- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

Parameters

- fn: handler function to call (as passed to touch_pad_isr_handler_register)
- arg: argument of the handler (as passed to touch_pad_isr_handler_register)

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters
• pad_num: pointer to touch pad which caused wakeup

\texttt{esp_err_t touch_pad_set_fsm_mode (touch_fsm_mode_t \textit{mode})}

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

\textbf{Return}

• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

\textbf{Parameters}

• \textit{mode}: FSM mode

\texttt{esp_err_t touch_pad_get_fsm_mode (touch_fsm_mode_t *\textit{mode})}

Get touch sensor FSM mode.

\textbf{Return}

• ESP_OK on success

\textbf{Parameters}

• \textit{mode}: pointer to accept FSM mode

\texttt{esp_err_t touch_pad_clear_status (void)}

To clear the touch sensor channel active status.

\textbf{Note} The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

\textbf{Return}

• ESP_OK on success

\texttt{uint32_t touch_pad_get_status (void)}

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

\textbf{Return}

• The touch sensor status. e.g. Touch1 trigger status is \texttt{status_mask & (BIT1)}.

\texttt{bool touch_pad_meas_is_done (void)}

Check touch sensor measurement status.

\textbf{Return}

• True measurement is under way
• False measurement done

\textbf{GPIO Lookup Macros} Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. \texttt{TOUCH_PAD_NUM5_GPIO_NUM} is the GPIO number of channel 5 (12);
2. \texttt{TOUCH_PAD_GPIO4_CHANNEL} is the channel number of GPIO 4 (channel 0).

\textbf{Header File}

• \texttt{components/soc/esp32/include/soc/touch_sensor_channel.h}

\textbf{Macros}

\texttt{TOUCH_PAD_GPIO4_CHANNEL}
\texttt{TOUCH_PAD_NUM0_GPIO_NUM}
\texttt{TOUCH_PAD_GPIO0_CHANNEL}
\texttt{TOUCH_PAD_NUM1_GPIO_NUM}
\texttt{TOUCH_PAD_GPIO2_CHANNEL}
\texttt{TOUCH_PAD_NUM2_GPIO_NUM}
\texttt{TOUCH_PAD_GPIO15_CHANNEL}
TOUCH_PAD_NUM3_GPIO_NUM
TOUCH_PAD_GPIO13_CHANNEL
TOUCH_PAD_NUM4_GPIO_NUM
TOUCH_PAD_GPIO12_CHANNEL
TOUCH_PAD_NUM5_GPIO_NUM
TOUCH_PAD_GPIO14_CHANNEL
TOUCH_PAD_NUM6_GPIO_NUM
TOUCH_PAD_GPIO27_CHANNEL
TOUCH_PAD_NUM7_GPIO_NUM
TOUCH_PAD_GPIO33_CHANNEL
TOUCH_PAD_NUM8_GPIO_NUM

Header File

- components/hal/include/hal/touch_sensor_types.h

Macros

TOUCH_PAD_BIT_MASK_ALL
TOUCH_PAD_SLOPE_DEFAULT
TOUCH_PAD_TIE_OPT_DEFAULT
TOUCH_PAD_BIT_MASK_MAX
TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD
TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT
TOUCH_PAD_THRESHOLD_MAX

If set touch threshold max value, The touch sensor can’t be in touched status

TOUCH_PAD_SLEEP_CYCLE_DEFAULT

The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff

TOUCH_PAD_MEASURE_CYCLE_DEFAULT

The timer frequency is 8Mhz, the max value is 0x7fff

TOUCH_FSM_MODE_DEFAULT

The touch FSM may be started by the software or timer

TOUCH_TRIGGER_MODE_DEFAULT

Interrupts can be triggered if sensor value gets below or above threshold

TOUCH_TRIGGER_SOURCE_DEFAULT

The wakeup trigger source can be SET1 or both SET1 and SET2
Enumerations

**enum touch_pad_t**

Touch pad channel

*Values:*

 TOUCH_PAD_NUM0 = 0
 Touch pad channel 0 is GPIO4(ESP32)

 TOUCH_PAD_NUM1
 Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

 TOUCH_PAD_NUM2
 Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

 TOUCH_PAD_NUM3
 Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

 TOUCH_PAD_NUM4
 Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

 TOUCH_PAD_NUM5
 Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

 TOUCH_PAD_NUM6
 Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

 TOUCH_PAD_NUM7
 Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

 TOUCH_PAD_NUM8
 Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

 TOUCH_PAD_NUM9
 Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

 TOUCH_PAD_MAX

**enum touch_high_volt_t**

Touch sensor high reference voltage

*Values:*

 TOUCH_HVOLT_KEEP = -1
 Touch sensor high reference voltage, no change

 TOUCH_HVOLT_2V4 = 0
 Touch sensor high reference voltage, 2.4V

 TOUCH_HVOLT_2V5
 Touch sensor high reference voltage, 2.5V

 TOUCH_HVOLT_2V6
 Touch sensor high reference voltage, 2.6V

 TOUCH_HVOLT_2V7
 Touch sensor high reference voltage, 2.7V

 TOUCH_HVOLT_MAX

**enum touch_low_volt_t**

Touch sensor low reference voltage

*Values:*

 TOUCH_LVOLT_KEEP = -1
 Touch sensor low reference voltage, no change

 TOUCH_LVOLT_0V5 = 0
 Touch sensor low reference voltage, 0.5V
Chapter 2. API Reference

**TOUCH_LVOLT_0V6**
Touch sensor low reference voltage, 0.6V

**TOUCH_LVOLT_0V7**
Touch sensor low reference voltage, 0.7V

**TOUCH_LVOLT_0V8**
Touch sensor low reference voltage, 0.8V

**TOUCH_LVOLT_MAX**

**enum touch_volt_atten_t**
Touch sensor high reference voltage attenuation

Values:

**TOUCH_HVOLT_ATTEN_KEEP = -1**
Touch sensor high reference voltage attenuation, no change

**TOUCH_HVOLT_ATTEN_1V5 = 0**
Touch sensor high reference voltage attenuation, 1.5V attenuation

**TOUCH_HVOLT_ATTEN_1V**
Touch sensor high reference voltage attenuation, 1.0V attenuation

**TOUCH_HVOLT_ATTEN_0V5**
Touch sensor high reference voltage attenuation, 0.5V attenuation

**TOUCH_HVOLT_ATTEN_0V**
Touch sensor high reference voltage attenuation, 0V attenuation

**TOUCH_HVOLT_ATTEN_MAX**

**enum touch_cnt_slope_t**
Touch sensor charge/discharge speed

Values:

**TOUCH_PAD_SLOPE_0 = 0**
Touch sensor charge / discharge speed, always zero

**TOUCH_PAD_SLOPE_1 = 1**
Touch sensor charge / discharge speed, slowest

**TOUCH_PAD_SLOPE_2 = 2**
Touch sensor charge / discharge speed

**TOUCH_PAD_SLOPE_3 = 3**
Touch sensor charge / discharge speed

**TOUCH_PAD_SLOPE_4 = 4**
Touch sensor charge / discharge speed

**TOUCH_PAD_SLOPE_5 = 5**
Touch sensor charge / discharge speed

**TOUCH_PAD_SLOPE_6 = 6**
Touch sensor charge / discharge speed

**TOUCH_PAD_SLOPE_7 = 7**
Touch sensor charge / discharge speed, fast

**TOUCH_PAD_SLOPE_MAX**

**enum touch_tie_opt_t**
Touch sensor initial charge level

Values:

**TOUCH_PAD_TIE_OPT_LOW = 0**
Initial level of charging voltage, low level
Chapter 2. API Reference

**TOUCH_PAD_TIE_OPT_HIGH** = 1
Initial level of charging voltage, high level

**TOUCH_PAD_TIE_OPT_MAX**

**enum touch_fsm_mode_t**
Touch sensor FSM mode

*Values:*

**TOUCH_FSM_MODE_TIMER** = 0
To start touch FSM by timer

**TOUCH_FSM_MODE_SW**
To start touch FSM by software trigger

**TOUCH_FSM_MODE_MAX**

**enum touch_trigger_mode_t**

*Values:*

**TOUCH_TRIGGER_BELOW** = 0
Touch interrupt will happen if counter value is less than threshold.

**TOUCH_TRIGGER_ABOVE** = 1
Touch interrupt will happen if counter value is larger than threshold.

**TOUCH_TRIGGER_MAX**

**enum touch_trigger_src_t**

*Values:*

**TOUCH_TRIGGER_SOURCE_BOTH** = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

**TOUCH_TRIGGER_SOURCE_SET1** = 1
wakeup interrupt is generated if SET1 is “touched”

**TOUCH_TRIGGER_SOURCE_MAX**

2.6.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

*Warning:* The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

**Sections**

- *Two-Wire Automotive Interface (TWAI)*
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself form the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter** (TEC) and the **Receive Error Counter** (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when both **TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when either **the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.
Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required.** The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT.** These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

![Fig. 21: Signal lines of the TWAI controller](image)

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller’s source clock (APB Clock).

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes**  The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).
**Listen Only Mode**: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However, the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the brp can be any even number from 2 to 128.
If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

![Bit timing configuration for 500kbit/s given BRP = 8](image)

Fig. 22: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`

Revision 2 or later of the ESP32 also supports the following bit rates:

- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12.5KBITS()`

**Acceptance Filter**  The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the acceptance code and the acceptance mask.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram
Fig. 23: Bit layout of single filter mode (Right side MSBit)

illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 24: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**ESP32 Errata Workarounds** The ESP32’s TWAI controller contains multiple hardware errata (more details about the errata can be found in the ESP32’s ECO document). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:

- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
• If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1 KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Fig. 25: State transition diagram of the TWAI driver (see table below)**

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled -&gt; Stopped</td>
<td><code>twai_driver_install()</code></td>
</tr>
<tr>
<td>B</td>
<td>Stopped -&gt; Uninstalled</td>
<td><code>twai_driver_uninstall()</code></td>
</tr>
<tr>
<td>C</td>
<td>Stopped -&gt; Running</td>
<td><code>twai_start()</code></td>
</tr>
<tr>
<td>D</td>
<td>Running -&gt; Stopped</td>
<td><code>twai_stop()</code></td>
</tr>
<tr>

<td><code>twai_initiate_recovery()</code></td>
</tr>
<tr>
<td>H</td>
<td>Recovering -&gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**  

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped**: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off**: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.
**Message Fields and Flags**  The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NONCOMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation**  The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.
**Message Transmission**  The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
//Configure message to transmit
twai_message_t message;
m-message.identifier = 0xA AAAA;
m-message.extd = 1;
m-message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}
//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception**  The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```c
#include "driver/twai.h"
...
//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}
//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts**  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
...
//Reconfigure alerts to detect Error Passive and Bus-Off error states
(continues on next page)
```
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the

twai_stop() and twai_driver_uninstall() functions.

#include "driver/twai.h"

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

Multiple ID Filter Configuration  The acceptance mask in twai_filter_config_t can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

Application Examples  Network Example: The TWAI Network example demonstrates communication between
two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.
Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

API Reference

Header File

- components/hal/include/hal/twai_types.h

Structures

struct twai_message_t
  Structure to store a TWAI message.

  **Note** The flags member is deprecated

Public Members

- `uint32_t extd`: 1
  Extended Frame Format (29bit ID)
- `uint32_t rtr`: 1
  Message is a Remote Frame
- `uint32_t ss`: 1
  Transmit as a Single Shot Transmission. Unused for received.
- `uint32_t self`: 1
  Transmit as a Self Reception Request. Unused for received.
- `uint32_t dlc_non_comp`: 1
  Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1
- `uint32_t reserved`: 27
  Reserved bits
- `uint32_t flags`
  Deprecated: Alternate way to set bits using message flags
- `uint32_t identifier`
  11 or 29 bit identifier
- `uint8_t data_length_code`
  Data length code
- `uint8_t data[TWAI_FRAME_MAX_DLC]`
  Data bytes (not relevant in RTR frame)

struct twai_timing_config_t
  Structure for bit timing configuration of the TWAI driver.

  **Note** Macro initializers are available for this structure

Public Members

- `uint32_t brp`
  Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported
- `uint8_t tseg_1`
  Timing segment 1 (Number of time quanta, between 1 to 16)
Chapter 2. API Reference

```c
uint8_t tseg_2
Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
Enables triple sampling when the TWAI controller samples a bit
```

```c
struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)
```

**Note** Macro initializers are available for this structure

**Public Members**

```c
uint32_t acceptance_code
32-bit acceptance code

uint32_t acceptance_mask
32-bit acceptance mask

bool single_filter
Use Single Filter Mode (see documentation)
```

**Macros**

```c
TWAI_EXTD_ID_MASK
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK
Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC
Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES
EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES
SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH
Error counter threshold for error passive
```

**Enumerations**

```c
enum twai_mode_t
TWAI Controller operating modes.
```

**Values:**

```c
TWAI_MODE_NORMAL
Normal operating mode where TWAI controller can send/receive/acknowledge messages

TWAI_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

TWAI_MODE_LISTEN_ONLY
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages
```
Header File

- components/driver/include/driver/twai.h

Functions

```c
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
```

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)
Note To reinstall the TWAI driver, call `twai_driver_uninstall()` first

Return

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

```c
esp_err_t twai_driver_uninstall(void)
```

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Return

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

```c
esp_err_t twai_start(void)
```

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Return

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

```c
esp_err_t twai_stop(void)
```

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Return

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

```c
esp_err_t twai_transmit(const twai_message_t *message, TickType_t ticks_to_wait)
```

Transmit a TWAI message.
This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- `[in] message`: Message to transmit
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block on the TX queue

```c
esp_err_t twai_receive(twai_message_t *message, TickType_t ticks_to_wait)
```

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] message`: Received message
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t twai_read_alerts(uint32_t *alerts, TickType_t ticks_to_wait)
```

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] alerts`: Bit field of raised alerts (see documentation for alert flags)
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block for alert

```c
esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**
- ESP_OK: Alerts reconfigured
• ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters
• [in] alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
• [out] current_alerts: Bit field of currently raised alerts. Set to NULL if unused

`esp_err_t twai_initiate_recovery (void)`
Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**
• ESP_OK: Bus recovery started
• ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

`esp_err_t twai_get_status_info (twai_status_info_t *status_info)`
Get current status information of the TWAI driver.

**Return**
• ESP_OK: Status information retrieved
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
• [out] status_info: Status information

`esp_err_t twai_clear_transmit_queue (void)`
Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**Return**
• ESP_OK: Transmit queue cleared
• ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

`esp_err_t twai_clear_receive_queue (void)`
Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when twai_start() is called.

**Return**
• ESP_OK: Transmit queue cleared
• ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

`struct twai_general_config_t`  
Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

`twai_mode_t mode`  
Mode of TWAI controller

`gpio_num_t tx_io`  
Transmit GPIO number
**Chapter 2. API Reference**

```c
gpio_num_t rx_io
    Receive GPIO number

gpio_num_t clkout_io
    CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io
    Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t tx_queue_len
    Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t rx_queue_len
    Number of messages RX queue can hold

uint32_t alerts_enabled
    Bit field of alerts to enable (see documentation)

uint32_t clkout_divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM,
    the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.
```

```c
struct twai_status_info_t
    Structure to store status information of TWAI driver.
```

**Public Members**

```c
twai_state_t state
    Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
    Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred
```

**Macros**

```c
TWAI_IO_UNUSED
    Marks GPIO as unused in TWAI configuration
```
Enumerations

```c
enum twai_state_t
{
    TWAI_STATE_STOPPED,
    TWAI_STATE_RUNNING,
    TWAI_STATE_BUS_OFF,
    TWAI_STATE_RECOVERING,
}
```

Values:

- **TWAI_STATE_STOPPED**: Stopped state. The TWAI controller will not participate in any TWAI bus activities.
- **TWAI_STATE_RUNNING**: Running state. The TWAI controller can transmit and receive messages.
- **TWAI_STATE_BUS_OFF**: Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered.
- **TWAI_STATE_RECOVERING**: Recovering state. The TWAI controller is undergoing bus recovery.

### 2.6.22 Universal Asynchronous Receiver/Transmitter (UART)

**Overview**

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

**Functional Overview**

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step**  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.
```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
  .baud_rate = 115200,
  .data_bits = UART_DATA_8_BITS,
  .parity = UART_PARITY_DISABLE,
  .stop_bits = UART_STOP_BITS_1,
  .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
  .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to peripherals/uart/uart_echo.

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baudrate</td>
<td>uart_set_baudrate()</td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td>uart_set_word_length() selected out of uart_word_length_t</td>
</tr>
<tr>
<td>Parity control</td>
<td>uart_set_parity() selected out of uart_parity_t</td>
</tr>
<tr>
<td>Number of stop bits</td>
<td>uart_set_stop_bits() selected out of uart_stop_bits_t</td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td>uart_set_hw_flow_ctrl() selected out of uart_flowcontrol_t</td>
</tr>
<tr>
<td>Communication mode</td>
<td>uart_set_mode() selected out of uart_mode_t</td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the current baud rate value, call uart_get_baudrate().

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function uart_set_pin() and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro UART_PIN_NO_CHANGE.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling uart_driver_install() and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, uart_queue, 10, &uart_queue, 0));
```
Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:
1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:
1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```
If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in [ESP32 Technical Reference Manual > UART Controller > UART Interrupts and UHCI Interrupts](#). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note**: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see [ESP32 Technical Reference Manual > UART](#).
Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function uart_set_mode()).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function uart_get_collision_flag() to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling uart_set_mode().

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

### Interface Connection Options

This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

**Note:**

- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

#### Circuit A: Collision Detection Circuit

 |                   |       |                   |
 |                   |       |                   |
 +-------------------+       +-------------------+
```

(continues on next page)
This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 1 and UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

**Application Examples**

The table below describes the code examples available in the directory peripherals/uart/.

#### Functions

**esp_err_t uart_driver_install** *(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)*

Install UART driver and set the UART to the default configuration. UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- rx_buffer_size: UART RX ring buffer size.
- tx_buffer_size: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- queue_size: UART event queue size/depth.
- uart_queue: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

**esp_err_t uart_driver_delete** *(uart_port_t uart_num)*

Uninstall UART driver.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

**bool uart_is_driver_installed** *(uart_port_t uart_num)*

Checks whether the driver is installed or not.

**Return**
- true driver is installed
- false driver is not installed
Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`
Set UART data bits.

Return
  • ESP_OK Success
  • ESP_FAIL Parameter error

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `data_bit`: UART data bits

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`
Get the UART data bit configuration.

Return
  • ESP_FAIL Parameter error
  • ESP_OK Success, result will be put in (*data_bit)

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `data_bit`: Pointer to accept value of UART data bits.

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`
Set UART stop bits.

Return
  • ESP_OK Success
  • ESP_FAIL Fail

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `stop_bits`: UART stop bits

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

Return
  • ESP_FAIL Parameter error
  • ESP_OK Success, result will be put in (*stop_bits)

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `stop_bits`: Pointer to accept value of UART stop bits.

`esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)`
Set UART parity mode.

Return
  • ESP_OK Success
  • ESP_FAIL Fail

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `parity_mode`: the enum of uart parity configuration

`esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)`
Get the UART parity mode configuration.

Return
  • ESP_FAIL Parameter error
  • ESP_OK Success, result will be put in (*parity_mode)

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
  • `parity_mode`: Pointer to accept value of UART parity mode.

`esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)`
Set UART baud rate.
Chapter 2. API Reference

Return
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: UART baud rate.

`esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)`
Get the UART baud rate configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*baudrate)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: Pointer to accept value of UART baud rate

`esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)`
Set UART line inverse mode.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of
uart_signal_inv_t

`esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)`
Set hardware flow control.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• flow_ctrl: Hardware flow control mode
• rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

`esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)`
Set software flow control.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• enable: switch on or off
• rx_thres_xon: low water mark
• rx_thres_xoff: high water mark

`esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)`
Get the UART hardware flow control configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• flow_ctrl: Option for different flow control mode.
Chapter 2. API Reference

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)

Clear UART interrupt status.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• clr_mask: Bit mask of the interrupt status to be cleared.

esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)

Set UART interrupt enable.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable_mask: Bit mask of the enable bits.

esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• disable_mask: Bit mask of the disable bits.

esp_err_t uart_enable_rx_intr(uart_port_t uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_disable_rx_intr(uart_port_t uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_disable_tx_intr(uart_port_t uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number

esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
```
enable: 1: enable; 0: disable
thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

**Note** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `tx_io_num`: UART TX pin GPIO number.
- `rx_io_num`: UART RX pin GPIO number.
- `rts_io_num`: UART RTS pin GPIO number.
- `cts_io_num`: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `level`: 1: RTS output low (active); 0: RTS output high (block)

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```

Manually set the UART DTR pin level.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `level`: 1: DTR output low; 0: DTR output high

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```

Set UART idle interval after tx FIFO is empty.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num`: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```

Set UART configuration parameters.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error
Chapter 2. API Reference

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `uart_config`: UART parameter settings

```c
esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```
Configure UART interrupts.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `intr_conf`: UART interrupt settings

```c
esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
```
Wait until UART TX FIFO is empty.

Return
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `ticks_to_wait`: Timeout, count in RTOS ticks

```c
int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
```
Send data to the UART port from a given buffer and length.

Note This function should only be used when UART TX buffer is not enabled.

Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `buffer`: data buffer address
- `len`: data length to send

```c
int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)
```
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `src`: data buffer address
- `size`: data length to send

```c
int uart_write_bytes_with_break(uart_port_t uart_num, const void *src, size_t size, int brk_len)
```
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.
Otherwise, if the `tx_buffer_size` > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `src`: data buffer address
- `size`: data length to send
- `brk_len`: break signal duration (unit: the time it takes to send one bit at current baudrate)

```c
int uart_read_bytes(uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Return**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `buf`: pointer to the buffer.
- `length`: data length
- `ticks_to_wait`: sTimeout, count in RTOS ticks

```c
esp_err_t uart_flush(uart_port_t uart_num)
```

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_flush_input(uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `size`: Pointer of size_t to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)
```

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
• **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_enable_pattern_det_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like `AT commands`. When the hardware detect a series of one same character, the interrupt will be triggered.

**Note** This function only works for esp32. And this function is deprecated, please use `uart_enable_pattern_det_baud_intr` instead.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number.
- **pattern_chr**: character of the pattern.
- **chr_num**: number of the character, 8bit value.
- **chr_tout**: timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char.
- **post_idle**: idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- **pre_idle**: idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like `AT commands`. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number.
- **pattern_chr**: character of the pattern.
- **chr_num**: number of the character, 8bit value.
- **chr_tout**: timeout of the interval between each pattern characters, 16bit value, unit is baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle**: idle time after the last pattern character, 16bit value, unit is baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- **pre_idle**: idle time before the first pattern character, 16bit value, unit is baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos (uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
### Chapter 2. API Reference

#### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

#### int uart_pattern_get_pos (uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Return
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

#### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

#### esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

#### Return
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

#### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **queue_length**: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

#### esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)

UART set communication mode.

**Note** This function must be executed after uart_driver_install(), when the driver object is initialized.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

#### Parameters
- **uart_num**: Uart number to configure, the max port number is (UART_NUM_MAX - 1).
- **mode**: UART UART mode to set

#### esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)

Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

#### Parameters
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold**: Threshold value above which RX fifo full interrupt is generated

#### esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)

Set uart threshold values for TX fifo empty.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**ESP_ERR_INVALID_STATE** Driver is not installed

**Parameters**

- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold**: Threshold value below which TX fifo empty interrupt is generated

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

**Return**

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_ERR_INVALID_STATE** Driver is not installed

**Parameters**

- **uart_num**: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh**: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool* collision_flag)
```

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Return**

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

**Parameters**

- **uart_num**: Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag**: Pointer to variable of type bool to return collision flag.

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**

- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**Parameters**

- **uart_num**: UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold**: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

```c
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int* out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.
Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

Parameters

- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
- [out] out_wakeup_threshold: output, set to the current value of wakeup threshold for the given UART.

\n
\texttt{esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)}

Wait until UART tx memory empty and the last char send ok (polling mode).

- Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters

- uart_num: UART number

\texttt{esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)}

Configure TX signal loop back to RX module, just for the test usage.

- Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters

- uart_num: UART number
- loop_back_en: Set to enable the loop back function, else set it false.

\texttt{void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)}

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- uart_num: UART number
- always_rx_timeout_en: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

\texttt{struct uart_intr_config_t}

UART interrupt configuration parameters for uart_intr_config function.

Public Members

\texttt{uint32_t intr_enable_mask}

UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

\texttt{uint8_t rx_timeout_thresh}

UART timeout interrupt threshold (unit: time of sending one byte)

\texttt{uint8_t txfifo_empty_intr_thresh}

UART TX empty interrupt threshold.

\texttt{uint8_t txfifo_full_thresh}

UART RX full interrupt threshold.

\texttt{struct uart_event_t}

Event structure used in UART event queue.
Public Members

```c
uart_event_type_t type
   UART event type
size_t size
   UART data size for UART_DATA event
bool timeout_flag
   UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
```

Macros

```c
UART_NUM_0
   UART port 0
UART_NUM_1
   UART port 1
UART_NUM_2
   UART port 2
UART_NUM_MAX
   UART port max
UART_PIN_NO_CHANGE
UART_FIFO_LEN
   Length of the UART HW FIFO.
UART_BITRATE_MAX
   Maximum configurable bitrate.
```

Type Definitions

```c
typedef intr_handler_t uart_isr_handle_t
```

Enumerations

```c
enum uart_event_type_t
   UART event types used in the ring buffer.
Values:
   UART_DATA
      UART data event
   UART_BREAK
      UART break event
   UART_BUFFER_FULL
      UART RX buffer full event
   UART_FIFO_OVF
      UART FIFO overflow event
   UART_FRAME_ERR
      UART RX frame error event
   UART_PARITY_ERR
      UART RX parity event
   UART_DATA_BREAK
      UART TX data and break event
```
UART_PATTERN_DET
UART pattern detected

UART_EVENT_MAX
UART event max index

Header File

- components/hal/include/hal/uart_types.h

Structures

struct uart_at_cmd_t
UART AT cmd char configuration parameters. Note that this function may differ on different chip. Please refer to the TRM at configuration.

Public Members

- uint8_t cmd_char
  UART AT cmd char
- uint8_t char_num
  AT cmd char repeat number
- uint32_t gap_tout
  gap time (in baud-rate) between AT cmd char
- uint32_t pre_idle
  the idle time (in baud-rate) between the non AT char and first AT char
- uint32_t post_idle
  the idle time (in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members

- uint8_t xon_char
  Xon flow control char
- uint8_t xoff_char
  Xoff flow control char
- uint8_t xon THRd
  If the software flow control is enabled and the data amount in rxfifo is less than xon THRd, an xon char
  will be sent
- uint8_t xoff THRd
  If the software flow control is enabled and the data amount in rxfifo is more than xoff THRd, an xoff char
  will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members

- int baud_rate
  UART baud rate
- uart_word_length_t data_bits
  UART byte size
**uart_parity_t**
- UART parity mode

**uart_stop_bits_t**
- UART stop bits

**uart_hw_flowcontrol_t**
- UART HW flow control mode (cts/rts)

**uint8_t**
- UART HW RTS threshold

**uart_source_clk**
- UART source clock selection

**bool**
- Deprecated method to select ref tick clock source, set source_clk field instead

---

**Type Definitions**

typedef int **uart_port_t**
- UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX - 1).

---

**Enumerations**

**enum uart_mode_t**
- UART mode selection.

**Values:**

- **UART_MODE_UART** = 0x00
  - mode: regular UART mode

- **UART_MODE_RS485_HALF_DUPLEX** = 0x01
  - mode: half duplex RS485 UART mode control by RTS pin

- **UART_MODE_IRDA** = 0x02
  - mode: IRDA UART mode

- **UART_MODE_RS485_COLLISION_DETECT** = 0x03
  - mode: RS485 collision detection UART mode (used for test purposes)

- **UART_MODE_RS485_APP_CTRL** = 0x04
  - mode: application control RS485 UART mode (used for test purposes)

**enum uart_word_length_t**
- UART word length constants.

**Values:**

- **UART_DATA_5_BITS** = 0x0
  - word length: 5bits

- **UART_DATA_6_BITS** = 0x1
  - word length: 6bits

- **UART_DATA_7_BITS** = 0x2
  - word length: 7bits

- **UART_DATA_8_BITS** = 0x3
  - word length: 8bits

- **UART_DATA_BITS_MAX** = 0x4

**enum uart_stop_bits_t**
- UART stop bits number.

**Values:**
UART_STOP_BITS_1 = 0x1
    stop bit: 1bit
UART_STOP_BITS_1_5 = 0x2
    stop bit: 1.5bits
UART_STOP_BITS_2 = 0x3
    stop bit: 2bits
UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
    UART parity constants.
    Values:
    UART_PARITY_DISABLE = 0x0
        Disable UART parity
    UART_PARITY_EVEN = 0x2
        Enable UART even parity
    UART_PARITY_ODD = 0x3
        Enable UART odd parity

enum uart_hw_flowcontrol_t
    UART hardware flow control modes.
    Values:
    UART_HW_FLOWCTRL_DISABLE = 0x0
        disable hardware flow control
    UART_HW_FLOWCTRL_RTS = 0x1
        enable RX hardware flow control (rts)
    UART_HW_FLOWCTRL_CTS = 0x2
        enable TX hardware flow control (cts)
    UART_HW_FLOWCTRL_CTS_RTS = 0x3
        enable hardware flow control
    UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
    UART signal bit map.
    Values:
    UART_SIGNAL_INV_DISABLE = 0
        Disable UART signal inverse
    UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
        inverse the UART irda_tx signal
    UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
        inverse the UART irda_rx signal
    UART_SIGNAL_RXD_INV = (0x1 << 2)
        inverse the UART rxd signal
    UART_SIGNAL_CTS_INV = (0x1 << 3)
        inverse the UART cts signal
    UART_SIGNAL_DSR_INV = (0x1 << 4)
        inverse the UART dsr signal
    UART_SIGNAL_TXD_INV = (0x1 << 5)
        inverse the UART txd signal
Chapter 2. API Reference

```c
UART_SIGNAL_RTS_INV = (0x1 << 6)
    inverse the UART rts signal
UART_SIGNAL_DTR_INV = (0x1 << 7)
    inverse the UART dtr signal

enum uart_sclk_t
    UART source clock.

    Values:
    UART_SCLK_APB = 0x0
        UART source clock from APB
    UART_SCLK_REF_TICK = 0x3
        UART source clock from REF_TICK
```

**GPIO Lookup Macros**  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. **UART_NUM_2_TXD_DIRECT_GPIO_NUM** returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. **UART_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. **UART_CTS_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- components/soc/esp32/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO22_DIRECT_CHANNEL
- UART_NUM_0_RTS_DIRECT_GPIO_NUM
- UART_GPIO1 DIRECT_CHANNEL
- UART_RXD_GPIO3_DIRECT_CHANNEL
- UART_CTS_GPIO19_DIRECT_CHANNEL
- UART_RTS_GPIO22_DIRECT_CHANNEL
UART_GPIO10_DIRECT_CHANNEL
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL

UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extensions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.
After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sdkconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

### 2.7.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for `git`). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see Custom `sdkconfig defaults`.

### 2.7.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

**Format checker**

tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

### 2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `configgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig` would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `configgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`. 
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.

4. Deprecated options and their replacements are automatically generated by `confgen.py`.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in menuconfig, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

#### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```bash
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```bash
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=CONFIG_ESP_ERR_TO_NAME_LOOKUP=

Available options:
• Default (binary application + 2nd stage bootloader)  
  (APP_BUILD_TYPE_APP_2NDBOOT)
• ELF file, loadable into RAM (EXPERIMENTAL)  (APP_BUILD_TYPE_ELFRAM)

CONFIG_APP_REPRODUCIBLE_BUILD
Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be created automatically. (or will be appended if you have one already)

*Default value:*
• No (disabled)

CONFIG_APP_NO_BLOBS
No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

*Default value:*
• No (disabled)

**Application manager**

Contains:
• CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
• CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
• CONFIG_APP_PROJECT_VER_FROM_CONFIG
• CONFIG_APP_RETRIEVE_LEN_ELF_SHA
• CONFIG_APP_COMPILE_TIME_DATE

CONFIG_APP_COMPILE_TIME_DATE
Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

*Default value:*
• Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
Exclude PROJECT_VER from firmware image

*Found in: Application manager*
The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**
Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**
Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER**
Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**Default value:**
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**
The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**
- from 8 to 64

**Default value:**
- 16

**Bootloader config**

Contains:
- CONFIG_BOOTLOADER_LOG_LEVEL
- CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION
• CONFIG_BOOTLOADER_SPI_WP_PIN
• CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
• CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT
• CONFIG_BOOTLOADER_APP_TEST
• CONFIG_BOOTLOADER_FACTORY_RESET
• CONFIG_BOOTLOADER_HOLD_TIME_GPIO
• CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
• CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS
• CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON
• CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP
• CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN
• CONFIG_BOOTLOADER_WDT_ENABLE
• CONFIG_BOOTLOADER_VDDSIO_BOOST

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootsloader optimization Level

Found in: Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootsloader log verbosity

Found in: Bootloader config

Specify how much output to see in bootloader logs.

Available options:

- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

Found in: Bootloader config

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.
If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

**Default value:**
- No (disabled) if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

**Range:**
- from 0 to 33 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**Default value:**
- 7 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.
CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if CONFIG_BOOTLOADER_FACTORY_RESET

**Default value:**
- 4 if CONFIG_BOOTLOADER_FACTORY_RESET
• from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**
• 18 if `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL**

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
• Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
• Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
• 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
• Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
• No (disabled)
CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

*Found in:* **Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE**

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

*Found in:* **Bootloader config**

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

*Found in:* **Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

*Found in:* **Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see **BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD** option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if **CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**
**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the efuse secure version field

*Found in:* Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- from 1 to 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**Default value:**
- 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

*Found in:* Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: emul_efuse, data, efuse, , 0x2000.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if (CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s
s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Range:**
- from 0 to 0x10 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**Default value:**
- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

**Found in:** Bootloader config

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T** DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

**Default value:**
- Yes (enabled)

Security features

Contains:
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
  - CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
  - CONFIG_SECURE_BOOT_VERIFICATION_KEY
  - CONFIG_SECURE_BOOTLOADER_MODE
  - CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
  - CONFIG_SECURE_UART_ROM_DL_MODE
  - CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

**Found in:** Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

**Found in:** Security features

**Available options:**
- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
  Refer to the documentation before enabling.
• RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

  Bootloader verifies app signatures

  Found in: Security features

  If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

  If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

  Default value:
  • No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && SECURE_SIGNED_APPS_ECDSA_SCHEME

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

  Verify app signature on update

  Found in: Security features

  If this option is set, any OTA updated apps will have the signature verified before being considered valid.

  When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

  If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

  Default value:
  • Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

CONFIG_SECURE_BOOT

  Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

  Found in: Security features

  Build a bootloader which enables Secure Boot on first boot.

  Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

  When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

  Default value:
  • No (disabled)

CONFIG_SECURE_BOOT_VERSION

  Select secure boot version

  Found in: Security features > CONFIG_SECURE_BOOT

  Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2,
ESP32-C3 ECO3. Secure Boot V1 is the AES based secure boot scheme. Supported in ESP32 and ESP32-ECO3.

**Available options:**

- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**

- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
  
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows re-flashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.
CHAPTER 2. API REFERENCE

**Default value:**
- “secure_boot Signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

`CONFIG_SECURE_BOOT_VERIFICATION_KEY`

Secure boot public signature verification key

*Found in:* Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in:* Security features

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader.

This feature provides a strong resistance against physical attacks on the device.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT` && `SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY`

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in:* Security features

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to efuse with `espfuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the efuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in:* Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.
Chapter 2. API Reference

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

Default value:
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**
Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**
- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**
Size of generated AES-XTS key

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated AES-XTS key.

AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block. AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**
- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**
Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**
- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options**
Contains:
- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC`
• \texttt{CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC}
• \texttt{CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE}
• \texttt{CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS}
• \texttt{CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED}

\textbf{CONFIG\_SECURE\_BOOT\_ALLOW\_ROM\_BASIC}

Leave ROM BASIC Interpreter available on reset

\textit{Found in: Security features $>$ Potentially insecure options}

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG\_SECURE\_BOOT\_INSECURE} $\|$ \texttt{SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT}

\textbf{CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG}

Allow JTAG Debugging

\textit{Found in: Security features $>$ Potentially insecure options}

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG\_SECURE\_BOOT\_INSECURE} $\|$ \texttt{SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT}

\textbf{CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION}

Allow app partition length not 64KB aligned

\textit{Found in: Security features $>$ Potentially insecure options}

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

\textbf{CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS}

Allow additional read protecting of efuses

\textit{Found in: Security features $>$ Potentially insecure options}

If not set (default, recommended), on first boot the bootloader will burn the WR\_DIS\_RD\_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.
If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block.

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application.

**CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if CONFIG_SECURE_BOOT_INSECURE && SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.
Only set this option in testing environments.

**Default value:**
- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

**Default value:**
- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

**Available options:**

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.
Secure Download mode is not compatible with the esptool.py flasher stub feature, espefuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Serial flasher config
Contains:
- CONFIG_ESPTOOLPY_AFTER
- CONFIG_ESPTOOLPY_BEFORE
- CONFIG_ESPTOOLPY_FLASHSIZE_DETECT
- CONFIG_ESPTOOLPY_NO_STUB
- CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE
- CONFIG_ESPTOOLPY_FLASHSIZE
- CONFIG_ESPTOOLPY_FLASHMODE
- CONFIG_ESPTOOLPY_FLASHFREQ

CONFIG_ESPTOOLPY_NO_STUB
Disable download stub
Found in: Serial flasher config
The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature
Default value:
- No (disabled)

CONFIG_ESPTOOLPY_FLASHMODE
Flash SPI mode
Found in: Serial flasher config
Mode the flash chip is flashed in, as well as the default mode for the binary to run in.
Available options:
- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE
Flash Sampling Mode
Found in: Serial flasher config
Available options:

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

**Available options:**

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_FLASHSIZE_DETECT**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

**Default value:**

- Yes (enabled)

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)
CONFIG_ESPTOOLPY_AFTER

After flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:
- CONFIG_PARTITION_TABLE_CUSTOM_FILENAME
- CONFIG_PARTITION_TABLE_MD5
- CONFIG_PARTITION_TABLE_OFFSET
- CONFIG_PARTITION_TABLE_TYPE

CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: Partition Table

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:
- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition. The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code. The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size. The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project. Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  - This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  - The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  - This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  - The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

*Default value:*  
- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

*Default value:*  
- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

*Default value:*  
- Yes (enabled) if `CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`
Compiler options

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS`
- `CONFIG_COMPILER_DUMPRTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -0g flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

*Available options:*

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

**CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL**

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

*Available options:*

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
Chapter 2. API Reference

- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

**CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT**
Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros:
- ESP_RETURN_ON_ERROR
- ESP_EXIT_ON_ERROR
- ESP_RETURN_ON_FALSE
- ESP_EXIT_ON_FALSE

*Default value:*
- No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**
Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

*Default value:*
- Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**
Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDFC++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

*Default value:*
- No (disabled)

Contains:
- **CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**
Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*
Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
- 0 if `CONFIG_COMPILER_CXX_EXCEPTIONS`

**CONFIG_COMPILER_CXX RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected – those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**
- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**
- No (disabled)
Chapter 2. API Reference

CONFIG_COMPILER_DISABLE_GCC8_WARNINGS

Disable new warnings introduced in GCC 6 - 8

*Found in: Compiler options*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.

*Default value:*

• No (disabled)

CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

Component config

Contains:

• ADC-Calibration
• Application Level Tracing

Application Level Tracing  Contains:
• CONFIG_APPTRACE_DESTINATION1
• CONFIG_APPTRACE_DESTINATION2
• FreeRTOS SystemView Tracing
• CONFIG_APPTRACE_GCOV_ENABLE
• CONFIG_APPTRACE_BUF_SIZE
• CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX
• CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH
• CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO
• CONFIG_APPTRACE_UART_BAUDRATE
• CONFIG_APPTRACE_UART_RX_GPIO
• CONFIG_APPTRACE_UART_RX_BUFF_SIZE
• CONFIG_APPTRACE_UART_TASK_PRIO
• CONFIG_APPTRACE_UART_TX_MSG_SIZE
• CONFIG_APPTRACE_UART_TX_GPIO
• CONFIG_APPTRACE_UART_TX_BUFF_SIZE

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

Available options:
• JTAG (APPRACE_DEST_JTAG)
• None (APPRACE_DEST_NONE)

CONFIG_APPTRACE_DESTINATION2

Data Destination 2

Found in: Component config > Application Level Tracing

Select destination for application trace: UART(XX) or none (to disable).

Available options:
• UART0 (APPRACE_DEST_UART0)
• UART1 (APPRACE_DEST_UART1)
• UART2 (APPRACE_DEST_UART2)
• USB_CDC (APPRACE_DEST_USB_CDC)
• None (APPRACE_DEST_UART_NONE)
**CONFIG_APPTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

**CONFIG_APPTRACE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

**CONFIG_APPTRACE_UART_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG_APPTRACE_UART_TX_MSG_SIZE**

UART TX message size

*Found in: Component config > Application Level Tracing*

Maximum size of the single message to transfer.

**CONFIG_APPTRACE_UART_TASK_PRIO**

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).
Chapter 2. API Reference

Range:
- from 1 to 32

Default value:
- 1

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the aptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- **CONFIG_APPTRACE_SV_CPU**
- **CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**
- **CONFIG_APPTRACE_SV_MAX_TASKS**
- **CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE**

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_DEST**

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView witt transfer data through defined interface.

**Available options:**
- Data destination JTAG (APTRACE_SV_DEST_JTAG)
  - Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APTRACE_SV_DEST_UART)
  - Send SEGGER SystemView events through UART interface.

**CONFIG_APPTRACE_SV_CPU**

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**
- CPU0 (APTRACE_SV_DEST_CPU_0)
  - Send SEGGER SystemView events for Pro CPU.
- CPU1 (APTRACE_SV_DEST_CPU_1)
  - Send SEGGER SystemView events for App CPU.

**CONFIG_APPTRACE_SV_TS_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (APTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APTRACE_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE_SV_MAX_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug.
CONFIG_APPTTRACE_SV_BUF_WAIT_TMO
Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTTRACE_SV_EVT_OVERFLOW_ENABLE
Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.

CONFIG_APPTTRACE_SV_EVT_ISR_ENTER_ENABLE
ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Enter” event.

CONFIG_APPTTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Exit” event.

CONFIG_APPTTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR to Scheduler” event.

CONFIG_APPTTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Execution” event.

CONFIG_APPTTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Execution” event.

CONFIG_APPTTRACE_SV_EVT_TASK_START_READY_ENABLE
Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Ready State” event.
Chapter 2. API Reference

**CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE**
Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Ready State” event.

**CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE**
Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Create” event.

**CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE**
Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Terminate” event.

**CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE**
System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “System Idle” event.

**CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE**
Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Enter” event.

**CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE**
Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.

**CONFIG_APPTRACE_GCOV_ENABLE**
GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**ESP-ASIO** Contains:

- **CONFIG_ASIO_SSL_SUPPORT**
**CONFIG_ASIO_SSL_SUPPORT**

Enable SSL/TLS support of ASIO

*Found in: Component config > ESP-ASIO*

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ASIO_SSL_LIBRARY_CHOICE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT*

The ASIO support multiple backend TLS libraries. Currently the mbedTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- esp-openssl (ASIO_USE_ESP_OPENSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO_USE_ESP_WOLFSSL)

**CONFIG_ASIO_SSL_BIO_SIZE**

Size of BIO object

*Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT*

Size in bytes of SSL-BIO implementation. Reducing the BIO size saves more RAM, but may slow down input output operations due to fragmentation.

**Default value:**
- 1024 if CONFIG_ASIO_SSL_SUPPORT

**Bluetooth** Contains:
- Bluedroid Options
- CONFIG_BT_ENABLED
- NimBLE Options

**CONFIG_BT_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

**Bluetooth controller** Contains:
- CONFIG_BTDM_CTRL_AUTO_LATENCY
- CONFIG_BTDM_BLE_ADVREPORT_FLOW_CTRL_SUPP
- CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
- CONFIG_BTDM_CTRL_BLE_MAX_CONN
- CONFIG_BTDM_BLE_SCAN_DUPL
- CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
- CONFIG_BTDM_CTRL_MODE
- CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
Chapter 2. API Reference

- `CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH`
- `CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN`
- `CONFIG_BTDM_CTRL_HCI_MODE_CHOICE`
- HCI UART(H4) Options
- `CONFIG_BTDM_CTRL_HLI`
- `CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT`
- MODEM SLEEP Options
- `CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG`
- `CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE`

**CONFIG_BTDM_CTRL_MODE**

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

*Available options:*
  - BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
  - BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
  - Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

**CONFIG_BTDM_CTRL_BLE_MAX_CONN**

BLE Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE maximum connections of bluetooth controller. Each connection uses 1 KB static DRAM whenever the BT controller is enabled.

*Range:*
  - from 1 to 9 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

*Default value:*
  - 3 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN**

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

*Range:*
  - from 1 to 7 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

*Default value:*
  - 2 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN**

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.
Range:

• from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) 
  && CONFIG_BT_ENABLED

Default value:

• 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && 
  CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH

BR/EDR Sync(SCO/eSCO) default datapath

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*  

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or  
the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed”  
to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

Available options:

• HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
  
• PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*  

Default value:

• Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && 
  CONFIG_BT_ENABLED

Contains:

• CONFIG_BTDM_CTRL_PCM_POLAR
  
• CONFIG_BTDM_CTRL_PCM_ROLE

CONFIG_BTDM_CTRL_PCM_ROLE

PCM Role

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CON-

FIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*  

PCM role can be configured as PCM master or PCM slave

Available options:

• PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
  
• PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

CONFIG_BTDM_CTRL_PCM_POLAR

PCM Polar

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CON-

FIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*  

PCM polarity can be configured as Falling Edge or Rising Edge

Available options:

• Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
  
• Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)
CONFIG_BTDM_CTRL_AUTO_LATENCY

Auto latency

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

Default value:
- No (disabled) if BTDM_CTRL_MODE_BTDM && CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT

Legacy Authentication Vendor Specific Event Enable

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

Default value:
- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE

The cpu core which bluetooth controller run

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:
- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

CONFIG_BTDM_CTRL_HCI_MODE_CHOICE

HCI mode

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Specify HCI mode as VHCI or UART(H4)

Available options:
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

HCI UART(H4) Options

Contains:
- CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE
- CONFIG_BTDM_CTRL_HCI_UART_NO

CONFIG_BTDM_CTRL_HCI_UART_NO

UART Number for HCI

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > HCI UART(H4) Options

Uart number for HCI. The available uart is UART1 and UART2.
Range:
  • from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && CONFIG_BT_ENABLED
Default value:
  • 1 if BTDM_CTRL_HCI_MODE_UART_H4 && CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE

UART Baudrate for HCI

Range:
  • from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && CONFIG_BT_ENABLED
Default value:
  • 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && CONFIG_BT_ENABLED

MODEM SLEEP Options

Contains:
  • CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
  • CONFIG_BTDM_CTRL_MODEM_SLEEP

CONFIG_BTDM_CTRL_MODEM_SLEEP

Bluetooth modem sleep

Enable/disable bluetooth controller low power mode.

Default value:
  • Yes (enabled) if CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE

Bluetooth Modem sleep mode

To select which strategy to use for modem sleep

Available options:
  • ORIG Mode (sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
    ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode,
    bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is
    used to maintain bluetooth reference clock.
  • EVED Mode (For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
    EVED mode is for BLE only and is only for internal test. Do not use it for production. This
    mode is not compatible with DFS nor light sleep

CONFIG_BTDM_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM
SLEEP Options
Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**

- **Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)**
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.

- **External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)**
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

**CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- **“251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock.** This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

**Available options:**

- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

**CONFIG_BTDM_BLE_SCAN_DUPL**

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && CONFIG_BT_ENABLED

**CONFIG_BTDM_SCAN_DUPL_TYPE**

Scan Duplicate Type

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*
Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- **Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)**
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once

- **Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)**
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

- **Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)**
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

**CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**Default value:**

- 200 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_MESH_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**Default value:**

- 200 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`
**CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED**

BLE full scan feature supported

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

*Default value:*

- Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) 
  && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

*Default value:*

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) 
  && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

*Range:*

- from 50 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

*Default value:*

- 100 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

*Range:*

- from 1 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED
Default value:
• 20 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_HLI
High level interrupt
Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller
Using Level 4 interrupt for Bluetooth.
Default value:
• Yes (enabled) if CONFIG_BT_ENABLED && CONFIG_BT_ENABLED

CONFIG_BT_HOST
Bluetooth Host
Found in: Component config > Bluetooth > CONFIG_BT_ENABLED
This helps to choose Bluetooth host stack
Available options:
• Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
• NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
• Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

Bluedroid Options Contains:
• CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
• CONFIG_BT_BLUEDROID_MEM_DEBUG
• CONFIG_BT_BTU_TASK_STACK_SIZE
• CONFIG_BT_BTC_TASK_STACK_SIZE
• CONFIG_BT_BLE_ENABLED
• BT DEBUG LOG LEVEL
• CONFIG_BT_ACL_CONNECTIONS
• CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
• CONFIG_BT_CLASSIC_ENABLED
• CONFIG_BT_HID_ENABLED
• CONFIG_BT_STACK_NO_LOG
• CONFIG_BT_MULTI_CONNECTION_ENABLE
• CONFIG_BT_MAX_DEVICE_NAME_LEN
• CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN
• CONFIG_BT_SSP_ENABLED
• CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE
• CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT
• CONFIG_BT_BLE_RPA_SUPPORTED
• CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
• CONFIG_BT_HFP_WBS_ENABLE

CONFIG_BT_BTU_TASK_STACK_SIZE
Bluetooth event (callback to application) task stack size
Found in: Component config > Bluetooth > Bluedroid Options
This select btc task stack size

**Default value:**
- 3072 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLUE_DROID_PINNED_TO_CORE_CHOICE**

The cpu core which BlueDroid run

*Found in: Component config > Bluetooth > BlueDroid Options*

Which the cpu core to run BlueDroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BT_BLUE_DROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUE_DROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth BlueDroid Host Stack task stack size

*Found in: Component config > Bluetooth > BlueDroid Options*

This select btu task stack size

**Default value:**
- 4096 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLUE_DROID_MEM_DEBUG**

BlueDroid memory debug

*Found in: Component config > Bluetooth > BlueDroid Options*

BlueDroid memory debug

**Default value:**
- No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > BlueDroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**
- No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > BlueDroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED
CONFIG_BT_SPP_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_ROLE

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Available options:**
- Hands Free Unit (BT_HFP_CLIENT_ENABLE)
- Audio Gateway (BT_HFP_AG_ENABLE)

CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**
- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**
- Yes (enabled) if `BT_HFP_AUDIO_DATA_PATH_HCI` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HID_ENABLED

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host
Default value:
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_ROLE**

Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

**Available options:**
- Classic BT HID Host (BT_HID_HOST_ENABLED)
  This enables the BT HID Host
- Classic BT HID Device (BT_HID_DEVICE_ENABLED)
  This enables the BT HID Device

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**
- Yes (enabled) if `CONFIG_BT_CLASSIC_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module (GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on GATT client mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_PPPC_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` & `BT_BLUEDROID_ENABLED`
CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 8 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATTs Service Change Mode

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

**Available options:**
- GATTs manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API esp_ble_gatts_send_service_change_indication()
- GATTs automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

CONFIG_BT_GATTC_ENABLE

Include GATT client module (GATTC)

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVFS_FLASH

Save gattc cache data to nvs flash

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash
Default value:
• No (disabled) if CONFIG_BT_GATTC_ENABLE && BT_GATTC_ENABLE

**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
• from 0 to 7 if CONFIG_BT_GATTC_ENABLE && BT_BLE_ENABLED

**Default value:**
• 3 if CONFIG_BT_GATTC_ENABLE && BT_BLE_ENABLED

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module (SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
• Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLE_ENABLED

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
• No (disabled) if CONFIG_BT_BLE_SMP_ENABLE && BT_BLE_ENABLED

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**
• No (disabled) if BT_BLE_ENABLED && BT_BLE_ENABLED

**BT DEBUG LOG LEVEL**

Contains:
• CONFIG_BT_LOG_A2D_TRACE_LEVEL
• CONFIG_BT_LOG_A2DP_TRACE_LEVEL
• CONFIG_BT_LOG_AVCT_TRACE_LEVEL
• CONFIG_BT_LOG_AVDT_TRACE_LEVEL
• CONFIG_BT_LOG_AVRC_TRACE_LEVEL
• CONFIG_BT_LOG_BNED_TRACE_LEVEL
• CONFIG_BT_LOG_BNEP_TRACE_LEVEL
• CONFIG_BT_LOG_BTLE_TRACE_LEVEL
• CONFIG_BT_LOG_BTIF_TRACE_LEVEL
• CONFIG_BT_LOG_BTIF_TRACE_LEVEL
• CONFIG_BT_LOG_BTIF_TRACE_LEVEL
• CONFIG_BT_LOG_BTIF_TRACE_LEVEL
Chapter 2. API Reference

• CONFIG_BT_LOG_GAP_TRACE_LEVEL
• CONFIG_BT_LOG_GATT_TRACE_LEVEL
• CONFIG_BT_LOG_HCI_TRACE_LEVEL
• CONFIG_BT_LOG_HID_TRACE_LEVEL
• CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
• CONFIG_BT_LOG_MCA_TRACE_LEVEL

• CONFIG_BT_LOG_SDP_TRACE_LEVEL
• CONFIG_BT_LOG_SMP_TRACE_LEVEL

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

• NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
• API (BT_LOG_HCI_TRACE_LEVEL_API)
• EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:

• NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTM_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

Available options:

• NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_L2CAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL**

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SDP_TRACE_LEVEL**

SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BNEP_TRACE_LEVEL**

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

**Available options:**
- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
Chapter 2. API Reference

- EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BNEP_TRACE_LEVELVERBOSE)

```c
CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:
- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVELVERBOSE)
```

```c
CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:
- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVELVERBOSE)
```

```c
CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:
- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVELVERBOSE)
```

```c
CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer

Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVELVERBOSE)
```
Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVRC_TRACE_LEVEL**

AVRClayer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRClayer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_MCA_TRACE_LEVEL**

MCAlayer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCAlayer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_HID_TRACE_LEVEL**

HIDlayer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_LOG_APPL_TRACE_LEVEL**

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GATT_TRACE_LEVEL**

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**
- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SMP_TRACE_LEVEL**

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**
- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTIF_TRACE_LEVEL**

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**
- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
Chapter 2. API Reference

- EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTC_TRACE_LEVEL**

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

**Available options:**
- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_OSI_TRACE_LEVEL**

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

**Available options:**
- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BLUFI_TRACE_LEVEL**

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

**Available options:**
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_ACL_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count
### CONFIG_BT_MULTI_CONNECTION_ENABLE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

*Default value:*

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

### CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

### CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

### CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

### CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

*Default value:*

• No (disabled) if BT_BLUE_DROID_ENABLED && (BT_DM_CTRL_MODE_BTDM || BT_DM_CTRL_MODE_BLE_ONLY) && BT_BLUE_DROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluez Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

**Range:**
• from 1 to 60 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**Default value:**
• 30 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of Bluetooth device name

*Found in: Component config > Bluetooth > Bluez Options*

Bluetooth Device name length shall be no larger than 248 octets. If the broadcast data cannot contain the complete device name, then only the short name will be displayed, the rest parts that can’t fit in will be truncated.

**Range:**
• from 32 to 248 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**Default value:**
• 32 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluez Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**
• No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

NimBLE Options

Contains:

• CONFIG_BT_NIMBLE_ACL_BUF_COUNT
• CONFIG_BT_NIMBLE_ACL_BUF_SIZE

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,
- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:
- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BT_NIMBLE_LOG_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity”.

Available options:
- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_HCI_UART_PORT**

HCI UART port

*Found in: Component config > Bluetooth > NimBLE Options*

Set the port number of HCI UART

Default value:
- 1 if BT_NIMBLE_USE_UART_HCI && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_UART_TX_PIN**

HCI uart Tx gpio

*Found in: Component config > Bluetooth > NimBLE Options*

Default value:
- 19 if BT_NIMBLE_USE_UART_HCI && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_UART_RX_PIN**

HCI uart Rx gpio

*Found in: Component config > Bluetooth > NimBLE Options*

Default value:
- 10 if BT_NIMBLE_USE_UART_HCI && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HCI_UART_TASK_STACK_SIZE

HCI uart task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

Set the size of uart task stack

**Default value:**
- 1000 if BT_NIMBLE_USE_UART_HCI && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_UART_BAUD

HCI uart baudrate

*Found in: Component config > Bluetooth > NimBLE Options*

HCI uart baud rate 115200 ~ 1000000

**Default value:**
- 921600 if BT_NIMBLE_USE_UART_HCI && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RUN_QA_TEST

Run QA test

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to run QA test.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RUN_BQB_TEST

Run BQB test

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to run BQB test.

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

**Range:**
- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security
**Default value:**
- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**
- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
- 5120 if CONFIG_BLE_MESH && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

*Default value:*
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

*Default value:*
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

*Default value:*
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CONTROLLER_TASK_PRIORITY
NimBLE Controller task priority

*Found in: Component config > Bluetooth > NimBLE Options*

This configures priority of NimBLE controller task

*Default value:*
- 23 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

*Default value:*
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

*Default value:*
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
• **CONFIG_BT_NIMBLE_SM_LEGACY**

**CONFIG_BT_NIMBLE_SM_LEGACY**

Security manager legacy pairing

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SM_SC**

**CONFIG_BT_NIMBLE_SM_SC**

Security manager secure connections (4.2)

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_DEBUG**

Enable extra runtime asserts and host debugging

*Found in:* Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION**

Enable LE encryption

*Found in:* Component config > Bluetooth > NimBLE Options

Enable encryption connection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS**

Use predefined public-private key pair

*Found in:* Component config > Bluetooth > NimBLE Options

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SM_SC` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**
- “nimble” if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
- 31 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**
- 256 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**Default value:**
- 24 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
• 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE**

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT**

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**

- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MEMORY_SETTINGS**

OS Memory Settings

*Found in: Component config > Bluetooth > NimBLE Options*

Settings memory blocks

**Default value:**

- Yes (enabled) if BT_NIMBLE_ENABLED

Contains:

- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE
**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT**

MSYS_1 Block Count

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MEMORY_SETTINGS

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 12 if CONFIG_BT_NIMBLE_MEMORY_SETTINGS && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE**

MSYS_1 Block Size

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MEMORY_SETTINGS

Dynamic memory size of block 1

**Default value:**
- 256 if CONFIG_BT_NIMBLE_MEMORY_SETTINGS && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT**

MSYS_2 Block Count

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MEMORY_SETTINGS

Dynamic memory count

**Default value:**
- 24 if CONFIG_BT_NIMBLE_MEMORY_SETTINGS && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE**

MSYS_2 Block Size

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MEMORY_SETTINGS

Dynamic memory size of block 2

**Default value:**
- 320 if CONFIG_BT_NIMBLE_MEMORY_SETTINGS && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in:* Component config > Bluetooth > NimBLE Options

Enable Host Flow control

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
Chapter 2. API Reference

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL
Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

**Default value:**

- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH
Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_RPA_TIMEOUT
RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**

- from 1 to 41400 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**Default value:**

- 900 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH
Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
CONFIG_BT_NIMBLE_MESH_RELAY
CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
CONFIG_BT_NIMBLE_MESH_NODE_COUNT

CONFIG_BT_NIMBLE_MESH_PROXY
Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options* > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV
Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options* > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioning

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_ADV
Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options* > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options* > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options* > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

**Default value:**
- No (disabled) if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This value defines Bluetooth Mesh device/node name

**Default value:**
- “nimble-mesh-node” if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Defines mesh node count.

**Default value:**
- 1 if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioner.

**Default value:**
- 0 if  `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

Found in: Component config > Bluetooth > NimBLE Options

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

Found in: Component config > Bluetooth > NimBLE Options

BLE Host stop procedure timeout in milliseconds.

Default value:
- 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

Found in: Component config > Bluetooth > NimBLE Options

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

Default value:
- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Defines maximum number of connection reattempts.

Range:
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

Default value:
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
Enable BLE v5.0 feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE v5.0 feature

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- CONFIG_BT_NIMBLE_EXT_ADV
CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

Enabled in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE

set ext adv maximum paket size

Enabled in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Ext ADV packet size

Default value:
• 1650 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Enabled in: Component config > Bluetooth > NimBLE Options

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:
• Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
• Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Enabled in: Component config > Bluetooth > NimBLE Options

BLE list size

Range:
• from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
• 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

Enabled in: Component config > Bluetooth > NimBLE Options

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

Range:
• from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
• 1 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
• 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_DATA_LEN**

Maximum length of the advertising data.

*Found in: Component config > Bluetooth > NimBLE Options*

Defines size of extended advertising data. Size should not increase 1650.

**Range:**
• from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
• 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
• 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to start periodic advertisement.

**Default value:**
• Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE.PERIODIC_ADV_SYNC_TRANSFER**

Enable Transfer Sync Events

*Found in: Component config > Bluetooth > NimBLE Options*

This enables controller transfer periodic sync events to host

**Default value:**
• Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS**

Maximum number of periodic advertising syncs.

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**
• from 1 to 8 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
• 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`
• 0 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
Enable 2M Phy

*Found in:* Component config > Bluetooth > NimBLE Options

Enable 2M-PHY

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
Enable coded Phy

*Found in:* Component config > Bluetooth > NimBLE Options

Enable coded-PHY

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HARDWARE_BLE_ONLY
Run example on Ble Only Hardware

*Found in:* Component config > Bluetooth > NimBLE Options

Run example on Ble Only Hardware

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST
Throughput Test Mode enable

*Found in:* Component config > Bluetooth > NimBLE Options

Enable the throughput test mode

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_LL_RESOLV_LIST_SIZE
BLE LL Resolving list size

*Found in:* Component config > Bluetooth > NimBLE Options

Configure the size of resolving list used in link layer.

**Default value:**
- 4 if `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_LL_DUP_SCAN_LIST_COUNT
BLE duplicate scan list count

*Found in:* Component config > Bluetooth > NimBLE Options

config the max count of duplicate scan list

**Range:**
- from 1 to 100 if `BT_NIMBLE_ENABLED`
Chapter 2. API Reference

Default value:
• 8 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SLEEP_ENABLE
Enable BLE sleep

Found in: Component config > Bluetooth > NimBLE Options
Enable BLE sleep

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLUFI_ENABLE
Enable blufi functionality

Found in: Component config > Bluetooth > NimBLE Options
Set this option to enable blufi functionality.

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_USE_ESP_TIMER
Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options
Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BLE_MESH
ESP BLE Mesh Support

Found in: Component config
This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:
• BLE Mesh and BLE coexistence support
• CONFIG_BLE_MESH_GATT_PROXY_CLIENT
• CONFIG_BLE_MESH_GATT_PROXY_SERVER
• BLE Mesh NET BUF DEBUG LOG LEVEL
• CONFIG_BLE_MESH_PROV
• CONFIG_BLE_MESH_PROXY
• BLE Mesh specific test option
• BLE Mesh STACK DEBUG LOG LEVEL
• CONFIG_BLE_MESH_NO_LOG
• CONFIG_BLE_MESH_IVU_DIVIDER
• CONFIG_BLE_MESH_FAST_PROV
• CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
• CONFIG_BLE_MESH_CRPL
• CONFIG_BLE_MESH_RX_SDU_MAX
• CONFIG_BLE_MESH_MODEL_KEY_COUNT
• CONFIG_BLE_MESH_APP_KEY_COUNT
Chapter 2. API Reference

- CONFIG_BLE_MESH_MODEL_GROUP_COUNT
- CONFIG_BLE_MESH_LABEL_COUNT

- CONFIG_BLE_MESH_HCI_5_0
- CONFIG_BLE_MESH_IV_UPDATE_TEST
- CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM
Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT) Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT) Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if (CONFIG_ESP32_SPIRAM_SUPPORT || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL) If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT) If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if CONFIG_BLE_MESH
BLE Mesh and BLE coexistence support  Contains:

- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

**Default value:**

- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.
**CONFIG_BLE_MESH_PROVISIONER**

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

**CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM**

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MAX_PROV_NODES**

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**
- from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PBA_SAME_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**
- from 1 to 10 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

*Range:*
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

*Default value:*
- 1 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

*Default value:*
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*
This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH

**Default value:**
- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH

- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PB_GATT**

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*
Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

**CONFIG_BLE_MESH_PROXY**

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**
- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**
- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`
Chapter 2. API Reference

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

*Range:*
  - from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

*Default value:*
  - 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

*Default value:*
  - No (disabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

*Default value:*
  - No (disabled) if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.
Default value:
- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, this information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:
- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
• from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
• from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**
• from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**
• from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**
• from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
• 10 if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Found in: Component config > CONFIG_BLE_MESH

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:
- from 2 to 65535 if CONFIG_BLE_MESH

Default value:
- 10 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

Found in: Component config > CONFIG_BLE_MESH

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:
- from 6 to 256 if CONFIG_BLE_MESH

Default value:
- 60 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

Found in: Component config > CONFIG_BLE_MESH

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

Range:
- from 2 to 96 if CONFIG_BLE_MESH

Default value:
- 4 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: Component config > CONFIG_BLE_MESH
Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**
- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**
- 384 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

**Range:**
- from 2 to 32 if `CONFIG_BLE_MESH`

**Default value:**
- 32 if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF &amp; CONFIG_BLE_MESH_RELAY &amp; CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF &amp; CONFIG_BLE_MESH_RELAY &amp; CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`
CONFIG_BLE_MESH_LPN_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSI Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as log₂(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**
- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 100 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 300 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_SCAN_LATENCY**

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_GROUPS**

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 8 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_FRIEND**

Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

**Default value:**
- 255 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SEG_RX**

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NO_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*
Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL**
Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

BLE_MESH_STACK

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**
- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**
Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

BLE_MESH_NET_BUF

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**
- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout (ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**
- from 100 to 1200000 if `CONFIG_BLE_MESH`

**Default value:**
- 4000 if `CONFIG_BLE_MESH`
Support for BLE Mesh Foundation models

Contains:

- CONFIG_BLE_MESH_CFG_CLI
- CONFIG_BLE_MESH_HEALTH_CLI
- CONFIG_BLE_MESH_HEALTH_SRV

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Health Server model.

Default value:

- Yes (enabled) if CONFIG_BLE_MESH

Support for BLE Mesh Client/Server models

Contains:

- CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
- CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
- CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
- CONFIG_BLE_MESH_GENERIC_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
- CONFIG_BLE_MESH_GENERIC_SERVER
- CONFIG_BLE_MESH_LIGHT_CTL_CLI
- CONFIG_BLE_MESH_LIGHT_HSL_CLI
- CONFIG_BLE_MESH_LIGHT_LC_CLI
- CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
- CONFIG_BLE_MESH_LIGHT_XYL_CLI
- CONFIG_BLE_MESH_LIGHTING_SERVER
- CONFIG_BLE_MESH_SCENE_CLI
- CONFIG_BLE_MESH_SCHEDULER_CLI
- CONFIG_BLE_MESH_SENSOR_CLI
- CONFIG_BLE_MESH_SENSOR_SERVER
- CONFIG_BLE_MESH_TIME_SCENE_SERVER
- CONFIG_BLE_MESH_TIME_CLI
Chapter 2. API Reference

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_LEVEL_CLI**

Generic Level Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Level Client model.

**CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI**

Generic Default Transition Time Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Default Transition Time Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI**

Generic Power OnOff Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI**

Generic Power Level Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power Level Client model.

**CONFIG_BLE_MESH_GENERIC_BATTERY_CLI**

Generic Battery Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Battery Client model.

**CONFIG_BLE_MESH_GENERIC_LOCATION_CLI**

Generic Location Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Location Client model.

**CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI**

Generic Property Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Property Client model.
CONFIG_BLE_MESH_SENSOR_CLI
   Sensor Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
   Time Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
   Scene Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
   Scheduler Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
   Light Lightness Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
   Light CTL Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI
   Light HSL Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
   Light XYL Client model
   Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
   Enable support for Light XYL Client model.
CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH
Chapter 2. API Reference

BLE Mesh specific test option  Contains:
  • CONFIG_BLE_MESH_DEBUG
  • CONFIG_BLE_MESH_SHELL
  • CONFIG_BLE_MESH_SELF_TEST

CONFIG_BLE_MESH_SELF_TEST
Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

*Default value:*
  • No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK
Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

*Default value:*
  • Yes (enabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST
Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

*Default value:*
  • No (disabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SHELL
Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

*Default value:*
  • No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG
Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

*Default value:*
  • No (disabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver configurations  Contains:

- ADC configuration
- GDMA Configuration
- GPIO Configuration
- GPTimer Configuration
- MCPWM configuration
- PCNT Configuration
- SPI configuration
- Temperature sensor Configuration
- TWAI configuration
- UART configuration

ADC configuration  Contains:

- CONFIG_ADC_DISABLE_DAC
- CONFIG_ADC_FORCE_XPD_FSM

CONFIG_ADC_FORCE_XPD_FSM

Use the FSM to control ADC power

*Found in:* Component config > Driver configurations > ADC configuration

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.
**Default value:**
- No (disabled)

**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

**MCPWM configuration**
- Contains:
  - **CONFIG_MCPWM_ISR_IN_IRAM**

**CONFIG_MCPWM_ISR_IN_IRAM**

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver configurations > MCPWM configuration*

If this option is not selected, the MCPWM interrupt will be deferred when the Cache is in a disabled state (e.g. Flash write/erase operation).

