```
Initialize fault submodule, currently low level triggering is not supported.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- input_level: set fault signal level, which will cause fault to occur
- fault_sig: set the fault pin, which needs to be enabled

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                                      mcpwm_fault_signal_t fault_sig,
                                      mcpwm_output_action_t action_on_pwmxa,
                                      mcpwm_output_action_t action_on_pwmxb)
```
Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for oneshot mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note** currently low level triggering is not supported

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for cyc mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)

Disable fault signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- fault_sig: fault pin, which needs to be disabled

esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig, mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)

Initialize capture submodule.

**Note** Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by mcpwm_isr_register, and in there, query the capture data.

**Note** The capture timer uses APB_CLK (typically 80MHz) as the count source.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- cap_sig: capture pin, which needs to be enabled
- num_of_pulse: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Disable capture signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin, which needs to be disabled

esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)

Enable capture channel.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_channel: capture channel, which needs to be enabled
• cap_conf: capture channel configuration

esp_err_t mcpwm_capture_disable_channel (mcpwm_unit_t mcpwm_num,
                                           mcpwm_capture_channel_id_t cap_channel)

Disable capture channel.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_channel: capture channel, which needs to be disabled

uint32_t mcpwm_capture_signal_get_value (mcpwm_unit_t mcpwm_num,
                                           mcpwm_capture_signal_t cap_sig)

Get capture value.

Return Captured value

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture channel on which value is to be measured

uint32_t mcpwm_capture_signal_get_edge (mcpwm_unit_t mcpwm_num,
                                        mcpwm_capture_signal_t cap_sig)

Get edge of capture signal.

Return Capture signal edge: 1 - positive edge, 2 - negative edge

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture channel of whose edge is to be determined

esp_err_t mcpwm_sync_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                               mcpwm_sync_signal_t sync_sig, uint32_t phase_val)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Note Count direction is undefined within this API

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• sync_sig: set the synchronization input signal
• phase_val: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

esp_err_t mcpwm_sync_configure (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                                 const mcpwm_sync_config_t * sync_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• sync_conf: sync configuration on this timer
**esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)**

Disable sync submodule on given timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)**

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- trigger: set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM_SWSYNC_SOURCE_DISABLE will disable the timer from generating sync signal.

**esp_err_t mcpwm_timer_trigger_soft_sync(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)**

Trigger a software sync event and sends it to a specific timer.

**Note**  
This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if MCPWM_SWSYNC_SOURCE_SYNCPIN is selected via mcpwm_set_timer_sync_output()
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_sync_invert_gpio_sync(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)**

Set external GPIO sync input inverter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- sync_sig: set sync signal of MCPWM, only supports GPIO sync signal
- invert: whether GPIO sync source input is inverted (to get negative edge trigger)

**esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void (*fn)(void *, void), void (*arg), int intr_alloc_flags, intr_handle_t *handle)**

Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- fn: interrupt handler function.
- arg: user-supplied argument passed to the handler function.
• **intr_alloc_flags**: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• **handle**: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Structures**

```c
struct mcpwm_pin_config_t
  pin number for MCPWM
```

**Public Members**

```c
int mcpwm0a_out_num
  MCPWM0A out pin
int mcpwm0b_out_num
  MCPWM0A out pin

**Public Members**

```c
struct cap_event_data_t
  event data that will be passed into ISR callback
```

```c
mcpwm_capture_on_edge_t cap_edge
  Which signal edge is detected
```
uint32_t `cap_value`
Corresponding timestamp when event occurs. Clock rate = APB (usually 80M)

```c
struct mcpwm_config_t
MCPWM config structure.
```

**Public Members**

```c
uint32_t `frequency`
Set frequency of MCPWM in Hz
```

```c
float `cmpr_a`
Set % duty cycle for operator a (MCPWMXA), i.e. for 62.3% duty cycle, duty_a = 62.3
```

```c
float `cmpr_b`
Set % duty cycle for operator b (MCPWMXB), i.e. for 48% duty cycle, duty_b = 48.0
```

```c
mcpwm_duty_type_t `duty_mode`
Set type of duty cycle
```

```c
mcpwm_counter_type_t `counter_mode`
Set type of MCPWM counter
```

```c
struct mcpwm_carrier_config_t
MCPWM carrier configuration structure.
```

**Public Members**

```c
uint8_t `carrier_period`
Set carrier period = (carrier_period + 1) * 800ns, carrier_period should be < 16
```

```c
uint8_t `carrier_duty`
Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)
```

```c
uint8_t `pulse_width_in_os`
Set pulse width of first pulse in one shot mode = (carrier period) * (pulse_width_in_os + 1), should be less then 16
```

```c
mcpwm_carrier_os_t `carrier_os_mode`
Enable or disable carrier oneshot mode
```

```c
mcpwm_carrier_out_ivt_t `carrier_ivt_mode`
Invert output of carrier
```

```c
struct mcpwm_capture_config_t
MCPWM config capture structure.
```

**Public Members**

```c
mcpwm_capture_on_edge_t `cap_edge`
Set capture edge
```

```c
uint32_t `cap_prescale`
Prescale of capture signal, ranging from 1 to 256
```

```c
cap_isr_cb_t `capture_cb`
User defined capture event callback, running under interrupt context
```

```c
void *`user_data`
User defined ISR callback function args
```

```c
struct mcpwm_sync_config_t
MCPWM config sync structure.
```
Public Members

```
mcpwm_sync_signal_t sync_sig
    Sets sync input signal that will cause timer to sync
```

```
uint32_t timer_val
    Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak
```

```
mcpwm_timer_direction_t count_direction
    Counting direction to be set after sync
```

Macros

```
MCPWM_OPR_A
MCPWM_OPR_B
MCPWM_OPR_MAX
MCPWM_SELCT_SYNC0
MCPWM_SELCT_SYNC1
MCPWM_SELCT_SYNC2
MCPWM_NO_CHANGE_IN_MCPWMXA
MCPWM_FORCE_MCPWMXA_LOW
MCPWM_FORCE_MCPWMXA_HIGH
MCPWM_TOG_MCPWMXA
MCPWM_NO_CHANGE_IN_MCPWMXB
MCPWM_FORCE_MCPWMXB_LOW
MCPWM_FORCE_MCPWMXB_HIGH
MCPWM_TOG_MCPWMXB
```

Type Definitions