Note that if this option is selected, all user registered ISR callbacks should never try to use cache as well (with IRAM_ATTR)

**Default value:**
- No (disabled)

**SPI configuration**
- Contains:
  - **CONFIG_SPI_MASTER_ISR_IN_IRAM**
  - **CONFIG_SPI_SLAVE_ISR_IN_IRAM**
  - **CONFIG_SPI_MASTER_IN_IRAM**
  - **CONFIG_SPI_SLAVE_IN_IRAM**

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)
**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue_trans, get_trans_result and transmit functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI configuration**  Contains:

- `CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID`
- `CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC`
- `CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT`
- `CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver configurations > TWAI configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:
- Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics).
- Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)
**CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver configurations > TWAI configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**

Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**

Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**

Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

**Temperature sensor Configuration**

Contains:
- **CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG**
- **CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATED_WARN**
**CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATED_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver configurations > Temperature sensor Configuration*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (*driver/temp_sensor.h*). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver configurations > Temperature sensor Configuration*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**UART configuration**

Contains:

- **CONFIG_UART_ISR_IN_IRAM**

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled)

**GPIO Configuration**

Contains:

- **CONFIG_GPIO_CTRL_FUNC_IN_IRAM**
- **CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**

**CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**

Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: Component config > Driver configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

**CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

Place GPIO control functions into IRAM

*Found in: Component config > Driver configurations > GPIO Configuration*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.
Default value:
• No (disabled)

GDMA Configuration  Contains:
• `CONFIG_GDMA_ISR_IRAM_SAFE`
• `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

`CONFIG_GDMA_CTRL_FUNC_IN_IRAM`
Place GDMA control functions into IRAM

*Found in: Component config > Driver configurations > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
• No (disabled) if SOC_GDMA_SUPPORTED

`CONFIG_GDMA_ISR_IRAM_SAFE`
GDMA ISR IRAM-Safe

*Found in: Component config > Driver configurations > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:
• No (disabled) if SOC_GDMA_SUPPORTED

GPTimer Configuration  Contains:
• `CONFIG_GPTIMER_ENABLE_DEBUG_LOG`
• `CONFIG_GPTIMER_ISR_IRAM_SAFE`
• `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`
• `CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN`

`CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`
Place GPTimer control functions into IRAM

*Found in: Component config > Driver configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
• No (disabled)

`CONFIG_GPTIMER_ISR_IRAM_SAFE`
GPTimer ISR IRAM-Safe

*Found in: Component config > Driver configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver configurations > GPTimer Configuration*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

CONFIG_GPTIMER_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver configurations > GPTimer Configuration*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**

- No (disabled)

PCNT Configuration  Contains:

- CONFIG_PCNT_ENABLE_DEBUG_LOG
- CONFIG_PCNT_ISR_IRAM_SAFE
- CONFIG_PCNT_CTRL_FUNC_IN_IRAM
- CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

CONFIG_PCNT_CTRL_FUNC_IN_IRAM

Place PCNT control functions into IRAM

*Found in: Component config > Driver configurations > PCNT Configuration*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

CONFIG_PCNT_ISR_IRAM_SAFE

PCNT ISR IRAM-Safe

*Found in: Component config > Driver configurations > PCNT Configuration*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)
**CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver configurations > PCNT Configuration*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_PCNT_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver configurations > PCNT Configuration*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**eFuse Bit Manager**
Contains:
- **CONFIG_EFUSE_CODE_SCHEME_SELECTOR**
- **CONFIG_EFUSE_VIRTUAL**
- **CONFIG_EFUSE_CUSTOM_TABLE**

**CONFIG_EFUSE_CUSTOM_TABLE**
Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**
Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if **CONFIG_EFUSE_CUSTOM_TABLE**

**CONFIG_EFUSE_VIRTUAL**
Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.
**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: “efuse_em, data, efuse, . 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**
- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS** Contains:

- **CONFIG_ESP_TLS_INSECURE**
- **CONFIG_ESP_TLS_LIBRARY_CHOOSE**
- **CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS**
- **CONFIG_ESP_DEBUG_WOLFSSL**
- **CONFIG_ESP_TLS_SERVER**
- **CONFIG_ESP_TLS_PSK VERIFICATION**
- **CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**
- **CONFIG_ESP_TLS_USE_DS_PERIPHERAL**
- **CONFIG_ESP_TLS_USE_SECURE_ELEMENT**

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)
CONFIG_ESP_TLS_USE_SECURE_ELEMENT

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

*Default value:*

- Yes (enabled) if ESP_TLS_USING_MBEDTLS && SOC_DIG_SIGN_SUPPORTED

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

*Default value:*

- 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS
Chapter 2. API Reference

**CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL**

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_INSECURE**

Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if ESP_TLS_USING_WOLFSSL

**CONFIG_ESP_DEBUG_WOLFSSL**

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.
**ESP32-specific**  Contains:

- `CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`
- `CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS`
- `CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL`
- `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`
- `CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY`
- `CONFIG_ESP32_XTAL_FREQ_SEL`
- `CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE`
- `CONFIG_ESP32_RTCDATA_IN_FAST_MEM`
- `CONFIG_ESP32_SPIRAM_SUPPORT`
- `CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE`
- `CONFIG_ESP32_TRAX`

**CONFIG_ESP32_SPIRAM_SUPPORT**

Support for external, SPI-connected RAM

*Found in: Component config > ESP32-specific*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**
- No (disabled)

**SPI RAM config**  Contains:

- `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_SPIWP_SD3_PIN`
- `CONFIG_SPIRAM_BANKSWITCH_ENABLE`
- `CONFIG_SPIRAM_2T_MODE`
- `CONFIG_SPIRAM_CACHE_SWITCH_WORKAROUND`
- `CONFIG_SPIRAM_BOOT_INIT`
- `CONFIG_SPIRAM_MALLOC_ALWAYS_INTERNAL`
- `PSRAM clock and cs IO for ESP32-D2WD`
- `PSRAM clock and cs IO for ESP32-DOWD`
- `PSRAM clock and cs IO for ESP32-PICO`
- `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL`
- `CONFIG_SPIRAM_MEMTEST`
- `CONFIG_SPIRAM_SPEED`
- `CONFIG_SPIRAM_OCCUPY_SPI_HOST`
- `CONFIG_SPIRAM_USE`
- `SPIRAM cache workaround debugging`
- `SPIRAM workaround libraries placement`
- `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- `CONFIG_SPIRAM_TYPE`
- `CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN`

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

**Available options:**
- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPSRAM16)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPSRAM32)
• ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode (80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY_FLASHFREQ_80M is true)

*Available options:*
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

*Default value:*
- Yes (enabled) if CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psmram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

*Default value:*
- No (disabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM.Allow_BSS_SEG_EXTERNAL_MEMORY && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

*Available options:*
**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

*Default value:*

- Yes (enabled) if `CONFIG_SPIRAM_BOOT_INIT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

*Range:*

- from 0 to 131072 if SPIRAM_USE_MALLOC && `CONFIG_ESP32_SPIRAM_SUPPORT`

*Default value:*

- 16384 if SPIRAM_USE_MALLOC && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

*Default value:*

- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.
Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**
- from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**
- 32768 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

**CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY**

Allow .noinit segment placed in external memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**Default value:**
- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32_SPIRAM_SUPPORT

**SPIRAM cache workaround debugging** Contains:

- **CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

Workaround strategy

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM cache workaround debugging
Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

Available options:
- Insert memw after vulnerable instructions (default) (SPI-RAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPI-RAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPI-RAM_CACHE_WORKAROUND_STRATEGY_NOPS)

SPIRAM workaround libraries placement
Contains:
- CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM

- CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM
Put libc’s jump related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM
Put libc’s math related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: abs, div, labs, lddiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM

Put libc’s number parsing related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM

Put libc’s I/O related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: wcrtomb, fwrite, wbuf, wsetup, fprintf, wctomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

Put libc’s time related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: asctime, asctime_r, ctime, ctime_r, lctime, lctime_r, gmtime, gmtime_r, strftime, mktime, tzset_r, tzset, time, gettinfo, systimes, month_lengths, timelocal, tzvars, tzlock, tzcalc_limits, and strptime. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM

Put libc’s characters related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: ctype_, toupper, tolower, toascii, strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM

Put libc’s memory related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM

Put libc’s string related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpy, strcspn, strdup, strdup_r, strlcat, strlcpy, strlen, strlwr, strncasecmp, strncat, strncmp, strncpy, strndup, strndup_r, strchr, strsep, strspn, strstr, strtok_r, and strupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM

Put libc’s random related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: srand, rand, and rand_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM

Put libc’s environment related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: environ, envlock, and getenv_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
Chapter 2. API Reference

CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM

Put libc’s file related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, sbrk, stdio, syslog, sysopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM

Put libc’s miscellaneous functions in IRAM, see help

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: raise and system. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_BANKSWITCH_ENABLE

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_spiram_writeback_cache needs some kind of mapping of some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

**Default value:**
- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_BANKSWITCH_RESERVE

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.
Range:
• from 1 to 62 if CONFIG_SPIRAM_BANKSWITCH_ENABLE && CONFIG_ESP32_SPIRAM_SUPPORT

Default value:
• 8 if CONFIG_SPIRAM_BANKSWITCH_ENABLE && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

*Default value:*
• No (disabled) if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

*Available options:*
• HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
• VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
• Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD**

Contains:
• CONFIG_D0WD_PSRAM_CLK_IO
• CONFIG_D0WD_PSRAM_CS_IO

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*
• from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

*Default value:*
• 17 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_D0WD_PSRAM_CS_IO
PSRAM CS IO number

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D0WD

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
• from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

Default value:
• 16 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

PSRAM clock and cs IO for ESP32-D2WD Contains:
• CONFIG_D2WD_PSRAM_CLK_IO
• CONFIG_D2WD_PSRAM_CS_IO

CONFIG_D2WD_PSRAM_CLK_IO
PSRAM CLK IO number

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
• from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

Default value:
• 9 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_D2WD_PSRAM_CS_IO
PSRAM CS IO number

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
• from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

Default value:
• 10 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

PSRAM clock and cs IO for ESP32-PICO Contains:
• CONFIG_PICO_PSRAM_CS_IO

CONFIG_PICO_PSRAM_CS_IO
PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf

**Range:****

- from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**

- 10 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

---

**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

**Default value:**

- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

---

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

**Range:**

- from 0 to 33 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**

- 7 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

---

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*
Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

**Default value:**
- No (disabled) if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_ESP32_TRAX**

Use TRAX tracing feature

*Found in: Component config > ESP32-specific*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
- No (disabled)

**CONFIG_ESP32_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP32-specific > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**
- No (disabled) if `CONFIG_ESP32_TRAX` && `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY**

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > ESP32-specific*

When ESP32 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**Range:**
- from 0 to 5000

**Default value:**
- 2000
CONFIG_ESP32_XTAL_FREQ_SEL

Main XTAL frequency

Found in: Component config > ESP32-specific

ESP32 currently supports the following XTAL frequencies:

- 26 MHz
- 40 MHz

Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.

Available options:

- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
- Autodetect (ESP32_XTAL_FREQ_AUTO)

CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE

Permanently disable BASIC ROM Console

Found in: Component config > ESP32-specific

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

Default value:

- No (disabled)

CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS

App compatible with bootloaders before ESP-IDF v2.1

Found in: Component config > ESP32-specific

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

Default value:

- No (disabled)

CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

App compatible with bootloader and partition table before ESP-IDF v3.1

Found in: Component config > ESP32-specific

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.
If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**
- No (disabled)

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP32-specific*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_ESP32_USE_FIXEDSTATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP32-specific*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

**Default value:**
- No (disabled)

**CONFIG_ESP32_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in: Component config > ESP32-specific > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE*

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_RESERVE_DRAM if Bluetooth controller is enabled.

**Range:**
- from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**Default value:**
- “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL**

Disable the interrupt level for the DPORT workarounds

*Found in: Component config > ESP32-specific*

To prevent interrupting DPORT workarounds, need to disable interrupt with a maximum used level in the system.

**Default value:**
- 5
CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

Enable IRAM as 8 bit accessible memory

_Found in: Component config > ESP32-specific_

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions `LoadStoreError (3)` and `LoadStoreAlignmentError (9)`. Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

**ADC-Calibration**  
Contains:

- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`
- `CONFIG_ADC_CAL_LUT_ENABLE`
- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`

**CONFIG_ADC_CAL_EFUSE_TP_ENABLE**

Use Two Point Values

_Found in: Component config > ADC-Calibration_

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**

Use eFuse Vref

_Found in: Component config > ADC-Calibration_

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CAL_LUT_ENABLE**

Use Lookup Tables

_Found in: Component config > ADC-Calibration_

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**

- Yes (enabled)

**Common ESP-related**  
Contains:

- `CONFIG_ESP_ERR_TO_NAME_LOOKUP`
CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**Ethernet**  
Contains:

- CONFIG_ETH_TRANSMIT_MUTEX
- CONFIG_ETH_USE_ESP32_EMAC
- CONFIG_ETH_USE_OPENETH
- CONFIG_ETH_USE_SPI_ETHERNET

**CONFIG_ETH_USE_ESP32_EMAC**

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**
- Yes (enabled)

Contains:

- CONFIG_ETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_DMA_TX_BUFFER_NUM
- CONFIG_ETH_SOFT_FLOW_CONTROL
- CONFIG_ETH_DMA_BUFFER_SIZE
- CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0
- CONFIG_ETH_PHY_INTERFACE
- CONFIG_ETH_RMII_CLK_OUT_GPIO
- CONFIG_ETH_RMII_CLK_MODE

**CONFIG_ETH_PHY_INTERFACE**

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

**Available options:**
- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

**CONFIG_ETH_RMII_CLK_MODE**

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**
**Chapter 2. API Reference**

- **Input RMII clock from external (ETH_RMII_CLK_INPUT)**
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- **Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)**
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

**CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

*Default value:*
- No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_RMII_CLK_OUT_GPIO**

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

*Range:*
  - from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

*Default value:*
  - 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_DMA_BUFFER_SIZE**

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

*Range:*
  - from 256 to 1600

*Default value:*
  - 512

**CONFIG_ETH_DMA_RX_BUFFER_NUM**

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

*Range:*
  - from 3 to 30

*Default value:*
  - 10
CONFIG_ETH_DMA_TX_BUFFER_NUM

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

CONFIG_ETH_SOFT_FLOW_CONTROL

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**
- No (disabled) if 
  CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 
  && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_USE_SPI_ETHERNET

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

Contains:
- CONFIG_ETH_SPI_ETHERNET_DM9051
- CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
- CONFIG_ETH_SPI_ETHERNET_W5500

CONFIG_ETH_SPI_ETHERNET_DM9051

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.
CONFIG_ETH_SPI ETHERNET KSZ8851SNL
Use KSZ8851SNL.
*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH
Support OpenCores Ethernet MAC (for use with QEMU).
*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM
Number of Ethernet DMA Rx buffers.
*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

**Default value:**
- 4 if `CONFIG_ETH_USE_OPENETH`

CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM
Number of Ethernet DMA Tx buffers.
*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

**Default value:**
- 1 if `CONFIG_ETH_USE_OPENETH`

CONFIG_ETH_TRANSMIT_MUTEX
Enable Transmit Mutex.
*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**
- No (disabled)
**Event Loop Library**  Contains:

- `CONFIG_ESP_EVENT_LOOP_PROFILING`
- `CONFIG_ESP_EVENT_POST_FROM_ISR`

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*

- No (disabled)

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

*Default value:*

- Yes (enabled)

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

*Default value:*

- Yes (enabled)

**GDB Stub**  Contains:

- `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`

**CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**CONFIG_ESP_GDBSTUB_MAX_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

*Default value:*

- 32 if `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`
**ESP HTTP client**  
Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**

Enable https  
*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport  

**Default value:**
- Yes (enabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**

Enable HTTP Basic Authentication  
*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS  

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**

Enable HTTP Digest Authentication  
*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS  

**Default value:**
- No (disabled)

**HTTP Server**  
Contains:

- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length  
*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server  

**Default value:**
- 512
**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**
- 512

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**
- Yes (enabled)

**CONFIG_HTTPD_PURGE_BUF_LEN**

Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**
- 32

**CONFIG_HTTPD_LOG_PURGE_DATA**

Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)

**CONFIG_HTTPD_WS_SUPPORT**

WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

**Default value:**
- No (disabled)

**ESP HTTPS OTA**

Contains:

- `CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP`
- `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB`
CONFIG_ESP_HTTPS_OTA_DECROPT_CB

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**
- No (disabled)

CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**
- No (disabled)

ESP HTTPS server  Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings  Contains:

- MAC Config
- CONFIG_ESP32_REV_MIN
- Peripheral Control
- RTC Clock Config
- Sleep Config

MAC Config  Contains:

- CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally
administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**

- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

**Sleep Config**

Contains:

- CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
- CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in:* Component config > Hardware Settings > Sleep Config

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured. This option will in fact consider VDD_SDIO auto power value (ESP_PD_OPTION_AUTO) as OFF. Also, it is possible to force a power domain to stay ON during light sleep by using esp_sleep_pd_config() function.

*Default value:*

- Yes (enabled)

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in:* Component config > Hardware Settings > Sleep Config

esp32c2, esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

PSRAM leakage current workaround in light sleep

*Found in:* Component config > Hardware Settings > Sleep Config

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.
CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND

Flash leakage current workaround in light sleep

Found in: Component config > Hardware Settings > Sleep Config

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

RTC Clock Config  Contains:

- CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
- CONFIG_RTC_XTAL_CAL_RETRY
- CONFIG_RTC_CLK_CAL_CYCLES
- CONFIG_RTC_CLK_SRC

CONFIG_RTC_CLK_SRC

RTC clock source

Found in: Component config > Hardware Settings > RTC Clock Config

Choose which clock is used as RTC clock source.

- **“Internal 150kHz oscillator”** option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **“External 32kHz crystal”** provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
- **“External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin can not be used as a GPIO in this case.**
- **“Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.**

Available options:

- Internal 150kHz RC oscillator (RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (RTC_CLK_SRC_EXT_CRYST)
- External 32kHz oscillator at 32K_XN pin (RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (RTC_CLK_SRC_INT_8MD256)

CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD

Additional current for external 32kHz crystal

Found in: Component config > Hardware Settings > RTC Clock Config

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allowing all wakeup sources, and save some code size.

- **“None” option will not provide additional current to external crystal**
• “Method 1” option can’t ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
• “Method 2” option can solve the external 32k issue, but the touchpad can’t work in this method.

Available options:
• None (RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
• Method 1 (RTC_EXT_CRYST_ADDIT_CURRENT)
• Method 2 (RTC_EXT_CRYST_ADDIT_CURRENT_V2)

CONFIG_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

Found in: Component config > Hardware Settings > RTC Clock Config

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:
• 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
• 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:
• from 0 to 27000 if RTC_CLK_SRC_EXT CRYS || RTC_CLK_SRC_EXT OSC || RTC_CLK_SRC_INT 8MD256
• from 0 to 32766

Default value:
• 3000 if RTC_CLK_SRC_EXT CRYS || RTC_CLK_SRC_EXT OSC || RTC_CLK_SRC_INT 8MD256
• 1024

CONFIG_RTC_XTAL_CAL_RETRY

Number of attempts to repeat 32k XTAL calibration

Found in: Component config > Hardware Settings > RTC Clock Config

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

Default value:
• 1 if RTC_CLK_SRC_EXT CRYS

Peripheral Control  Contains:

• CONFIG_PERIPH_CTRL_FUNC_IN_IRAM

CONFIG_PERIPH_CTRL_FUNC_IN_IRAM

Place peripheral control functions into IRAM

Found in: Component config > Hardware Settings > Peripheral Control

Place peripheral control functions (e.g. periph_module_reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.
Chapter 2. API Reference

**Default value:**
- No (disabled)

**CONFIG_ESP32_REV_MIN**
Minimum Supported ESP32 Revision

*Found in: Component config > Hardware Settings*

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

**Available options:**
- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)

**LCD and Touch Panel**
Contains:
- **LCD Peripheral Configuration**

**LCD Peripheral Configuration**
Contains:
- **CONFIG_LCD_ENABLE_DEBUG_LOG**
- **CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**
- **CONFIG_LCD_RGB_ISR_IRAM_SAFE**

**CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**
LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**
- 32

**CONFIG_LCD_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**CONFIG_LCD_RGB_ISR_IRAM_SAFE**
RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**
Chapter 2. API Reference

- No (disabled) if SOC_LCD_RGB_SUPPORTED

ESP NETIF Adapter  Contains:

- `CONFIG_ESP_NETIF_L2_TAP`
- `CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`
- `CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB`

`CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event `SYSTEM_EVENT_STA_LOST_IP` will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

`CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB`

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**

- LwIP (`ESP_NETIF_TCPIP_LWIP`)  
  LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (`ESP_NETIF_LOOPBACK`)  
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

`CONFIG_ESP_NETIF_L2_TAP`

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

`CONFIG_ESP_NETIF_L2_TAP_MAX_FDS`

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

**Range:**

- from 1 to 10 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**
Chapter 2.  API Reference

- 5 if `CONFIG_ESP_NETIF_L2_TAP`

**CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE**

Size of L2 TAP Rx queue

`Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP`

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**
- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**
- 20 if `CONFIG_ESP_NETIF_L2_TAP`

**PHY** Contains:
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE**

Store phy calibration data in NVS

`Found in: Component config > PHY`

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

`Found in: Component config > PHY`

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID`
- `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`
CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID
Reset default PHY init data if invalid

Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.
If unsure, choose ‘n’.

Default value:
• No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN
Support multiple PHY init data bin

Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

Default value:
• No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED
Support embedded multiple phy init data bin to app bin

Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

If enabled, multiple phy init data bin will embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

Default value:
• No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_INIT_DATA_ERROR
Terminate operation when PHY init data error

Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

Default value:
• No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MAX_WIFI_TX_POWER
Max WiFi TX power (dBm)

Found in: Component config > PHY
Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled)

### Power Management

Contains:

- CONFIG_PM_SLP_DISABLE_GPIO
- CONFIG_PM_SLP_IRAM_OPT
- CONFIG_PMRTOS_IDLE_OPT
- CONFIG_PM_ENABLE

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled)

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

**CONFIG_PM_PROFILING**

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.
Default value:
• No (disabled) if `CONFIG_PM_ENABLE`

`CONFIG_PM_TRACE`
Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

Default value:
• No (disabled) if `CONFIG_PM_ENABLE`

`CONFIG_PM_SLP_IRAM_OPT`
Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

`CONFIG_PM_RTOS_IDLE_OPT`
Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

`CONFIG_PM_SLP_DISABLE_GPIO`
Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200–300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call ‘gpio_sleep_sel_dis’ to disable this feature on those pins. You can also keep this feature on and call ‘gpio_sleep_set_direction’ and ‘gpio_sleep_set_pull_mode’ to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIOSUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

**ESP System Settings** Contains:

• `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
• `Brownout Detector`
• `CONFIG_ESP_CONSOLE_UART`
• `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
• `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
• `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
• `CONFIG_ESP_TASK_WDT`
• `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
• CONFIG_ESP_INT_WDT
• CONFIG_ESP_MAIN_TASK_AFFINITY
• CONFIG_ESP_MAIN_TASK_STACK_SIZE
• CONFIG_ESP_DEBUG_OCD_AWARE
• Memory protection
• CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE
• CONFIG_ESP_DEBUG_STUBS_ENABLE
• CONFIG_ESP_SYSTEM_PANIC
• CONFIG_ESP_PANIC_HANDLER_IRAM
• CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE
• CONFIG_ESP_CONSOLE_UART_BAUDRATE
• CONFIG_ESP_CONSOLE_UART_NUM
• CONFIG_ESP_CONSOLE_UART_RX_GPIO
• CONFIG_ESP_CONSOLE_UART_TX_GPIO

CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ

CPU frequency

Found in: Component config > ESP System Settings

CPU frequency to be set on application startup.

Available options:
- 40 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_40)
- 80 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_80)
- 160 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_160)
- 240 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_240)

CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

Found in: Component config > ESP System Settings

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

Available options:
- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and do a debug on runtime.

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

Found in: Component config > ESP System Settings

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).
If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC_SLOW_CLK calibration" (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection**  Contains:

* CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**

Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

* Yes (enabled) if CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**

System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**

* 32
**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**

Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different applications.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**

Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute an expression with shared stack.

**Default value:**
- 2048

**CONFIG_ESP_CONSOLE_UART**

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.
Available options:

- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- USB CDC (ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_NONE)

**CONFIG_ESP_CONSOLE_UART_NUM**

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

Available options:

- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSOLE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

*Range:*

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

*Default value:*

- 1 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

*Range:*

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

*Default value:*

- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM
CONFIG_ESP_CONSOLE_UART_BAUDRATE

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 4000000 if `CONFIG_PM_ENABLE`
- from 1200 to 1000000 if `CONFIG_PM_ENABLE`

**Default value:**
- 115200

CONFIG_ESP_INT_WDT

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)

CONFIG_ESP_INT_WDT_TIMEOUT_MS

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in miliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
- from 10 to 10000

**Default value:**
- 300 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`
- 800 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`

CONFIG_ESP_INT_WDT_CHECK_CPU1

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_INT_WDT` && `CONFIG_FREERTOS_UNICORE`
CONFIG_ESP_TASK_WDT

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

*Default value:*
  - Yes (enabled)

CONFIG_ESP_TASK_WDT_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

*Default value:*
  - No (disabled)

CONFIG_ESP_TASK_WDT_TIMEOUT_S

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

*Range:*
  - from 1 to 60

*Default value:*
  - 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

*Default value:*
  - Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

*Default value:*
  - Yes (enabled) if `CONFIG_ESP_TASK_WDT` && `CONFIG_FREERTOS_UNICORE`
CONFIG_ESP_PANIC_HANDLER_IRAM

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

CONFIG_ESP_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**
- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if CONFIG_ESP32_TRAX && ESP32S2_TRAX && ESP32S3_TRAX

CONFIG_ESP_DEBUG_OCD_AWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**

- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog and other system checks.

**Brownout Detector**

Contains:

- CONFIG_ESP_BROWNOUT_DET
**CONFIG_ESP_BROWNOUT_DET**

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_BROWNOUT_DET_LVL_SEL**

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_7)

**IPC (Inter-Processor Call)**

Contains:
- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

**CONFIG_ESP_IPC_TASK_STACK_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.
Chapter 2. API Reference

Default value:
- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`

High resolution timer (esp_timer)
Contains:
- `CONFIG_ESP_TIMER_PROFILING`
- `CONFIG_ESP_TIMER_TASK_STACK_SIZE`
- `CONFIG_ESP_TIMER_INTERRUPT_LEVEL`
- `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`

`CONFIG_ESP_TIMER_PROFILING`
Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

Default value:
- No (disabled)

`CONFIG_ESP_TIMER_TASK_STACK_SIZE`
High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

Range:
- from 2048 to 65536

Default value:
- 3584

`CONFIG_ESP_TIMER_INTERRUPT_LEVEL`
Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

Range:
- from 1 to 3
- from 1 to 1

Default value:
- 1

`CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`
Support ISR dispatch method

*New in:* Component config > High resolution timer (esp_timer)

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)

**Wi-Fi**

Contains:

- `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`
- `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE`
- `CONFIG_ESP32_WIFI_TX_BUFFER`
- `CONFIG_ESP32_WIFI_AMDU_RX_ENABLED`
- `CONFIG_ESP32_WIFI_AMDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_CSI_ENABLED`
- `CONFIG_ESP_WIFI_GMAC_SUPPORT`
- `CONFIG_ESP32_WIFI_IRAM_OPT`
- `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP32_WIFI_NVSD_ENABLED`
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
- `CONFIG_ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in:* Component config > Wi-Fi

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in:* Component config > Wi-Fi

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP32_WIFI_AMDU_RX_ENABLED is enabled, this...
value is recommended to set equal or bigger than ESP32_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*
Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:
- from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

Default value:
- 16 if ESP32_WIFI_STATIC_TX_BUFFER

**CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

Range:
- from 16 to 128 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

Default value:
- 32 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:
- from 1 to 128

Default value:
- 32

**CONFIG_ESP32_WIFI_CSI_ENABLED**

WiFi CSI(Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

Default value:
- No (disabled)
**CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of the time, we should NOT change the default value unless special reason, e.g., test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12.

**Range:**
- from 2 to 32

**Default value:**
- 6

**CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_RX_BA_WIN**

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time, we should NOT change the default value unless special reason, e.g., test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`

**CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED**
WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if `CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT` 
- CONFIG_ESP32_WIFI_NVS_ENABLED

**CONFIG_ESP32_WIFI_NVS_ENABLED**

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added ontop of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
- 752

**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*
Set the number of WiFi management short buffer.

**Range:**
- from 6 to 32

**Default value:**
- 32

### CONFIG_ESP32_WIFI_IRAM_OPT

WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### CONFIG_ESP32_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

### CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by `ESP32_WIFI_IRAM_OPT` and `ESP32_WIFI_RX_IRAM_OPT`, or this one. If already enabled `ESP32_WIFI_IRAM_OPT`, the other 7.3KB IRAM memory would be taken by this option. If already enabled `ESP32_WIFI_RX_IRAM_OPT`, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.
**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 50 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 10 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

**Core dump** Contains:
- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_DECODE`
Chapter 2. API Reference

- **CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (ESP_COREDUMP_ENABLE_TO_UART)
- None (ESP_COREDUMP_ENABLE_TO_NONE)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

**Available options:**

- Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

**Available options:**

- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.
CONFIG_ESP_COREDUMP_UART_DELAY

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

*Default value:*
  
  • 0 if ESP_COREDUMP_ENABLE_TO_UART

CONFIG_ESP_COREDUMP_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

*Available options:*
  
  • Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
  • Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

FAT Filesystem support  Contains:

• CONFIG_FATFS_API_ENCODING
• CONFIG_FATFS_USE_FASTSEEK
• CONFIG_FATFS_CHOOSE_TYPE
• CONFIG_FATFS_LONG_FILENAMES
• CONFIG_FATFS_MAX_LFN
• CONFIG_FATFS_FS_LOCK
• CONFIG_FATFS_VOLUME_COUNT
• CONFIG_FATFS_CHOOSE_CODEPAGE
• CONFIG_FATFS_ALLOC_PREFER_EXTRAM
• CONFIG_FATFS_SECTOR_SIZE
• CONFIG_FATFS_SECTORS_PER_CLUSTER
• CONFIG_FATFS_TIMEOUT_MS
• CONFIG_FATFS_PER_FILE_CACHE

CONFIG_FATFS_VOLUME_COUNT

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

*Range:*
  
  • from 1 to 10

*Default value:*
  
  • 2

CONFIG_FATFS_SECTOR_SIZE

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

*Available options:*
  
  • 512 (FATFS_SECTOR_512)
  • 1024 (FATFS_SECTOR_1024)
  • 2048 (FATFS_SECTOR_2048)
• 4096 (FATFS_SECTOR_4096)

**CONFIG_FATFS_SECTORS_PER_CLUSTER**

Sectors per cluster

*Found in: Component config > FAT Filesystem support*

This value specifies how many sectors there are in one cluster.

**Available options:**

- 1 (FATFS_SECTORS_PER_CLUSTER_1)
- 2 (FATFS_SECTORS_PER_CLUSTER_2)
- 4 (FATFS_SECTORS_PER_CLUSTER_4)
- 8 (FATFS_SECTORS_PER_CLUSTER_8)
- 16 (FATFS_SECTORS_PER_CLUSTER_16)
- 32 (FATFS_SECTORS_PER_CLUSTER_32)
- 64 (FATFS_SECTORS_PER_CLUSTER_64)
- 128 (FATFS_SECTORS_PER_CLUSTER_128)

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

**CONFIG_FATFS_CHOOSE_TYPE**

FAT type

*Found in: Component config > FAT Filesystem support*
If user specifies automatic detection of the FAT type, the FATFS generator will determine the type by the size.

**Available options:**
- Select a suitable FAT type automatically. (FATFS_AUTO_TYPE)
- FAT12 (FATFS_FAT12)
- FAT16 (FATFS_FAT16)

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap (Currently not supported by FATFS partition generator).

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

**CONFIG_FATFS_MAX_LFN**

Max long filename length

*Found in: Component config > FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

**Range:**
- from 12 to 255

**Default value:**
- 255

**CONFIG_FATFS_API_ENCODING**

API character encoding

*Found in: Component config > FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

**CONFIG_FATFS_FS_LOCK**

Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.
Note that the file lock control is independent of re-entrancy.

**Range:**
- from 0 to 65535

**Default value:**
- 0

**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**
- Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
**CONFIG_FATFS_FASTSEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

**FreeRTOS**

Contains:

- `CONFIG_FREERTOS_FPU_IN_ISR`
- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_ENABLE_TASK_FUNCTION_WRAPPER`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_SMP`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_USE_IDLE_HOOK`
- `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`
- `CONFIG_FREERTOS_USE_TICK_HOOK`
- `CONFIG_FREERTOS_CORETIMER`

**CONFIG_FREERTOS_SMP**

Run the SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS*

This will cause the FreeRTOS component to compile with the SMP FreeRTOS kernel instead. THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

**Default value:**

- No (disabled)
**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.

**CONFIG_FREERTOS_CORETIMER**

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**
- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
  Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
  Select this to use systimer with the 3 interrupt priority.

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

Enable FreeRTOS platform optimized scheduler

*Found in: Component config > FreeRTOS*

On most platforms there are instructions can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_FREERTOS_HZ**

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*
Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called `vApplicationStackOverflowHook` when this happens.

**Available options:**
- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW=0)
- Check by stack pointer value (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW=1)
- Check using canary bytes (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW=2)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Set a debug watchpoint as a stack overflow check

*Found in: Component config > FreeRTOS*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the
interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**
- Yes (enabled)

### CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

Number of thread local storage pointers

*Found in: Component config > FreeRTOS*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**
- from 1 to 256

**Default value:**
- 1

### CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

Idle Task stack size

*Found in: Component config > FreeRTOS*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

**Range:**
- from 768 to 32768

**Default value:**
- 1536

### CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

*Found in: Component config > FreeRTOS*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**
- from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
- from 1536 to 32768

**Default value:**
- 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
- 1536

### CONFIG_FREERTOS_USE_IDLE_HOOK

Use FreeRTOS idle hook

*Found in: Component config > FreeRTOS*
• If enabled, configUSE_IDLE_HOOK will be defined as 1 in FreeRTOS.
• The application must provide the hook function `void vApplicationIdleHook(void);`
• `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
• The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**
• No (disabled)

**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

Use FreeRTOS minimal idle hook

*Found in: Component config > FreeRTOS*

• The application must provide the hook function `void vApplicationMinimalIdleHook(void);`
• `vApplicationMinimalIdleHook()` is called from FreeRTOS idle task(s)

**Default value:**
• No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

Use FreeRTOS tick hook

*Found in: Component config > FreeRTOS*

• If enabled, configUSE_TICK_HOOK will be defined as 1 in FreeRTOS.
• The application must provide the hook function `void vApplicationTickHook(void);`
• `vApplicationTickHook()` is called from FreeRTOS’ `xTaskIncrementTick()`
• The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**
• No (disabled)

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

Maximum task name length

*Found in: Component config > FreeRTOS*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**Range:**
• from 1 to 256

**Default value:**
• 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

Support legacy FreeRTOS API

*Found in: Component config > FreeRTOS*

This option enables the configENABLE_BACKWARD_COMPATIBILITY option, thus allowing the usage of legacy function names and types present in versions prior to FreeRTOS v8.0.0.
Default value:
• No (disabled)

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook

Found in: Component config > FreeRTOS

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```c
void vPortCleanUpTCB ( void *pxTCB ) {
    // place clean up code here
}
```

Default value:
• No (disabled)

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

FreeRTOS timer task priority

Found in: Component config > FreeRTOS

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the priority that the timer task will run at.

Range:
• from 1 to 25

Default value:
• 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

FreeRTOS timer task stack size

Found in: Component config > FreeRTOS

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

Range:
• from 1536 to 32768

Default value:
• 2048

CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

FreeRTOS timer queue length

Found in: Component config > FreeRTOS

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the ‘timer command queue’. The ‘timer command queue’ is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.
CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

FreeRTOS queue registry size

*Found in: Component config > FreeRTOS*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

**Range:**
- from 5 to 20

**Default value:**
- 10

CONFIG_FREERTOS_USE_TRACE_FACILITY

Enable FreeRTOS trace facility

*Found in: Component config > FreeRTOS*

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

**Default value:**
- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

Enable FreeRTOS stats formatting functions

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY*

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_TRACE_FACILITY

CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS
CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS

Enable FreeRTOS to collect run time stats

*Found in: Component config > FreeRTOS*

If enabled, configGENERATE_RUN_TIME_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS_USE_STATS_FORMATTING_FUNCTIONS and FREERTOS_USE_TRACE_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

**Default value:**
- No (disabled)

CONFIG_FREERTOS_RUN_TIME_STATS_CLK

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**
- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

CONFIG_FREERTOS_USE_TICKLESS_IDLE

Tickless idle support

*Found in: Component config > FreeRTOS*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE
**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**
- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Default value:**
- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: Component config > FreeRTOS*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS port*_.CRITICAL calls

*Found in: Component config > FreeRTOS*

If enabled, context of port*_.CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_.CRITICAL from ISR context would cause assert failure

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH**

Place FreeRTOS functions into Flash

*Found in: Component config > FreeRTOS*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IARAM. This saves up to 8KB of IARAM depending on which functions are used.

**Default value:**
- No (disabled)
CONFIG_FREERTOS_FPU_IN_ISR
Allow use of float inside Level 1 ISR (EXPERIMENTAL)
*Found in: Component config > FreeRTOS*

When enabled, the usage of float type is allowed inside Level 1 ISRs.

**Default value:**
- No (disabled)

CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT
Enable task snapshot functions
*Found in: Component config > FreeRTOS*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked. Task snapshots are primarily used by GDB Stub and Core dump.

**Default value:**
- Yes (enabled)

CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH
Place task snapshot functions into flash
*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT && CONFIG_ESP_PANIC_HANDLER_IRAM

Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:
- CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
- CONFIG_HAL_LOG_LEVEL

CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
Default HAL assertion level
*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**
- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)

CONFIG_HAL_LOG_LEVEL
HAL layer log verbosity
*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.
Available options:

- No output (HAL_LOG_LEVEL_NONE)
- Error (HAL_LOG_LEVEL_ERROR)
- Warning (HAL_LOG_LEVEL_WARN)
- Info (HAL_LOG_LEVEL_INFO)
- Debug (HAL_LOG_LEVEL_DEBUG)
- Verbose (HAL_LOG_LEVEL_VERBOSE)

Heap memory debugging

Contains:

- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS
- CONFIG_HEAP_TASK_TRACKING
- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH

CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

CONFIG_HEAP_TRACING_DEST

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

Available options:

- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.
**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

**Log output** Contains:

- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`

**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set() function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**

- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.
This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in:* Component config > Log output

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in:* Component config > Log output

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an NTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP**

Contains:

- Checksums
- DHCP server
- CONFIG_LWIP_DHCP_OPTIONS_LEN
- CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID
- CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID
- CONFIG_LWIP_DHCP_DOES_ARP_CHECK
- CONFIG_LWIP_DHCP_RESTORE_LAST_IP
- CONFIG_LWIP_PPP_CHAP_SUPPORT
- CONFIG_LWIP_L2_TO_L3_COPY
- CONFIG_LWIP_IPV6_DHCP6
- CONFIG_LWIP_IP4_FRAG
- CONFIG_LWIP_IP6_FRAG
- CONFIG_LWIP_IP_FORWARD
- CONFIG_LWIP_NETBUF_RECVINFO
- CONFIG_LWIP_AUTOIP
• CONFIG_LWIP_IPV6
• CONFIG_LWIP_ENABLE_LCP_ECHO
• CONFIG_LWIP_ESP_LWIP_ASSERT
• CONFIG_LWIP_DEBUG
• CONFIG_LWIP_IRAM_OPTIMIZATION
• CONFIG_LWIP_STATS
• CONFIG_LWIP_TIMERS_ONDEMAND
• CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES
• CONFIG_LWIP_PPP_MPPE_SUPPORT
• CONFIG_LWIP_PPP_MSCHAP_SUPPORT
• CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
• CONFIG_LWIP_PPP_PAP_SUPPORT
• CONFIG_LWIP_PPP_DEBUG_ON
• CONFIG_LWIP_PPP_SUPPORT
• CONFIG_LWIP_IP4_REASSEMBLY
• CONFIG_LWIP_IP6_REASSEMBLY
• CONFIG_LWIP_SLIP_SUPPORT
• CONFIG_LWIP_SO_LINGER
• CONFIG_LWIP_SO_RCVBUF
• CONFIG_LWIP_SO_REUSE
• CONFIG_LWIP_NETIF_STATUS_CALLBACK
• CONFIG_LWIP_TCPIP_CORE_LOCKING
• CONFIG_LWIP_NETIF_API
• Hooks
• ICMP
• CONFIG_LWIP_LOCAL_HOSTNAME
• LWIP RAW API
• CONFIG_LWIP_IPV6 ND6 NUM_NEIGHBORS
• CONFIG_LWIP_IPV6 MEMP NUM ND6 QUEUE
• CONFIG_LWIP_MAX_SOCKETS
• CONFIG_LWIP_ESP_GRATUITOUS_ARP
• SNTP
• CONFIG_LWIP_USE_ONLY LWIP SELECT
• CONFIG_LWIP_NETIF LOOPBACK
• TCP
• CONFIG_LWIP_TCPIP TASK AFFINITY
• CONFIG_LWIP_TCPIP TASK STACK SIZE
• CONFIG_LWIP_TCPIP_RECVMBOX_SIZE
• UDP
• CONFIG_LWIP_IPV6 RDNSS MAX DNS SERVERS

CONFIG_LWIP_LOCAL_HOSTNAME

Local netif hostname

Found in: Component config > LWIP

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

Default value:
• “espressif”

CONFIG_LWIP_NETIF_API

Enable usage of standard POSIX APIs in LWIP

Found in: Component config > LWIP
If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

**Default value:**
- No (disabled)

### CONFIG_LWIP_TCP/IP_CORE_LOCKING

Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCP/IP_CORE() and UNLOCK_TCP/IP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.

**Default value:**
- No (disabled)

### CONFIG_LWIP_DNS_SUPPORT_MDNS QUERIES

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**
- Yes (enabled)

### CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2 (WIFI Driver) will be copied to a new buffer before sending it to layer3 (LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**
- No (disabled)

### CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)
**CONFIG_LWIP_TIMERS_ONDEMAND**

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MAX_SOCKETS**

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**
- from 1 to 16

**Default value:**
- 10

**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_LINGER**

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1,l_linger can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_SO_REUSE_RXTOALL

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_SO_RCVBUF

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)

CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_IP4_REASSEMBLY
Enable reassembly incoming fragmented IP4 packets

Found in: Component config > LWIP

Enabling this option allows reassembling incoming fragmented IP4 packets.

Default value:
• No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY
Enable reassembly incoming fragmented IP6 packets

Found in: Component config > LWIP

Enabling this option allows reassembling incoming fragmented IP6 packets.

Default value:
• No (disabled)

CONFIG_LWIP_IP_FORWARD
Enable IP forwarding

Found in: Component config > LWIP

Enabling this option allows packets forwarding across multiple interfaces.

Default value:
• No (disabled)

CONFIG_LWIP_IPV4_NAPT
Enable NAT (new/experimental)

Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD

Enabling this option allows Network Address and Port Translation.

Default value:
• No (disabled) if CONFIG_LWIP_IP_FORWARD

CONFIG_LWIP_STATS
Enable LWIP statistics

Found in: Component config > LWIP

Enabling this option allows LWIP statistics

Default value:
• No (disabled)

CONFIG_LWIP_ESP_GRATUITOUS_ARP
Send gratuitous ARP periodically

Found in: Component config > LWIP

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.
Default value:
  • Yes (enabled)

**CONFIG_LWIP_GARP_TMR_INTERVAL**

GARP timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP GRATUITOUS ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**
  • 60

**CONFIG_LWIP_TCPIP_RECMBOX_SIZE**

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
  • from 6 to 64 if CONFIG_LWIP_WND_SCALE
  • from 6 to 1024 if CONFIG_LWIP_WND_SCALE

**Default value:**
  • 32

**CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
  • Yes (enabled)

**CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
  • No (disabled)

**CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
  • Yes (enabled)
CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

*Default value:*
- No (disabled)

CONFIG_LWIP_DHCP_OPTIONS_LEN

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

*Range:*
- from 68 to 255

*Default value:*
- 68
- 108

DHCP server  Contains:
- CONFIG_LWIP_DHCPS

CONFIG_LWIP_DHCPS

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

*Default value:*
- Yes (enabled)

CONFIG_LWIP_DHCPS_LEASE_UNIT

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

*Range:*
- from 1 to 3600

*Default value:*
- 60
CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

*Range:*
  - from 1 to 64

*Default value:*
  - 8

CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

*Default value:*
  - No (disabled)

Contains:
  - CONFIG_LWIP_AUTOIP_TRIES
  - CONFIG_LWIP_AUTOIP_MAX_CONFLICTS
  - CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

CONFIG_LWIP_AUTOIP_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

*Range:*
  - from 1 to 100 if CONFIG_LWIP_AUTOIP

*Default value:*
  - 2 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_AUTOIP_MAX_CONFLICTS

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

*Range:*
  - from 1 to 100 if CONFIG_LWIP_AUTOIP

*Default value:*
  - 9 if CONFIG_LWIP_AUTOIP
CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

*Range:*
  * from 5 to 120 if `CONFIG_LWIP_AUTOIP`

*Default value:*
  * 20 if `CONFIG_LWIP_AUTOIP`

CONFIG_LWIP_IPV6

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

*Default value:*
  * Yes (enabled)

CONFIG_LWIP_IPV6_AUTOCONFIG

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPv6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

*Default value:*
  * No (disabled)

CONFIG_LWIP_IPV6_NUM_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

*Default value:*
  * 3

CONFIG_LWIP_IPV6_FORWARD

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

*Default value:*
  * No (disabled)
CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS
Use IPv6 Router Advertisement Recursive DNS Server Option

Found in: Component config > LWIP

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

Default value:
- 0 if CONFIG_LWIP_IPV6_AUTOCONFIG

CONFIG_LWIP_IPV6_DHCP6
Enable DHCPv6 stateless address autoconfiguration

Found in: Component config > LWIP

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

Default value:
- No (disabled) if CONFIG_LWIP_IPV6_AUTOCONFIG

CONFIG_LWIP_NETIF_STATUS_CALLBACK
Enable status callback for network interfaces

Found in: Component config > LWIP

Enable callbacks when the network interface is up/down and addresses are changed.

Default value:
- No (disabled)

CONFIG_LWIP_NETIF_LOOPBACK
Support per-interface loopback

Found in: Component config > LWIP

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

Default value:
- Yes (enabled)

Contains:
- CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS
Max queued loopback packets per interface

Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

Range:
- from 0 to 16
Chapter 2. API Reference

Default value:
  • 8

TCP Contains:
  • CONFIG_LWIP_TCPWndDefault
  • CONFIG_LWIP_TCP_SND_BUF_DEFAULT
  • CONFIG_LWIP_TCP_RECVMBOX_SIZE
  • CONFIG_LWIP_TCP_RTO_TIME
  • CONFIG_LWIP_MAX_ACTIVE_TCP
  • CONFIG_LWIP_MAX_LISTENING_TCP
  • CONFIG_LWIP_TCP_MAXRTX
  • CONFIG_LWIP_TCP_SYNMAXRTX
  • CONFIG_LWIP_TCP_MSL
  • CONFIG_LWIP_TCP_MSS
  • CONFIG_LWIP_TCP_OVERSIZE
  • CONFIG_LWIP_TCP_QUEUE_OOSEQ
  • CONFIG_LWIP_WND_SCALE
  • CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION
  • CONFIG_LWIP_TCP_TMR_INTERVAL

CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

Found in: Component config > LWIP > TCP

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

Range:
  • from 1 to 1024

Default value:
  • 16

CONFIG_LWIP_MAX_LISTENING_TCP

Maximum listening TCP Connections

Found in: Component config > LWIP > TCP

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

Range:
  • from 1 to 1024

Default value:
  • 16

CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION

TCP high speed retransmissions

Found in: Component config > LWIP > TCP
Chapter 2. API Reference

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

Default value:
- Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**
- from 3 to 12

**Default value:**
- 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

**Range:**
- from 3 to 12

**Default value:**
- 6
- 12

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220<= TCP_mSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval(ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250
CONFIG_LWIP_TCP_MSL

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

CONFIG_LWIP_TCP_SND_BUF_DEFAULT

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 5744

CONFIG_LWIP_TCP_WND_DEFAULT

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 5744

CONFIG_LWIP_TCP_RECVMBBOX_SIZE

Default TCP receive mailbox size

*Found in: Component config > LWIP > TCP*

Set TCP receive mailbox size. Generally bigger value means higher throughput but more memory. The recommended value is: LWIP_TCP_WND_DEFAULT/TCP_MSS + 2. e.g. if LWIP_TCP_WND_DEFAULT=14360, TCP_MSS=1436, then the recommended receive mailbox size is (14360/1436 + 2) = 12.

TCP receive mailbox is a per socket mailbox, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mailbox and the application then fetches the packets from mail box. It means LWIP can caches maximum LWIP_TCP_RECVMBBOX_SIZE packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is
LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCP_SACK_OUT**

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.
Default value:
• No (disabled) if \texttt{CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP}

\texttt{CONFIG\_LWIP\_TCP\_RCV\_SCALE}

Set TCP receiving window scaling factor

\textit{Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_WND\_SCALE}

Enable this feature to support TCP window scaling.

\textbf{Range:}
• from 0 to 14 if \texttt{CONFIG\_LWIP\_WND\_SCALE}

\textbf{Default value:}
• 0 if \texttt{CONFIG\_LWIP\_WND\_SCALE}

\texttt{CONFIG\_LWIP\_TCP\_RTO\_TIME}

Default TCP rto time

\textit{Found in: Component config > LWIP > TCP}

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

\textbf{Default value:}
• 3000
• 1500

\textbf{UDP Contains:}

• \texttt{CONFIG\_LWIP\_UDP\_RECV\_VBOX\_SIZE}
• \texttt{CONFIG\_LWIP\_MAX\_UDP\_PCBS}

\texttt{CONFIG\_LWIP\_MAX\_UDP\_PCBS}

Maximum active UDP control blocks

\textit{Found in: Component config > LWIP > UDP}

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

\textbf{Range:}
• from 1 to 1024

\textbf{Default value:}
• 16

\texttt{CONFIG\_LWIP\_UDP\_RECV\_VBOX\_SIZE}

Default UDP receive mailbox size

\textit{Found in: Component config > LWIP > UDP}

Set UDP receive mailbox size. The recommended value is 6.

UDP receive mailbox is a per socket mailbox, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mailbox and the application then fetches the packets from mailbox. It means LWIP can caches maximum UDP\_RECCVMBOX\_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is \texttt{UDP\_RECCVMBOX\_SIZE} multiples the maximum UDP socket number. In other words, the bigger \texttt{UDP\_RECCVMBOX\_SIZE} means more memory. On the other hand, if the receive mailbox is too small, the mailbox may be full. If the mailbox is full, the LWIP drops the packets. So generally we
need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

### Checksums
Contains:
- `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`
- `CONFIG_LWIP_CHECKSUM_CHECK_IP`
- `CONFIG_LWIP_CHECKSUM_CHECK_UDP`

**CONFIG_LWIP_CHECKSUM_CHECK_IP**
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_UDP**
Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_ICMP**
Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
TCP/IP Task Stack Size

*Found in: Component config > LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072
**CONFIG_LWIP_TCPIP_TASK_AFFINITY**

TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**

- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)

**CONFIG_LWIP_PPP_SUPPORT**

Enable PPP support (new/experimental)

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible. PPP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- **CONFIG_LWIP_PPP_ENABLE_IPV6**

**CONFIG_LWIP_PPP_ENABLE_IPV6**

Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**

- Yes (enabled) if CONFIG_LWIP_PPP_SUPPORT && CONFIG_LWIP_IPV6

**CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE**

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

**CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**

---
Chapter 2. API Reference

- from 3 to 10
  
  **Default value:**
  - 5

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**
- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*

**CONFIG_LWIP_PPP_PAP_SUPPORT**

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support

**Default value:**
- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*

**CONFIG_LWIP_PPP_CHAP_SUPPORT**

Enable CHAP support

*Found in: Component config > LWIP*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**
- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*

**CONFIG_LWIP_PPP_MSCHAP_SUPPORT**

Enable MSCHAP support

*Found in: Component config > LWIP*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**
- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*

**CONFIG_LWIP_PPP_MPPE_SUPPORT**

Enable MPPE support

*Found in: Component config > LWIP*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**
- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*
Chapter 2. API Reference

**CONFIG_LWIP_ENABLE_LCP_ECHO**
Enable LCP ECHO

*Found in: Component config > LWIP*
Enable LCP echo keepalive requests

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

---

**CONFIG_LWIP_LCP_ECHO_INTERVAL**
Echo interval (s)

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*
Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**
- from 0 to 1000000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIPENABLE_LCP_ECHO`

---

**CONFIG_LWIP_LCP_MAX_ECHOFAILS**
Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*
Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

---

**CONFIG_LWIP_PPP_DEBUG_ON**
Enable PPP debug log output

*Found in: Component config > LWIP*
Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

---

**CONFIG_LWIP_SLIP_SUPPORT**
Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*
Enable SLIP stack. Now only SLIP over serial is possible.
SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`
**CONFIG_LWIP_SLIP_DEBUG_ON**

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*

Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

**ICMP**

Contains:

- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

**CONFIG_LWIP_ICMP**

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MULTICAST_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**CONFIG_LWIP_BROADCAST_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**LWIP RAW API**

Contains:

- `CONFIG_LWIP_MAX_RAW_PCBS`

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16
SNTP  Contains:

- `CONFIG_LWIP_SNTP_MAX_SERVERS`
- `CONFIG_LWIP_SNTP_UPDATE_DELAY`
- `CONFIG_LWIP_DHCP_GET_NTP_SRV`

`CONFIG_LWIP_SNTP_MAX_SERVERS`

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

*Range:*  
- from 1 to 16  

*Default value:*  
- 1

`CONFIG_LWIP_DHCP_GET_NTP_SRV`

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

*Default value:*  
- No (disabled)

`CONFIG_LWIP_DHCP_MAX_NTP_SERVERS`

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

*Range:*  
- from 1 to 16 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

*Default value:*  
- 1 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

`CONFIG_LWIP_SNTP_UPDATE_DELAY`

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

*Range:*  
- from 15000 to 4294967295

*Default value:*  
- 3600000
CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

Found in: Component config > LWIP

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

Default value:
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE

Hooks

Contains:
- CONFIG_LWIP_HOOK_ND6_GET_GW
- CONFIG_LWIP_HOOK_IP6_INPUT
- CONFIG_LWIP_HOOK_IP6_ROUTE
- CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
- CONFIG_LWIP_HOOK_TCP_ISN

CONFIG_LWIP_HOOK_TCP_ISN

TCP ISN Hook

Found in: Component config > LWIP > Hooks

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (tcp_next_iss) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to LWIP_HOOK_TCP_ISN_CUSTOM to provide custom implementation. Set to LWIP_HOOK_TCP_ISN_NONE to use lwIP implementation.

Available options:
- No hook declared (LWIP_HOOK_TCP_ISN_NONE)
- Default implementation (LWIP_HOOK_TCP_ISN_DEFAULT)
- Custom implementation (LWIP_HOOK_TCP_ISN_CUSTOM)

CONFIG_LWIP_HOOK_IP6_ROUTE

IPv6 route Hook

Found in: Component config > LWIP > Hooks

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:
- No hook declared (LWIP_HOOK_IP6_ROUTE_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_ROUTE_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_ROUTE_CUSTOM)

CONFIG_LWIP_HOOK_ND6_GET_GW

IPv6 get gateway Hook

Found in: Component config > LWIP > Hooks
Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_ND6_GET_GW_NONE)
- Default (weak) implementation (LWIP_HOOK_ND6_GET_GW_DEFAULT)
- Custom implementation (LWIP_HOOK_ND6_GET_GW_CUSTOM)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_INPUT**

IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_INPUT_CUSTOM)

**CONFIG_LWIP_DEBUG**

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_DHCP_DEBUG`
- `CONFIG_LWIP_DHCP_STATE_DEBUG`
- `CONFIG_LWIP_DNS_DEBUG`
- `CONFIG_LWIP_ETHARP_DEBUG`
- `CONFIG_LWIP_ICMP_DEBUG`
- `CONFIG_LWIP_ICMP6_DEBUG`
- `CONFIG_LWIP_IP_DEBUG`
- `CONFIG_LWIP_IP6_DEBUG`
- `CONFIG_LWIP_NETIF_DEBUG`
• `CONFIG_LWIP_PBUF_DEBUG`
• `CONFIG_LWIP_SNTP_DEBUG`
• `CONFIG_LWIP_SOCKETS_DEBUG`
• `CONFIG_LWIP_TCP_DEBUG`

`CONFIG_LWIP_NETIF_DEBUG`

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`

`CONFIG_LWIP_PBUF_DEBUG`

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`

`CONFIG_LWIP_ETHARP_DEBUG`

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`

`CONFIG_LWIP_API_LIB_DEBUG`

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`

`CONFIG_LWIP_SOCKETS_DEBUG`

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`

`CONFIG_LWIP_IP_DEBUG`

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if `CONFIG_LWIP_DEBUG`
**CONFIG_LWIP_ICMP_DEBUG**
Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG && CONFIG_LWIP_ICMP

**CONFIG_LWIP_DHCP_STATE_DEBUG**
Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_DHCP_DEBUG**
Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_IP6_DEBUG**
Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_ICMP6_DEBUG**
Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_TCP_DEBUG**
Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_SNTP_DEBUG**
Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG
CONFIG_LWIP_DNS_DEBUG

Enable DNS debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:
  • No (disabled) if CONFIG_LWIP_DEBUG

mbedTLS  Contains:

  • CONFIG_MBEDTLSASYMMETRICCONTENTLEN
  • Certificate Bundle
  • Certificates
  • CONFIG_MBEDTLSCHACHA20_C
  • CONFIG_MBEDTLDHM_C

Chapter 2. API Reference

- CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN
- CONFIG_MBEDTLS_TLS_MODE
- CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_ROM_MD5
- CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > mbedTLS

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:
- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)

Allows to use IRAM memory region as 8bit accessible region. TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

Found in: Component config > mbedTLS

Maximum TLS message length (in bytes) supported by mbedTLS. 16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

Range:
- from 512 to 16384

Default value:
- 16384
**CONFIG_MBEDTLSASYMMETRICCONTENT_LEN**

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN**

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 16384

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 4096

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_INCONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTODTLS && CONFIG_MBEDTLS_SSL_VARIABLEBUFFER_LENGTH

**CONFIG_MBEDTLS_DYNAMIC FREE_CONFIG_DATA**

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC BUFFER*

Free private key and DHM data after its usage in handshake process.
The option will decrease heap cost when handshake, but also lead to problem:
Because all certificate, private key and DHM data are freed so users should register certificate and private
key to ssl config object again.

Default value:
• No (disabled) if CONFIGMBEDTLS_DYNAMIC_BUFFER

CONFIGMBEDTLS_DYNAMIC_FREE_CA_CERT
Free SSL CA certificate after its usage

Found in: Component config > mbedTLS > CONFIGMBEDTLS_DYNAMIC_BUFFER > CONFIGMBEDTLS_DYNAMIC_FREE_CONFIG_DATA
Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint
for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS
handshake again, the CA certificate should once again be registered to the ssl object.

Default value:
• Yes (enabled) if CONFIGMBEDTLS_DYNAMIC_FREE_CONFIG_DATA

CONFIGMBEDTLS_DEBUG
Enable mbedTLS debugging

Found in: Component config > mbedTLS
Enable mbedTLS debugging functions at compile time.
If this option is enabled, you can include “mbedtls/esp_debug.h” and call
mbedtls.esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the
ESP log mechanism.

Default value:
• No (disabled)

CONFIGMBEDTLS_DEBUG_LEVEL
Set mbedTLS debugging level

Found in: Component config > mbedTLS > CONFIGMBEDTLS_DEBUG
Set mbedTLS debugging level

Available options:
• Warning (MBEDTLS_DEBUG_LEVEL_WARN)
• Info (MBEDTLS_DEBUG_LEVEL_INFO)
• Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
• Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedTLS v3.x related
Contains:
• DTLS-based configurations
• CONFIGMBEDTLS_SSL_CONTEXT_SERIALIZATION
• CONFIGMBEDTLS_X509_TRUSTED_CERT_CALLBACK
• CONFIGMBEDTLS_SSL_KEEP_PEER_CERTIFICATE
• CONFIGMBEDTLS_SSL_PROTO_TLS1_3
• CONFIGMBEDTLS_ECDH_LEGACY_CONTEXT
• CONFIGMBEDTLS_SSL_VARIABLE_BUFFER_LENGTH
CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
Support TLS 1.3 protocol

Default value:
- No (disabled) if CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE && CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE
Enable TLS 1.3 middlebox compatibility mode

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH
Variable SSL buffer length

Default value:
- No (disabled)

CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
Use a backward compatible ECDH context (Experimental)

Default value:
- No (disabled) if CONFIG_MBEDTLS_ECDH_C && CONFIG_MBEDTLS_ECP_RESTARTABLE

CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
Enable trusted certificate callbacks

Default value:
- No (disabled)

CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION
Enable serialization of the TLS context structures

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.
See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

**Default value:**
- Yes (enabled) if MBEDTLS_DYNAMIC_FREE_PEER_CERT

**DTLS-based configurations**

Contains:

- **CONFIG_MBEDTLS_SSL_DTLS_SRTP**
- **CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

**CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

**CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

**Default value:**
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

**CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

**Default value:**
• 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY**

Record plaintext padding (for DTLS 1.2)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2. The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**
- 16 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG_MBEDTLS_SSL_DTLS_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension. See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE**

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Available options:**
- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  Use only the most common certificates from the default bundles, reducing the size with 50%,
  while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE
Add custom certificates to the default bundle

```
Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE
```

Default value:
- No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH
Custom certificate bundle path

```
Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE
```

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS
Maximum no of certificates allowed in certificate bundle

```
Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE
```

Default value:
- 200

CONFIG_MBEDTLS_ECP_RESTARTABLE
Enable mbedTLS ecp restartable

```
Found in: Component config > mbedTLS
```

Enable “non-blocking” ECC operations that can return early and be resumed.

Default value:
- No (disabled)

CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