```
typedef mcpwm_generator_t mcpwm_operator_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t
typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t
    MCPWM capture channel ID alias.
typedef bool (*cap_isr_cb_t)(mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel, const cap_event_data_t *edata, void *user_data)
    Type of capture event callback.
```

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR (usually has ‘_ISR’ postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters

- `mcpwm`: MCPWM unit(0-1)
- `cap_channel`: capture channel ID
- `edata`: Capture event data, contains capture edge and capture value, fed by the driver
- `user_data`: User registered data, passed from mcpwm_capture_config_t
Enumerations

enum mcpwm_io_signals_t
IO signals for the MCPWM.
- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
PWM0A output pin
MCPWM0B
PWM0B output pin
MCPWM1A
PWM1A output pin
MCPWM1B
PWM1B output pin
MCPWM2A
PWM2A output pin
MCPWM2B
PWM2B output pin
MCPWM_SYNC_0
SYNC0 input pin
MCPWM_SYNC_1
SYNC1 input pin
MCPWM_SYNC_2
SYNC2 input pin
MCPWM_FAULT_0
FAULT0 input pin
MCPWM_FAULT_1
FAULT1 input pin
MCPWM_FAULT_2
FAULT2 input pin
MCPWM_CAP_0 = 84
CAP0 input pin
MCPWM_CAP_1
CAP1 input pin
MCPWM_CAP_2
CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

MCPWM_UNIT_0
MCPWM unit 0 selected
MCPWM_UNIT_1
MCPWM unit 1 selected
MCPWM_UNIT_MAX
Max number of MCPWM units

enum mcpwm_timer_t
Select MCPWM timer.
Values:
MCPWM_TIMER_0
Select MCPWM timer0
MCPWM_TIMER_1
Select MCPWM timer1
MCPWM_TIMER_2
Select MCPWM timer2
MCPWM TIMER_MAX
Max number of timers in a unit

enum mcpwm_generator_t
Select MCPWM operator.
Values:
MCPWM_GEN_A
Select MCPWMXA, where ‘X’ is operator number
MCPWM_GEN_B
Select MCPWMXB, where ‘X’ is operator number
MCPWM_GEN_MAX
Num of generators to each operator of MCPWM

enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.
Values:
MCPWM_ONESHOT_MODE_DIS
Enable oneshot mode
MCPWM_ONESHOT_MODE_EN
Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.
Values:
MCPWM_CARRIER_OUT_IVT_DIS
Enable carrier output inversion
MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion

enum mcpwm_fault_signal_t
MCPWM select fault signal input.
Values:
MCPWM_SELECT_F0
Select F0 as input
MCPWM_SELECT_F1
Select F1 as input
MCPWM_SELECT_F2
Select F2 as input
enum mcpwm_sync_signal_t
MCPWM select sync signal input.

Values:

MCPWM_SELECT_NO_INPUT
   No sync input selected

MCPWM_SELECT_TIMER0_SYNC
   Select software sync signal from timer0 as input

MCPWM_SELECT_TIMER1_SYNC
   Select software sync signal from timer1 as input

MCPWM_SELECT_TIMER2_SYNC
   Select software sync signal from timer2 as input

MCPWM_SELECT_GPIO_SYNC0
   Select GPIO SYNC0 as input

MCPWM_SELECT_GPIO_SYNC1
   Select GPIO SYNC1 as input

MCPWM_SELECT_GPIO_SYNC2
   Select GPIO SYNC2 as input

enum mcpwm_timer_sync_trigger_t
MCPWM timer sync event trigger.

Values:

MCPWM_SWSYNC_SOURCE_SYNCIN
   the input sync signal will be routed to its sync output path

MCPWM_SWSYNC_SOURCE_TEZ
   sync signal generated when timer counts to zero

MCPWM_SWSYNC_SOURCE_TEP
   sync signal generated when timer counts to peak

MCPWM_SWSYNC_SOURCE_DISABLED
   timer does not generate sync signals

enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.

Values:

MCPWM_LOW_LEVEL_TGR
   Fault condition occurs when fault input signal goes from high to low

MCPWM_HIGH_LEVEL_TGR
   Fault condition occurs when fault input signal goes low to high

enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.

Values:

MCPWM_NEG_EDGE = BIT(0)
   Capture the negative edge

MCPWM_POS_EDGE = BIT(1)
   Capture the positive edge

MCPWM_BOTH_EDGE = BIT(1) | BIT(0)
   Capture both edges
enum mcpwm_intr_t
   Interrupt masks for MCPWM capture.
   Values:
   MCPWM_LL_INTR_CAP0 = BIT(27)
      Capture 0 happened.
   MCPWM_LL_INTR_CAP1 = BIT(28)
      Capture 1 happened.
   MCPWM_LL_INTR_CAP2 = BIT(29)
      Capture 2 happened.

enum mcpwm_counter_type_t
   Select type of MCPWM counter.
   Values:
   MCPWM_FREEZE_COUNTER
      Counter freeze
   MCPWM_UP_COUNTER
      For asymmetric MCPWM
   MCPWM_DOWN_COUNTER
      For asymmetric MCPWM
   MCPWM_UP_DOWN_COUNTER
      For symmetric MCPWM, frequency is half of MCPWM frequency set
   MCPWM_COUNTER_MAX
      Maximum counter mode

enum mcpwm_duty_type_t
   Select type of MCPWM duty cycle mode.
   Values:
   MCPWM_DUTY_MODE_0 = 0
      Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM
   MCPWM_DUTY_MODE_1
      Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM
   MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
   MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH
   MCPWM_DUTY_MODE_MAX
      Num of duty cycle modes

enum mcpwm_deadtime_type_t
   MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.
   Values:
   MCPWM_DEADTIME_BYPASS = 0
      Bypass the deadtime
   MCPWM_BYPASS_RED
      MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay
   MCPWM_BYPASS_FED
      MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay
MCPWM_ACTIVE_HIGH_MODE
  MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_LOW_MODE
  MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
  MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
  MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA
  MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXB
  MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX
  Maximum number of supported dead time modes

enum mcpwm_output_action_t
  MCPWM select action to be taken on the output when event happens.

Values:

  MCPWM_ACTION_NO_CHANGE = 0
  No change in the output

  MCPWM_ACTION_FORCE_LOW
  Make output low

  MCPWM_ACTION_FORCE_HIGH
  Make output high

  MCPWM_ACTION_TOGGLE
  Make output toggle

enum mcpwm_capture_signal_t
  MCPWM select capture signal input.

Values:

  MCPWM_SELECT_CAP0
  Select CAP0 as input

  MCPWM_SELECT_CAP1
  Select CAP1 as input

  MCPWM_SELECT_CAP2
  Select CAP2 as input

2.6.10 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control
input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`.

To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

Note: For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.
The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*.
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`

**API Reference**

**Header File**

- components/driver/include/driver/pcnt.h

**Functions**

```c
esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)

Configure Pulse Counter unit.

*Note* This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- `pcnt_config`: Pointer of Pulse Counter unit configure parameter
```

```c
esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)

Get pulse counter value.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- `pcnt_unit`: Pulse Counter unit number
- `count`: Pointer to accept counter value
```

```c
esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)

Pause PCNT counter of PCNT unit.
```
Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number

\texttt{esp_err_t pcnt\_counter\_resume (pcnt\_unit\_t pcnt\_unit)}

Resume counting for PCNT counter.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number, select from pcnt_unit_t

\texttt{esp_err_t pcnt\_counter\_clear (pcnt\_unit\_t pcnt\_unit)}

Clear and reset PCNT counter value to zero.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number, select from pcnt_unit_t

\texttt{esp_err_t pcnt\_intr\_enable (pcnt\_unit\_t pcnt\_unit)}

Enable PCNT interrupt for PCNT unit.

Note Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with \texttt{pcnt\_event\_enable()} and \texttt{pcnt\_event\_disable()}.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number

\texttt{esp_err_t pcnt\_intr\_disable (pcnt\_unit\_t pcnt\_unit)}

Disable PCNT interrupt for PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number

\texttt{esp_err_t pcnt\_event\_enable (pcnt\_unit\_t unit, pcnt\_evt\_type\_t evt\_type)}

Enable PCNT event of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\texttt{esp_err_t pcnt\_event\_disable (pcnt\_unit\_t unit, pcnt\_evt\_type\_t evt\_type)}

Disable PCNT event of PCNT unit.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_set_event_value(pcnt_unit_t unit, pcntEvt_type_t evt_type, int16_t value)`

Set PCNT event value of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Counter value for PCNT event

`esp_err_t pcnt_get_event_value(pcnt_unit_t unit, pcnt EVT_type_t evt_type, int16_t *value)`

Get PCNT event value of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Pointer to accept counter value for PCNT event

`esp_err_t pcnt_get_event_status(pcnt_unit_t unit, uint32_t *status)`

Get PCNT event status of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- status: Pointer to accept event status word

`esp_err_t pcnt_isr_unregister(pcnt_isr_handle_t handle)`

Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- handle: handle to unregister the ISR service.

`esp_err_t pcnt_isr_register(void (*fn)(void *)) void * , void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)`

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.
Return
- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling pcnt_isr_unregister to unregister this ISR service if needed, but only if the handle is not NULL.

```c
esp_err_t pcnt_set_pin(pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)
```
Configure PCNT pulse signal input pin and control input pin.

Note Set the signal input to PCNT_PIN_NOT_USED if unused.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- channel: PCNT channel number
- pulse_io: Pulse signal input GPIO
- ctrl_io: Control signal input GPIO

```c
esp_err_t pcnt_filter_enable(pcnt_unit_t unit)
```
Enable PCNT input filter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number

```c
esp_err_t pcnt_filter_disable(pcnt_unit_t unit)
```
Disable PCNT input filter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number

```c
esp_err_t pcnt_set_filter_value(pcnt_unit_t unit, uint16_t filter_val)
```
Set PCNT filter value.

Note filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value(pcnt_unit_t unit, uint16_t *filter_val)
```
Get PCNT filter value.
### Chapter 2. API Reference

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

#### Parameters
- **unit**: PCNT unit number
- **filter_val**: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode(pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```

Set PCNT counter mode.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

#### Parameters
- **unit**: PCNT unit number
- **channel**: PCNT channel number
- **pos_mode**: Counter mode when detecting positive edge
- **neg_mode**: Counter mode when detecting negative edge
- **hctrl_mode**: Counter mode when control signal is high level
- **lctrl_mode**: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add(pcnt_unit_t unit, void(* isr_handler)(void* args))
```

Add ISR handler for specified unit.

Call this function after using `pcnt_isr_service_install()` to install the PCNT driver’s ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in `pcnt_isr_service_install()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

#### Parameters
- **unit**: PCNT unit number
- **isr_handler**: Interrupt handler function.
- **args**: Parameter for handler function

```c
esp_err_t pcnt_isr_service_install(int intr_alloc_flags)
```

Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

#### Parameters
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

```c
void pcnt_isr_service_uninstall()
```

Uninstall PCNT ISR service, freeing related resources.
Chapter 2. API Reference

esp_err_t pcnt_isr_handler_remove(pcnt_unit_t unit)
Delete ISR handler for specified unit.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number

Structures
struct pcnt_config_t
Pulse Counter configuration for a single channel.

Public Members
int pulse_gpio_num
Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

int ctrl_gpio_num
Control signal input GPIO number, a negative value will be ignored

pcnt_ctrl_mode_t lctrl_mode
PCNT low control mode

pcnt_ctrl_mode_t hctrl_mode
PCNT high control mode

pcnt_count_mode_t pos_mode
PCNT positive edge count mode

pcnt_count_mode_t neg_mode
PCNT negative edge count mode

int16_t counter_h_lim
Maximum counter value

int16_t counter_l_lim
Minimum counter value

pcnt_unit_t unit
PCNT unit number

pcnt_channel_t channel
the PCNT channel

Macros
PCNT_PIN_NOT_USED
When selected for a pin, this pin will not be used

PCNT_MODE_KEEP
Control mode: won’t change counter mode

PCNT_MODE_REVERSE
Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE
Control mode: Inhibit counter(counter value will not change in this condition)

PCNT_MODE_MAX

PCNT_COUNT_DIS
Counter mode: Inhibit counter(counter value will not change in this condition)
Chapter 2. API Reference

PCNT_COUNT_INC
   Counter mode: Increase counter value

PCNT_COUNT_DEC
   Counter mode: Decrease counter value

PCNT_COUNT_MAX

Type Definitions
typedef  intr_handle_t  pcnt_isr_handle_t
typedef  pcnt_channel_level_action_t pcnt_ctrl_mode_t
   Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.
   Note  Configuration covers two actions, one for high, and one for low level on the control input

typedef  pcnt_channel_edge_action_t pcnt_count_mode_t
   Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.
   Note  Configuration covers two actions, one for positive, and one for negative edge on the pulse input

Enumerations
enum pcnt_port_t
   PCNT port number, the max port number is (PCNT_PORT_MAX - 1).
   Values:
   
   PCNT_PORT_0
      PCNT port 0
   PCNT_PORT_MAX
      PCNT port max

enum pcnt_unit_t
   Selection of all available PCNT units.
   Values:
   
   PCNT_UNIT_0
      PCNT unit 0
   PCNT_UNIT_1
      PCNT unit 1
   PCNT_UNIT_2
      PCNT unit 2
   PCNT_UNIT_3
      PCNT unit 3
   PCNT_UNIT_4
      PCNT unit 4
   PCNT_UNIT_5
      PCNT unit 5
   PCNT_UNIT_6
      PCNT unit 6
   PCNT_UNIT_7
      PCNT unit 7
   PCNT_UNIT_MAX

enum pcnt_channel_t
   Selection of channels available for a single PCNT unit.
   Values:
PCNT_CHANNEL_0
    PCNT channel 0

PCNT_CHANNEL_1
    PCNT channel 1

PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
    Selection of counter’s events the may trigger an interrupt.
    Values:
    
    PCNT_EVT_THRES_1 = 1 << 2
        PCNT watch point event: threshold1 value event

    PCNT_EVT_THRES_0 = 1 << 3
        PCNT watch point event: threshold0 value event

    PCNT_EVT_L_LIM = 1 << 4
        PCNT watch point event: Minimum counter value

    PCNT_EVT_H_LIM = 1 << 5
        PCNT watch point event: Maximum counter value

    PCNT_EVT_ZERO = 1 << 6
        PCNT watch point event: counter value zero event

    PCNT_EVT_MAX

Header File

Enumerations
enum pcnt_channel_level_action_t
    PCNT channel action on control level.
    Values:
    
    PCNT_CHANNEL_LEVEL_ACTION_KEEP
        Keep current count mode

    PCNT_CHANNEL_LEVEL_ACTION_INVERSE
        Invert current count mode (increase -> decrease, decrease -> increase)

    PCNT_CHANNEL_LEVEL_ACTION_HOLD
        Hold current count value

enum pcnt_channel_edge_action_t
    PCNT channel action on signal edge.
    Values:
    
    PCNT_CHANNEL_EDGE_ACTION_HOLD
        Hold current count value

    PCNT_CHANNEL_EDGE_ACTION_INCREASE
        Increase count value

    PCNT_CHANNEL_EDGE_ACTION_DECREASE
        Decrease count value

enum pcnt_unit_count_sign_t
    PCNT unit counter value’s sign.
    Values:
2.6.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to the flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

Fig. 18: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

Fig. 19: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. **Use Interrupts**

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

**Configure Driver**

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

**Common Parameters**

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The **RMT operation mode** - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many **memory blocks** will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the `flags`.
  - When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See `power_management` for more information.
  - When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within `[1.. 255]` range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in `flags`, RMT source clock is changed to REF_TICK or XTL.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in **Transmit Mode** or **Receive Mode**:

**Transmit Mode** When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`

**Receive Mode** In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is `[0..255]`.
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in *Use Interrupts*.

Now, depending on how the channel is configured, we are ready to either *Transmit Data* or *Receive Data*. This is described in next two sections.

**Transmit Data**

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Fig. 20: Structure of RMT items (L - signal level)](image)

For a simple example how to define a block of items see `peripherals/rmt/morse_code`.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

**Receive Data**

**Warning:** RMT RX channel can’t receive packet whose items are larger than its memory block size. If you set the memory block number to 1, then this RX channel can’t receive packet with more than 64 items. This is a hardware limitation.
Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

### Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

### Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

### Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

### Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

### Use Interrupts

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
• The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
• Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling 
`rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific 
bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in 
`soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the event_name is one of 
four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

**Warning:** It’s not recommended for users to register an interrupt handler in their applications. RMT driver is 
highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has regis-
tered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification 
when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

### Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then 
not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

### Application Examples

- Using RMT to send morse code: `peripherals/rmt/morse_code`
- Using RMT to drive RGB LED strip: `peripherals/rmt/led_strip`
- NEC remote control TX and RX example: `peripherals/rmt/ir_protocols`
- Musical buzzer example: `peripherals/rmt/musical_buzzer`

### API Reference

**Header File**

- `components/driver/include/driver/rmt.h`

**Functions**

```c
esp_err_t rmt_set_clk_div (rmt_channel_t channel, uint8_t div_cnt)
Set RMT clock divider, channel clock is divided from source clock.
```

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `div_cnt`: RMT counter clock divider

```c
esp_err_t rmt_get_clk_div (rmt_channel_t channel, uint8_t *div_cnt)
Get RMT clock divider, channel clock is divided from source clock.
```

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `div_cnt`: pointer to accept RMT counter divider
**esp_err_t rmt_set_rx_idle_thresh** *(rmt_channel_t channel, uint16_t thresh)*

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

**esp_err_t rmt_get_rx_idle_thresh** *(rmt_channel_t channel, uint16_t* thresh)*

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

**esp_err_t rmt_set_mem_block_num** *(rmt_channel_t channel, uint8_t rmt_mem_num)*

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by:
- Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and
- end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

@note
If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel.
Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

**esp_err_t rmt_get_mem_block_num** *(rmt_channel_t channel, uint8_t* rmt_mem_num)*

Get RMT memory block number.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rmt_mem_num: Pointer to accept RMT RX memory block number

\textbf{esp_err_t rmt_set_tx_carrier}(rmt_channel_t \textit{channel}, bool \textit{carrier_en}, uint16_t \textit{high_level}, uint16_t \textit{low_level}, rmt_carrier_level_t \textit{carrier_level})

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier.
The unit of carrier_high/lower is the source clock tick, not the divided channel counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• carrier_en: Whether to enable output carrier.
• high_level: High level duration of carrier
• low_level: Low level duration of carrier.
• carrier_level: Configure the way carrier wave is modulated for channel.
  – 1’ b1: transmit on low output level
  – 1’ b0: transmit on high output level

\textbf{esp_err_t rmt_set_mem_pd}(rmt_channel_t \textit{channel}, bool \textit{pd_en})

Set RMT memory in low power mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: RMT memory low power enable.

\textbf{esp_err_t rmt_get_mem_pd}(rmt_channel_t \textit{channel}, bool* \textit{pd_en})

Get RMT memory low power mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: Pointer to accept RMT memory low power mode.

\textbf{esp_err_t rmt_tx_start}(rmt_channel_t \textit{channel}, bool \textit{tx_idx_rst})

Set RMT start sending data from memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

\textbf{esp_err_t rmt_tx_stop}(rmt_channel_t \textit{channel})

Set RMT stop sending.

Return
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)`
Set RMT start receiving data.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

`esp_err_t rmt_rx_stop(rmt_channel_t channel)`
Set RMT stop receiving data.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_tx_memory_reset(rmt_channel_t channel)`
Reset RMT TX memory.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_rx_memory_reset(rmt_channel_t channel)`
Reset RMT RX memory.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_set_memory_owner(rmt_channel_t channel, rmt_mem_owner_t owner)`
Set RMT memory owner.

Note Setting memroy is only valid for RX channel.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- owner: To set when the transmitter or receiver can process the memory of channel.

`esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)`
Get RMT memory owner.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- owner: Pointer to get memory owner.
esp_err_t rmt_set_tx_loop_mode(rmt_channel_t channel, bool loop_en)
Set RMT tx loop mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

esp_err_t rmt_get_tx_loop_mode(rmt_channel_t channel, bool *loop_en)
Get RMT tx loop mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• loop_en: Pointer to accept RMT transmitter loop sending mode.

esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold.
Counted in source clock, not divided counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_filter_en: To enable RMT receiver filter.
• thresh: Threshold of pulse width for receiver.

esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• base_clk: To choose source clock for RMT module.

esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
Chapter 2. API Reference

- **src_clk**: Pointer to accept source clock for RMT module.

  ```
  esp_err_t rmt_set_idle_level (rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
  
  Set RMT idle output level for transmitter.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - idle_out_en: To enable idle level output.
  - level: To set the output signal’s level for channel in idle state.

  ```
  esp_err_t rmt_get_idle_level (rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
  
  Get RMT idle output level for transmitter.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - idle_out_en: Pointer to accept value of enable idle.
  - level: Pointer to accept value of output signal’s level in idle state for specified channel.

  ```
  esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
  
  Get RMT status.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

  ```
  esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
  
  Set RMT RX interrupt enable.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - en: enable or disable RX interrupt.

  ```
  esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)
  
  Set RMT RX error interrupt enable.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - en: enable or disable RX err interrupt.

  ```
  esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)
  
  Set RMT TX interrupt enable.
  ```

  **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

  **Parameters**
  - channel: RMT channel
  - en: enable or disable TX interrupt.
**esp_err_t rmt_set_tx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)**

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

**esp_err_t rmt_set_gpio(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)**

Configure the GPIO used by RMT channel.