```
Found in: Component config > mbedTLS
```

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

Default value:
- No (disabled)
**CONFIG_MBEDTLS_HARDWARE_AES**

Enable hardware AES acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_GCM**

Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM && CONFIG_MBEDTLS_HARDWARE_AES

**CONFIG_MBEDTLS_HARDWARE_MPI**

Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_SHA**

Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST
CONFIG_MBEDTLS_HARDWARE_ECC
Enable hardware ECC acceleration
*Found in: Component config > mbedTLS*
Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS
*Default value:*
  - Yes (enabled) if SOC_ECC_SUPPORTED

CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK
Fallback to software implementation for curves not supported in hardware
*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*
Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.
*Default value:*
  - Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

CONFIG_MBEDTLS_ROM_MD5
Use MD5 implementation in ROM
*Found in: Component config > mbedTLS*
Use ROM MD5 in mbedTLS.
*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN
Enable hardware ECDSA sign acceleration when using ATECC608A
*Found in: Component config > mbedTLS*
This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)
*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
Enable hardware ECDSA verify acceleration when using ATECC608A
*Found in: Component config > mbedTLS*
This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)
*Default value:*
  - No (disabled)
### CONFIG_MBEDTLS_HAVE_TIME
Enable mbedtls time support

*Found in: Component config > mbedtls*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

**Default value:**
- Yes (enabled)

### CONFIG_MBEDTLS_PLATFORM_TIME_ALT
Enable mbedtls time support: platform-specific

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function “mbedtls_platform_set_time()” that allows to set an alternative time function pointer.

**Default value:**
- No (disabled)

### CONFIG_MBEDTLS_HAVE_TIME_DATE
Enable mbedtls certificate expiry check

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**
- No (disabled)

### CONFIG_MBEDTLS_ECDSA_DETERMINISTIC
Enable deterministic ECDSA

*Found in: Component config > mbedtls*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**
• Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

**Default value:**

• Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

• Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
• Server (MBEDTLS_TLS_SERVER_ONLY)
• Client (MBEDTLS_TLS_CLIENT_ONLY)
• None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**

Contains:

• CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
• CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
• CONFIG_MBEDTLS_PSK_MODES
• CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
• CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authenticication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

• No (disabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_PSK**

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CON-FIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

• No (disabled) if CONFIG_MBEDTLS_PSK_MODES
CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK
Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:*
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK
Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:*
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK
Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

*Default value:*
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
Enable RSA-only based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to support ciphersuites with prefix TLS-RSA-WITH-

*Default value:*
• Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
Enable DHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

*Default value:*
• Yes (enabled) if CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE
Support Elliptic Curve based ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**
Enable ECDHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**
Enable ECDHE-ECDSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**
Enable ECDH-ECDSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**
Enable ECDH-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**
Enable ECJPAKE based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Chapter 2. API Reference

**CONFIG_MBEDTLS_SSL_RENEGOTIATION**

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_2**

Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1**

Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

*Default value:*
  - No (disabled)

**CONFIG_MBEDTLS_SSL_PROTO_DTLS**

Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.2 to be enabled for DTLS 1.2

*Default value:*
  - No (disabled)

**CONFIG_MBEDTLS_SSL_ALPN**

Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS**

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

*Default value:*
  - Yes (enabled)
CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in:* Component config > mbedTLS

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

Symmetric Ciphers  Contains:

- CONFIG_MBEDTLS_AES_C
- CONFIG_MBEDTLS_BLOWFISH_C
- CONFIG_MBEDTLS_CAMELLIA_C
- CONFIG_MBEDTLS_CCM_C
- CONFIG_MBEDTLS_DES_C
- CONFIG_MBEDTLS_GCM_C
- CONFIG_MBEDTLS_NIST_KW_C
- CONFIG_MBEDTLS_RC4_MODE
- CONFIG_MBEDTLS_XTEA_C

CONFIG_MBEDTLS_AES_C

AES block cipher

*Found in:* Component config > mbedTLS > Symmetric Ciphers

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

*Found in:* Component config > mbedTLS > Symmetric Ciphers

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

*Found in:* Component config > mbedTLS > Symmetric Ciphers

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_RC4_MODE

RC4 Stream Cipher (legacy, insecure)

*Found in:* Component config > mbedTLS > Symmetric Ciphers

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.
Available options:
- Disabled (MBEDTLS_RC4_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS_RC4_ENABLED_NO_DEFAULT)
- Enabled (MBEDTLS_RC4_ENABLED)

CONFIG_MBEDTLS_BLOWFISH_C
Blowfish block cipher (read help)

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_XTEA_C
XTEA block cipher

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CCM_C
CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_GCM_C
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*
Enable the RIPEMD-160 hash algorithm.

**Default value:**
* No (disabled)

Certificates
Contains:
* CONFIG_MBEDTLS_PEM_PARSE_C
* CONFIG_MBEDTLS_PEM_WRITE_C
* CONFIG_MBEDTLS_X509_CRL_PARSE_C
* CONFIG_MBEDTLS_X509_CSR_PARSE_C

CONFIG_MBEDTLS_PEM_PARSE_C
Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*
Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**
* Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C
Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*
Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**
* Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C
X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

**Default value:**
* Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C
X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*
Support for parsing X.509 Certificate Signing Requests

**Default value:**
* Yes (enabled)
CONFIG_MBEDTLS_ECP_C
Elliptic Curve Ciphers
*Found in:* Component config > mbedTLS

*Default value:*
- Yes (enabled)

CONFIG_MBEDTLS_DHM_C
Diffie-Hellman-Merkle key exchange (DHM)
*Found in:* Component config > mbedTLS
Enable DHM. Needed to use DHE-xxx TLS ciphersuites.
Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file mbedtls/dhm.h file.

*Default value:*
- No (disabled)

CONFIG_MBEDTLS_ECDH_C
Elliptic Curve Diffie-Hellman (ECDH)
*Found in:* Component config > mbedTLS
Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

*Default value:*
- Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C
Elliptic Curve DSA
*Found in:* Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C
Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

*Default value:*
- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C
Elliptic curve J-PAKE
*Found in:* Component config > mbedTLS
Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

*Default value:*
- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED
Enable SECP192R1 curve
*Found in:* Component config > mbedTLS
Enable support for SECP192R1 Elliptic Curve.

*Default value:*
- Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C
CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

*Found in: Component config > mbedtls*

Enable support for SECP224R1 Elliptic Curve.

*Default value:*

- Yes (enabled) if \((\text{CONFIG}_\text{MBEDTLS}_\text{ATCA}_\text{HW}_\text{ECDSA}\_\text{SIGN} \mid\mid \text{CONFIG}_\text{MBEDTLS}_\text{ATCA}_\text{HW}_\text{ECDSA}\_\text{VERIFY}) \& \& \text{CONFIG}_\text{MBEDTLS}_\text{ECP}\_\text{C}\)
Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS*

Support for DP Elliptic Curve.

**Default value:**
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedTLS*

Support for DP Elliptic Curve.

**Default value:**
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedTLS*

Support for DP Elliptic Curve.

**Default value:**
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: Component config > mbedTLS*

Enable support for CURVE25519 Elliptic Curve.

**Default value:**
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)
CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST ‘modulo p’ optimisations

*Found in: Component config > mbedTLS*

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.

*Default value:*
  • Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

*Default value:*
  • No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

*Default value:*
  • No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C

ChaCha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

*Default value:*
  • No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

*Default value:*
  • No (disabled)
CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS

Show configurations with potential security risks

*Found in: Component config > mbedTLS*

**Default value:**
- No (disabled)

Contains:
- CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions
Default value:
• No (disabled) if CONFIG_MBEDTLS_SECURITY_RISKS

**mDNS** Contains:

- `CONFIG_MDNS_MAX_INTERFACES`
- `CONFIG_MDNS_MAX_SERVICES`
- `CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS`
- MDNS Predefined interfaces
- `CONFIG_MDNS.Strict_MODE`
- `CONFIG_MDNS_TASK_AFFINITY`
- `CONFIG_MDNS_TASK_PRIORITY`
- `CONFIG_MDNS_TASK_STACK_SIZE`
- `CONFIG_MDNS_TIMER_PERIOD_MS`
- `CONFIG_MDNS_MULTIPLE_INSTANCE`
- `CONFIG_MDNS_NETWORKING_SOCKET`

**CONFIG_MDNS_MAX_INTERFACES**

Max number of interfaces

*Found in: Component config > mDNS*

Number of network interfaces to be served by the mDNS library. Lowering this number helps to reduce some static RAM usage.

*Range:*
  • from 1 to 9

*Default value:*
  • 3

**CONFIG_MDNS_MAX_SERVICES**

Max number of services

*Found in: Component config > mDNS*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

*Range:*
  • from 1 to 64

*Default value:*
  • 10

**CONFIG_MDNS_TASK_PRIORITY**

mDNS task priority

*Found in: Component config > mDNS*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

*Range:*
  • from 1 to 255

*Default value:*
  • 1
CONFIG_MDNS_TASK_STACK_SIZE

mDNS task stack size

*Found in: Component config > mDNS*

Allows setting mDNS task stack size.

**Default value:**
- 4096

CONFIG_MDNS_TASK_AFFINITY

mDNS task affinity

*Found in: Component config > mDNS*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

**Available options:**
- No affinity (MDNS_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (MDNS_TASK_AFFINITY_CPU0)
- CPU1 (MDNS_TASK_AFFINITY_CPU1)

CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS

mDNS adding service timeout (ms)

*Found in: Component config > mDNS*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

**Range:**
- from 10 to 30000

**Default value:**
- 2000

CONFIG_MDNS STRICT MODE

mDNS strict mode

*Found in: Component config > mDNS*

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mDNS resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

**Default value:**
- No (disabled)

CONFIG_MDNS TIMER_PERIOD_MS

mDNS timer period (ms)

*Found in: Component config > mDNS*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**Range:**
- from 10 to 10000

**Default value:**
Chapter 2. API Reference

- 100

**CONFIG_MDNS_NETWORKING_SOCKET**

Use BSD sockets for mDNS networking

*Found in: Component config > mDNS*

Enables optional mDNS networking implementation using BSD sockets in UDP multicast mode. This option creates a new thread to serve receiving packets (TODO). This option uses additional N sockets, where N is number of interfaces.

**Default value:**
- No (disabled)

**CONFIG_MDNS_MULTIPLE_INSTANCE**

Multiple instances under the same service type

*Found in: Component config > mDNS*

Enables adding multiple service instances under the same service type.

**Default value:**
- Yes (enabled)

**MDNS Predefined interfaces**

Contains:
- **CONFIG_MDNS_PREDEF_NETIF_ETH**
- **CONFIG_MDNS_PREDEF_NETIF_AP**
- **CONFIG_MDNS_PREDEF_NETIF_STA**

**CONFIG_MDNS_PREDEF_NETIF_STA**

Use predefined interface for WiFi Station

*Found in: Component config > mDNS > MDNS Predefined interfaces*

Set up mDNS for the default WiFi station. Disable this option if you do not need mDNS on default WiFi STA.

**Default value:**
- Yes (enabled)

**CONFIG_MDNS_PREDEF_NETIF_AP**

Use predefined interface for WiFi Access Point

*Found in: Component config > mDNS > MDNS Predefined interfaces*

Set up mDNS for the default WiFi Access Point. Disable this option if you do not need mDNS on default WiFi AP.

**Default value:**
- Yes (enabled)

**CONFIG_MDNS_PREDEF_NETIF_ETH**

Use predefined interface for Ethernet

*Found in: Component config > mDNS > MDNS Predefined interfaces*

Set up mDNS for the default Ethernet interface. Disable this option if you do not need mDNS on default Ethernet.
Default value:
• Yes (enabled)

ESP-MQTT Configurations  Contains:
• CONFIG_MQTT_CUSTOM_OUTBOX
• CONFIG_MQTT_TRANSPORT_SSL
• CONFIG_MQTT_TRANSPORT_WEBSOCKET
• CONFIG_MQTT_PROTOCOL_311
• CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
• CONFIG_MQTT_USE_CUSTOM_CONFIG
• CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS
• CONFIG_MQTT_REPORT_DELETED_MESSAGES
• CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED
• CONFIG_MQTT_MSG_ID_INCREMENTAL

CONFIG_MQTT_PROTOCOL_311
Enable MQTT protocol 3.1.1
Found in: Component config > ESP-MQTT Configurations
If not, this library will use MQTT protocol 3.1
Default value:
• Yes (enabled)

CONFIG_MQTT_TRANSPORT_SSL
Enable MQTT over SSL
Found in: Component config > ESP-MQTT Configurations
Enable MQTT transport over SSL with mbedTLS
Default value:
• Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET
Enable MQTT over Websocket
Found in: Component config > ESP-MQTT Configurations
Enable MQTT transport over Websocket.
Default value:
• Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE
Enable MQTT over Websocket Secure
Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET
Enable MQTT transport over Websocket Secure.
Default value:
• Yes (enabled)
CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather then a random value (used by default)

**Default value:**
- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.

**Default value:**
- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

**Default value:**
- 1883 if CONFIG_MQTT_USE_CUSTOM_CONFIG
**CONFIG_MQTT_SSL_DEFAULT_PORT**

Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over SSL port

**Default value:**
- 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_SSL`

**CONFIG_MQTT_WS_DEFAULT_PORT**

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket port

**Default value:**
- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

**CONFIG_MQTT_WSS_DEFAULT_PORT**

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

**Default value:**
- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

**CONFIG_MQTT_BUFFER_SIZE**

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

**Default value:**
- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_STACK_SIZE**

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

**Default value:**
- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_DISABLE_API_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

**Default value:**
Chapter 2. API Reference

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**CONFIG_MQTT_TASK_CORE_SELECTION**

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqtt mqttCOMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

**Default value:**

- No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib**

Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`
**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘n’, LF) appears on stdout. Three options are possible:

- **CRLF**: whenever LF is encountered, prepend it with CR
- **LF**: no modification is applied, stdout is sent as is
- **CR**: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘n’, LF) on stdin. Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘—enable-newlib-nano-formatted-io’:

https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**Default value:**

- No (disabled)
**CONFIG_NEWLIB_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- **If both high-resolution** (systimer for all targets except ESP32) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.6 (6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC_STORE registers are** used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
- None (NEWLIB_TIME_SYSCALL_USE_NONE)

**NVS**

Contains:

- **CONFIG_NVS_ENCRYPTION**
- **CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**

**CONFIG_NVS_ENCRYPTION**

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if **CONFIG_SECURE_FLASH_ENC_ENABLED**

**CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**OpenThread**

Contains:

- **CONFIG_OPENTHREAD_ENABLED**
CONFIG_OPENTHREAD_ENABLED

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

CONFIG_OPENTHREAD_RADIO_TYPE

Config the Thread radio type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Configure how OpenThread connects to the 15.4 radio

**Available options:**
- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.

CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**
- Full Thread Device (OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_DIAG

Enable diag

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**
- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*
Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_JOINER**

Enable Joiner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_SRPM_CLIENT**

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_BORDER_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_ESP_LIB_FROM_INTERNAL_SRC**

Build esp_openthread libraries from source

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Override the shipped libopenthread_br.a and libopenthread_port.a, for internal builds.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS**

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

**Range:**
- from 50 to 100 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 65 if `CONFIG_OPENTHREAD_ENABLED`
**PThreads** Contains:

- `CONFIG_PTHREAD_TASK_NAME_DEFAULT`
- `CONFIG_PTHREAD_TASK_CORE_DEFAULT`
- `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
- `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`
- `CONFIG_PTHREAD_STACK_MIN`

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**Range:**
- from 0 to 255

**Default value:**
- 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**
- 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
- 768

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**
- No affinity (`PTHREAD_DEFAULT_CORE_NO_AFFINITY`)
- Core 0 (`PTHREAD_DEFAULT_CORE_0`)
- Core 1 (`PTHREAD_DEFAULT_CORE_1`)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
SPI Flash driver  Contains:

- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_CHECK_ERASE, TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- CONFIG_SPI_FLASH_SHARE_SPI1_BUS
- CONFIG_SPI_FLASH_USE_LEGACY_IMPL
- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_DANGEROUS_WRITE

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE
CONFIG_SPI_FLASH_ENABLE_COUNTERS
Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

- spi_flash_reset_counters
- spi_flash_dump_counters
- spi_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

*Default value:*
  - 0

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

*Default value:*
  - Yes (enabled)

CONFIG_SPI_FLASH_DANGEROUS_WRITE
Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

*Available options:*
  - Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
  - Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
  - Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_USE_LEGACY_IMPL
Use the legacy implementation before IDF v4.0

*Found in: Component config > SPI Flash driver*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

*Default value:*
  - No (disabled)
CONFIG_SPI_FLASH_SHARE_SPI1_BUS

Support other devices attached to SPI1 bus

Found in: Component config > SPI Flash driver

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

Default value:
• No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

Found in: Component config > SPI Flash driver

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

Default value:
• No (disabled)

CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

Found in: Component config > SPI Flash driver

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS and SPI\_FLASH\_ERASE\_YIELD\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check SPI Flash API reference document under section OS Function.

Default value:
• Yes (enabled)

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

Default value:
• 20

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Defines how many ticks will be before returning to continue a erasing.

Default value:
• 1
CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration option helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**
- from 256 to 8192

**Default value:**
- 8192

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the default_registered_chips structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL

Auto-detect flash chips

Contains:
- CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP
- CONFIG_SPI_FLASH_SUPPORT_GD_CHIP
- CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
- CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP
- CONFIG_SPI_FLASH_SUPPORT_TH_CHIP
- CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP
CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by \_\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by \_\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by \_\_drv member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by \_\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by \_\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- No (disabled)
- Yes (enabled)
CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- No (disabled)
- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)

**SPIFFS Configuration**

Contains:
- **Debug Configuration**
- **CONFIG_SPIFFS_USE_MAGIC**
- **CONFIG_SPIFFS_GC_STATS**
- **CONFIG_SPIFFS_PAGE_CHECK**
- **CONFIG_SPIFFS_FOLLOW_SYMLINKS**
- **CONFIG_SPIFFS_MAX_PARTITIONS**
- **CONFIG_SPIFFS_USE_MTIME**
- **CONFIG_SPIFFS_GC_MAX_RUNS**
- **CONFIG_SPIFFS_OBJ_NAME_LEN**
- **CONFIG_SPIFFS_META_LENGTH**
- **SPIFFS Cache Configuration**
- **CONFIG_SPIFFS_PAGE_SIZE**
- **CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**
- from 1 to 10

**Default value:**
- 3

**SPIFFS Cache Configuration**

Contains:
- **CONFIG_SPIFFS_CACHE**
CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration

Enables/disables memory read caching of nucleus file system operations.

Default value:
  • Yes (enabled)

CONFIG_SPIFFS_CACHE_WR

Enable SPIFFS Write Caching

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enables memory write caching for file descriptors in hydrogen.

Default value:
  • Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS

Enable SPIFFS Cache Statistics

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable/disable statistics on caching. Debug/test purpose only.

Default value:
  • No (disabled)

CONFIG_SPIFFS_PAGE_CHECK

Enable SPIFFS Page Check

Found in: Component config > SPIFFS Configuration

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:
  • Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS

Set Maximum GC Runs

Found in: Component config > SPIFFS Configuration

Define maximum number of GC runs to perform to reach desired free pages.

Range:
  • from 1 to 10000

Default value:
  • 10
**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- from 256 to 1024

**Default value:**
- 256

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- from 1 to 256

**Default value:**
- 32

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**
- 4

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**
- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

**Debug Configuration**

Contains:
- CONFIG_SPIFFS_DBG
- CONFIG_SPIFFS_API_DBG
- CONFIG_SPIFFS_CACHE_DBG
- CONFIG_SPIFFS_CHECK_DBG
- CONFIG_SPIFFS_TEST_VISUALISATION
- CONFIG_SPIFFS_GC_DBG
CONFIG_SPIFFS_DBG
Enable general SPIFFS debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print general debug messages to the console.

Default value:
- No (disabled)

CONFIG_SPIFFS_API_DBG
Enable SPIFFS API debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print API debug messages to the console.

Default value:
- No (disabled)

CONFIG_SPIFFS_GC_DBG
Enable SPIFFS Garbage Cleaner debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print GC debug messages to the console.

Default value:
- No (disabled)

CONFIG_SPIFFS_CACHE_DBG
Enable SPIFFS Cache debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print cache debug messages to the console.

Default value:
- No (disabled)

CONFIG_SPIFFS_CHECK_DBG
Enable SPIFFS Filesystem Check debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print Filesystem Check debug messages to the console.

Default value:
- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION
Enable SPIFFS Filesystem Visualization

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enable this option to enable SPIFFS_vis function in the API.

Default value:
- No (disabled)
Chapter 2. API Reference

TCP Transport

Contains:

• Websocket

Websocket

Contains:

• CONFIG_WS_TRANSPORT

CONFIG_WS_TRANSPORT

Enable Websocket Transport

Found in: Component config > TCP Transport > Websocket

Enable support for creating websocket transport.

Default value:

• Yes (enabled)

CONFIG_WS_BUFFER_SIZE

Websocket transport buffer size

Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:

• 1024

Ultra Low Power (ULP) Co-processor

Contains:

• CONFIG_ULP_COPROC_ENABLED

CONFIG_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Co-processor

Found in: Component config > Ultra Low Power (ULP) Co-processor

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

Default value:

• No (disabled)

CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V. Please note that ESP32 only supports ULP FSM.

Available options:

• ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
• ULP RISC-V (ULP_COPROC_TYPE_RISCV)
CONFIG_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

*Found in:* Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if CONFIG_ULP_COPROC_ENABLED

**Default value:**
- 512 if CONFIG_ULP_COPROC_ENABLED

Unity unit testing library Contains:

- CONFIGUNITY_ENABLE_COLOR
- CONFIGUNITY_ENABLE_IDF_TEST_RUNNER
- CONFIGUNITY_ENABLE_FIXTURE
- CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL
- CONFIGUNITY_ENABLE_64BIT
- CONFIGUNITY_ENABLE_DOUBLE
- CONFIGUNITY_ENABLE_FLOAT

CONFIGUNITY_ENABLE_FLOAT

Support for float type

*Found in:* Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIGUNITY_ENABLE_DOUBLE

Support for double type

*Found in:* Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIGUNITY_ENABLE_64BIT

Support for 64-bit integer types

*Found in:* Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)
CONFIG_UNITY_ENABLE_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

Virtual file system  Contains:

- CONFIG_VFS_SUPPORT_IO

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.
open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

Default value:
• Yes (enabled)

CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r,
seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Default value:
• Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT

Provide select function

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

Default value:
• Yes (enabled) if CONFIG_VFS_SUPPORT_IO && CONFIG_LWIP_USE_ONLY_LWIP_SELECT

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

Select() related functions might produce an unconventionally lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

Default value:
• Yes (enabled)
CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

Disabling this option can save memory when the support for termios.h is not required.

Default value:
- Yes (enabled)

Host File System I/O (Semihosting) Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS
- CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O
(Semihosting)

Define maximum number of host filesystem mount points.

Default value:
- 1

CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN

Host FS: Maximum path length for the host base directory

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O
(Semihosting)

Define maximum path length for the host base directory which is to be mounted. If host path passed to
esp_vfs_semihost_register() is longer than this value it will be truncated.

Default value:
- 128

Wear Levelling Contains:

- CONFIG_WL_SECTOR_MODE
- CONFIG_WL_SECTOR_SIZE

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

Found in: Component config > Wear Levelling

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash
device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is
used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted
filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory,
but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each
file opened).

Available options:
- 512 (WL_SECTOR_SIZE_512)
Chapter 2. API Reference

- 4096 (WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

*Available options:*
  - Performance (WL_SECTOR_MODE_PERF)
  - Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- CONFIG_WIFI_PROV_BLE_BONDING
- CONFIG_WIFI_PROV_BLE_SEC_CONN
- CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION
- CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
- CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

*Range:*
  - from 1 to 255

*Default value:*
  - 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

*Range:*
  - from 5 to 600

*Default value:*
  - 30

**CONFIG_WIFI_PROV_BLE_BONDING**
Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_WIFI_PROV_BLE_SEC_CONN**

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED`

**CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED`

**Supplicant**

Contains:

- `CONFIG_WPA_TESTING_OPTIONS`
- `CONFIG_WPA_11KV_SUPPORT`
- `CONFIG_WPA_DPP_SUPPORT`
- `CONFIG_WPA_MBO_SUPPORT`
- `CONFIG_WPA_SUITE_B_192`
- `CONFIG_WPA_WAPI_PSK`
- `CONFIG_WPA_DEBUG_PRINT`
- `CONFIG_WPA_WPS_STRICT`
- `CONFIG_WPA_MBEDTLS_CRYPTO`

**CONFIG_WPA_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**

- Yes (enabled)

**CONFIG_WPA_WAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)
**CONFIG_WPA_SUITE_B_192**

Enable NSA suite B support with 192 bit key

*Found in: Component config > Supplicant*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**
- No (disabled)

**CONFIG_WPA_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**
- No (disabled)

**CONFIG_WPA_TESTING_OPTIONS**

Add DPP testing code

*Found in: Component config > Supplicant*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

**CONFIG_WPA_WPS_STRICT**

Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**
- No (disabled)

**CONFIG_WPA_11KV_SUPPORT**

Enable 802.11k, 802.11v APIs handling

*Found in: Component config > Supplicant*

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)
CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

*Found in:* Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if `CONFIG_WPA_11KV_SUPPORT`

CONFIG_WPA_MBO_SUPPORT

Enable MBO support

*Found in:* Component config > Supplicant

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)

CONFIG_WPA_DPP_SUPPORT

Enable DPP support

*Found in:* Component config > Supplicant

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

**Deprecated options and their replacements**

- `CONFIG_A2DP_ENABLE` (*CONFIG_BT_A2DP_ENABLE*)

Chapter 2. API Reference

2.8 Provisioning API

2.8.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Transport Example (SoftAP + HTTP) with Security 1

For sample usage, see wifi_provisioning/src/scheme_softap.c
/* Session ID may be used for persistence */
printf("Session ID : %d", session_id);

/* Echo back the received data */
*outlen = inlen;
/* Output data length updated */
*outbuf = malloc(*inlen);
/* This will be deallocated outside */
memcpy(*outbuf, inbuf, inlen);

/* Private data that was passed at the time of endpoint creation */
uint32_t *priv = (uint32_t *) priv_data;
if (priv) {
    printf("Private data : %d", *priv);
}
return ESP_OK;

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid */
    /* throughout the scope of protocomm endpoint. This need not be */
    /* static, */
    /* ie. could be dynamically allocated and freed at the time of */
    /* endpoint */
    /* removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for */
    /* request handlers, setting security creates an endpoint and */
    /* registers */
    /* the handler provided by protocomm_security1. One can similarly use */
    /* protocomm_security0. Only one type of security can be set for a */
    /* protocomm instance at a time. */
    /* protocomm_set_security(pc, "security_endpoint", &protocomm_security1," */
    /* &pop_obj); */

    /* Private data passed to the endpoint must be valid throughout the */
    /* scope */
    /* of protocomm endpoint. This need not be static, ie. could be */
    /* dynamically */
    /* allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a */
    /* unique name */
* and register a handler function along with private data to be passed at the time of handler execution. Multiple endpoints can be added as long as they are identified by unique names */

```c
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, (void *) &priv_data);

return pc;
```

/* Example function for stopping a protocomm instance */

```c
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}
```

**Transport Example (BLE) with Security 0**

For sample usage, see [wifi_provisioning/src/scheme_ble.c](wifi_provisioning/src/scheme_ble.c)

```c
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
               * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80, 0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);

    (continues on next page)
```
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, _ NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

API Reference

Header File

• components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new(void)
Create a new protocomm instance.
This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t
structure initialized to NULL.

Return
• protocomm_t*: On success
• NULL: No memory for allocating new instance

void protocomm_delete(protocomm_t *pc)
Delete a protocomm instance.
This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters
• [in] pc: Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint(protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)
Add endpoint request handler for a protocomm instance.
This API will bind an endpoint handler function to the specified endpoint name, along with any private data
that needs to be passed to the handler at the time of call.

Note
• An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
• This function internally calls the registered add_endpoint() function of the selected transport
which is a member of the protocomm_t instance structure.

Return
• ESP_OK: Success
• ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_NO_MEM: Error allocating endpoint resource
• ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

Parameters
• [in] pc: Pointer to the protocomm instance
• [in] ep_name: Endpoint identifier(name) string
Chapter 2. API Reference

- [in] h: Endpoint handler function
- [in] priv_data: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**
- This function internally calls the registered remove_endpoint() function which is a member of the protocomm_t instance structure.

**Return**
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```

Allocates internal resources for new transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] session_id: Unique ID for a communication session

```c
esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)
```

Frees internal resources used by a transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] session_id: Unique ID for a communication session

```c
esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- Resulting output buffer must be deallocated by the caller.

**Return**
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] session_id: Unique ID for a communication session
• [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
• [in] inlen: Length of the input buffer
• [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
• [out] outlen: Buffer length of the allocated output buffer

```c
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**
- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

```c
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**
- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn’t exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

```c
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Version endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string
Chapter 2. API Reference

```c
esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)
```

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Return**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

**Type Definitions**

```c
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```c
typedef struct protocomm
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note** Structure of the protocomm object is kept private

**Header File**

- components/protocomm/include/security/protocomm_security.h

**Structures**

```c
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

**Public Members**

```c
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```c
uint16_t len
```

Length (in bytes) of the proof of possession data

**Public Members**

```c
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

**Public Members**

```c
int ver
```

Unique version number of security implementation

```c
esp_err_t (*init)(protocomm_security_handle_t *handle)
```

Function for initializing/allocating security infrastructure

```c
esp_err_t (*cleanup)(protocomm_security_handle_t handle)
```

Function for deallocating security infrastructure

```c
esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
```

Starts new secure transport session with specified ID
**API Reference**

*esp_err_t* (*close_transport_session*) (protocomm_security_handle_t handle, uint32_t session_id)

Closes a secure transport session with specified ID.

*esp_err_t* (*security_req_handler*) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session.

*esp_err_t* (*encrypt*) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the encryption algorithm.

*esp_err_t* (*decrypt*) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the decryption algorithm.

**Type Definitions**

typedef struct protocomm_security_pop protocomm_security_pop_t

Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t

Protocomm security object structure.

*Note* This structure should not have any dynamic members to allow re-entrancy.

**Header File**

- components/protocomm/include/security/protocomm_security0.h

**Header File**

- components/protocomm/include/security/protocomm_security1.h

**Header File**

- components/protocomm/include/transports/protocomm_httpd.h

**Functions**

*esp_err_t* protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

*Note* This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_SUPPORTED: Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE: Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM: Memory allocation for server resource failed
- ESP_ERR_HTTPD_*: HTTP server error on start

**Parameters**

- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server
```c
esp_err_t protocomm_httpd_stop (protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

**Parameters**

- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

**Unions**

```c
union protocomm_httpd_config_data_t
```

#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

**Public Members**

- void **handle**
  
  HTTP Server Handle, if ext_handle_provided is set to true

```c
struct protocomm_http_server_config_t
```

HTTP Server Configuration, if a server is not already active

**Structures**

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

- uint16_t **port**
  
  Port on which the HTTP server will listen

- size_t **stack_size**
  
  Stack size of server task, adjusted depending upon stack usage of endpoint handler

- unsigned **task_priority**
  
  Priority of server task

```c
struct protocomm_httpd_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

- bool **ext_handle_provided**
  
  Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

```c
protocomm_httpd_config_data_t **data**
```

Protocomm HTTPD Configuration Data

**Macros**

PROTOCOL_HTTPD_DEFAULT_CONFIG()

**Header File**

- components/protocomm/include/transports/protocomm_ble.h
Functions

```
esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
```
Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return
- ESP_OK: Success
- ESP_FAIL: Simple BLE start error
- ESP_ERR_NO_MEM: Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE: Error in ble config
- ESP_ERR_INVALID_ARG: Null arguments

Parameters
- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing BLE

```
esp_err_t protocomm_ble_stop (protocomm_t *pc)
```
Stop Bluetooth Low Energy based transport layer for provisioning.

Stop service/task responsible for BLE based interactions for provisioning

Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

Return
- ESP_OK: Success
- ESP_FAIL: Simple BLE stop error
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance

Parameters
- [in] pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

```
struct name_uuid
```
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

```
const char *name
```
Name of the handler, which is passed to protocomm layer

```
uint16_t uuid
```
UUID to be assigned to the BLE characteristic which is mapped to the handler

```
struct protocomm_ble_config
```
Config parameters for protocomm BLE service.

Public Members

```
char device_name[MAX_BLE_DEVNAME_LEN]
```
BLE device name being broadcast at the time of provisioning

```
uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
```
128 bit UUID of the provisioning service

```
uint8_t *manufacturer_data
```
BLE device manufacturer data pointer in advertisement

```
ssize_t manufacturer_data_len
```
BLE device manufacturer data length in advertisement
Chapter 2. API Reference

```c
ssize_t nu_lookup_count
   Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t *nu_lookup
   Pointer to the Name-UUID lookup table
```

### Macros

- **MAX_BLE_DEVNAME_LEN**
  
  BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

- **BLE_UUID128_VAL_LENGTH**
  
  Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes. However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

### Type Definitions

- **typedef struct name_uuid protocomm_ble_name_uuid_t**
  
  This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

- **typedef struct protocomm_ble_config protocomm_ble_config_t**
  
  Config parameters for protocomm BLE service.

## 2.8.2 Unified Provisioning

### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol:** The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. **Transport Flexibility:** The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. **Security Scheme Flexibility:** It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. **Compact Data Representation:** The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.
1. Transport specific discovery and connection

Some form of beaoning

Client connects

2. Session Establishment

Get Version Request

Get Version Response

Session Setup Request

Session Setup Response

One or multiple steps as per protocol

3. Configuration

App specific Set Config (optional)

Set Config Response (optional)

Wi-Fi SetConfig(SSID, Passphrase...)

Wi-Fi SetConfig response

Wi-Fi ApplyConfig cmd

Wi-Fi ApplyConfig resp

Wi-Fi GetStatus cmd (repeated)

Wi-Fi GetStatus resp (repeated)

4. Close connection

Close Connection
Chapter 2. API Reference

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.

4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases.

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called Protocol Communication (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi
configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- Android:
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.
Fig. 28: Security1

```
Client

Generate Key Pair
{cli_privkey, cli_pubkey} = curve25519_keygen()

SessionCmd0(cli_pubkey)

{dev_privkey, dev_pubkey} = curve25519_keygen()

dev_rand = gen_16byte_random()

shared_key(No PoP) = curve25519(dev_privkey, cli_pubkey)
shared_key(with PoP) = curve25519(dev_privkey, cli_pubkey) ^ SHA256(pop)

SessionResp0(dev_pubkey, dev_rand)

Shared Key

shared_key(No PoP) = curve25519(cli_privkey, dev_pubkey)
shared_key(with PoP) = curve25519(cli_privkey, dev_pubkey) ^ SHA256(pop)

Verification Token

cli_verify = aes_ctr_enc(key=shared_key, data=dev_pubkey, nonce=dev_rand)

SessionCmd1(cli_verify)

Verify Client

check (dev_pubkey == aes_ctr_dec(cli_verify...))

dev_verify = aes_ctr_enc(key=shared_key, data=cli_pubkey, nonce=(prev-context))

SessionResp1(dev_verify)

Verify Device

check (cli_pubkey == aes_ctr_dec(dev_verify...))
```

Espressif Systems 1311 Release v5.0-dev-2563-g45c1d1cba2
Submit Document Feedback
• iOS:
  – BLE Provisioning app on app store.
  – SoftAP Provisioning app on app Store.
  – Source code on GitHub: esp-idf-provisioning-ios.
• Linux/MacOS/Windows: tools/espruino (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.8.3 Wi-Fi Provisioning

#### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr_ APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

#### Initialization

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other wifi_prov_mgr_ APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
  .scheme = WIFI_PROV_SCHEME_BLE,
  .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands
- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
- **WIFI_PROV_EVENT_HANDLER_NONE** - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **app_event_handler** (Deprecated) - It is now recommended to catch `WIFI_PROV_EVENT`'s that are emitted to the default event loop handler. See definition of ``wifi_prov_cb_event_t`` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV:
                wifi_sta_config_t* wifi_sta_cfg = (wifi_sta_config_t*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials\nSSID : %s\nPassword : %s", wifi_sta_cfg->ssid, wifi_sta_cfg->password);
                break;
            case WIFI_PROV_CRED_FAIL:
                wifi_prov_sta_fail_reason_t* reason = (wifi_prov_sta_fail_reason_t*)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\nReason : %s\nPlease reset to factory and retry\naccess-point not found");
                break;
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
• main application must implement some logic to call esp_wifi_APIs for erasing the credentials at runtime
• main application must implement some logic to force start the provisioning irrespective of the provisioning state
```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

### Start Provisioning Service

At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plaintext communication. In this case the pop is simply ignored

See [Provisioning](#) for details about the security features.
```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

### Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.
```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```
The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`'s and call `:cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`.

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()` . This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocol endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: ```json:
```

Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocol sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocol security 0).
See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under protocomm/proto, which define the Protobuf message structures supported by prov-session endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of wifi_config commands, serialized as Protobuf messages (the corresponding .proto files can be found under wifi_provisioning/proto):

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during set_config and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the wifi_config commands described above. The wifi_scan endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - **group_channels** (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - **period_ms** (input) - Scan parameter specifying how long to wait on each channel
- **scan_status** - Gives the status of scanning process:
  - **scan_finished** (output) - When scan has finished this returns true
  - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- **scan_result** - For fetching scan results. This can be called even if scan is still on going
  - **start_index** (input) - Starting index from where to fetch the entries from the results list
  - **count** (input) - Number of entries to fetch from the starting index
  - **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

Additional Endpoints  In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_,
→key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
→custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.
One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see `provisioning/wifi_prov_mgr`

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.

- **Linux/MacOS/Windows:** `tools/esp_prov` (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

**API Reference**

**Header File**

- `components/wifi_provisioning/include/wifi_provisioning/manager.h`
**Functions**

`esp_err_t wifi_prov_mgr_init(wifi_prov_mgr_config_t config)`  
Initialize provisioning manager instance.

- Configures the manager and allocates internal resources
- Configuration specifies the provisioning scheme (transport) and event handlers
- Event WIFI_PROV_INIT is emitted right after initialization is complete

**Return**
- ESP_OK: Success
- ESP_FAIL: Fail

**Parameters**
- `[in] config`: Configuration structure

`void wifi_prov_mgr_deinit(void)`  
Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished
- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

`esp_err_t wifi_prov_mgr_is_provisioned(bool *provisioned)`  
Checks if device is provisioned.

- This checks if Wi-Fi credentials are present on the NVS
- The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component
- If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**
- ESP_OK: Retrieved provision state successfully
- ESP_FAIL: Wi-Fi not initialized
- ESP_ERR_INVALID_ARG: Null arguments supplied
- ESP_ERR_INVALID_STATE: Manager not initialized

**Parameters**
- `[out] provisioned`: True if provisioned, else false

`esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)`  
Start provisioning service.

- This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:
  - wifi_prov_scheme_ble: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
  - wifi_prov_scheme_softap: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

- Event WIFI_PROV_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

**Return**
- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

**Parameters**
• **[in] security**: Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages

• **[in]** pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session

• **[in]** service_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE

• **[in]** service_key: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning (void)
    Stop provisioning service.

    If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

    If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

    This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

    Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

    Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

    For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)
    Wait for provisioning service to finish.

    Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

    This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
    Disable auto stopping of provisioning service upon completion.

    By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

    This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

    **Note**: This must be called before executing wifi_prov_mgr_start_provisioning()

    **Return**
    - ESP_OK : Success
    - ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

    **Parameters**
    - **[in]** cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.
**esp_err_t wifi_prov_mgr_set_app_info** (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM : Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**
- [in] label: String indicating the application name.
- [in] version: String indicating the application version. There is no constraint on format.
- [in] capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] total_capabilities: Size of capabilities array

**esp_err_t wifi_prov_mgr_endpoint_create** (const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**
- [in] ep_name: unique name of the endpoint

**esp_err_t wifi_prov_mgr_endpoint_register** (const char *ep_name, proto_comm_req_handler_t handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**
- [in] ep_name: Name of the endpoint
void wifi_prov_mgr_endpoint_unregister (const char * ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters

- [in] ep_name: Name of the endpoint

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t * state)

Get state of Wi-Fi Station during provisioning.

Return

- ESP_OK: Successfully retrieved Wi-Fi state
- ESP_FAIL: Provisioning app not running

Parameters

- [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Return

- ESP_OK: Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL: Provisioning app not running

Parameters

- [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t * wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_prov_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Return

- ESP_OK: Wi-Fi configured and started successfully
- ESP_FAIL: Failed to set configuration

Parameters

- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

esp_err_t wifi_prov_mgr_reset_provisioning (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Return

- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

Return

- ESP_OK: Reset provisioning state machine successfully
Chapter 2. API Reference

- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

```c
struct wifi_prov_event_handler_t
Event handler that is used by the manager while provisioning service is active.
```

Public Members

```c
wifi_prov_cb_func_t event_cb
Callback function to be executed on provisioning events
```

```c
void *user_data
User context data to pass as parameter to callback function
```

```c
struct wifi_prov_scheme
Structure for specifying the provisioning scheme to be followed by the manager.
```

Note: Ready to use schemes are available:
- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

Public Members

```c
esp_err_t (*prov_start)(protocomm_t *pc, void *config)
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration
```

```c
esp_err_t (*prov_stop)(protocomm_t *pc)
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
```

```c
void (*new_config)(void)
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()
```

```c
void (*delete_config)(void *config)
Function which is to be called by the manager to delete a configuration generated using new_config()
```

```c
esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure
```

```c
esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure
```

```c
wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning This is set to :
- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport
```

```c
struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.
```
Public Members

`wifi_prov_scheme_t scheme`

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

`wifi_prov_event_handler_t scheme_event_handler`

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

`wifi_prov_event_handler_t app_event_handler`

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

Macros

`WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

Type Definitions

`typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)`

`typedef struct wifi_prov_scheme wifi_prov_scheme_t`

Structure for specifying the provisioning scheme to be followed by the manager.

Note

Ready to use schemes are available:

- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

`typedef enum wifi_prov_security wifi_prov_security_t`

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Enumerations

`enum wifi_prov_cb_event_t`

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

`WIFI_PROV_INIT`

Emitted when the manager is initialized

`WIFI_PROV_START`

Indicates that provisioning has started

`WIFI_PROV_CRED_RECV`

Emitted when Wi-Fi AP credentials are received via protocomm endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure
WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t.

WIFI_PROV_CRED_SUCCESS
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV.

WIFI_PROV_END
Signals that provisioning service has stopped.

WIFI_PROV_DEINIT
Signals that manager has been de-initialized.

enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

Values:

WIFI_PROV_SECURITY_0 = 0
No security (plain-text communication)

WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
• proof of possession (pop) based authentication
• AES-CTR encryption

Header File
• components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions

void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov Scheme_BLE_set Service_uuid (uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

Note: The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

Return
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : Null argument

Parameters
• [in] uuid128: A custom 128 bit UUID

esp_err_t wifi_prov_scheme_ble_set_mfg_data (uint8_t *mfg_data, ssize_t mfg_data_len)
Set manufacturer specific data in scan response.
This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning().
Note  It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. (mfg_data_len + 2) < 31 - (device_name_length + 2 ). If the mfg_data length exceeds this limit, the length will be truncated.

Return
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Parameters
- [in] mfg_data: Custom manufacturer data
- [in] mfg_data_len: Manufacturer data length

Macros
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File
- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions
void wifi_prov_scheme_softap_set_httpd_handle (void *handle)
Provide HTTPD Server handle externally.
Useful in cases wherein applications need the webservice for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note  This API should be called before wifi_prov_mgr_start_provisioning()

Parameters
- [in] handle: Handle to HTTPD server instance

Header File
- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File
- components/wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions
esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
Handler for receiving and responding to requests from master.
This is to be registered as the wifi_config endpoint handler (protocomm proto-comm_req_handler_t) using protocomm_add_endpoint()

Structures
struct wifi_prov_sta_conn_info_t
WiFi STA connected status information.
Public Members

char ip_addr[IP4ADDR_STRLEN_MAX]
IP Address received by station

char bssid[6]
BSSID of the AP to which connection was established

char ssid[33]
SSID of the to which connection was established

uint8_t channel
Channel of the AP

uint8_t auth_mode
Authorization mode of the AP

struct wifi_prov_config_get_data_t
WiFi status data to be sent in response to get_status request from master.

Public Members

wifi_prov_sta_state_t wifi_state
WiFi state of the station

wifi_prov_sta_fail_reason_t fail_reason
Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)

wifi_prov_sta_conn_info_t conn_info
Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

struct wifi_prov_config_set_data_t
WiFi config data received by slave during set_config request from master.

Public Members

char ssid[33]
SSID of the AP to which the slave is to be connected

char password[64]
Password of the AP

char bssid[6]
BSSID of the AP

uint8_t channel
Channel of the AP

struct wifi_prov_config_handlers
Internal handlers for receiving and responding to protocol requests from master.
This is to be passed as priv_data for protocol request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifiProvCtx_t **ctx)
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values
**esp_err_t** (*apply_config_handler*) (**wifi_prov_ctx_t** **ctx**)  
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

**wifi_prov_ctx_t** **ctx**  
Context pointer to be passed to above handler functions upon invocation

### Type Definitions

**typedef struct wifi_prov_ctx wifi_prov_ctx_t**  
Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.

**typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t**  
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

**enum wifi_prov_sta_state_t**  
WiFi STA status for conveying back to the provisioning master.

Values:

- **WIFI_PROV_STA_CONNECTING**
- **WIFI_PROV_STA_CONNECTED**
- **WIFI_PROV_STA_DISCONNECTED**

**enum wifi_prov_sta_fail_reason_t**  
WiFi STA connection fail reason.

Values:

- **WIFI_PROV_STA_AUTH_ERROR**
- **WIFI_PROV_STA_AP_NOT_FOUND**

Code examples for above API are provided in the `provisioning` directory of ESP-IDF examples.

Code example for above API is provided in `wifi/smart_config`.

Code example for above API is provided in `wifi/wifi_easy_connect/dpp-enrollee`.

### 2.9 Storage API

#### 2.9.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.
Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.

The function esp_vfs_fat_unregister_path() deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with esp_vfs_fat_ functions:

1. Call esp_vfs_fat_register() to specify:
   • Path prefix where to mount the filesystem (e.g. "/sdcard", "/spiflash")
   • FatFs drive number
   • A variable which will receive the pointer to the FATFS structure
2. Call ff_diskio_register() to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function f_mount, and optionally f_fdisk, f_mkfs, to mount the filesystem using the same drive number which was passed to esp_vfs_fat_register(). For more information, see FatFs documentation.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to esp_vfs_register() (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the CONFIG_FATFS_LONG_FILENAMES option. More details on the FatFs filenames are available here.
5. Optionally, by enabling the option CONFIG_FATFS_USE_FASTSEEK, use the POSIX lseek function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").
7. Close all open files.
8. Call the FatFs function f_mount for the same drive number, with NULL FATFS* argument, to unmount the filesystem.
9. Call the FatFs function ff_diskio_register() with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.
10. Call esp_vfs_fat_unregister_path() with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions esp_vfs_fat_sdmmc_mount, esp_vfs_fat_sdspi_mount and esp_vfs_fat_sdcard_unmount wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

esp_err_t esp_vfs_fat_register(const char* base_path, const char* fat_drive, size_t max_files, FATFS** out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

Note This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Return

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
• ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

Parameters

• base_path: path prefix where FATFS should be registered
• fat_drive: FATFS drive specification; if only one drive is used, can be an empty string
• max_files: maximum number of files which can be open at the same time
• [out] out_fs: pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.
Esp_err_t esp_vfs_fat_unregister_path(const char *base_path)

Un-register FATFS from VFS.

Note FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

Parameters
- base_path: path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called.

Using FatFs with VFS and SD cards

The header file fatfs/vfs/esp_vfs_fat.h defines convenience functions esp_vfs_fat_sdmmc_mount(), esp_vfs_fat_sdspi_mount() and esp_vfs_fat_sdcardUnmount(). These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function esp_vfs_fat_sdmmcUnmount() unmounts the filesystem and releases the resources acquired by esp_vfs_fat_sdmmc_mount().

Esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note Use this API to mount a card through SDPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters
- base_path: path where partition should be registered (e.g. “/sdcard”)
- host_config: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- slot_config: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT(). (Deprecated) For SPI peripheral, pass a pointer to sdspi_slot_config_t structure initialized using SD_SPI_SLOT_CONFIG_DEFAULT().
- mount_config: pointer to structure with extra parameters for mounting FATFS
- [out] out_card: if not NULL, pointer to the card information structure will be returned via this argument
**esp_err_t esp_vfs_fat_sdmmc_unmount** (void)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

**esp_err_t esp_vfs_fat_sdspi_mount** (const char *base_path, const sdmmc_host_t *host_config_input, const sdspi_device_config_t *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**Parameters**
- **base_path**: path where partition should be registered (e.g. “/sdcard”)
- **host_config_input**: Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config**: Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to sdspi_device_config_t structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
- **mount_config**: pointer to structure with extra parameters for mounting FATFS
- **[out] out_card**: If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

**struct esp_vfs_fat_mount_config_t**
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

**Public Members**

- **bool format_if_mount_failed**
  If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

- **int max_files**
  Max number of open files.

- **size_t allocation_unit_size**
  If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_llevelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.
Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```c
esp_err_t esp_vfs_fat_sdcard_unmount(const char *base_path, sdmmc_card_t *card)
```

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn’t been called

### Using FatFs with VFS in read-only mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflash_unmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```c
esp_err_t esp_vfs_fat_spiflash_mount_ro(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_ro` was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**
- `base_path`: path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS

```c
esp_err_t esp_vfs_fat_spiflash_unmount_ro(const char *base_path, const char *partition_label)
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_ro()`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_rw wl` hasn’t been called

**Parameters**
- `base_path`: path where partition should be registered (e.g. “/spiflash”)
- `partition_label`: label of partition to be unmounted

### FatFS disk I/O layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.
They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function \texttt{ff_diskio_register_sdmmc}.

\textbf{void ff_diskio_register} (BYTE pdrv, \textbf{const ff_diskio_impl_t *} discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

\textbf{Parameters}

- \texttt{pdrv}: drive number
- \texttt{discio_impl}: pointer to \texttt{ff_diskio_impl_t} structure with diskio functions or NULL to unregister and free previously registered drive

\textbf{struct ff_diskio_impl_t}

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

\textbf{Public Members}

\textbf{DSTATUS (*init)(unsigned char pdrv)}

disk initialization function

\textbf{DSTATUS (*status)(unsigned char pdrv)}

disk status check function

\textbf{DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)}

sector read function

\textbf{DRESULT (*write)(unsigned char pdrv, \textbf{const unsigned char *} buff, uint32_t sector, unsigned count)}

sector write function

\textbf{DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)}

function to get info about disk and do some misc operations

\textbf{void ff_diskio_register_sdmmc} (unsigned char pdrv, \texttt{sdmmc_card_t *} card)

Register SD/MMC diskio driver

\textbf{Parameters}

- \texttt{pdrv}: drive number
- \texttt{card}: pointer to \texttt{sdmmc_card_t} structure describing a card; card should be initialized before calling \texttt{f_mount}.

\textbf{esp_err_t ff_diskio_register_wl_partition} (unsigned char pdrv, \texttt{wl_handle_t} flash_handle)

Register spi flash partition

\textbf{Parameters}

- \texttt{pdrv}: drive number
- \texttt{flash_handle}: handle of the wear levelling partition.

\textbf{esp_err_t ff_diskio_register_raw_partition} (unsigned char pdrv, \textbf{const esp_partition_t *} part_handle)

Register spi flash partition

\textbf{Parameters}

- \texttt{pdrv}: drive number
- \texttt{part_handle}: pointer to raw flash partition.

\textbf{FATFS partition generator}

We provide a partition generator for FATFS (\texttt{wl_fatfsgen.py}) which is integrated into the build system and could be easily used in the user project.
Chapter 2. API Reference

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.

The script is based on the partition generator (fatfsgen.py) and except for generating partition also initializes wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters, and can contain multiple period ("." ) characters within the filename and additional characters "+", "", ":", "=" and also "]". The long files name characters are encoded using utf-16, on the contrary to short file names encoded using utf-8.

**Build system integration with FATFS partition generator**

It is possible to invoke FATFS generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```python
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support you can use `fatfs_create_rawflash_image`:

```python
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project’s CMakeLists.txt.

If you decided because of any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. partition - the name of the partition as defined in the partition table (e.g. storage/fatfsgen/partitions_example.csv).
2. base_dir - the directory that will be encoded to FATFS partition and optionally flashed into the device. Beware that you have to specified suitable size of the partition in the partition table.
3. flag FLASH_IN_PROJECT - optionally, user can opt to have the image automatically flashed together with the appbinaries, partition tables, etc. on idf.py flash -p <PORT> by specifying FLASH_IN_PROJECT.

For example:

```python
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py or a custom build system target.

For an example, see storage/fatfsgen.

### 2.9.2 Manufacturing Utility

**Introduction**

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only). Just download it, unzip, and follow the instructions inside the doc folder.
- Direct flash programming using custom production tools.
Chapter 2. API Reference

Prerequisites

This utility is dependent on esp-idf’s NVS partition utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
- You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,  <!-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the *namespace* entry.

Each line should have three parameters: *key, type, encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
appl,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

- before and after ‘,’
- at the end of each line in a CSV file
Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

key1,key2,key3,.....
value1,value2,value3,.....

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, -help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>
Chapter 2. API Reference

Commands:

Run mfg_gen.py {command} -h for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

To generate factory images for each device (Default):

Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
[--keyfile KEYFILE] [--inputkey INPUTKEY]
[--outdir OUTDIR]
conf values prefix size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--fileid</td>
<td>Unique file identifier(any key in values file) for each filename suffix (Default: numeric value(1,2,3...))</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen
```
Chapter 2. API Reference

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created. This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to **NVS key partition** for more details.

- Encrypt by providing the encryption keys as input binary file:

  ```bash
  python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
  ```

To generate only encryption keys:

Usage:: python mfg_gen.py generate-key [-h] [-keyfile KEYFILE] [-outdir OUTDIR]

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>-keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```bash
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`. To provide custom target filename use the `--keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

### 2.9.3 Non-volatile storage library

**Introduction**

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying storage** Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.
**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

**Keys and values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- **integer types:** uint8_t, int8_t, uint16_t, int16_t, uint32_t, int32_t, uint64_t, int64_t
- zero-terminated string
- variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as float and double might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the nvs_open() or nvs_open_from_partition call. This call returns an opaque handle, which is used in subsequent calls to the nvs_get_* , nvs_set_* , and nvs_commit() functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- nvs_entry_find() returns an opaque handle, which is used in subsequent calls to the nvs_entry_next() and nvs_entry_info() functions.
- nvs_entry_next() returns iterator to the next key-value pair.
- nvs_entry_info() returns information about each key-value pair

If none or no other key-value pair was found for given criteria, nvs_entry_find() and nvs_entry_next() return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function nvs_release_iterator().

**Security, tampering, and robustness** NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.
Chapter 2. API Reference

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as sector-number. The NVS Encryption can be enabled by enabling CONFIG_NVS_ENCRYPTION. The keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when Flash Encryption is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the NVS key partition. Two partition tables containing the NVS key partition are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (idf.py menuconfig). Please refer to the example security/flash_encryption for how to configure and use NVS encryption feature.

NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted and its size should be the minimum partition size (4KB). Refer to Partition Tables for more details. Two additional partition tables which contain the NVS key partition are provided under the partition table option (menuconfig->Partition Table). They can be directly used for NVS Encryption. The structure of these partitions is depicted below.

```
+---------------------------------------------+
| XTS encryption key (32)                    |
|---------------------------------------------+
| XTS tweak key (32)                         |
|---------------------------------------------+
| CRC32 (4)                                  |
+---------------------------------------------+
```

The XTS encryption keys in the NVS key partition can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:
   When NVS encryption is enabled the nvs_flash_init() API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first NVS key partition. Then the API function automatically generates and stores the NVS keys in that partition by making use of the nvs_flash_generate_keys() API function provided by nvs_flash/include/nvs_flash.h. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of nvs_flash_secure_init_partition(). The API functions nvs_flash_secure_init() and nvs_flash_secure_init_partition() do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the nvs_flash_generate_keys() API function provided by nvs_flash.h. The API function will then write those keys onto the key-partition in encrypted form.

2. Use pre-generated key partition:
   This option will be required by the user when keys in the NVS key partition are not generated by the application. The NVS key partition containing the XTS encryption keys can be generated with the
help of **NVS Partition Generator Utility**. Then the user can store the pre generated key partition on
the flash with help of the following two commands:

i) Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

ii) Store the keys in the **NVS key partition** (on the flash) with the help of `parttool.py` (see Partition
Tool section in `partition-tables` for more details)

```
parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_-partition offset" write_partition --partition-name="name of nvs_key_-partition" --input "nvs_key partition"
```

Since the key partition is marked as *encrypted* and **Flash Encryption** is enabled, the bootloader will encrypt this
partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-
partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of
encryption/decryption.

**Encrypted Read/Write**    The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of,
and writing to an encrypted nvs partition as well.

**Encrypt the default NVS partition:** To enable encryption for the default NVS partition no additional steps are
necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally per-
forms some additional steps using the first **NVS key partition** found to enable encryption for the default NVS partition
(refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function
also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition:** To enable encryption for a custom NVS par-
tition, `nvs_flash_secure_init_partition()` API function is used instead of
`nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are
used, the applications are expected to follow the steps below in order to perform NVS read/write operations with
encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a
flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details,
please refer to **NVS Partition Generator Utility**.

**Application Example**

You can find code examples in the `storage` directory of ESP-IDF examples:

```
storage/nvs_rw_value
```

Demonstrates how to read a single integer value from, and write it to NVS.
The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

**storage/nvs_rwlock_blob**

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- value - tracks the number of the ESP32 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

**storage/nvs_rwlock_value_cxx**

This example does exactly the same as **storage/nvs_rwlock_value**, except that it uses the C++ NVS handle class.

**Internals**

**Log of key-value pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

- **Empty/Uninitialized** Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.
- **Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.
- **Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.
- **Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.
- **Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

![Sequence number diagram](continues_on_next_page)
Chapter 2. API Reference

Structure of a page  For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xef for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2’b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2’b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2’b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.
Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The **Span** field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.
Item hash list  To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, Page::findItem first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- components/nvs_flash/include/nvs_flash.h

Functions

```c
esp_err_t nvs_flash_init (void)
```

Initialize the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

1. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
2. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
3. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Return

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

```c
esp_err_t nvs_flash_init_partition (const char *partition_label)
```

Initialize NVS flash storage for the specified partition.

Return

- ESP_OK if storage was successfully initialized.
Chapter 2. API Reference

- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters
- [in] partition_label: Label of the partition. Must be no longer than 16 characters.

`esp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

Return
- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters
- [in] partition: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_deinit(void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Return
- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition(const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

Return
- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

Parameters
- [in] partition_label: Label of the partition

`esp_err_t nvs_flash_erase(void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)

`esp_err_t nvs_flash_erase_partition(const char *part_name)`

Erase specified NVS partition.

Erase all content of a specified NVS partition

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

Parameters
- [in] part_name: Name (label) of the partition which should be erased
**Chapter 2. API Reference**

**esp_err_t nvs_flash_erase_partition_ptr(const esp_partition_t *partition)**

Erase custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**
- **[in]** partition: pointer to a partition obtained by the ESP partition API.

**esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)**

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**
- **[in]** cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

**esp_err_t nvs_flash_secure_init_partition (const char *partition_label, nvs_sec_cfg_t *cfg)**

Initialize NVS flash storage for the specified partition.

**Return**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**
- **[in]** partition_label: Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **[in]** cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption/decryption is used.

**esp_err_t nvs_flash_generate_keys (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)**

Generate and store NVS keys in the provided esp partition.

**Return**
- ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from esp_partition_write/erase APIs.

**Parameters**
- **[in]** partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **[out]** cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**esp_err_t nvs_flash_read_security_cfg (const esp_partition_t * partition, nvs_sec_cfg_t *cfg)**

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked ‘encrypted’.
Return -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt - or error codes from esp_partition_read API.

Parameters
• [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures
struct nvs_sec_cfg_t
Key for encryption and decryption.

Public Members
uint8_t eky[NVS_KEY_SIZE]
XTS encryption and decryption key
uint8_t tky[NVS_KEY_SIZE]
XTS tweak key

Macros
NVS_KEY_SIZE

Header File
• components/nvs_flash/include/nvs.h

Functions
esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)
set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called.

Return
• ESP_OK if value was set successfully
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

Parameters
• [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
• [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
• [in] value: The value to set.

esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
set uint8_t value for given key

This function is the same as nvs_set_i8 except for the data type.
Chapter 2. API Reference

```c
esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)
```

Set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

**Return**
- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

**Parameters**
- [in] handle: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

```c
esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)
```

Get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.

Return

- ESP_OK if the value was retrieved successfully
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

- [in] handle: Handle obtained from nvs_open function.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
get uint8_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
get int16_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
get uint16_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
get int32_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
get uint32_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
get int64_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
get uint64_t value for given key
This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)
get string value for given key
These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.
In case of any error, out_value is not modified.
All functions expect out_value to be a pointer to an already allocated variable of the given type.
nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable
pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero
terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and
has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated
C strings, and nvs_get/set_blob used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

**Return**
- ESP_OK if the value was retrieved successfully
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

**Parameters**
- `[in] handle`: Handle obtained from nvs_open function.
- `[in] key`: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `[out] out_value`: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- `[inout] length`: A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char* key, void* out_value, size_t* length)
```

This function behaves the same as nvs_get_str, except for the data type.

```c
esp_err_t nvs_open(const char* name, nvs_open_mode_t open_mode, nvs_handle_t* out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition. Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

**Return**
- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

**Parameters**
- `[in] name`: Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `[in] open_mode`: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `[out] out_handle`: If successful (return code is zero), handle will be returned in this argument.

```c
esp_err_t nvs_open_from_partition(const char* part_name, const char* name, nvs_open_mode_t open_mode, nvs_handle_t* out_handle)
```
Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

Return
- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NVS_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

Parameters
- [in] part_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out_handle: If successful (return code is zero), handle will be returned in this argument.

```
esp_err_t nvs_set_blob(nvs_handle_t handle, const char* key, const void* value, size_t length)
```

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

Return
- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

Parameters
- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set.
- [in] length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

```
esp_err_t nvs_erase_key(nvs_handle_t handle, const char* key)
```

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

Return
- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

Parameters
- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
• [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

**esp_err_t** nvs_erase_all (nvs_handle_t handle)
Erase all key-value pairs in a namespace.
Note that actual storage may not be updated until nvs_commit function is called.

**Return**
• ESP_OK if erase operation was successful
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if handle was opened as read only
• other error codes from the underlying storage driver

**Parameters**
• [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**esp_err_t** nvs_commit (nvs_handle_t handle)
Write any pending changes to non-volatile storage.
After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**
• ESP_OK if the changes have been written successfully
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• other error codes from the underlying storage driver

**Parameters**
• [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**void** nvs_close (nvs_handle_t handle)
Close the storage handle and free any allocated resources.
This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**
• [in] handle: Storage handle to close

**esp_err_t** nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)
Fill structure nvs_stats_t. It provides info about used memory the partition.
This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free_entries:
Nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
       nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
```

**Return**
• ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
• ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
• ESP_ERR_NVS_INVALID_ARG if nvs_stats equal to NULL.
• ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

Parameters
• [in] part_name: Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
• [out] nvs_stats: Returns filled structure nvs_states_t. It provides info about used memory the partition.

 esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t* used_entries)
Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs...in one namespace:

nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

Return
• ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
• ESP_ERR_INVALID_ARG if used_entries equal to NULL.
• Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

Parameters
• [in] handle: Handle obtained from nvs_open function.
• [out] used_entries: Returns amount of used entries from a namespace.

 nvs_iterator_t nvs_entry_find (const char *part_name, const char *namespace_name, nvs_type_t type)
Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified...partition and namespace

nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
}
```

// Note: no need to release iterator obtained from nvs_entry_find function when // nvs_entry_find or nvs_entry_next function return NULL, indicating no...other

// element for specified criteria was found.
```

Return Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using nvs_release_iterator when not used any
more.

Parameters
- **[in]** `part_name`: Partition name
- **[in]** `namespace_name`: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **[in]** `type`: One of `nvs_type_t` values.

`nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)`
Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Return NULL if no entry was found, valid `nvs_iterator_t` otherwise.

Parameters
- **[in]** `iterator`: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

`void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)`
Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

Parameters
- **[in]** `iterator`: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- **[out]** `out_info`: Structure to which entry information is copied.

`void nvs_release_iterator (nvs_iterator_t iterator)`
Release iterator.

Parameters
- **[in]** `iterator`: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

Structures

**struct nvs_entry_info_t**
Information about entry obtained from `nvs_entry_info` function

Public Members

- `char namespace_name[16]`
  Namespace to which key-value belong
- `char key[NVS_KEY_NAME_MAX_SIZE]`
  Key of stored key-value pair
- `nvs_type_t type`
  Type of stored key-value pair

**struct nvs_stats_t**
Note Info about storage space NVS.

Public Members

- `size_t used_entries`
  Amount of used entries.
- `size_t free_entries`
  Amount of free entries.
- `size_t total_entries`
  Amount all available entries.
- `size_t namespace_count`
  Amount name space.
Macros

ESP_ERR_NVS_BASE
Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED
The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND
Id namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH
The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY
Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE
There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME
Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE
Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
Key name is too long

ESP_ERR_NVS_PAGE_FULL
Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
String or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version
Chapter 2. API Reference

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE
Maximal length of NVS key name (including null terminator)

Type Definitions
typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations
enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:

NVS_READONLY
Read only

NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.

Values:

NVS_TYPE_U8 = 0x01
Type uint8_t

NVS_TYPE_I8 = 0x11
Type int8_t

NVS_TYPE_U16 = 0x02
Type uint16_t

NVS_TYPE_I16 = 0x12
Type int16_t

NVS_TYPE_U32 = 0x04
Type uint32_t

NVS_TYPE_I32 = 0x14
Type int32_t
2.9.4 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in `requirements.txt` in the root of the esp-idf directory.

CSV file format

Each line of a `.csv` file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64 and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value.</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace is fixed and is not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>
Note: The first line of the CSV file should be the column header and it is not configurable. Comments (if provided) are allowed only as the first line of the CSV file, the following line then should always be the column header. Comments should always start with the # symbol.

Below is an example dump of such a CSV file:

```
key,type,encoding,value     <-- column header
namespace_name,namespace,,   <-- First entry should be of type "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

Note:
Make sure there are no spaces:
• before and after ,
• at the end of each line in a CSV file

NVS Entry and Namespace association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of entry. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:
++-----------------------------------------------++
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
++-----------------------------------------------++

(continues on next page)
To generate NVS partition (Default):

Usage:

```bash
python nvs_partition_gen.py generate [-h] [--version (1,2)] [--outdir --OUTDIR] input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

(continues on next page)
You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen
```

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

### To generate only encryption keys:

#### Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created.</td>
</tr>
<tr>
<td></td>
<td>(Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:
To generate encrypted NVS partition:

Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                        [-IINPUTKEY]
                        [--file KEYFILE] [-input]
                        [-outdir OUTDIR]
                        input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version.</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled.</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled.</td>
</tr>
<tr>
<td></td>
<td>Default: Version 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
</tbody>
</table>

(continues on next page)
This newly created file having encryption keys in:

Note:
Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
--0x3000 --keygen --keyfile sample_keys.bin

Note: Encryption key of the following format <outdir>/keys/sample_keys.bin is created.

Note: This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to NVS key partition for more details.

- Encrypt by providing the encryption keys as input binary file:

python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
--0x3000 --inputkey sample_keys.bin

To decrypt encrypted NVS partition:

Usage:

python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key
--output

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
</tbody>
</table>
When flashing the binary onto the device, make sure it is consistent with the application. 

Note: Minimum NVS Partition Size needed is 0x3000 bytes.

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**Multipage Blob Support Enabled (Version 2):** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** Minimum NVS Partition Size needed is 0x3000 bytes.

**Note:** When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.

- Utility supports using multiline strings with file type and singleline strings with data type in the CSV file.
- 64-bit datatype is not yet supported.

### 2.9.5 SD/SDIO/MMC Driver

#### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (driver/include/driver/sdmmc_host.h and driver/include/driver/sdspi_host.h) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see SDMMC Host API
- SD SPI host, see SD SPI Host API

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the sdmmc_host_t structure. This structure contains pointers to various functions of the host.

#### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the storage/sd_card directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

#### Combo (memory + IO) cards

The driver does not support SD combo cards. Combo cards are treated as IO cards.

#### Thread safety

Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the sdmmc_card_t structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

#### Protocol layer API

The protocol layer is given the sdmmc_host_t structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the sdmmc_card_t structure. When sending commands to the SD/MMC host driver, the protocol layer uses the sdmmc_command_t structure to describe the command, arguments, expected return values, and data to transfer if there is any.

#### Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., sdmmc_host_init(), sdmmc_host_init_slot().
2. To initialize the card, call sdmmc_card_init() and pass to it the parameters host - the host driver information, and card - a pointer to the structure sdmmc_card_t which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.

4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

**Using API with eMMC chips** From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

**Using API with SDIO cards** Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See ESP Serial Slave Link and example peripherals/sdio/host.

**API Reference**

**Header File**

- `components/sdmmc/include/sdmmc_cmd.h`

**Functions**

```c
esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)
```

Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Return**
• ESP_OK on success
• One of the error codes from SDMMC host controller

**Parameters**
• `host`: pointer to structure defining host controller
• `out_card`: pointer to structure which will receive information about the card when the function completes

```c
void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)
```

Print information about the card to a stream.

**Parameters**
• `stream`: stream obtained using fopen or fdopen
• `card`: card information structure initialized using sdmmc_card_init

```c
esp_err_t sdmmc_get_status (sdmmc_card_t *card)
```

Get status of SD/MMC card

**Return**
• ESP_OK on success
• One of the error codes from SDMMC host controller

**Parameters**
• `card`: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```

Write given number of sectors to SD/MMC card

**Return**
• ESP_OK on success
• One of the error codes from SDMMC host controller

**Parameters**
• `card`: pointer to card information structure previously initialized using sdmmc_card_init
• `src`: pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
• `start_sector`: sector where to start writing
• `sector_count`: number of sectors to write

```c
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```

Read given number of sectors from the SD/MMC card

**Return**
• ESP_OK on success
• One of the error codes from SDMMC host controller

**Parameters**
• `card`: pointer to card information structure previously initialized using sdmmc_card_init
• `dst`: pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
• `start_sector`: sector where to start reading
• `sector_count`: number of sectors to read

```c
esp_err_t sdmmc_erase_sectors (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
```

Erase given number of sectors from the SD/MMC card

**Note** When sdmmc_erase_sectors used with cards in SDSPi mode, it was observed that card requires re-init after erase operation.

**Return**
• ESP_OK on success
• One of the error codes from SDMMC host controller

**Parameters**
• `card`: pointer to card information structure previously initialized using sdmmc_card_init
• `start_sector`: sector where to start erase
• `sector_count`: number of sectors to erase
Chapter 2. API Reference

- **arg**: erase command (CMD38) argument

```c
esp_err_t sdmmc_can_discard(sdmmc_card_t *card)
```
Check if SD/MMC card supports discard

**Return**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_can_trim(sdmmc_card_t *card)
```
Check if SD/MMC card supports trim

**Return**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_mmc_can_sanitize(sdmmc_card_t *card)
```
Check if SD/MMC card supports sanitize

**Return**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_mmc_sanitize(sdmmc_card_t *card, uint32_t timeout_ms)
```
Sanitize the data that was unmapped by a Discard command

**Note**
Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with sdmmc_erase_sectors argument

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ms**: timeout value in milliseconds required to sanitize the selected range of sectors.

```c
esp_err_t sdmmc_full_erase(sdmmc_card_t *card)
```
Erase complete SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```
Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **reg**: byte address within IO function
- **[out] out_byte**: output, receives the value read from the card
esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- reg: byte address within IO function
- in_byte: value to be written
- [out] out_byte: if not NULL, receives new byte value read from the card (read-after-write).

esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where reading starts
- dst: buffer which receives the data read from card
- size: number of bytes to read

esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- src: data to be written
- size: number of bytes to write

esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
Chapter 2. API Reference

- **addr**: byte address within IO function where writing starts
- **dst**: buffer which receives the data read from card
- **size**: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_write_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **addr**: byte address within IO function where writing starts
- **src**: data to be written
- **size**: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_enable_int(sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_io_wait_int(sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Return**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ticks**: time to wait for the interrupt, in RTOS ticks

```c
esp_err_t sdmmc_io_get_cis_data(sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Return**
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc_io_read_bytes

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer**: Output buffer of the CIS data
- **buffer_size**: Size of the buffer.
Chapter 2. API Reference

- **inout_cis_size**: Mandatory, pointer to a size, input and output.
  - **input**: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - **output**: The size required to store all the CIS data, if CIS_CODE_END is found.

```c
esp_err_t sdmmc_io_print_cis_info(uint8_t *buffer, size_t buffer_size, FILE *fp)
```

 Parse and print the CIS information of an SDIO card.

**Note** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

**Return**
- **ESP_OK**: on success
- **ESP_ERR_NOT_SUPPORTED**: if the value from the card is not supported to be parsed.
- **ESP_ERR_INVALID_SIZE**: if the CIS size fields are not correct.

**Parameters**
- **buffer**: Buffer to parse
- **buffer_size**: Size of the buffer.
- **fp**: File pointer to print to, set to NULL to print to stdout.

**Header File**
- `components/driver/include/driver/sdmmc_types.h`

**Structures**

**struct sdmmc_csd_t**
Decoded values from SD card Card Specific Data register

**Public Members**

- **int csd_ver**
  CSD structure format
- **int mmc_ver**
  MMC version (for CID format)
- **int capacity**
  total number of sectors
- **int sector_size**
  sector size in bytes
- **int read_block_len**
  block length for reads
- **int card_command_class**
  Card Command Class for SD
- **int tr_speed**
  Max transfer speed

**struct sdmmc_cid_t**
Decoded values from SD card Card IDentification register

**Public Members**

- **int mfg_id**
  manufacturer identification number
int oem_id
   OEM/product identification number

char name[8]
   product name (MMC v1 has the longest)

int revision
   product revision

int serial
   product serial number

int date
   manufacturing date

struct sdmmc_scr_t
   Decoded values from SD Configuration Register
   Note: When new member is added, update reserved bits accordingly

   Public Members

   uint32_t sd_spec : 4
      SD Physical layer specification version, reported by card

   uint32_t erase_mem_state : 1
      data state on card after erase whether 0 or 1 (card vendor dependent)

   uint32_t bus_width : 4
      bus widths supported by card: BIT(0): 1-bit bus, BIT(2): 4-bit bus

   uint32_t reserved : 23
      reserved for future expansion

   uint32_t rsvd_mnf
      reserved for manufacturer usage

struct sdmmc_ssr_t
   Decoded values from SD Status Register
   Note: When new member is added, update reserved bits accordingly

   Public Members

   uint32_t cur_bus_width : 2
      SD current bus width

   uint32_t discard_support : 1
      SD discard feature support

   uint32_t fule_support : 1
      SD FULE (Full User Area Logical Erase) feature support

   uint32_t reserved : 28
      reserved for future expansion

struct sdmmc_ext_csd_t
   Decoded values of Extended Card Specific Data

   Public Members

   uint8_t rev
      Extended CSD Revision

   uint8_t power_class
      Power class used by the card
uint8_t erase_mem_state
data state on card after erase whether 0 or 1 (card vendor dependent)

uint8_t sec_feature
secure data management features supported by the card

struct sdmmc_switch_func_rsp_t
SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
response data

struct sdmmc_command_t
SD/MMC command information

Public Members

uint32_t opcode
SD or MMC command index

uint32_t arg
SD/MMC command argument

sdmmc_response_t response
response buffer

void *data
buffer to send or read into

size_t datalen
length of data buffer

size_t blklen
block length

int flags
see below

esp_err_t error
error returned from transfer

uint32_t timeout_ms
response timeout, in milliseconds

struct sdmmc_host_t
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
flags defining host properties

int slot
slot number, to be passed to host functions

int max_freq_khz
max frequency supported by the host
Chapter 2. API Reference

float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init)(void)
Host function to initialize the driver

esp_err_t (*set_bus_width)(int slot, size_t width)
host function to set bus width

size_t (*get_bus_width)(int slot)
host function to get bus width

esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)
host function to do a transaction

esp_err_t (*deinit)(void)
host function to deinitialize the driver

esp_err_t (*deinit_p)(int slot)
host function to deinitialize the driver, called with the slot

esp_err_t (*io_int_enable)(int slot)
Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
decoded SCR (SD card Configuration Register) value

sdmmc_ssr_t ssr
decoded SSR (SD Status Register) value

sdmmc_ext_csd_t ext_csd
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)
Chapter 2. API Reference

```
uint16_t max_freq_khz
   Maximum frequency, in kHz, supported by the card

uint32_t is_mem : 1
   Bit indicates if the card is a memory card

uint32_t is_sdio : 1
   Bit indicates if the card is an IO card

uint32_t is_mmc : 1
   Bit indicates if the card is MMC

uint32_t num_io_functions : 3
   If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width : 2
   log2(bus width supported by card)

uint32_t is_ddr : 1
   Card supports DDR mode

uint32_t reserved : 23
   Reserved for future expansion
```

**Macros**

- **SDMMC_HOST_FLAG_1BIT**
  host supports 1-line SD and MMC protocol

- **SDMMC_HOST_FLAG_4BIT**
  host supports 4-line SD and MMC protocol

- **SDMMC_HOST_FLAG_8BIT**
  host supports 8-line MMC protocol

- **SDMMC_HOST_FLAG_SPI**
  host supports SPI protocol

- **SDMMC_HOST_FLAG_DDR**
  host supports DDR mode for SD/MMC

- **SDMMC_HOST_FLAG_DEINIT_ARG**
  host deinit function called with the slot argument

- **SDMMC_FREQ_DEFAULT**
  SD/MMC Default speed (limited by clock divider)

- **SDMMC_FREQ_HIGHSPEED**
  SD High speed (limited by clock divider)

- **SDMMC_FREQ_PROBING**
  SD/MMC probing speed

- **SDMMC_FREQ_52M**
  MMC 52MHz speed

- **SDMMC_FREQ_26M**
  MMC 26MHz speed

**Type Definitions**

```
typedef uint32_t sdmmc_response_t[4]
   SD/MMC command response buffer
```
### Enumerations

```c
enum sdmmc_erase_arg_t
SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.
DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the
previously written data may be partially or fully read by the host depending on card implementation.
MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.
DISCARD: The Discard function allows the host to identify data that is no longer required so that the device
can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group
After discard operation, the original data may be remained partially or fully accessible to the host dependent
on device.

Values:
SDMMC_ERASE_ARG = 0
    Erase operation on SD, Trim operation on MMC
SDMMC_DISCARD_ARG = 1
    Discard operation for SD/MMC
```

### 2.9.6 SPI Flash API

#### Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, memory mapping for data in
the external flash. The `spi_flash` component also has higher-level API functions which work with partitions defined
in the partition table.

Different from the API before IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the “main” SPI flash
chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external
flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

**Note:** Instead of through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI
peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.

However due to limitations of the cache, operations through the cache are limited to the main flash. The address
range limitation for these operations are also on the cache side. The cache is not able to access external flash chips
or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code
or access to variables in the flash.

**Note:** Flash APIs after IDF v4.0 are no longer atomic. A writing operation during another on-going read operation,
on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and
partly updated as new written.

Kconfig option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` can be used to switch `spi_flash_*` functions back
to the implementation before ESP-IDF v4.0. However, the code size may get bigger if you use the new API and the
old API at the same time.

Encrypted reads and writes use the old implementation, even if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is not
enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash
chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main
flash, which is determined by the HW.
Support for Features of Flash Chips

Quad/Dual mode chips  Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don’t need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

   1. ISSI
   2. GD
   3. MXIC
   4. FM
   5. Winbond
   6. XMC
   7. BOYA

Optional Features

Optional features for flash  Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

   • Auto Suspend & Resume
   • Flash unique ID
   • High performance mode
   • OPI flash support
   • 32-bit Address Flash Chips

Note:

   • The features listed above needs to be supported by both esp chips and flash chips.
   • If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
   • If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention:  This document only shows that IDF code has supported the features of those flash chips. It’s not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume  ESP Chips List:

   1. ESP32C3

Flash Chips List:

   1. XM25QxxC series.

Flash unique ID  Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

   ALL
Chapter 2. API Reference

Flash Chips List:
1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

Note: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:
1. ESP32S3

Flash Chips (name & ID) List:
1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

Attention: It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:
1. ESP32S3

Flash Chips List:
1. MX25UM25645G

32-bit Address Flash Chips

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regrettfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:
ALL ESP Chips support this.

Flash Chips List:
1. W25Q256
2. GD25Q256
There are some features that are not supported by all flash models, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16MB) that needs longer address to access.
- Flash unique ID - means that flash supports its unique 64-bits ID.

If you want to use these features, you need to ensure ESP32 supports this feature, and ALL the flash chips in your product have this feature. For more details, refer Optional features for flash.

Users can also customize their own flash chip driver, see Overriding Default Chip Drivers for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers**  During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

**Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List**

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List provided by IDF. Instead, the linker will search for the structure of the same name (default_registered_chips) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the default_registered_chips structure)
   - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly.

**Note:**

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***/(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***/get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***/(vendor)_get_caps`. Take the example below as a reference. (If the flash support suspend and read unique id).
  3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.
Chapter 2. API Reference

```c
spi_flash_caps_t spi_flash_chip_***{vendor}_get_caps(esp_flash_t *chip) {
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```c
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example storage/custom_flash_driver.

4. Add linking dependency from spi_flash component to the new custom_chip_driver component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the custom_chip_driver component:

   ```
   idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
   set_property(TARGET ${spi_flash_lib} APPEND PROPERTY INTERFACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
   ```

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See Linker Script Generation for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

Example  See also storage/custom_flash_driver.

Initializing a Flash Device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `spi_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.
**Chapter 2. API Reference**

---

**SPI Flash Size**

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

**Concurrency Constraints for flash on SPI1**

*Concurrency Constraints for flash on SPI1*  The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

**When the caches are disabled**  Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches will suspend all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also OS Functions, SPI Bus Lock.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g. IRAM, DRAM) and flash cache, please refer to the application memory layout documentation.

**IRAM-Safe Interrupt Handlers**  For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See How to place code in IRAM.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:**  When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

**Non-IRAM-Safe Interrupt Handlers**  If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users won’t see the corresponding hardware event happening.
**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See *Concurrency Constraints for flash on SPI* for more details.

### Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

### Memory Mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:
• `spi_flash_mmap()` must be given a 64 KB aligned physical address.
• `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

### SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

**Host driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However due to the speed limitations of ESP32, the HAL layer can’t provide high-speed implementations to some reading commands (So we didn’t do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the esp_flash API can access to the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see **SPI Bus Lock**) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may requires to use the bus monopolized during a period. (especially when the device doesn’t have CS wire, or the wire is controlled by the software like SDSPIdriver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.
OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It’s pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
   - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
   - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which will trigger the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

- Non-Volatile Storage (NVS) API provides a structured API for storing small pieces of data in SPI flash.

Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File
Functions

```c
esp_err_t spi_bus_add_flash_device (esp_flash_t **out_chip, esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.
The bus should be already initialized by `spi_bus_initialization`.

Return
- ESP_ERR_INVALID_ARG: `out_chip` is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

Parameters
- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

```c
esp_err_t spi_bus_remove_flash_device (esp_flash_t *chip)
```

Remove a SPI Flash device from the SPI bus.

Return
- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Parameters
- `chip`: The flash device to remove.

Structures

```c
struct esp_flash_spi_device_config_t
```

Configurations for the SPI Flash to init.