**Return**
- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

**Parameters**
- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

**esp_err_t rmt_config(const rmt_config_t *rmt_param)**

Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- rmt_param: RMT parameter struct

**esp_err_t rmt_isr_register(void (*fn)(void *, void *, int, rmt_isr_handle_t) *handle)**

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

**Parameters**
- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

**esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)**

Deregister previously registered RMT interrupt handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**
- handle: Handle obtained from rmt_isr_register
```c
esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)

Fill memory data of channel with given RMT items.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.
```

```c
esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)

Initialize RMT driver.

Return
- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
```

```c
esp_err_t rmt_driver_uninstall(rmt_channel_t channel)

Uninstall RMT driver.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
```

```c
esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)

Get the current status of eight channels.

Note Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters
- [out] channel_status: store the current status of each channel
```

```c
esp_err_t rmt_get_counter_clock(rmt_channel_t channel, uint32_t *clock_hz)

Get speed of channel’s internal counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters
- channel: RMT channel
- [out] clock_hz: counter clock speed, in hz
```

```c
esp_err_t rmt_write_items(rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)

RMT send waveform from rmt_item array.

return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- [out] clock_hz: counter clock speed, in hz
```

This API allows user to send waveform with any length.
Note This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psm when calling rmt_write_items.
- item_num: RMT data item number.
- wait_tx_done:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

`esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)`
Wait RMT TX finished.

Return
- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters
- channel: RMT channel
- wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

`esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t *buf_handle)`
Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

`esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)`
Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return
- ESP_FAIL Init fail.
- ESP_OK Init success.

Parameters
- channel: RMT channel.
- fn: Point to the data conversion function.

`esp_err_t rmt_translator_set_context(rmt_channel_t channel, void *context)`
Set user context for the translator of specific channel.

Return
- ESP_FAIL Set context fail
- ESP_OK Set context success

Parameters
- channel: RMT channel number
- context: User context
**esp_err_t rmt_translator_get_context (const size_t *item_num, void **context)**

Get the user context set by `rmt_translator_set_context`.

**Note** This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

**Return**
- ESP_FAIL Get context fail
- ESP_OK Get context success

**Parameters**
- `item_num`: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
- `context`: Returned User context

**esp_err_t rmt_write_sample (rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)**

Translate uint8_t type of data into rmt format and send it out. Requires `rmt_translator_init` to init the translator first.

**Return**
- ESP_FAIL Send fail
- ESP_OK Send success

**Parameters**
- `channel`: RMT channel.
- `src`: Pointer to the raw data.
- `src_size`: The size of the raw data.
- `wait_tx_done`: Set true to wait all data send done.

**rmt_tx_end_callback_t rmt_register_tx_end_callback (rmt_tx_end_fn_t function, void *arg)**

Registers a callback that will be called when transmission ends.

 Called by rmt_driver_isr_default in interrupt context.

**Note** Requires `rmt_driver_install` to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- `function`: Function to be called from the default interrupt handler or NULL.
- `arg`: Argument which will be provided to the callback when it is called.

**esp_err_t rmt_memory_rw_rst (rmt_channel_t channel)**

Reset RMT TX/RX memory index.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel

**void rmt_set_intr_enable_mask (uint32_t mask)**

Set mask value to RMT interrupt enable register.

**Parameters**
- `mask`: Bit mask to set to the register

**void rmt_clr_intr_enable_mask (uint32_t mask)**

Clear mask value to RMT interrupt enable register.

**Parameters**
- `mask`: Bit mask to clear the register

**esp_err_t rmt_set_pin (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)**

Set RMT pin.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Parameters

- **channel**: RMT channel
- **mode**: TX or RX mode for RMT
- **gpio_num**: GPIO number to transmit or receive the signal.

Structures

```c
struct rmt_item32_t
    Definition of RMT item.
```

Public Members

```c
uint32_t duration0 : 15
    Duration of level0

uint32_t level0 : 1
    Level of the first part

uint32_t duration1 : 15
    Duration of level1

uint32_t level1 : 1
    Level of the second part

uint32_t val
    Equivalent unsigned value for the RMT item
```

```c
struct rmt_tx_config_t
    Data struct of RMT TX configure parameters.
```

Public Members

```c
uint32_t carrier_freq_hz
    RMT carrier frequency

rmt_carrier_level_t carrier_level
    Level of the RMT output, when the carrier is applied

rmt_idle_level_t idle_level
    RMT idle level

uint8_t carrier_duty_percent
    RMT carrier duty (%)

bool carrier_en
    RMT carrier enable

bool loop_en
    Enable sending RMT items in a loop

bool idle_output_en
    RMT idle level output enable
```

```c
struct rmt_rx_config_t
    Data struct of RMT RX configure parameters.
```

Public Members

```c
uint16_t idle_threshold
    RMT RX idle threshold

uint8_t filter_ticks_thresh
    RMT filter tick number
```
bool filter_en
    RMT receiver filter enable

struct rmt_config_t
    Data struct of RMT configure parameters.

Public Members

rmt_mode_t rmt_mode
    RMT mode: transmitter or receiver

rmt_channel_t channel
    RMT channel

gpio_num_t gpio_num
    RMT GPIO number

uint8_t clk_div
    RMT channel counter divider

uint8_t mem_block_num
    RMT memory block number

uint32_t flags
    RMT channel extra configurations, OR'd with RMT_CHANNEL_FLAGS_[*]

rmt_tx_config_t tx_config
    RMT TX parameter

rmt_rx_config_t rx_config
    RMT RX parameter

struct rmt_tx_end_callback_t
    Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t function
    Function which is called on RMT TX end

void *arg
    Optional argument passed to function

Macros

RMT_CHANNEL_FLAGS_AWARE_DFS
    Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG
    Invert RMT signal

RMT_MEM_ITEM_NUM
    Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)
    Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)
    Default configuration for RX channel.
Type Definitions

```c
typedef intr_handle_t rmt_isr_handle_t
RMT interrupt handle.

typedef void (*rmt_isr_fn_t)(rmt_isr_handle_t channel, void *arg)
Type of RMT ISR callback function.
```

```c
typedef void(*rmt_tx_end_fn_t)(rmt_channel_t channel,void*arg)
Type of RMT Tx End callback function.
```

```c
typedef void(*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
User callback function to convert uint8_t type data to rmt format(rmt_item32_t).
```

\[\text{This function may be called from an ISR, so, the code should be short and efficient.}\]

Note In fact, item_num should be a multiple of translated_size, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be
\[
\text{item_num} = \text{translated_size} \times 8.
\]

Parameters

- `src`: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- `[out] dest`: Pointer to the buffer storing the rmt format data.
- `src_size`: The raw data size.
- `wanted_num`: The number of rmt format data that wanted to get.
- `[out] translated_size`: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- `[out] item_num`: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. It should return 0 if no data was converted.

Header File

- `components/hal/include/hal/rmt_types.h`

Structures

```c
struct rmt_channel_status_result_t
Data struct of RMT channel status.
```

Public Members

```c
rmt_channel_status_t status[RMT_CHANNEL_MAX]
Store the current status of each channel
```

Enumerations

```c
enum rmt_channel_t
RMT channel ID.
```

Values:

- `RMT_CHANNEL_0`: RMT channel number 0
- `RMT_CHANNEL_1`: RMT channel number 1
- `RMT_CHANNEL_2`: RMT channel number 2
- `RMT_CHANNEL_3`: RMT channel number 3
- `RMT_CHANNEL_4`: RMT channel number 4
Chapter 2. API Reference

RMT_CHANNEL_5
   RMT channel number 5

RMT_CHANNEL_6
   RMT channel number 6

RMT_CHANNEL_7
   RMT channel number 7

RMT_CHANNEL_MAX
   Number of RMT channels

enum rmt_mem_owner_t
   RMT Internal Memory Owner.
   Values:
   
   RMT_MEM_OWNER_TX
      RMT RX mode, RMT transmitter owns the memory block
   
   RMT_MEM_OWNER_RX
      RMT RX mode, RMT receiver owns the memory block
   
   RMT_MEM_OWNER_MAX

enum rmt_source_clk_t
   Clock Source of RMT Channel.
   Values:
   
   RMT_BASECLK_REF = 0
      RMT source clock is REF_TICK, 1MHz by default
   
   RMT_BASECLK_APB = 1
      RMT source clock is APB CLK, 80Mhz by default
   
   RMT_BASECLK_MAX

enum rmt_data_mode_t
   RMT Data Mode.
   
   Note  We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.
   
   Values:
   
   RMT_DATA_MODE_FIFO
   
   RMT_DATA_MODE_MEM
   
   RMT_DATA_MODE_MAX

enum rmt_mode_t
   RMT Channel Working Mode (TX or RX)
   Values:
   
   RMT_MODE_TX
      RMT TX mode
   
   RMT_MODE_RX
      RMT RX mode
   
   RMT_MODE_MAX

enum rmt_idle_level_t
   RMT Idle Level.
   Values:
   
   RMT_IDLE_LEVEL_LOW
      RMT TX idle level: low Level
Chapter 2. API Reference

RMT_IDLE_LEVEL_HIGH
RMT TX idle level: high Level

RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
RMT Carrier Level.

Values:

RMT_CARRIER_LEVEL_LOW
RMT carrier wave is modulated for low Level output

RMT_CARRIER_LEVEL_HIGH
RMT carrier wave is modulated for high Level output

RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
RMT Channel Status.

Values:

RMT_CHANNEL_UNINIT
RMT channel uninitialized

RMT_CHANNEL_IDLE
RMT channel status idle

RMT_CHANNEL_BUSY
RMT channel status busy

2.6.12 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

- Overview of compatibility between the default pull states on pins of Espressif’s products and the states required by the SD bus
- Solutions - ideas on how to resolve compatibility issues
- Related information - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.
Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2** for models with 3.3 V flash chip
- ESP32-D2WD:
  - **No Pull-ups**
  - **No Pull-up on GPIO12**

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**

Modules

  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - **No Pull-ups**
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**

Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**
  - **Download Mode Not Working (minor issue)**
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**
  - **Download Mode Not Working (minor issue)**
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - **Pull-up Conflicts on GPIO13** (v4.1, v3, v2, and v1)
  - **Conflicts Between Bootstrap and SDIO on DAT2** (v4.1, v2, and v1)
  - **Download Mode Not Working (minor issue)** (v2, v1)
You can determine the version of your ESP23-WROVER-KIT by checking which module is mounted on it:
  - ESP32-WROVER-B on v4.1
  - ESP32-WROVER on v3
  - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSC
  - Required pull-ups are provided
  - **Conflicts Between Bootstrap and SDIO on DAT2**
- ESP32-LyraT
  - Required pull-ups are provided
  - **Pull-up Conflicts on GPIO13**

Non-Espressif Hosts  Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.
**Chapter 2. API Reference**

**Solutions**

**No Pull-ups**  If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13**  If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode
- Perform one of the following actions on the GPIO13 pin:
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2**  There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   **Warning:**  Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on [http://www.espressif.com/](http://www.espressif.com/). If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
```
```
```
```
```
```
```
```
```
```

• For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and reflash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

No Pull-up on GPIO12  Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

Download Mode Not Working (minor issue)  When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

• For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
• For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  – LEDs would not affect operation in most cases.
  – Pull-down resistors can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

Related Information

MTDI Strapping Pin  MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

• For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
• For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
• On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see Overview of Compatibility.

Internal Pull-ups and Strapping Requirements  Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

• WPU: Weak pull-up inside the SoC
• WPD: Weak pull-down inside the SoC
• PU: Pull-up inside Espressif modules but outside the SoC

### 2.6.13 SDMMC Host Driver

#### Overview

ESP32’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

- Slot 0 (SDMMC_HOST_SLOT_0) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (SDMMC_HOST_SLOT_1) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD</td>
<td>GPIO11</td>
<td>GPIO15</td>
</tr>
<tr>

<td>GPIO6</td>
<td>GPIO14</td>
</tr>
<tr>
<td>D0</td>
<td>GPIO7</td>
<td>GPIO2</td>
</tr>
<tr>
<td>D1</td>
<td>GPIO8</td>
<td>GPIO4</td>
</tr>
<tr>
<td>D2</td>
<td>GPIO9</td>
<td>GPIO12</td>
</tr>
<tr>
<td>D3</td>
<td>GPIO10</td>
<td>GPIO13</td>
</tr>
<tr>
<td>D4</td>
<td>GPIO16</td>
<td></td>
</tr>
<tr>
<td>D5</td>
<td>GPIO17</td>
<td></td>
</tr>
<tr>
<td>D6</td>
<td>GPIO5</td>
<td></td>
</tr>
<tr>
<td>D7</td>
<td>GPIO18</td>
<td></td>
</tr>
<tr>
<td>CD</td>
<td>any input via GPIO matrix</td>
<td></td>
</tr>
<tr>
<td>WP</td>
<td>any input via GPIO matrix</td>
<td></td>
</tr>
</tbody>
</table>

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the cd and wp members of the sdmmc_slot_config_t structure before calling sdmmc_host_init_slot(). Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1_*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

#### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:
• High Speed DDR mode, 8-line eMMC
• UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

• sdmmc_host_init()
• sdmmc_host_init_slot()
• sdmmc_host_deinit()

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in thesdmmc_host_t structure:

• sdmmc_host_set_bus_width()
• sdmmc_host_set_card_clk()
• sdmmc_host_do_transaction()

Configuring Bus Width and Frequency

With the default initializers forsdmmc_host_t andsdmmc_slot_config_t (SDMMC_HOST_DEFAULT andSDMMC_SLOT_CONFIG_DEFAULT), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing themax_freq_khz field ofsdmmc_host_t:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set thewidth field ofsdmmc_slot_config_t. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

DDR Mode for eMMC chips

By default, DDR mode will be used if:

• SDMMC host frequency is set toSDMMC_FREQ_HIGHSPEED insdmmc_host_t structure, and
• eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keepingSDMMC_FREQ_HIGHSPEED frequency, clearSDMMC_HOST_FLAG_DDR bit inflags field ofsdmmc_host_t:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

SeeSD/SDIO/MMC Driverfor the higher level driver which implements the protocol layer.

SeeSD SPI Host Driverfor a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

SeeSD Pull-up Requirementsfor pullup support and compatibilities of modules and development kits.
API Reference

Header File

- components/driver/include/driver/sdmmc_host.h

Functions

`esp_err_t sdmmc_host_init (void)`
Initialize SDMMC host peripheral.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
- ESP_ERR_NO_MEM if memory cannot be allocated

`esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)`
Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:
- Slot 0: 8-bit wide, maps to HS1_* signals in PIN_MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN_MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config`: additional configuration for the slot

`esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)`
Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

`size_t sdmmc_host_get_slot_width (int slot)`
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

`esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)`
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future
Chapter 2. API Reference

**esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)**

Enable or disable DDR mode of SD interface.

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz**: card clock frequency, in kHz

**Return**
- **ESP_OK** on success
- **ESP_ERR_NOT_SUPPORTED** if DDR mode is not supported on this slot

**esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)**

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

**Return**
- **ESP_OK** on success
- **ESP_ERR_TIMEOUT** if response or data transfer has timed out
- **ESP_ERR_INVALID_CRC** if response or data transfer CRC check has failed
- **ESP_ERR_INVALID_RESPONSE** if the card has sent an invalid response
- **ESP_ERR_INVALID_SIZE** if the size of data transfer is not valid in SD protocol
- **ESP_ERR_INVALID_ARG** if the data buffer is not in DMA capable memory

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo**: pointer to structure describing command and data to transfer

**esp_err_t sdmmc_host_io_int_enable (int slot)**

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP_OK, other errors possible in the future

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- **ESP_OK** on success (interrupt received)
- **ESP_ERR_TIMEOUT** if the interrupt did not occur within timeout_ticks

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **timeout_ticks**: number of RTOS ticks to wait for the interrupt

**esp_err_t sdmmc_host_deinit (void)**

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**
- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if sdmmc_host_init function has not been called

**esp_err_t sdmmc_host_pullup_en (int slot, int width)**

Enable the pull-ups of sd pins.
This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in sdmmc_slot_config_t::flags instead.

Note You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

Return

- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

Parameters

- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.

Structures

struct sdmmc_slot_config_t
Extra configuration for SDMMC peripheral slot

Public Members

- gpio_num_t gpio_cd
  GPIO number of card detect signal.
- gpio_num_t cd
  GPIO number of card detect signal; shorter name.
- gpio_num_t gpio_wp
  GPIO number of write protect signal.
- gpio_num_t wp
  GPIO number of write protect signal; shorter name.
- uint8_t width
  Bus width used by the slot (might be less than the max width supported)
- uint32_t flags
  Features used by this slot.

Macros

- SDMMC_HOST_SLOT_0
  SDMMC slot 0.
- SDMMC_HOST_SLOT_1
  SDMMC slot 1.
- SDMMC_HOST_DEFAULT()
  Default sdmmc_host_t structure initializer for SDMMC peripheral.
  Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
- SDMMC_SLOT_FLAG_INTERNAL_PULLUP
  Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.
- SDMMC_SLOT_NO_CD
  indicates that card detect line is not used
- SDMMC_SLOT_NO_WP
  indicates that write protect line is not used
- SDMMC_SLOT_WIDTH_DEFAULT
  use the maximum possible width for the slot
Chapter 2. API Reference

**SDMMC_SLOT_CONFIG_DEFAULT**

Macro defining default configuration of SDMMC host slot

### 2.6.14 SD SPI Host Driver

**Overview**

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi_dev_handle_t* returned when attaching the device to an SPI bus by calling *sdspi_host_init_device*. The bus should be already initialized before (by *spi_bus_initialize*).

This driver’s naming pattern was adopted from the **SDMMC Host** driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See **SDMMC Host**) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of **SPI Master driver** based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

**How to Use**

Firstly, use the macro **SDSPI_DEVICE_CONFIG_DEFAULT** to initialize a structure *sdmmc_slot_config_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use **SDSPI_HOST_DEFAULT** macro to initialize a *sdmmc_host_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device *spi_handle* just returned from *sdspi_host_init_device*. Call *sdmmc_card_init* with the *sdmmc_host_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

**Other Details**

Only the following driver’s API functions are normally used by most applications:

- *sdspi_host_init()*
- *sdspi_host_init_device()*
- *sdspi_host_remove_device()*
- *sdspi_host_deinit()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc_host_t* structure. For more details, see the **SD/SDIO/MMC Driver**.

**Note:** SD over SPI does not support speeds above **SDMMC_FREQ_DEFAULT** due to the limitations of the SPI driver.

---

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see **Sharing the SPI bus among SD card and other SPI devices**.

Sharing the SPI bus among SD card and other SPI devices  The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

Pin loading of other devices  When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC loading  SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large. You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency cannot, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

DC loading  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

Initialization sequence

Note:  If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by spi_bus_initialize.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling spi_bus_add_device. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).

3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`. This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed. If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.

4. Now you can talk to other SPI devices freely!

**API Reference**

**Header File**

- `components/driver/include/driver/sdspi_host.h`

**Functions**

`esp_err_t sdspi_host_init (void)`

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe

**Note** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note** The SDIO oversdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**Parameters**

- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

`esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)`

Remove an SD SPI device.

**Return** Always ESP_OK

**Parameters**

- `handle`: Handle of the SD SPI device

`esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)`

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_ * functions are not called.