Public Members

```c
spi_host_device_t host_id
```

Bus to use.

```c
int cs_io_num
```

GPIO pin to output the CS signal.

```c
esp_flash_io_mode_t io_mode
```

IO mode to read from the Flash.

```c
esp_flash_speed_t speed
```

Speed of the Flash clock.

```c
int input_delay_ns
```

Input delay of the data pins, in ns. Set to 0 if unknown.

```c
int cs_id
```

CS line ID, ignored when not `host_id` is not SPI1_HOST, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

Header File

- components/spi_flash/include/esp_flash.h

Functions

```c
esp_err_t esp_flash_init (esp_flash_t *chip)
```

 Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.
Chapter 2. API Reference

Note Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

Note If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

Return ESP_OK on success, or a flash error code if initialisation fails.

Parameters
• chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

bool esp_flash_chip_driver_initialized(const esp_flash_t *chip)

Check if appropriate chip driver is set.

Return true if set, otherwise false.

Parameters
• chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

esp_err_t esp_flash_read_id(esp_flash_t *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] out_id: Pointer to receive ID value.

Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] out_size: Detected size in bytes.

esp_err_t esp_flash_read_unique_chip_id(esp_flash_t *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
• [out] out_id: Pointer to receive unique ID value.

Return
• ESP_OK on success, or a flash error code if operation failed.
• ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

esp_err_t esp_flash_erase_chip(esp_flash_t *chip)

Erase flash chip contents.

Return
• ESP_OK on success.
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• Other flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• start: Address to start erasing flash. Must be sector aligned.
• len: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv>
block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase
commands.

Return
• ESP_OK on success,
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated
by WREN = 1 after the command is sent.
• Other flash error code if operation failed.

```
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```

Read if the entire chip is write protected.

Note A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’
field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] write_protected: Pointer to boolean, set to the value of the write protect flag.

```
esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protect)
```

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write
protection can be removed via a follow-up call to this function.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the
‘chip->drv’ field).

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• write_protect: Boolean value for the write protect flag

Return ESP_OK on success, or a flash error code if operation failed.

```
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the
‘chip->drv’ field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] out_regions: Pointer to receive a pointer to the array of protectable regions of the
chip.
• [out] out_num_regions: Pointer to an integer receiving the count of protectable regions in
the array returned in ‘regions’.

```
esp_err_t esp_flash_get_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

Note It is possible for this result to be false and write operations to still fail, if protection is enabled for the
entire chip.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the
‘chip->drv’ field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **region**: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.

• **[out]** `out_protected`: Pointer to a flag which is set based on the protected status for this region.

```c
esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`
- `protect`: Write protection flag to set.

```c
esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `buffer`: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address`: Address on flash to read from. Must be less than chip->size field.
- `length`: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (i.e. encrypted) data. Use the flash cache to transparently decrypt data.

**Return**

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

```c
esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `address`: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length`: Length (in bytes) of data to write.

**Return**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size.
Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

Parameters

- chip: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- address: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- buffer: Pointer to a buffer with the data to write.
- length: Length (in bytes) of data to write. 16 byte aligned.

```
esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

Parameters

- chip: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- address: Address on flash to read from.
- out_buffer: Pointer to a buffer for the data to read to.
- length: Length (in bytes) of data to read.

```
static bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Return true if flash works in quad mode, otherwise false

Parameters

- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Structures

```
struct esp_flash_region_t
```

Structure for describing a region of flash.

Public Members

```
uint32_t offset
```

Start address of this region.

```
uint32_t size
```

Size of the region.

```
struct esp_flash_os_functions_t
```

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

```
esp_err_t (*start)(void *arg)
```

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).
esp_err_t (*end) (void *arg)
Called after completing any flash operation.

esp_err_t (*region_protected) (void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS.

esp_err_t (*delay_us) (void *arg, uint32_t us)
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void (*get_temp_buffer) (void *arg, size_t request_size, size_t *out_size)
Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (*release_temp_buffer) (void *arg, void *temp_buf)
Called for release temp buffer.

esp_err_t (*check_yield) (void *arg, uint32_t chip_status, uint32_t *out_request)
Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (*yield) (void *arg, uint32_t *out_status)
Yield to other tasks. Called during erase operations.

int64_t (*get_system_time) (void *arg)
Called for get system time.

struct esp_flash_t
Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t *host
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32_t chip_id
Detected chip id.

uint32_t busy : 1
This flag is used to verify chip’s status.

uint32_t reserved_flags : 31
reserved.
### Macros

- SPI_FLASH_YIELD_REQ_YIELD
- SPI_FLASH_YIELD_REQ_SUSPEND
- SPI_FLASH_YIELD_STA_RESUME

### Type Definitions

```c
typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t
```

### Header File

- components/spi_flash/include/esp_spi_flash.h

### Functions

- `esp_err_t spi_flash_wrap_set (spi_flash_wrap_mode_t mode)`
  - **Return**: `esp_err_t`: ESP_OK for successful.
  - **Parameters**
    - `mode`: wrap mode support disable, 16 32, 64 byte

- `void spi_flash_init (void)`
  - Initialize SPI flash access driver.
  - This function must be called exactly once, before any other spi_flash_* functions are called. Currently this function is called from startup code. There is no need to call it from application code.

- `size_t spi_flash_get_chip_size (void)`
  - Get flash chip size, as set in binary image header.
  - **Note**: This value does not necessarily match real flash size.
  - **Return**: size of flash chip, in bytes

- `esp_err_t spi_flash_erase_sector (size_t sector)`
  - Erase the Flash sector.
  - **Return** `esp_err_t`
  - **Parameters**
    - `sector`: Sector number, the count starts at sector 0, 4KB per sector.

- `esp_err_t spi_flash_erase_range (size_t start_address, size_t size)`
  - Erase a range of flash sectors.
  - **Return** `esp_err_t`
  - **Parameters**
    - `start_address`: Address where erase operation has to start. Must be 4kB-aligned
    - `size`: Size of erased range, in bytes. Must be divisible by 4kB.

- `esp_err_t spi_flash_write (size_t dest_addr, const void *src, size_t size)`
  - Write data to Flash.
  - **Note**: For fastest write performance, write a 4 byte aligned size at a 4 byte aligned offset in flash from a source buffer in DRAM. Varying any of these parameters will still work, but will be slower due to buffering.
  - **Note**: Writing more than 8KB at a time will be split into multiple write operations to avoid disrupting other tasks in the system.
  - **Return** `esp_err_t`
  - **Parameters**
    - `dest_addr`: Destination address in Flash.
    - `src`: Pointer to the source buffer.
    - `size`: Length of data, in bytes.

- `esp_err_t spi_flash_write_encrypted (size_t dest_addr, const void *src, size_t size)`
  - Write data encrypted to Flash.
Note Flash encryption must be enabled for this function to work.

Note Flash encryption must be enabled when calling this function. If flash encryption is disabled, the function returns ESP_ERR_INVALID_STATE. Use esp_flash_encryption_enabled() function to determine if flash encryption is enabled.

Note Both dest_addr and size must be multiples of 16 bytes. For absolute best performance, both dest_addr and size arguments should be multiples of 32 bytes.

Return esp_err_t

Parameters

• dest_addr: Destination address in Flash. Must be a multiple of 16 bytes.
• src: Pointer to the source buffer.
• size: Length of data, in bytes. Must be a multiple of 16 bytes.

esp_err_t spi_flash_read (size_t src_addr, void *dest, size_t size)

Read data from Flash.

Note For fastest read performance, all parameters should be 4 byte aligned. If source address and read size are not 4 byte aligned, read may be split into multiple flash operations. If destination buffer is not 4 byte aligned, a temporary buffer will be allocated on the stack.

Note Reading more than 16KB of data at a time will be split into multiple reads to avoid disruption to other tasks in the system. Consider using spi_flash_mmap() to read large amounts of data.

Return esp_err_t

Parameters

• src_addr: source address of the data in Flash.
• dest: pointer to the destination buffer
• size: length of data

esp_err_t spi_flash_read_encrypted (size_t src, void *dest, size_t size)

Read data from Encrypted Flash.

If flash encryption is enabled, this function will transparently decrypt data as it is read. If flash encryption is not enabled, this function behaves the same as spi_flash_read().

See esp_flash_encryption_enabled() for a function to check if flash encryption is enabled.

Return esp_err_t

Parameters

• src: source address of the data in Flash.
• dest: pointer to the destination buffer
• size: length of data

esp_err_t spi_flash_mmap (size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.

Return ESP_OK on success, ESP_ERR_NO_MEM if pages cannot be allocated

Parameters

• src_addr: Physical address in flash where requested region starts. This address must be aligned to 64KB boundary (SPI_FLASH_MMU_PAGE_SIZE)
• size: Size of region to be mapped. This size will be rounded up to a 64KB boundary
• memory: Address space where the region should be mapped (data or instruction)
• [out] out_ptr: Output, pointer to the mapped memory region
• [out] out_handle: Output, handle which should be used for spi_flash_munmap call

esp_err_t spi_flash_mmap_pages (const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map sequences of pages of flash memory into data or instruction address space.
This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as \texttt{spi\_flash\_mmap()} but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

**Return**

- \texttt{ESP\_OK} on success
- \texttt{ESP\_ERR\_NO\_MEM} if pages cannot be allocated
- \texttt{ESP\_ERR\_INVALID\_ARG} if pagecount is zero or pages array is not in internal memory

**Parameters**

- \texttt{pages}: An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- \texttt{page\_count}: Number of entries in the pages array
- \texttt{memory}: Address space where the region should be mapped (instruction or data)
- \texttt{[out] out\_ptr}: Output, pointer to the mapped memory region
- \texttt{[out] out\_handle}: Output, handle which should be used for \texttt{spi\_flash\_munmap} call

```c
void \texttt{spi\_flash\_munmap}\ (\texttt{spi\_flash\_mmap\_handle\_t handle})
```

Release region previously obtained using \texttt{spi\_flash\_mmap}.

**Note** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**

- \texttt{handle}: Handle obtained from \texttt{spi\_flash\_mmap}

```c
void \texttt{spi\_flash\_mmap\_dump}\ (void)
```

Display information about mapped regions.

This function lists handles obtained using \texttt{spi\_flash\_mmap}, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

```c
\texttt{uint32\_t\ spi\_flash\_mmap\_get\_free\_pages}\ (\texttt{spi\_flash\_mmap\_memory\_t memory})
```

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual \texttt{spi\_flash\_mmap} (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Return** number of free pages which can be mmaped

**Parameters**

- \texttt{memory}: memory type of MMU table free page

```c
\texttt{size\_t\ spi\_flash\_cache2phys}\ (\texttt{const void * cached})
```

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via \texttt{spi\_flash\_mmap()}, any address in memory mapped flash space can be looked up.

**Return**

- \texttt{SPI\_FLASH\_CACHE2PHYS\_FAIL} If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

**Parameters**

- \texttt{cached}: Pointer to flashed cached memory.

```c
\texttt{const void *\ spi\_flash\_phys2cache}\ (\texttt{size\_t phys\_offs, spi\_flash\_mmap\_memory\_t memory})
```

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via \texttt{spi\_flash\_mmap()}, any address in flash can be looked up.

**Note** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to
that physical address. It is also possible for a single physical address to be mapped to both the IROM and
DROM regions.

**Note** This function doesn’t impose any alignment constraints, but if memory argument is
SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned
pointer will result in a crash.

**Return**
- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

**Parameters**
- phys_offs: Physical offset in flash memory to look up.
- memory: Address space type to look up a flash cache address mapping for (instruction or data)

```c
bool spi_flash_cache_enabled(void)
```
Check at runtime if flash cache is enabled on both CPUs.

**Return** true if both CPUs have flash cache enabled, false otherwise.

```c
void spi_flash_enable_cache(uint32_t cpuid)
```
Re-enable cache for the core defined as cpuid parameter.

**Parameters**
- cpuid: the core number to enable instruction cache for

```c
void spi_flash_guard_set(const spi_flash_guard_funcs_t *funcs)
```
Sets guard functions to access flash.

**Note** Pointed structure and corresponding guard functions should not reside in flash. For example structure
can be placed in DRAM and functions in IRAM sections.

**Parameters**
- funcs: pointer to structure holding flash access guard functions.

```c
const spi_flash_guard_funcs_t *spi_flash_guard_get(void)
```
Get the guard functions used for flash access.

**Return** The guard functions that were set via spi_flash_guard_set(). These functions can be called if imple-
menting custom low-level SPI flash operations.

**Structures**

```c
struct spi_flash_guard_funcs_t
```
Structure holding SPI flash access critical sections management functions.

Flash API uses two types of flash access management functions: 1) Functions which prepare/restore flash cache
and interrupts before calling appropriate ROM functions (SPIWrite, SPIRead and SPIEraseBlock):

- ’start’ function should disable flash cache and non-IRAM interrupts and is invoked before the call to
  one of ROM function above.
- ’end’ function should restore state of flash cache and non-IRAM interrupts and is invoked after the call to
  one of ROM function above. These two functions are not recursive. 2) Functions which synchronizes
  access to internal data used by flash API. This functions are mostly intended to synchronize access to
  flash API internal data in multithreaded environment and use OS primitives:
- ’op_lock’ locks access to flash API internal data.
- ’op_unlock’ unlocks access to flash API internal data. These two functions are recursive and can be
  used around the outside of multiple calls to ‘start’ & ‘end’, in order to create atomic multi-part flash
  operations. 3) When CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED is disabled, flash
  writing/erasing API checks for addresses provided by user to avoid corruption of critical flash regions
  (bootloader, partition table, running application etc.).

Different versions of the guarding functions should be used depending on the context of execution (with or
without functional OS). In normal conditions when flash API is called from task the functions use OS primitives.
When there is no OS at all or when it is not guaranteed that OS is functional (accessing flash from exception
handler) these functions cannot use OS primitives or even does not need them (multithreaded access is not
possible).
Note Structure and corresponding guard functions should not reside in flash. For example structure can be placed in DRAM and functions in IRAM sections.

Public Members

- `spi_flash.guard_start_func_t start`  
  Critical section start function.

- `spi_flash.guard_end_func_t end`  
  Critical section end function.

- `spi.flash_op.lock_func_t op_lock`  
  Flash access API lock function.

- `spi.flash_op.unlock_func_t op_unlock`  
  Flash access API unlock function.

- `spi.flash.is.safe.write_address_t is_safe_write_address`  
  Checks flash write addresses.

- `spi.flash_os.yield_t yield`  
  Yield to the OS during flash erase

Macros

- `ESP_ERR_FLASH_OP_FAIL`  
  ESP flash operation fail.

- `ESP_ERR_FLASH_OP_TIMEOUT`  
  ESP flash operation timeout.

- `SPI_FLASH_SEC_SIZE`  
  SPI Flash sector size

- `SPIFLASH_MMU_PAGE_SIZE`  
  Flash cache MMU mapping page size

- `SPI_FLASH_CACHE2PHYS_FAIL`  
  SPI Flash cache2phys fail

Type Definitions

- `typedef uint32_t spi_flash.mmap.handle_t`  
  Opaque handle for memory region obtained from `spi.flash.mmap`.

- `typedef void (*spi.flash.guard.start_func_t) (void)`  
  SPI flash critical section enter function.

- `typedef void (*spi.flash.guard.end_func_t) (void)`  
  SPI flash critical section exit function.

- `typedef void (*spi.flash.op.lock_func_t) (void)`  
  SPI flash operation lock function.

- `typedef void (*spi.flash.op.unlock_func_t) (void)`  
  SPI flash operation unlock function.

- `typedef bool (*spi.flash.is.safe.write.address_t) (size_t addr, size_t size)`  
  Function to protect SPI flash critical regions corruption.

- `typedef void (*spi.flash.os.yield_t) (void)`  
  Function to yield to the OS during erase operation.

Enumerations

- `enum spi.flash.wrap.mode_t`  
  Values:

  - `FLASH_WRAP_MODE_8B = 0`
  - `FLASH_WRAP_MODE_16B = 2`
Chapter 2. API Reference

FLASH_WRAP_MODE_32B = 4
FLASH_WRAP_MODE_64B = 6
FLASH_WRAP_MODE_DISABLE = 1
e num spi_flash_mmap_memory_t
    Enumeration which specifies memory space requested in an mmap call.
    Values:
    SPI_FLASH_MMAP_DATA
        map to data memory (Vaddr0), allows byte-aligned access, 4 MB total
    SPI_FLASH_MMAP_INST
        map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

Header File
    • components/hal/include/hal/spi_flash_types.h

Structures
struct spi_flash_trans_t
    Definition of a common transaction. Also holds the return value.

Public Members
    uint8_t reserved
        Reserved, must be 0.
    uint8_t mosi_len
        Output data length, in bytes.
    uint8_t miso_len
        Input data length, in bytes.
    uint8_t address_bitlen
        Length of address in bits, set to 0 if command does not need an address.
    uint32_t address
        Address to perform operation on.
    const uint8_t* mosi_data
        Output data to salve.
    uint8_t* miso_data
        [out] Input data from slave, little endian
    uint32_t flags
        Flags for this transaction. Set to 0 for now.
    uint16_t command
        Command to send.
    uint8_t dummy_bitlen
        Basic dummy bits to use.
    uint32_t io_mode
        Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.
struct spi_flash_sus_cmd_conf
    Configuration structure for the flash chip suspend feature.
Public Members

uint32_t **sus_mask**
SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr** : 8
Read flash status register(2) command.

uint32_t **sus_cmd** : 8
Flash suspend command.

uint32_t **res_cmd** : 8
Flash resume command.

uint32_t **reserved** : 8
Reserved, set to 0.

**struct spi_flash_encryption_t**
Structure for flash encryption operations.

Public Members

void (*flash_encryption_enable) (void)
Enable the flash encryption.

void (*flash_encryption_disable) (void)
Disable the flash encryption.

void (*flash_encryption_data_prepare) (uint32_t address, const uint32_t *buffer, uint32_t size)
Prepare flash encryption before operation.

Note  address and buffer must be 8-word aligned.

Parameters

• address: The destination address in flash for the write operation.
• buffer: Data for programming
• size: Size to program.

void (*flash_encryption_done) (void)
Flash data encryption operation is done.

void (*flash_encryption_destroy) (void)
Destroy encrypted result

bool (*flash_encryption_check) (uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer

Parameters

• address: the address of written flash partition.
• length: Buffer size.

**struct spi_flash_host_inst_t**
SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
Pointer to the implementation function table.

**struct spi_flash_host_driver_s**
Host driver configuration and context structure.
Public Members

```c
esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those
registers when we send continuously
```

```c
esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.
```

```c
esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
Read flash ID.
```

```c
void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.
```

```c
void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific sector by its start address.
```

```c
void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific block by its start address.
```

```c
esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.
```

```c
esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
Disable write protection.
```

```c
void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.
```

```c
bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
Check whether the SPI host supports direct write.
When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.
```

```c
int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for write data. The program_page should be called iteratively with the return value of this
function.
```

```c
esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.
```

```c
bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
Check whether the SPI host supports direct read.
When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.
```

```c
int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for read data. The read should be called iteratively with the return value of this function.
```

Return Length that can be actually written in one program_page call

Parameters
- address: Beginning flash address to write
- len: Length request to write
- align_addr: Output of the aligned address to write to
- page_size: Physical page size of the flash chip

Return Length that can be actually read in one read call

Parameters
- address: Beginning flash address to read
- len: Length request to read
- align_addr: Output of the aligned address to read
- page_size: Physical page size of the flash chip
Chapter 2. API Reference

uint32_t(*host_status)(spi_flash_host_inst_t *host)
Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t(*configure_host_io_mode)(spi.flash_host_inst_t *host, uint32_t command,
uint32_t addr_bitlen, int dummy_bitlen_base,
esp.flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void(*poll_cmd_done)(spi_flash_host_inst_t *host)
Internal use, poll the HW until the last operation is done.

esp_err_t(*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void(*check_suspend)(spi_flash_host_inst_t *host)
Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void(*resume)(spi_flash_host_inst_t *host)
Resume flash from suspend manually

void(*suspend)(spi_flash_host_inst_t *host)
Set flash in suspend status manually

esp_err_t(*sus_setup)(spi.flash_host_inst_t *host, const spi.flash_sus_cmd_conf *sus_conf)
Suspend feature setup for setting cmd and status register mask.

---

Macros

SPI_FLASH_TRANS_FLAG_CMD16
Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

ESP_FLASH_SPEED_MIN
Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_CONFIG_CONF_BITS
OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG
A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN
Slowest io mode supported by ESP32, currently SlowRd.

---

Type Definitions

typedef struct spi_flash_host_driver_s spi.flash_host_driver_t

Enumerations

gen enum esp.flash_speed_t
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:
**ESP_FLASH_5MHZ = 0**
- The flash runs under 5MHz.

**ESP_FLASH_10MHZ**
- The flash runs under 10MHz.

**ESP_FLASH_20MHZ**
- The flash runs under 20MHz.

**ESP_FLASH_26MHZ**
- The flash runs under 26MHz.

**ESP_FLASH_40MHZ**
- The flash runs under 40MHz.

**ESP_FLASH_80MHZ**
- The flash runs under 80MHz.

**ESP_FLASH_120MHZ**
- The flash runs under 120MHz. 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

**ESP_FLASH_SPEED_MAX**
- The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

```c
enum esp_flash_io_mode_t
{
    SPI_FLASH_SLOWRD = 0,
    Data read using single I/O, some limits on speed.
    SPI_FLASH_FASTRD,
    Data read using single I/O, no limit on speed.
    SPI_FLASH_DOUT,
    Data read using dual I/O.
    SPI_FLASH_DIO,
    Both address & data transferred using dual I/O.
    SPI_FLASH_QOUT,
    Data read using quad I/O.
    SPI_FLASH_QIO,
    Both address & data transferred using quad I/O.
    SPI_FLASH_OPI_STR = SPI_FLASH_OPI_FLAG,
    Only support on OPI flash, flash read and write under STR mode.
    SPI_FLASH_OPI_DTR,
    Only support on OPI flash, flash read and write under DTR mode.
    SPI_FLASH_READ_MODE_MAX,
    The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.
}
```

**Header File**
- `components/hal/include/hal/esp_flash_err.h`

**Macros**
- **ESP_ERR_FLASH_NOT_INITIALISED**
  - `esp_flash_chip_t` structure not correctly initialised by esp_flash_init().
- **ESP_ERR_FLASH_UNSUPPORTED_HOST**
  - Requested operation isn’t supported via this host SPI bus (chip->spi field).
ESP_ERR_FLASH_UNSUPPORTED_CHIP
Requested operation isn’t supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED
Write operation failed due to chip’s write protection being enabled.

Enumerations
enum [anonymous]
Values:

ESP_ERR_FLASH_SIZE_NOT_MATCH = ESP_ERR_INVALID_SIZE
The chip doesn’t have enough space for the current partition table.

ESP_ERR_FLASH_NO_RESPONSE = ESP_ERR_INVALID_RESPONSE
Chip did not respond to the command, or timed out.

API Reference - Partition Table

Header File
• components/spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
Find partition based on one or more parameters.

Return iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found.
Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

Parameters
• type: Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• subtype: Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
• label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_find_first (esp_partition_type_t type,
                                              esp_partition_subtype_t subtype, const char *label)
Find first partition based on one or more parameters.

Return pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

Parameters
• type: Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• subtype: Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
• label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)
Get esp_partition_t structure for given partition.

Return pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.
esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)
Move partition iterator to the next partition found.
Any copies of the iterator will be invalid after this call.

Return NULL if no partition was found, valid esp_partition_iterator_t otherwise.
Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

void esp_partition_iterator_release (esp_partition_iterator_t iterator)
Release partition iterator.
Parameters
• iterator: Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it
is not necessary to check its value before calling this function.

const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)
Verify partition data.
Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)
This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to
the permanent partition data stored in flash.
Pointers returned from this function can be compared directly to the address of any pointer returned from
esp_partition_get(), as a test for equality.

Return
• If partition not found, returns NULL.
• If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for
the lifetime of the application.
Parameters
• partition: Pointer to partition data to verify. Must be non-NULL. All fields of this structure
must match the partition table entry in flash for this function to return a successful match.

esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
Read data from the partition.
Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

Return ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes
from lower-level flash driver.
Parameters
• partition: Pointer to partition structure obtained using esp_partition_find_first or
esp_partition_get. Must be non-NULL.
• dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must
be at least ‘size’ bytes long.
• src_offset: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

esp_err_t esp_partition_write (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
Write data to the partition.
Before writing data to flash, corresponding region of flash needs to be erased. This can be done using
esp_partition_erase_range function.
Partitions marked with an encryption flag will automatically be written via the spi_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See
the spi_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

Note Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.
Return ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds parti-
tion size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes
from lower-level flash driver.
Chapter 2. API Reference

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

```
esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition without any transformation/decryption.

**Note** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Return** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- src_offset: Address of the data to be read, relative to the beginning of the partition.
- size: Size of data to be read, in bytes.

```
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Return** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

```
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Erase part of the partition.

**Return** ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.
Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

**Return** ESP_OK, if successful

**Parameters**

- **partition**: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset**: Offset from the beginning of partition where mapping should start.
- **size**: Size of the area to be mapped.
- **memory**: Memory space where the region should be mapped
- **out_ptr**: Output, pointer to the mapped memory region
- **out_handle**: Output, handle which should be used for spi_flash_munmap call

`esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)`

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

**Parameters**

- [in] partition: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- [out] sha_256: Returned SHA-256 digest for a given partition.

`bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)`

Check for the identity of two partitions by SHA-256 digest.

**Return**

- True: In case of the two firmware is equal.
- False: Otherwise

**Parameters**

- [in] partition_1: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- [in] partition_2: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

`esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)`

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

**Return**

- ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters
• flash_chip: Pointer to the structure identifying the flash chip
• offset: Address in bytes, where the partition starts
• size: Size of the partition in bytes
• label: Partition name
• type: One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
• [out] out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

```
esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)
```

Deregister the partition previously registered using esp_partition_register_external.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Parameters
• partition: pointer to the partition structure obtained from esp_partition_register_external.

Structures
```
struct esp_partition_t
```

Partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

Public Members

```
esp_flash_t *flash_chip
```

SPI flash chip on which the partition resides

```
esp_partition_type_t type
```

Partition type (app/data)

```
esp_partition_subtype_t subtype
```

Partition subtype

```
uint32_t address
```

Starting address of the partition in flash

```
uint32_t size
```

Size of the partition, in bytes

```
char label[17]
```

Partition label, zero-terminated ASCII string

```
bool encrypted
```

Flag is set to true if partition is encrypted
Chapter 2. API Reference

Macros

ESP_PARTITION_SUBTYPE_OTA(i)

Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t

Opaque partition iterator type.

Enumerations

enum esp_partition_type_t

Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

ESP_PARTITION_TYPE_APP = 0x00
Application partition type.

ESP_PARTITION_TYPE_DATA = 0x01
Data partition type.

ESP_PARTITION_TYPE_ANY = 0xff
Used to search for partitions with any type.

enum esp_partition_subtype_t

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

Note: These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

ESP_PARTITION_SUBTYPE_APP_FACTORY = 0x00
Factory application partition.

ESP_PARTITION_SUBTYPE_APP_OTA_MIN = 0x10
Base for OTA partition subtypes.

ESP_PARTITION_SUBTYPE_APP_OTA_0 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 0
OTA partition 0.

ESP_PARTITION_SUBTYPE_APP_OTA_1 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1
OTA partition 1.

ESP_PARTITION_SUBTYPE_APP_OTA_2 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2
OTA partition 2.

ESP_PARTITION_SUBTYPE_APP_OTA_3 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3
OTA partition 3.

ESP_PARTITION_SUBTYPE_APP_OTA_4 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4
OTA partition 4.

ESP_PARTITION_SUBTYPE_APP_OTA_5 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5
OTA partition 5.

ESP_PARTITION_SUBTYPE_APP_OTA_6 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6
OTA partition 6.

ESP_PARTITION_SUBTYPE_APP_OTA_7 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7
OTA partition 7.
ESP_PARTITION_SUBTYPE_APP_OTA_8 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8
OTA partition 8.

ESP_PARTITION_SUBTYPE_APP_OTA_9 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9
OTA partition 9.

ESP_PARTITION_SUBTYPE_APP_OTA_10 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.

ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA_OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.

ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
Partition for emulate eFuse bits.

ESP_PARTITION_SUBTYPE_DATA_UNDEFINED = 0x06
Undefined (or unspecified) data partition.

ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
SPIFFS partition.

ESP_PARTITION_SUBTYPE_ANY = 0xff
Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

- components/bootloader_support/include/esp_flash_encrypt.h
Chapter 2. API Reference

Functions

bool esp_flash_encryption_enabled (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Return true if flash encryption is enabled.

esp_err_t esp_flash_encrypt_check_and_update (void)

esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

Note This function resets RTC_WDT between operations with sectors.

Return ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

Parameters

• src_addr: Source offset in flash. Should be multiple of 4096 bytes.
• data_length: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void esp_flash_write_protect_crypt_cnt (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

Return

void esp_flash_encryption_init_checks (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

Note This function is called automatically during app startup, it doesn’t need to be called from the app.

• Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
• Log warnings if the efuse config doesn’t match the project config in any way

esp_err_t esp_flash_encryption_enable_secure_features (void)

Set all secure eFuse features related to flash encryption.

Return

• ESP_OK - Successfully

void esp_flash_encryption_set_release_mode (void)

Switches Flash Encryption from “Development” to “Release”.

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

• ” disable encrypt in dl mode”
• set FLASH_CRYPT_CNT efuse to max

Enumerations

enum esp_flash_enc_mode_t

Values:
Chapter 2. API Reference

ESP_FLASH_ENC_MODE_DISABLED
ESP_FLASH_ENC_MODE_DEVELOPMENT
ESP_FLASH_ENC_MODE_RELEASE

2.9.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. here) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
- When ESP32 experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via esp_spiffs_check function. More details in the official SPIFFS FAQ <https://github.com/pellepl/spiffs/wiki/FAQ>.

Tools

spiffsgen.py  spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffgen.py directly from the build system by calling spiffs_create_partition_image:
This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image`—the image size is automatically obtained from the project’s partition table.

`spiffs_create_partition_image` must be called from one of the component `CMakeLists.txt` files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` by specifying `FLASH_IN_PROJECT`. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image:

```
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see `storage/spiffsgen`.

Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`.

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000... --spiffs.bin
```

**Notes on which SPIFFS tool to use**  The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for
mkspiffs and the user has to do the corresponding work: compiling mkspiffs during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

See also

• Partition Table documentation

Application Example

An example of using SPIFFS is provided in the storage/spiffs directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

• components/spiffs/include/esp_spiffs.h

Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```

Register and mount SPIFFS to VFS with given path prefix.

**Return**

• ESP_OK if success
• ESP_ERR_NO_MEM if objects could not be allocated
• ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
• ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
• ESP_FAIL if mount or format fails

**Parameters**

• `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

```c
esp_err_t esp_vfs_spiffs_unregister(const char* partition_label)
```

Unregister and unmount SPIFFS from VFS

**Return**

• ESP_OK if successful
• ESP_ERR_INVALID_STATE already unregistered

**Parameters**

• `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

```c
bool esp_spiffs_mounted(const char *partition_label)
```

Check if SPIFFS is mounted

**Return**

• true if mounted
• false if not mounted

**Parameters**

• `partition_label`: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

```c
esp_err_t esp_spiffs_format(const char *partition_label)
```

Format the SPIFFS partition

**Return**

• ESP_OK if successful
• ESP_FAIL on error

**Parameters**

• `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.
**esp_err_t esp_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)**

Get information for SPIFFS

**Return**
- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

**Parameters**
- partition_label: Same label as passed to esp_vfs_spiffs_register
- [out] total_bytes: Size of the file system
- [out] used_bytes: Current used bytes in the file system

**esp_err_t esp_spiffs_check(const char *partition_label)**

Check integrity of SPIFFS

**Return**
- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

**Parameters**
- partition_label: Same label as passed to esp_vfs_spiffs_register

**esp_err_t esp_spiffs_gc(const char *partition_label, size_t size_to_gc)**

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

**Parameters**
- partition_label: Label of the partition to be garbage-collected. The partition must be already mounted.
- size_to_gc: The number of bytes that the GC process should attempt to make available.

**Structures**

```c
struct esp_vfs_spiffs_conf_t
```

Configuration structure for esp_vfs_spiffs_register.

**Public Members**

```c
const char *base_path
```

File path prefix associated with the filesystem.

```c
const char *partition_label
```

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

```c
size_t max_files
```

Maximum files that could be open at the same time.
bool format_if_mount_failed
    If true, it will format the file system if it fails to mount.

2.9.8 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

FS registration

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t * fs, int fd, const void * data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized
```

(continues on next page)
Synchronous input/output multiplexing  Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

Non-socket VFS drivers  If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
.start_select = &uart_start_select,
.end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

Note:  `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- `peripherals/uart/uart_select`
- `system/select`

Socket VFS drivers  A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:
In definition of esp_vfs_t:

```c
.socket_select = &lwip_select,
.get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
.stop_socket_select = &lwip_stop_socket_select,
.stop_socket_select_isr = &lwip_stop_socket_select_isr,
```

// ... other members initialized

socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

Note: If you use select() for socket file descriptors only then you can disable the CONFIG_VFS_SUPPORT_SELECT option to reduce the code size and improve performance. You should not change the socket driver during an active select() call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.
Chapter 2. API Reference

File descriptors

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib’s `sys/types.h`. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

Standard IO streams (stdin, stdout, stderr)

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘n’ ) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

Standard streams and FreeRTOS tasks  FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The __getreent() function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT-_stdin(_stdout, _stderr) before creating the task.

Event fds

`eventfd()` call is a powerful tool to notify a select() based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

### API Reference

#### Header File

- `components/vfs/include/esp_vfs.h`

#### Functions

- `ssize_t esp_vfs_write (struct _reent *r, int fd, const *data, size_t size)`
  
  These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

- `off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)`

- `ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)`

- `int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)`

- `int esp_vfs_close (struct _reent *r, int fd)`

- `int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)`

- `int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)`

- `int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)`

- `int esp_vfs_unlink (struct _reent *r, const char *path)`

- `int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)`

- `int esp_vfs_utime (const char *path, const struct utimbuf *times)`

- `esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)`

  Register a virtual filesystem for given path prefix.

  **Return** ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

  **Parameters**

  - `base_path`: file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/” . For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0” . In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.

  - `vfs`: Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.

  - `ctx`: If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

- `esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)`

  Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

  This is a special-purpose function intended for registering LWIP sockets to VFS.

  **Return** ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

  **Parameters**

  - `vfs`: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().

  - `ctx`: Pointer to context structure. Meaning is the same as for esp_vfs_register().

  - `min_fd`: The smallest file descriptor this VFS will use.

  - `max_fd`: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).
**esp_err_t esp_vfs_register_with_id(const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)**

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

**Parameters**
- vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
- vfs_id: Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

**esp_err_t esp_vfs_unregister(const char* base_path)**

Unregister a virtual filesystem for given path prefix

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

**Parameters**
- base_path: file prefix previously used in esp_vfs_register call

**esp_err_t esp_vfs_unregister_with_id(esp_vfs_id_t vfs_id)**

Unregister a virtual filesystem with the given index

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

**Parameters**
- vfs_id: The VFS ID returned by esp_vfs_register_with_id

**esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)**

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**Parameters**
- vfs_id: VFS identifier returned by esp_vfs_register_with_id.
- fd: The registered file descriptor will be written to this address.

**esp_err_t esp_vfs_register_fd_with_local_fd(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)**

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**Parameters**
- vfs_id: VFS identifier returned by esp_vfs_register_with_id.
- local_fd: The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- permanent: Whether the fd should be treated as permanent (not removed after close())
- fd: The registered file descriptor will be written to this address.

**esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)**

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**Parameters**
- vfs_id: VFS identifier returned by esp_vfs_register_with_id.
- fd: File descriptor which should be unregistered.