**Return**

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- **handle**: Handle of the sdspi device
- **cmdinfo**: pointer to structure describing command and data to transfer

`esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)`

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- **host**: Handle of the sdspi device
- **freq_khz**: card clock frequency, in kHz

`esp_err_t sdspi_host_deinit (void)`

Release resources allocated using sdspi_host_init.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

`esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)`

Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
- **handle**: Handle of the sdspi device

`esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)`

Wait for SDIO interrupt until timeout.

**Return**
- ESP_OK on success

**Parameters**
- **handle**: Handle of the sdspi device
- **timeout_ticks**: Ticks to wait before timeout.

`esp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)`

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call gpio_install_isr_service() before this function.

**Parameters**
- **slot**: SPI controller to use (SPI2_HOST or SPI3_HOST)
- **slot_config**: pointer to slot configuration structure

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

**struct sdspi_device_config_t**

Extra configuration for SD SPI device.
Public Members

*spi_host_device_t* `host_id`
SPI host to use, SPIx_HOST (see spi_types.h).

*gpio_num_t* `gpio_cs`
GPIO number of CS signal.

*gpio_num_t* `gpio_cd`
GPIO number of card detect signal.

*gpio_num_t* `gpio_wp`
GPIO number of write protect signal.

*gpio_num_t* `gpio_int`
GPIO number of interrupt line (input) for SDIO card.

```c
struct sdspi_slot_config_t
```
Extra configuration for SPI host.

Public Members

*gpio_num_t* `gpio_cs`
GPIO number of CS signal.

*gpio_num_t* `gpio_cd`
GPIO number of card detect signal.

*gpio_num_t* `gpio_wp`
GPIO number of write protect signal.

*gpio_num_t* `gpio_int`
GPIO number of interrupt line (input) for SDIO card.

*gpio_num_t* `gpio_miso`
GPIO number of MISO signal.

*gpio_num_t* `gpio_mosi`
GPIO number of MOSI signal.

*gpio_num_t* `gpio_sck`
GPIO number of SCK signal.

```c
int dma_channel
```
DMA channel to be used by SPI driver (1 or 2).

Macros

`SDSPI_DEFAULT_HOST`
Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

`SDSPI_SLOT_NO_CD`
indicates that card detect line is not used

`SDSPI_SLOT_NO_WP`
indicates that write protect line is not used

`SDSPI_SLOT_NO_INT`
indicates that interrupt line is not used

`SDSPI_DEVICE_CONFIG_DEFAULT()`
Macro defining default configuration of SD SPI device.
SDSPI_SLOT_CONFIG_DEFAULT()  
Macro defining default configuration of SPI host

**Type Definitions**

typedef int.sdspi_dev_handle_t  
Handle representing an SD SPI device.

### 2.6.15 SDIO Card Slave Driver

#### Overview

The ESP32 SDIO Card peripherals (Host, Slave) share two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only run on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>
<th>Slot1</th>
<th>Slot2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLK</td>
<td>SCLK</td>
<td>6</td>
<td>14</td>
</tr>
<tr>
<td>CMD</td>
<td>MOSI</td>
<td>11</td>
<td>15</td>
</tr>
<tr>
<td>DAT0</td>
<td>MISO</td>
<td>7</td>
<td>2</td>
</tr>
<tr>
<td>DAT1</td>
<td>Interrupt</td>
<td>8</td>
<td>4</td>
</tr>
<tr>
<td>DAT2</td>
<td>N.C. (pullup)</td>
<td>9</td>
<td>12</td>
</tr>
<tr>
<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**Note:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 Kohm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check *Overview of Compatibility* to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See *Overview of Compatibility* to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- **Modules:** ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- **Kits:** ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to *SD Pull-up Requirements* for more technical details of the pullups.
The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology** The SDIO slave driver uses the following terms:
- **Transfer**: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending**: slave to host transfers.
- **Receiving**: host to slave transfers.

**Note:** Register names in ESP32 Technical Reference Manual > SDIO Slave Controller [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO**: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \( \text{requested length} = 0x1F800 - \text{address} \).
- **Ownership**: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length**: The length requested in one transfer determined by the FIFO address.
- **Transfer length**: The length requested in one transfer determined by the CMD53 byte/block count field.

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- **Receiving buffer size**: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the recv_buffer_size member of sdio_slave_config_t.
- **Interrupts**: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in **Interrupts**.
- **Registers**: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO Slave Initialization.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to ESP SDIO Slave Protocol. There is also a component ESP Serial Slave Link for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.
**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts**  The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If non-blocking call is needed, set `wait=0`.

The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When ESP_ERR_NOT_FINISHED is returned by this API, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.

If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.

4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode**: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- **Packet Mode**: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.
Note: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the sending_mode member of sdio_slave_config_t, and the buffer numbers can be set in the send_queue_size. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call sdio_slave_transmit to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an arg indicating the buffer) to sdio_slave_send_queue. If non-blocking call is needed, set wait=0. If the wait is not portMAX_DELAY (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call sdio_slave_send_get_finished to get and deal with a finished transfer. A buffer should be keep unmodified until returned from sdio_slave_send_get_finished. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the arg in the queue parameter:

1. Directly point arg to a dynamic-allocated buffer, and use the arg to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point arg to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t *buffer;
    size_t size;
    int id;
} sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, // the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void**)&arg, portMAX_DELAY);
ESP_LOGI("tag", "(#d) successfully send %d bytes of %p", arg->id, arg->size,
        /*arg->buffer);
some_post_callback(arg); // do more things
```

3. Working with the receiving part of this driver, point arg to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```
More about this, see peripherals/sdio.

Application Example

Slave/master communication: peripherals/sdio.

API Reference

Header File

- components/hal/include/hal/sdio_slave_types.h

Enumerations

**enum sdio_slave_hostint_t**

Mask of interrupts sending to the host.

Values:

- `SDIO_SLAVE_HOSTINT_BIT0` = BIT(0)
  General purpose interrupt bit 0.
- `SDIO_SLAVE_HOSTINT_BIT1` = BIT(1)
- `SDIO_SLAVE_HOSTINT_BIT2` = BIT(2)
- `SDIO_SLAVE_HOSTINT_BIT3` = BIT(3)
- `SDIO_SLAVE_HOSTINT_BIT4` = BIT(4)
- `SDIO_SLAVE_HOSTINT_BIT5` = BIT(5)
- `SDIO_SLAVE_HOSTINT_BIT6` = BIT(6)
- `SDIO_SLAVE_HOSTINT_BIT7` = BIT(7)
- `SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET` = BIT(23)
  New packet available.

**enum sdio_slave_timing_t**

Timing of SDIO slave.

Values:

- `SDIO_SLAVE_TIMING_PSEND_PSAMPLE` = 0
  Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.
- `SDIO_SLAVE_TIMING_NSEND_PSAMPLE`
  Send at negedge, and sample at posedge. Default value for DS mode and below.
- `SDIO_SLAVE_TIMING_PSEND_NSAMPLE`
  Send at posedge, and sample at negedge.
- `SDIO_SLAVE_TIMING_NSEND_NSAMPLE`
  Send at negedge, and sample at negedge.

**enum sdio_slave_sending_mode_t**

Configuration of SDIO slave mode.

Values:

- `SDIO_SLAVE_SEND_STREAM` = 0
  Stream mode, all packets to send will be combined as one if possible.
- `SDIO_SLAVE_SEND_PACKET` = 1
  Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).
Header File

- components/driver/include/driver/sdio_slave.h

Functions

**esp_err_t sdio_slave_initialize**(sdio_slave_config_t *config)

Initialize the sdio slave driver

**Return**

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

**Parameters**

- config: Configuration of the sdio slave driver.

**void sdio_slave_deinit**(void)

De-initialize the sdio slave driver to release the resources.

**esp_err_t sdio_slave_start**(void)

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

**Note** The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.

**Return**

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

**void sdio_slave_stop**(void)

Stop hardware from sending and receiving, also set IOREADY1 to 0.

**Note** this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call sdio_slave_reset to do that.

**esp_err_t sdio_slave_reset**(void)

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Return**

- always return ESP_OK.

**sdio_slave_buf_handle_t sdio_slave_recv_register_buf**(uint8_t *start)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note** The driver will use and only use the amount of space specified in the recv_buffer_size member set in the sdio_slave_config_t. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return** The buffer handle if success, otherwise NULL.

**Parameters**

- start: The start address of the buffer.

**esp_err_t sdio_slave_recv_unregister_buf**(sdio_slave_buf_handle_t handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return** ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

**Parameters**

- handle: Handle to the buffer to release.

**esp_err_t sdio_slave_recv_load_buf**(sdio_slave_buf_handle_t handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

**Return**

- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by sdio_slave_recv can you load it again.
- ESP_OK if success

*Espressif Systems 964 Release v5.0-dev-1712-g4a553510b7*

Submit Document Feedback
Chapter 2. API Reference

Parameters
- `handle`: Handle to the buffer ready to receive data.

```c
esp_err_t sdio_slave_recv_packet (sdio_slave_buf_handle_t *handle_ret, TickType_t wait)
```

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

Parameters
- `handle_ret`: Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- `wait`: Time to wait before data received.

```c
uint8_t* sdio_slave_recv_get_buf (sdio_slave_buf_handle_t handle, size_t* len_o)
```

Retrieve the buffer corresponding to a handle.

**Return** buffer address if success, otherwise NULL.

**Parameters**
- `handle`: Handle to get the buffer.
- `len_o`: Output of buffer length

```c
esp_err_t sdio_slave_send_queue (uint8_t* addr, size_t len, void* arg, TickType_t wait)
```

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

**Parameters**
• **addr**: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
• **len**: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
• **arg**: Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
• **wait**: Time to wait if the buffer is full.

```c
esp_err_t sdio_slave_send_get_finished (void **out_arg, TickType_t wait)
```

Return the ownership of a finished transaction.

Parameters
• **out_arg**: Argument of the finished transaction. Set to NULL if unused.
• **wait**: Time to wait if there’s no finished sending transaction.

```c
esp_err_t sdio_slave_transmit (uint8_t *addr, size_t len)
```

Start a new sending transfer, and wait for it (blocked) to be finished.

Parameters
• **addr**: Start address of the buffer to send
• **len**: Length of buffer to send.

```c
uint8_t sdio_slave_read_reg (int pos)
```

Read the spi slave register shared with host.

Note register 28 to 31 are reserved for interrupt vector.

Parameters
• **pos**: register address, 0-27 or 32-63.

```c
esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)
```

Write the spi slave register shared with host.

Note register 29 and 31 are used for interrupt vector.

Parameters
• **pos**: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
• **reg**: the value to write.

```c
sdio_slave_hostint_t sdio_slave_get_host_intena (void)
```

Get the interrupt enable for host.

Parameters
• **mask**: Enable mask for host interrupt.

```c
void sdio_slave_set_host_intena (sdio_slave_hostint_t mask)
```

Set the interrupt enable for host.

Parameters
• **mask**: Enable mask for host interrupt.

```c
esp_err_t sdio_slave_send_host_int (uint8_t pos)
```

Interrupt the host by general purpose interrupt.

Parameters
• **pos**: Interrupt num, 0-7.

```c
void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
```

Clear general purpose interrupt to host.
Parameters

- `mask`: Interrupt bits to clear, by bit mask.

```c
esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)
```

Wait for general purpose interrupt from host.

**Note** this clears the interrupt at the same time.

**Return** ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

**Parameters**

- `pos`: Interrupt source number to wait for. is set.
- `wait`: Time to wait before interrupt triggered.

**Structures**

```c
struct sdio_slave_config_t
```

Configuration of SDIO slave.

**Public Members**

- `sdio_slave_timing_t timing`
  timing of sdio_slave. see `sdio_slave_timing_t`.

- `sdio_slave_sending_mode_t sending_mode`
  mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible;
  SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

- `int send_queue_size`
  max buffers that can be queued before sending.

- `size_t recv_buffer_size`
  If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

- `sdio_event_cb_t event_cb`
  when the host interrupts slave, this callback will be called with interrupt number (0-7).

- `uint32_t flags`
  Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_*.

**Macros**

- `SDIO_SLAVE_RECV_MAX_BUFFER`
- `SDIO_SLAVE_FLAG_DAT2_DISABLED`
  It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

- `SDIO_SLAVE_FLAG_HOST_INTR_DISABLED`
  The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

- `SDIO_SLAVE_FLAG_INTERNAL_PULLUP`
  Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.
Chapter 2. API Reference

Type Definitions

definition typedef void (*sdio_event_cb_t)(uint8_t event)
definition typedef void* sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

2.6.16 Sigma-delta Modulation

Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are 8 independent sigma-delta modulation channels identified with sigmadelta_channel_t. Each channel is capable of outputting the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in sigmadelta_config_t and then applying this configuration with sigmadelta_config().

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - sigmadelta_set_prescale()
- **Duty** of the output signal - sigmadelta_set_duty()
- **GPIO pin** to output modulated signal - sigmadelta_set_pin()

The range of the ‘duty’ input parameter of sigmadelta_set_duty() is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of sigmadelta_set_duty().

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

Application Example

Sigma-delta Modulation example: peripherals/sigmadelta.

API Reference

Header File

- components/driver/include/driver/sigmadelta.h

Functions

esp_err_t sigmadelta_config(const sigmadelta_config_t* config)

Configure Sigma-delta channel.

Return

- ESP_OK Success
Fig. 21: Sallen-Key Low Pass Filter

- ESP_ERR_INVALID_STATE sigmadata driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `config`: Pointer of Sigma-delta channel configuration struct

`esp_err_t sigmadata_set_duty(sigmadelta_channel_t channel, int8_t duty)`
Set Sigma-delta channel duty.

```
This function is used to set Sigma-delta channel duty, if you add a capacitor between the output pin and ground, the average output voltage will be Vdc = VDDIO / 256 * duty + VDDIO/2, where VDDIO is the power supply voltage.
```

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadata driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: Sigma-delta channel number
- `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

`esp_err_t sigmadata_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)`
Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadata driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadata_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)`
Set Sigma-delta signal output pin.
Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• channel: Sigma-delta channel number
• gpio_num: GPIO number of output pin.

Structures

struct sigmadelta_config_t
Sigma-delta configure struct.

Public Members

sigmadelta_channel_t channel
Sigma-delta channel number

int8_t sigmadelta_duty
Sigma-delta duty, duty ranges from -128 to 127.

uint8_t sigmadelta_prescale
Sigma-delta prescale, prescaler ranges from 0 to 255.

uint8_t sigmadelta_gpio
Sigma-delta output io number, refer to gpio.h for more details.

Header File

• components/hal/include/hal/sigmadelta_types.h

Enumerations

enum sigmadelta_port_t
SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

Values:

SIGMADELTA_PORT_0
SIGMADELTA port 0

SIGMADELTA_PORT_MAX
SIGMADELTA port max

enum sigmadelta_channel_t
Sigma-delta channel list.

Values:

SIGMADELTA_CHANNEL_0
Sigma-delta channel 0

SIGMADELTA_CHANNEL_1
Sigma-delta channel 1

SIGMADELTA_CHANNEL_2
Sigma-delta channel 2

SIGMADELTA_CHANNEL_3
Sigma-delta channel 3

SIGMADELTA_CHANNEL_4
Sigma-delta channel 4
2.6.17 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

Overview of ESP32’s SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.
### API Reference

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>

### Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

### SPI Features
Chapter 2. API Reference

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
- There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.
The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer
can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes
on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes,
thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the
interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status
bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the
ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling
and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while
these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when
the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions
`spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more in-
formation, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set
the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to
check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the
Bus IO setting Flag column.

<table>
<thead>
<tr>
<th>Mode name</th>

<td>4</td>
<td>4</td>
<td>SPI_TRANS_MODE_QIO</td>
<td>SPI_TRANS_MULTILINE_ADDR</td>
</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the
struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command
and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member
`spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to
default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or
`SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the
rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the
struct `spi_transaction_ext_t`.
If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see Transaction Line Mode.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t` If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in Transaction Line Mode.

**Note:** Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see Known Issues.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA`
flag on the transmission. For received data, use \texttt{rx\_data} and set \texttt{SPI\_TRANS\_USE\_RXDATA}. In both cases, do not touch the \texttt{tx\_buffer} or \texttt{rx\_buffer} members, because they use the same memory locations as \texttt{tx\_data} and \texttt{rx\_data}.

**Transactions with Integers Other Than \texttt{uint8\_t}** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if \texttt{0b00010} needs to be sent, it should be written into a \texttt{uint8\_t} variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of \texttt{uint16\_t} and \texttt{uint32\_t} variables is stored at the smallest address. Hence, if \texttt{uint16\_t} is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from \texttt{uint8\_t} arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- \texttt{SPI\_SWAP\_DATA\_TX} for data to be transmitted
- \texttt{SPI\_SWAP\_DATA\_RX} for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function \texttt{spi\_device\_polling\_end()} after \texttt{spi\_device\_polling\_start()} to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with \texttt{spi\_device\_polling\_transmit()} so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call \texttt{spi\_device\_polling\_start()}. To do that, you can keep calling \texttt{spi\_device\_get\_trans\_result()} until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**Notes on Using the SPI Master driver on SPI1 Bus**

**Note:** Though the \texttt{SPI Bus Lock} feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between \texttt{spi\_device\_acquire\_bus()} and \texttt{spi\_device\_release\_bus()}.  
   - Implicit bus acquiring between \texttt{spi\_device\_polling\_start()} and \texttt{spi\_device\_polling\_end()} (or inside \texttt{spi\_device\_polling\_transmit()}).

   During the time above, all other tasks and most ISRs will be disabled (see \texttt{IRAM-Safe Interrupt Handlers}). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the
PSRAM) will cause a *Cache disabled but cached memory region accessed* exception. For differences between IRAM, DRAM, and flash cache, please refer to the *application memory layout* documentation.

To place functions into the IRAM, you can either:

1. Add `IRAM_ATTR` (include “esp_attr.h”) to the function like:
   ```c
   IRAM_ATTR void foo(void) {}  
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.

2. Use the `noflash` placement in the `linker.lf`. See more in *Linker Script Generation*. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:

1. Add `DRAM_ATTR` (include “esp_attr.h”) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;  
   ```

2. Use the `noflash` placement in the `linker.lf`. See more in *Linker Script Generation*.

Please also see the example `peripherals/spi_master/hd_eeprom`.

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration**

Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.
Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See **Interrupt Transactions**. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see **Polling Transactions**.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

**SPI Clock Frequency**  Transferring each byte takes eight times the clock period $8/f_{spi}$.

If the clock frequency is too high, the use of some functions might be limited. See **Timing Considerations**.

**Cache Miss**  The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}/MHz/\mu s$ for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see **IRAM-Safe Interrupt Handlers**.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is $< 0$, which means the setup timing requirement is violated and the reading might be incorrect.
The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33–77% in comparison to the existing `input delay`. To retain a higher frequency, you have to use the IO_MUX pins or the `dummy bit workaround`. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the Host only writes data, the `dummy bit workaround` and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

The SPI master driver still works even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.
Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
Freq\ limit\ [MHz] = \frac{80}{(\text{floor}(\text{MISO\ delay[ns]}/12.5) + 1)}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

<table>
<thead>
<tr>
<th>Master</th>

</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used.
If such transactions are required, you have to use one of the alternative solutions:
1. Use full-duplex transactions instead.
2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:
   ```c
   ret = spi_bus_initialize(VSPI_HOST, &buscfg, 0);
   ```
   This can prohibit you from transmitting and receiving data longer than 64 bytes.
3. Try using the command and address fields to replace the write phase.
4. Full-duplex transactions are not compatible with the _dummy bit workaround_, hence the frequency is limited. See _dummy bit speed-up workaround_.
5. _dummy_bits_ in _spi_device_interface_config_t_ and _spi_transaction_ext_t_ are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
6. _cs_ena_pretrans_ is not compatible with the command and address phases of full-duplex transactions.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**Header File**
- components/hal/include/hal/spi_types.h

**Structures**
- `struct spi_line_mode_t`
  Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

  **Public Members**
  - `uint8_t cmd_lines`
    The line width of command phase, e.g. 2-line-cmd-phase.
  - `uint8_t addr_lines`
    The line width of address phase, e.g. 1-line-addr-phase.
  - `uint8_t data_lines`
    The line width of data phase, e.g. 4-line-data-phase.

**Enumerations**
- `enum spi_host_device_t`
  Enum with the three SPI peripherals that are software-accessible in it.

  **Values:**
  - `SPI1_HOST = 0`
    SPI1.
  - `SPI2_HOST = 1`
    SPI2.
  - `SPI3_HOST = 2`
    SPI3.
  - `SPI_HOST_MAX`
    Invalid host value

- `enum spi_clock_source_t`
  **Values:**
SPI_CLK_APB
Select APB as the source clock.

SPI_CLK_XTAL
Select XTAL as the source clock.

enum spi_event_t
SPI Events.

Values:

SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File

• components/driver/include/driver/spi_common.h

Functions

esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config,
                                 spi_dma_chan_t dma_chan)
Initialize a SPI bus.

Warning SPI0/1 is not supported

Warning If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

• ESP_ERR_INVALID_ARG if configuration is invalid
• ESP_ERR_INVALID_STATE if host already is in use
• ESP_ERR_NOT_FOUND if there is no available DMA channel
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters

• host_id: SPI peripheral that controls this bus
• bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
• dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  – Selecting SPI_DMA_DISABLED limits the size of transactions.
– Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
– Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_bus_free(spi_host_device_t host_id)
```
Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral to free

### Structures

#### struct spi_bus_config_t

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

#### Public Members

- `int mosi_io_num`: GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.
- `int data0_io_num`: GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.
- `int miso_io_num`: GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.
- `int data1_io_num`: GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.
- `int sclk_io_num`: GPIO pin for SPI Clock signal, or -1 if not used.
- `int quadwp_io_num`: GPIO pin for WP (Write Protect) signal, or -1 if not used.
- `int data2_io_num`: GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.
- `int quadhd_io_num`: GPIO pin for HD (Hold) signal, or -1 if not used.
- `int data3_io_num`: GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.
- `int data4_io_num`: GPIO pin for spi data4 signal in octal mode, or -1 if not used.
- `int data5_io_num`: GPIO pin for spi data5 signal in octal mode, or -1 if not used.
- `int data6_io_num`: GPIO pin for spi data6 signal in octal mode, or -1 if not used.
- `int data7_io_num`: GPIO pin for spi data7 signal in octal mode, or -1 if not used.
```
int max_transfer_sz
Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

int intr_flags
Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX (DATA, LEN)
Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
E.g. to send 9 bits of data, you can:
```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```
Then points tx_buffer to &data.

Parameters

• DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
• LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.
E.g. to transform the data of 15 bits placed in a 4-byte array to integer:
```
uint16_t data = SPI_SWAP_DATA_RX(*(*uint32_t*)tx_data, 15);
```

Parameters

• DATA: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
• LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iOMUX pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.
```
Chapter 2. API Reference

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7
Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL
Check existing of MOSI/MISO/ WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

Type Definitions

typedef spi_common_dma_t spi_dma_chan_t

Enumerations

enum spi_common_dma_t
SPI DMA channels.

Values:

SPI_DMA_DISABLED = 0
Do not enable DMA for SPI.

SPI_DMA_CH1 = 1
Enable DMA, select DMA Channel 1.

SPI_DMA_CH2 = 2
Enable DMA, select DMA Channel 2.

SPI_DMA_CH_AUTO = 3
Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File

• components/driver/include/driver/spi_master.h

Functions

esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
Allocate a device on a SPI bus.
This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral
and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three
devices.

Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed
pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters

• host_id: SPI peripheral to allocate device on
• dev_config: SPI interface protocol config for the device
• handle: Pointer to variable to hold the device handle

esp_err_t spi_bus_remove_device (spi_device_handle_t handle)
Remove a device from the SPI bus.
Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if device already is freed
• ESP_OK on success

Parameters
• handle: Device handle to free

```
esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
• ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
• ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

Parameters
• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Description of transaction to execute
• ticks_to_wait: Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
• ESP_OK on success

Parameters
• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
• ticks_to_wait: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```
Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters
• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Description of transaction to execute
**esp_err_t** spi_device_polling_start**(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; currently only port_MAX_DELAY is supported.

**esp_err_t** spi_device_polling_end**(spi_device_handle_t handle, TickType_t ticks_to_wait)**

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**esp_err_t** spi_device_polling_transmit**(spi_device_handle_t handle, spi_transaction_t *trans_desc)**

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute

**esp_err_t** spi_device_acquire_bus**(spi_device_handle_t device, TickType_t wait)**

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**
- ESP_ERR_INVALID_ARG: wait is not set to portMAX_DELAY.
- ESP_OK: Success.

**Parameters**
- device: The device to occupy the bus.
Chapter 2. API Reference

- **wait**: Time to wait before the the bus is occupied by the device. Currently MUST set to.port-MAX_DELAY.

```c
void spi_device_release_bus(spi_device_handle_t dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.
```

**Parameters**
- **dev**: The device to release the bus.

```c
int spi_cal_clock (int fapb, int hz, int duty_cycle, uint32_t *reg_o)

Calculate the working frequency that is most close to desired frequency, and also the register value.
```

**Parameters**
- **fapb**: The frequency of apb clock, should be APB_CLK_FREQ.
- **hz**: Desired working frequency
- **duty_cycle**: Duty cycle of the spi clock
- **reg_o**: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

```c
int spi_get_actual_clock (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.
```

**Return** Actual working frequency that most fit.

**Parameters**
- **fapb**: The frequency of apb clock, should be APB_CLK_FREQ.
- **hz**: Desired working frequency
- **duty_cycle**: Duty cycle of the spi clock

```c
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.
```

**Note** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- **gpio_is_used**: True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns**: Input delay from SCLK launch edge to MISO data valid.
- **eff_clk**: Effective clock frequency (in Hz) from spi_cal_clock.
- **dummy_o**: Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o**: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be aplied in the half duplex mode.
```

**Return** Frequency limit of current configurations.

**Parameters**
- **gpio_is_used**: True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns**: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t

This is a configuration for a SPI slave device that is connected to one of the SPI buses.
```

**Public Members**

```c
uint8_t command_bits

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not
used, otherwise ignored.

uint8_t address_bits
Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

uint8_t dummy_bits
Amount of dummy bits to insert between address and data phase.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:

• 0: (0, 0)
• 1: (0, 1)
• 2: (1, 0)
• 3: (1, 1)

uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*

int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
CS GPIO pin for this device, or -1 if not used.

uint32_t flags
Bitwise OR of SPI_DEVICE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.
Public Members

uint32_t flags
   Bitwise OR of SPI_TRANS_" flags.

uint16_t cmd
   Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

   NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

   Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr
   Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

   NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

   Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
   Total data length, in bits.

size_t rxlength
   Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
   User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
   Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
   If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t tx_data[4]
   If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
   This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
   Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
   The command length in this transaction, in bits.

uint8_t address_bits
   The address length in this transaction, in bits.

uint8_t dummy_bits
   The dummy length in this transaction, in bits.
Chapter 2. API Reference

**Macros**

**SPI_MASTER_FREQ_8M**
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

- **8MHz**
- **SPI_MASTER_FREQ_9M**
  - 8.89MHz
- **SPI_MASTER_FREQ_10M**
  - 10MHz
- **SPI_MASTER_FREQ_11M**
  - 11.43MHz
- **SPI_MASTER_FREQ_13M**
  - 13.33MHz
- **SPI_MASTER_FREQ_16M**
  - 16MHz
- **SPI_MASTER_FREQ_20M**
  - 20MHz
- **SPI_MASTER_FREQ_26M**
  - 26.67MHz
- **SPI_MASTER_FREQ_40M**
  - 40MHz
- **SPI_MASTER_FREQ_80M**
  - 80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.
Chapter 2. API Reference

**SPI_TRANS_MODE_QIO**

Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**

Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_ADDR**

Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_DUMMY**

Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_CS_KEEP_ACTIVE**

Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI_TRANS_MODE_OCT**

Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**Type Definitions**

```c
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

### 2.6.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

#### Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.
## Terminology

The terms used in relation to the SPI slave driver are given in the table below.

<table>

</table>

## Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.
**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the `bus_config`. Set the unused signals to -1. If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.
If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions *spi_slave_queue_trans()* and then *spi_slave_get_trans_result()* instead of using *spi_slave_transmit()*.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in peripherals/spi_slave.

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th></th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency is equal to the limitation, it can lead to random errors. 2. The clock uncertainty between Host and Device (12.5ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.