**int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)**

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Return The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

**Parameters**
Chapter 2. API Reference

- **nfds**: Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- **readfds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout**: If not NULL, then points to a timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

```c
void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**
- **sem**: semaphore structure which was passed to the driver by the start_select call

```c
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**
- **sem**: semaphore structure which was passed to the driver by the start_select call
- **woken**: is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pread()

**Return** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

**Parameters**
- **fd**: File descriptor used for read
- **dst**: Pointer to the buffer where the output will be written
- **size**: Number of bytes to be read
- **offset**: Starting offset of the read

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pwrite()

**Return** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Parameters**
- **fd**: File descriptor used for write
- **src**: Pointer to the buffer from where the output will be read
- **size**: Number of bytes to write
- **offset**: Starting offset of the write

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for select()
Public Members

```c
bool is_sem_local
    type of "sem" is SemaphoreHandle_t when true, defined by socket driver otherwise
void *sem
    semaphore instance
```

```c
struct esp_vfs_t
    VFS definition structure.
```

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

```c
int flags
    ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT
ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
    Write with context pointer
ssize_t (*write)(int fd, const void *data, size_t size)
    Write without context pointer
off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
    Seek with context pointer
off_t (*lseek)(int fd, off_t size, int mode)
    Seek without context pointer
ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
    Read with context pointer
ssize_t (*read)(int fd, void *dst, size_t size)
    Read without context pointer
ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
    pread with context pointer
ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
    pread without context pointer
ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
    pwrite with context pointer
ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
    pwrite without context pointer
int (*open_p)(void *ctx, const char *path, int flags, int mode)
    open with context pointer
int (*open)(const char *path, int flags, int mode)
    open without context pointer
int (*close_p)(void *ctx, int fd)
    close with context pointer
```
int (*close) (int fd)
    close without context pointer

int (*fstat_p) (void *ctx, int fd, struct stat *st)
    fstat with context pointer

int (*fstat) (int fd, struct stat *st)
    fstat without context pointer

int (*stat_p) (void *ctx, const char *path, struct stat *st)
    stat with context pointer

int (*stat) (const char *path, struct stat *st)
    stat without context pointer

int (*link_p) (void *ctx, const char *n1, const char *n2)
    link with context pointer

int (*link) (const char *n1, const char *n2)
    link without context pointer

int (*unlink_p) (void *ctx, const char *path)
    unlink with context pointer

int (*unlink) (const char *path)
    unlink without context pointer

int (*rename_p) (void *ctx, const char *src, const char *dst)
    rename with context pointer

int (*rename) (const char *src, const char *dst)
    rename without context pointer

DIR *(*opendir_p) (void *ctx, const char *name)
    opendir with context pointer

DIR *(*opendir) (const char *name)
    opendir without context pointer

struct dirent *(*readdir_p) (void *ctx, DIR *pdir)
    readdir with context pointer

struct dirent *(*readdir) (DIR *pdir)
    readdir without context pointer

int (*readdir_r_p) (void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r with context pointer

int (*readdir_r) (DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r without context pointer

long (*telldir_p) (void *ctx, DIR *pdir)
    telldir with context pointer

long (*telldir) (DIR *pdir)
    telldir without context pointer

void (*seekdir_p) (void *ctx, DIR *pdir, long offset)
    seekdir with context pointer

void (*seekdir) (DIR *pdir, long offset)
    seekdir without context pointer

int (*closedir_p) (void *ctx, DIR *pdir)
    closedir with context pointer

int (*closedir) (DIR *pdir)
    closedir without context pointer
Chapter 2. API Reference

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)  
    mkdir with context pointer
int (*mkdir)(const char *name, mode_t mode)  
    mkdir without context pointer
int (*rmdir_p)(void *ctx, const char *name)  
    rmdir with context pointer
int (*rmdir)(const char *name)  
    rmdir without context pointer
int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)  
    fcntl with context pointer
int (*fcntl)(int fd, int cmd, int arg)  
    fcntl without context pointer
int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)  
    ioctl with context pointer
int (*ioctl)(int fd, int cmd, va_list args)  
    ioctl without context pointer
int (*fsync_p)(void *ctx, int fd)  
    fsync with context pointer
int (*fsync)(int fd)  
    fsync without context pointer
int (*access_p)(void *ctx, const char *path, int amode)  
    access with context pointer
int (*access)(const char *path, int amode)  
    access without context pointer
int (*truncate_p)(void *ctx, const char *path, off_t length)  
    truncate with context pointer
int (*truncate)(const char *path, off_t length)  
    truncate without context pointer
int (*ftruncate_p)(void *ctx, int fd, off_t length)  
    ftruncate with context pointer
int (*ftruncate)(int fd, off_t length)  
    ftruncate without context pointer
int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)  
    utime with context pointer
int (*utime)(const char *path, const struct utimbuf *times)  
    utime without context pointer
int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)  
    tcsetattr with context pointer
int (*tcsetattr)(int fd, int optional_actions, const struct termios *p)  
    tcsetattr without context pointer
int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)  
    tcgetattr with context pointer
int (*tcgetattr)(int fd, struct termios *p)  
    tcgetattr without context pointer
int (*tcdrain_p)(void *ctx, int fd)  
    tcdrain with context pointer
int (*tcdrain) (int fd)
tcdrain without context pointer

int (*tcflush_p) (void *ctx, int fd, int select)
tcflush with context pointer

int (*tcflush) (int fd, int select)
tcflush without context pointer

int (*tcflow_p) (void *ctx, int fd, int action)
tcflow with context pointer

int (*tcflow) (int fd, int action)
tcflow without context pointer

pid_t (*tcgetsid_p) (void *ctx, int fd)
tcgetsid with context pointer

pid_t (*tcgetsid) (int fd)
tcgetsid without context pointer

int (*tcsendbreak_p) (void *ctx, int fd, int duration)
tcsendbreak with context pointer

int (*tcsendbreak) (int fd, int duration)
tcsendbreak without context pointer

esp_err_t (*start_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)
start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*socket_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select) (void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr) (void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore) (void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (*end_select) (void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

**Macros**

**MAX_FDS**
Maximum number of (global) file descriptors.

**ESP_VFS_PATH_MAX**
Maximum length of path prefix (not including zero terminator)

**ESP_VFS_FLAG_DEFAULT**
Default value of flags member in esp_vfs_t structure.

**ESP_VFS_FLAG_CONTEXT_PTR**
Flag which indicates that FS needs extra context pointer in syscalls.
Type Definitions

```c
typedef int esp_vfs_id_t
```

Header File

- components/vfs/include/esp_vfs_dev.h

Functions

```c
void esp_vfs_dev_uart_register (void)
add /dev/uart virtual filesystem driver
```

This function is called from startup code to enable serial output

```c
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
Set the line endings expected to be received on UART.
```

This specifies the conversion between line endings received on UART and newlines (\n, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Parameters**

- `mode`: line endings expected on UART

```c
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
Set the line endings to send to UART.
```

This specifies the conversion between newlines (\n, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Parameters**

- `mode`: line endings to send to UART

```c
int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings expected to be received on specified UART.
```

This specifies the conversion between line endings received on UART and newlines (\n, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Return** 0 if successed, or -1 when an error (specified by errno) have occurred.

**Parameters**

- `uart_num`: the UART number
- `mode`: line endings to send to UART

```c
int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings to send to specified UART.
```

This specifies the conversion between newlines (\n, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Return** 0 if successed, or -1 when an error (specified by errno) have occurred.

**Parameters**
• uart_num: the UART number
• mode: line endings to send to UART

void esp_vfs_dev_uart_use_nonblocking (int uart_num)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters
• uart_num: UART peripheral number

void esp_vfs_dev_uart_use_driver (int uart_num)
set VFS to use UART driver for reading and writing

Note application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

Parameters
• uart_num: UART peripheral number

void esp_vfs_usb_serial_jtag_use_driver (void)
set VFS to use USB-SERIAL-JTAG driver for reading and writing

Note application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void esp_vfs_usb_serial_jtag_use_nonblocking (void)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File
• components/vfs/include/esp_vfs_eventfd.h

Functions

esp_err_t esp_vfs_eventfd_register (const esp_vfs_eventfd_config_t *config)
Registers the event vfs.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t esp_vfs_eventfd_unregister (void)
Unregisters the event vfs.

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

int eventfd (unsigned int initial, int flags)

Structures

struct esp_vfs_eventfd_config_t
Eventfd vfs initialization settings.

Public Members

size_t max_fds
The maximum number of eventfds supported

Macros

EFD_SUPPORT_ISR
ESP_VFS_EVENTD_CONFIG_DEFAULT ()
2.9.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

See also

- [FAT Filesystem](#)
- [Partition Table documentation](#)
Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the `storage/wear_levelling` directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the `storage/wear_levelling/README.md` file for more information.

High level API Reference

Header Files

- fatfs/vfs/esp_vfs_fat.h

Functions

```c
esp_err_t esp_vfs_fat_spiflash_mount_rw_wl(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config, wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:
- finds the partition with defined `partition_label`. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact.

Return

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_rw_wl` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

Parameters

- `base_path`: path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] wl_handle`: wear levelling driver handle

```c
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

Public Members

```c
bool format_if_mount_failed
```

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

```c
int max_files
```

Max number of open files.

```c
size_t allocation_unit_size
```

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

**Parameters**
- base_path: path where partition should be registered (e.g. “/spiflash”)
- wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

### Mid level API Reference

#### Header File
- components/wear_levelling/include/wear_levelling.h

#### Functions

**esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl(const char *base_path, wl_handle_t handle)**

Mount WL for defined partition.

**Return**
- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

**Parameters**
- base_path: that will be used for access
- out_handle: handle of the WL instance

**esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl(const char *base_path, wl_handle_t handle)**

Unmount WL for defined partition.

**Return**
- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

**Parameters**
- handle: WL partition handle

**esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl(const char *base_path, wl_handle_t handle)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

**Parameters**
- base_path: path where partition should be registered (e.g. “/spiflash”)
- wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

**esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl(const char *base_path, wl_handle_t handle)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

**Parameters**
- base_path: path where partition should be registered (e.g. “/spiflash”)
- wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl
• ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
• ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

Parameters
• handle: WL handle that are related to the partition
• dest_addr: Address where the data should be written, relative to the beginning of the partition.
• src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
• size: Size of data to be written, in bytes.

`esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)`
Read data from the WL storage.

Return
• ESP_OK, if data was read successfully;
• ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
• ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

Parameters
• handle: WL module instance that was initialized before
• dest: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
• src_addr: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

`size_t wl_size (wl_handle_t handle)`
Get size of the WL storage.

Return usable size, in bytes

Parameters
• handle: WL module handle that was initialized before

`size_t wl_sector_size (wl_handle_t handle)`
Get sector size of the WL instance.

Return sector size, in bytes

Parameters
• handle: WL module handle that was initialized before

Macros

WL_INVALID_HANDLE

Type Definitions

typedef int32_t wl_handle_t

Code examples for this API section are provided in the `storage` directory of ESP-IDF examples.

2.10 System API

2.10.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
   • offset for 0 Segment = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t).
Formore detailson the type of memory segments and their address ranges, see ESP32 Technical Reference Manual.

You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
ESPIDF 1012 (valid) Validation Hash:...
```

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32 image_info build/app.bin
```

<table>
<thead>
<tr>
<th>Segment Count</th>
<th>offset for 0 Segment</th>
<th>size of esp_image_segment_header_t</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset for 0 Segment</td>
<td>+ length of 0 Segment</td>
<td>offset for 1 Segment</td>
</tr>
<tr>
<td>offset for 1 Segment</td>
<td>+ length of 1 Segment</td>
<td>offset for 2 Segment</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The count of each segment is defined in the segment_count field that is stored in esp_image_header_t.
The count cannot be more than ESP_IMAGE_MAX_SEGMENTS.

You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 file_offs 0x00000018 SOC_DROM
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 file_offs 0x00013d08 SOC_RTC_DRAM
I (571) esp_image: segment 3: paddr=0x00033d18 vaddr=0x3ff80000 file_offs 0x00013d10 DRAM
I (612) esp_image: segment 4: paddr=0x00036600 vaddr=0x3ff80000 file_offs 0x00013d10 DRAM
I (654) esp_image: segment 5: paddr=0x00036608 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (695) esp_image: segment 6: paddr=0x0003660a vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (737) esp_image: segment 7: paddr=0x0003660c vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (847) esp_image: segment 8: paddr=0x00036610 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (888) esp_image: segment 9: paddr=0x00036612 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (929) esp_image: segment 10: paddr=0x00036614 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (971) esp_image: segment 11: paddr=0x00036616 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
I (1012) esp_image: segment 12: paddr=0x00036618 vaddr=0x3ff80000 file_offs 0x000165f8 DRAM
```

For more details on the type of memory segments and their address ranges, see ESP32 Technical Reference Manual.
3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the options `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

**Application Description**

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- magic_word - the magic word for the `esp_app_desc` structure.
- secure_version - see Anti-rollback.
- version - see App version.
- project_name is filled from PROJECT_NAME.
- time and date - compile time and date.
- idf_ver - version of ESP-IDF.
- app_elf_sha256 - contains sha256 for the elf application file.

- The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

**Adding a Custom Structure to an Application**

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`) + sizeof(`esp_app_desc_t`).

To guarantee that the custom structure is located in the image even if it is not used, you need to add target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc") into CMakeLists.txt.

**API Reference**

**Header File**

- components/bootloader_support/include/esp_app_format.h

**Structures**

- `struct esp_image_header_t`
  
  Main header of binary image.
Chapter 2. API Reference

Public Members

uint8_t magic
   Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t segment_count
   Count of memory segments

uint8_t spi_mode
   flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t spi_speed : 4
   flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t spi_size : 4
   flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
   Entry address

uint8_t wp_pin
   WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to
   configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pin_drv[3]
   Drive settings for the SPI flash pins (read by ROM bootloader)

struct esp_chip_id_t chip_id
   Chip identification number

uint8_t min_chip_rev
   Minimum chip revision supported by image

uint8_t reserved[8]
   Reserved bytes in additional header space, currently unused

uint8_t hash_appended
   If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included
   in image length. This digest is separate to secure boot and only used for detecting corruption. For secure
   boot signed images, the signature is appended after this (and the simple hash is included in the signed
   data).

struct esp_image_segment_header_t
   Header of binary image segment.

Public Members

uint32_t load_addr
   Address of segment

uint32_t data_len
   Length of data

struct esp_app_desc_t
   Description about application.

Public Members

uint32_t magic_word
   Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t secure_version
   Secure version
uint32_t reserv1[2]
    reserv1
char version[32]
    Application version
char project_name[32]
    Project name
char time[16]
    Compile time
char date[16]
    Compile date
char idf_ver[32]
    Version IDF
uint8_t app_elf_sha256[32]
    sha256 of elf file
uint32_t reserv2[20]
    reserv2

**Macros**

**ESP_IMAGE_HEADER_MAGIC**
    The magic word for the `esp_image_header_t` structure.

**ESP_IMAGE_MAX_SEGMENTS**
    Max count of segments in the image.

**ESP_APP_DESC_MAGIC_WORD**
    The magic word for the `esp_app_desc` structure that is in DROM.

**Enumerations**

**enum esp_chip_id_t**
    ESP chip ID.
    
    Values:

    **ESP_CHIP_ID_ESP32** = 0x0000
        chip ID: ESP32

    **ESP_CHIP_ID_ESP32S2** = 0x0002
        chip ID: ESP32-S2

    **ESP_CHIP_ID_ESP32C3** = 0x0005
        chip ID: ESP32-C3

    **ESP_CHIP_ID_ESP32S3** = 0x0009
        chip ID: ESP32-S3

    **ESP_CHIP_ID_ESP32C2** = 0x000C
        chip ID: ESP32-C2

    **ESP_CHIP_ID_INVALID** = 0xFFFF
        Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

**enum esp_image_spi_mode_t**
    SPI flash mode, used in `esp_image_header_t`.
    
    Values:

    **ESP_IMAGE_SPI_MODE_QIO**
        SPI mode QIO

    **ESP_IMAGE_SPI_MODE_QOUT**
        SPI mode QOUT
Chapter 2. API Reference

ESP_IMAGE_SPI_MODE_DIO
SPI mode DIO

ESP_IMAGE_SPI_MODE_DOUT
SPI mode DOUT

ESP_IMAGE_SPI_MODE_FAST_READ
SPI mode FAST_READ

ESP_IMAGE_SPI_MODE_SLOW_READ
SPI mode SLOW_READ

enum esp_image_spi_freq_t
SPI flash clock frequency.

Values:

ESP_IMAGE_SPI_SPEED_40M
SPI clock frequency 40 MHz

ESP_IMAGE_SPI_SPEED_26M
SPI clock frequency 26 MHz

ESP_IMAGE_SPI_SPEED_20M
SPI clock frequency 20 MHz

ESP_IMAGE_SPI_SPEED_80M = 0xF
SPI clock frequency 80 MHz

enum esp_image_flash_size_t
Supported SPI flash sizes.

Values:

ESP_IMAGE_FLASH_SIZE_1MB = 0
SPI flash size 1 MB

ESP_IMAGE_FLASH_SIZE_2MB
SPI flash size 2 MB

ESP_IMAGE_FLASH_SIZE_4MB
SPI flash size 4 MB

ESP_IMAGE_FLASH_SIZE_8MB
SPI flash size 8 MB

ESP_IMAGE_FLASH_SIZE_16MB
SPI flash size 16 MB

ESP_IMAGE_FLASH_SIZE_32MB
SPI flash size 32 MB

ESP_IMAGE_FLASH_SIZE_64MB
SPI flash size 64 MB

ESP_IMAGE_FLASH_SIZE_128MB
SPI flash size 128 MB

ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.10.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with
minimal overhead on program execution. Developers can use this library to send application specific state of execution
to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of
this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- components/app_trace/include/esp_app_trace.h

Functions

**esp_err_t esp_apptrace_init (void)**

Initializes application tracing module.

*Note* Should be called before any esp_apptrace_xxx call.

*Return* ESP_OK on success, otherwise see esp_err_t

**void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)**

Configures down buffer.

*Note* Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and

esp_apptrace_read. This function does not protect internal data by lock.

*Parameters*

- *buf*: Address of buffer to use for down channel (host to target) data.
- *size*: Size of the buffer.

**uint8_t *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)**

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must

be called to indicate it.

*Return* non-NULL on success, otherwise NULL.

*Parameters*

- *dest*: Indicates HW interface to send data.
- *size*: Size of data to write to trace buffer.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)**

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded

by esp_apptrace_buffer_get.

*Return* ESP_OK on success, otherwise see esp_err_t

*Parameters*

- *dest*: Indicates HW interface to send data. Should be identical to the same parameter in call to

esp_apptrace_buffer_get.
- *ptr*: Address of trace buffer to release. Should be the value returned by call to

esp_apptrace_buffer_get.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)**

Writes data to trace buffer.

*Return* ESP_OK on success, otherwise see esp_err_t

*Parameters*

- *dest*: Indicates HW interface to send data.
- *data*: Address of data to write to trace buffer.
- *size*: Size of data to write to trace buffer.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
```c
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
  
  vprintf-like function to send log messages to host via specified HW interface.

  Return  Number of bytes written.

  Parameters
  •  dest: Indicates HW interface to send data.
  •  tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
  •  fmt: Address of format string.
  •  ap: List of arguments.

int esp_apptrace_vprintf(const char *fmt, va_list ap)
  
  vprintf-like function to send log messages to host.

  Return  Number of bytes written.

  Parameters
  •  fmt: Address of format string.
  •  ap: List of arguments.

esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
  
  Flushes remaining data in trace buffer to host.

  Return  ESP_OK on success, otherwise see esp_err_t

  Parameters
  •  dest: Indicates HW interface to flush data on.
  •  tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)
  
  Flushes remaining data in trace buffer to host without locking internal data. This is a special version of
eesp_apptrace_flush which should be called from panic handler.

  Return  ESP_OK on success, otherwise see esp_err_t

  Parameters
  •  dest: Indicates HW interface to flush data on.
  •  min_sz: Threshold for flushing data. If current filling level is above this value, data will be flushed.
  TRAX destinations only.
  •  tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)
  
  Reads host data from trace buffer.

  Return  ESP_OK on success, otherwise see esp_err_t

  Parameters
  •  dest: Indicates HW interface to read the data on.
  •  data: Address of buffer to put data from trace buffer.
  •  size: Pointer to store size of read data. Before call to this function pointed memory must hold
  requested size of data
  •  tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

uint8_t *esp_apptrace_down_buffer_get(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)
  
  Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put
  must be called to indicate it.

  Return  non-NULL on success, otherwise NULL.

  Parameters
  •  dest: Indicates HW interface to receive data.
  •  size: Address to store size of available data in down buffer. Must be initialized with requested
  value.
  •  tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_down_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
  
  Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded
by esp_apptrace_down_buffer_get.

  Return  ESP_OK on success, otherwise see esp_err_t

  Parameters
```

Chapter 2. API Reference

- dest: Indicates HW interface to receive data. Should be identical to the same parameter in call to `esp_apptrace_down_buffer_get`.
- ptr: Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_down_buffer_get`.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
bool esp_apptrace_host_is_connected(esp_apptrace_dest_t dest)
```

Checks whether host is connected.

**Return**
- true if host is connected, otherwise false

**Parameters**
- dest: Indicates HW interface to use.

```c
void *esp_apptrace_fopen (esp_apptrace_dest_t dest, const char *path, const char *mode)
```

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

**Return**
- non zero file handle on success, otherwise 0

**Parameters**
- dest: Indicates HW interface to use.
- path: Path to file.
- mode: Mode string. See fopen for details.

```c
int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)
```

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

**Return**
- Zero on success, otherwise non-zero. See fclose for details.

**Parameters**
- dest: Indicates HW interface to use.
- stream: File handle returned by esp_apptrace_fopen.

```c
size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
```

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

**Return**
- Number of written items. See fwrite for details.

**Parameters**
- dest: Indicates HW interface to use.
- ptr: Address of data to write.
- size: Size of an item.
- nmemb: Number of items to write.
- stream: File handle returned by esp_apptrace_fopen.

```c
size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
```

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

**Return**
- Number of read items. See fread for details.

**Parameters**
- dest: Indicates HW interface to use.
- ptr: Address to store read data.
- size: Size of an item.
- nmemb: Number of items to read.
- stream: File handle returned by esp_apptrace_fopen.

```c
int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)
```

Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

**Return**
- Zero on success, otherwise non-zero. See fseek for details.

**Parameters**
- dest: Indicates HW interface to use.
- stream: File handle returned by esp_apptrace_fopen.
- offset: Offset. See fseek for details.
Chapter 2. API Reference

int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)
Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

Return Current position in file. See ftell for details.
Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)
Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Return ESP_OK on success, otherwise see esp_err_t
Parameters
• dest: Indicates HW interface to use.

void esp_gcov_dump (void)
Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations
enum esp_apptrace_dest_t
Application trace data destinations bits.
Values:

ESP_APPTRACE_DEST_JTAG = 1
JTAG destination.

ESP_APPTRACE_DEST_TRAX = ESP_APPTRACE_DEST_JTAG
xxx_TRAX name is obsolete, use more common xxx_JTAG

ESP_APPTRACE_DEST_UART
UART destination.

ESP_APPTRACE_DEST_MAX = ESP_APPTRACE_DEST_UART + 1

ESP_APPTRACE_DEST_NUM

Header File
• components/app_trace/include/esp_sysview_trace.h

Functions
static esp_err_t esp_sysview_flush (uint32_t tmo)
Flushes remaining data in SystemView trace buffer to host.

Return ESP_OK.
Parameters
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

int esp_sysview_vprintf (const char *format, va_list args)
vprintf-like function to sent log messages to the host.

Return Number of bytes written.
Parameters
• format: Address of format string.
• args: List of arguments.

esp_err_t esp_sysview_heap_trace_start (uint32_t tmo)
Starts SystemView heap tracing.

Return ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.
Parameters
• tmo: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

```c
esp_err_t esp_sysview_heap_trace_stop (void)
```
Stops SystemView heap tracing.

Return ESP_OK.

```c
void esp_sysview_heap_trace_alloc (void *addr, uint32_t size, const void *callers)
```
Sends heap allocation event to the host.

**Parameters**

- `addr`: Address of allocated block.
- `size`: Size of allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

```c
void esp_sysview_heap_trace_free (void *addr, const void *callers)
```
Sends heap de-allocation event to the host.

**Parameters**

- `addr`: Address of de-allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

### 2.10.3 Call function with external stack

**Overview**

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter.

**Usage**

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that function
- the size of stack in bytes
- a pointer to the shared stack function

The user defined function will be deferred as a callback and can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
```
SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
assert (printf_lock != NULL);

//Call the desired function using the macro helper:
esp_execute_shared_stack_function (printf_lock,
   shared_stack,
   8192,
   external_stack_function);

vSemaphoreDelete (printf_lock);
free (shared_stack);
}

API Reference

Header File

- components/esp_system/include/esp_expression_with_stack.h

Functions

void esp_execute_shared_stack_function (SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters

- lock: Mutex object to protect in case of shared stack
- stack: Pointer to user allocated stack
- stack_size: Size of current stack in bytes
- function: pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions

typedef void (*shared_stack_function) (void)

2.10.4 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by linenoise library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by argtable3 library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

Note: These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use getopt or custom code for argument parsing, instead of argtable3. Likewise, it is possible to use simpler means of command input (such as fgets) together with the rest of the means for command splitting and argument parsing.
**Line editing**

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see \[6n or similar escape sequence when running system/console example instead of a command prompt (e.g. esp> ), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and idf_monitor.py (which can be invoked using idf.py monitor from project directory).

Here is an overview of functions provided by linenoise library.

**Configuration**  
Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

```c
linenoiseClearScreen()
```

Clear terminal screen using an escape sequence and position the cursor at the top left corner.

```c
linenoiseSetMultiLine()
```

Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

```c
linenoiseAllowEmpty()
```

Set whether linenoise library will return a zero-length string (if true) or NULL (if false) for empty lines. By default, zero-length strings are returned.

```c
linenoiseSetMaxLineLen()
```

Set maximum length of the line for linenoise library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4 KB.

**Main loop**  
`linenoise()`  

In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns completed line once ‘enter’ key is pressed. As such, it handles the ‘read’ part of the loop.

```c
linenoiseFree()
```

This function must be called to release the command line buffer obtained from `linenoise()` function.

**Hints and completions**  
`linenoiseSetCompletionCallback()`  

When user presses ‘tab’ key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.

```c
calendar component provides a ready made function to provide completions for registered commands, esp_console_get_completion() (see below).
```

```c
linenoiseAddCompletion()
```

Submit Document Feedback
Function to be called by completion callback to inform the library about possible completions of the currently typed command.

`linenoiseSetHintsCallback()`

Whenever user input changes, linenoise invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

`linenoiseSetFreeHintsCallback()`

If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

**History**

`linenoiseHistorySetMaxLen()`

This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

`linenoiseHistoryAdd()`

Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

`linenoiseHistorySave()`

Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

`linenoiseHistoryLoad()`

Counterpart to `linenoiseHistorySave()`, loads history from a file.

`linenoiseHistoryFree()`

Releases memory used to store command history. Call this function when done working with linenoise library.

**Splitting of command line into arguments**

**console** component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123 456, def]`
- `\a \b\c\"` → `[\a, \b, \c]"`
Argument parsing

For argument parsing, console component includes argtable3 library. Please see tutorial for an introduction to argtable3. Github repository also includes examples.

Command registration and dispatching

console component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to esp_console_init(), and calls esp_console_cmd_register() function to register command handlers.

For each command, application provides the following information (in the form of esp_console_cmd_t structure):

• Command name (string without spaces)
• Help text explaining what the command does
• Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
• The command handler function.

A few other functions are provided by the command registration module:

esp_console_run()

This function takes the command line string, splits it into argc/argv argument list using esp_console_split_argv(), looks up the command in the list of registered components, and if it is found, executes its handler.

esp_console_register_help_command()

Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

esp_console_get_completion()

Callback function to be used with linenoiseSetCompletionCallback() from linenoise library. Provides completions to linenoise based on the list of registered commands.

esp_console_get_hint()

Callback function to be used with linenoiseSetHintsCallback() from linenoise library. Provides argument hints for registered commands to linenoise.

Initialize console REPL environment

To establish a basic REPL environment, console component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call esp_console_new_repl_uart() to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. help).

After that, you can register your own commands with esp_console_cmd_register(). The REPL environment keeps in init state until you call esp_console_start_repl().

Application Example

Example application illustrating usage of the console component is available in system/console directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.
Besides that, ESP-IDF contains several useful examples which based on console component and can be treated as “tools” when developing applications. For example, peripherals/i2c/i2c_tools, wifi/iperf.

**API Reference**

**Header File**

- components/console/esp_console.h

**Functions**

- `esp_err_t esp_console_init(const esp_console_config_t *config)`
  
  initialize console module

  **Note**  Call this once before using other console module features

  **Return**

  - ESP_OK on success
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_STATE if already initialized
  - ESP_ERR_INVALID_ARG if the configuration is invalid

  **Parameters**

  - config: console configuration

- `esp_err_t esp_console_deinit(void)`
  
  de-initialize console module

  **Note**  Call this once when done using console module functions

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if not initialized yet

- `esp_err_t esp_console_cmd_register(const esp_console_cmd_t *cmd)`
  
  Register console command.

  **Return**

  - ESP_OK on success
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_ARG if command description includes invalid arguments

  **Parameters**

  - cmd: pointer to the command description; can point to a temporary value

- `esp_err_t esp_console_run(const char *cmdline, int *cmd_ret)`
  
  Run command line.

  **Return**

  - ESP_OK, if command was run
  - ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
  - ESP_ERR_INVALID.Arg, if command with given name wasn’t registered
  - ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

  **Parameters**

  - cmdline: command line (command name followed by a number of arguments)
  - [out] cmd_ret: return code from the command (set if command was run)

- `size_t esp_console_split_argv(char *line, char **argv, size_t argv_size)`
  
  Split command line into arguments in place.

  * - This function finds whitespace-separated arguments in the given input line.
  * - 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3']
  * - Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.

(continues on next page)
Note  Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

Return  number of arguments found (argc)

Parameters  
- line: pointer to buffer to parse; it is modified in place  
- argv: array where the pointers to arguments are written  
- argv_size: number of elements in argv_array (max. number of arguments)

void esp_console_get_completion (const char *buf, linenoiseCompletions *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

linenoiseSetCompletionCallback(&esp_console_get_completion);

Parameters  
- buf: the string typed by the user  
- lc: linenoiseCompletions to be filled in

const char *esp_console_get_hint (const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

linenoiseSetHintsCallback((linenoiseHintsCallback*)&esp_console_get_hint);

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

Return  string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

Parameters  
- buf: line typed by the user  
- [out] color: ANSI color code to be used when displaying the hint  
- [out] bold: set to 1 if hint has to be displayed in bold

esp_err_t esp_console_register_help_command (void)

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

Return  
- ESP_OK on success  
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

esp_err_t esp_console_new_repl_uart (const esp_console_dev_uart_config_t *dev_config, 
                        const esp_console_repl_config_t *repl_config, 
                        esp_console_repl_t **ret_repl)

Establish a console REPL environment over UART driver.

Note  This is an all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)  
- Configures the stdin/stdout to go through the UART driver  
- Initializes linenoise  
- Spawn new thread to run REPL in the background

Attention  This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Return
**Chapter 2. API Reference**

- ESP_OK on success
- ESP_FAIL Parameter error

**Parameters**
- [in] dev_config: UART device configuration
- [in] repl_config: REPL configuration
- [out] ret_repl: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_new_repl_usb_cdc(const esp_console_dev_usb_cdc_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over USB CDC.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

**Return**
- ESP_OK on success
- ESP_FAIL Parameter error

**Parameters**
- [in] dev_config: USB CDC configuration
- [in] repl_config: REPL configuration
- [out] ret_repl: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_start_repl(esp_console_repl_t *repl)
```

Start REPL environment.

**Note** Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

**Parameters**
- [in] repl: REPL handle returned from esp_console_new_repl_xxx

**Structures**

**struct esp_console_config_t**
Parameters for console initialization.

**Public Members**

- size_t max_cmdline_length
  - length of command line buffer, in bytes
- size_t max_cmdline_args
  - maximum number of command line arguments to parse
- int hint_color
  - ASCII color code of hint text.
- int hint_bold
  - Set to 1 to print hint text in bold.

**struct esp_console_repl_config_t**
Parameters for console REPL (Read Eval Print Loop)

**Public Members**

- uint32_t max_history_len
  - maximum length for the history
**const** char *history_save_path
file path used to save history commands, set to NULL won’t save to file system

uint32_t task_stack_size
repl task stack size

uint32_t task_priority
repl task priority

**const** char *prompt
prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
maximum length of a command line. If 0, default value will be used

**struct esp_console_dev_uart_config_t**
Parameters for console device: UART.

**Public Members**

int channel
UART channel number (count from zero)

int baud_rate
Communication baud rate.

int tx_gpio_num
GPIO number for TX path, -1 means using default one.

int rx_gpio_num
GPIO number for RX path, -1 means using default one.

**struct esp_console_dev_usb_cdc_config_t**
Parameters for console device: USB CDC.

**Note** It’s an empty structure for now, reserved for future

**struct esp_console_cmd_t**
Console command description.

**Public Members**

**const** char *command
Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

**const** char *help
Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

**const** char *hint
Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

**esp_console_cmd_func_t** func
Pointer to a function which implements the command.

void *argtable
Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

**struct esp_console_repl_s**
Console REPL base structure.
Public Members

\[ \text{esp_err_t (*del)(esp_console_repl_t *repl)} \]
Delete console REPL environment.

Return
- ESP_OK on success
- ESP_FAIL on errors

Parameters
- \([\text{in}]\) repl: REPL handle returned from esp_console_new_repl_xxx

Macros

\[ \text{ESP\_CONSOLE\_CONFIG\_DEFAULT()} \]
Default console configuration value.

\[ \text{ESP\_CONSOLE\_REPL\_CONFIG\_DEFAULT()} \]
Default console repl configuration value.

2.10.5 eFuse Manager

Introduction
The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):
- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
• EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:

• common (esp_efuse_table.csv) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.

• custom - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see WR_DIS and RD_DIS in the common table).

**efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.

**bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

**bit_count** The number of bits to use in this field (1..). This parameter can not be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:
# Factory MAC address

<table>
<thead>
<tr>
<th>Field</th>
<th>Block</th>
<th>Offset</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY</td>
<td>EFUSE_BLK0</td>
<td>72</td>
<td>8</td>
<td>Factory MAC addr [0]</td>
</tr>
<tr>
<td></td>
<td>EFUSE_BLK0</td>
<td>64</td>
<td>8</td>
<td>Factory MAC addr [1]</td>
</tr>
<tr>
<td></td>
<td>EFUSE_BLK0</td>
<td>56</td>
<td>8</td>
<td>Factory MAC addr [2]</td>
</tr>
<tr>
<td></td>
<td>EFUSE_BLK0</td>
<td>48</td>
<td>8</td>
<td>Factory MAC addr [3]</td>
</tr>
<tr>
<td></td>
<td>EFUSE_BLK0</td>
<td>40</td>
<td>8</td>
<td>Factory MAC addr [4]</td>
</tr>
<tr>
<td></td>
<td>EFUSE_BLK0</td>
<td>32</td>
<td>8</td>
<td>Factory MAC addr [5]</td>
</tr>
<tr>
<td>MAC_FACTORY_CRC</td>
<td>EFUSE_BLK0</td>
<td>80</td>
<td>8</td>
<td>CRC8 for factory MAC addr</td>
</tr>
</tbody>
</table>

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

## Structured efuse fields

</tbody>
</table>

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.

The IDF names for structured efuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by _. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2.B1, etc.

### efuse_table_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:

```bash
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv
```

After generation in the folder $IDF_PATH/components/efuse/esp32 the following:

- `esp_efuse_table.c` file.
- In include folder `esp_efuse_table.c` file.
To generate a custom files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_.table.csv
```

After generation in the folder PROJECT_PATH/main create:

- `esp_efuse_custom_table.c` file.
- In include folder `esp Efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp Efuse_custom_table.h"
```

### Supported coding scheme

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details see System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p PORT summary` command.
- from esptool utility logs (during flashing).
- calling the function in the code `esp Efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an CONFIG_EFUSE_CODE_SCHEME_SELECTOR option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp Efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks `esp Efuse_read...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.
To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**Note:** If there is already pre-written data in the eFuse block using the 3/4 or Repeat encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_hd, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

**FOR TESTING ONLY (NOT RECOMMENDED):** You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

### How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32.esp_efuse_table.csv --info
```

---Espressif---

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv .

(continues on next page)
Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

**Debug eFuse & Unit tests**

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse` partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

**espefuse.py** esptool includes a useful tool for reading/writing ESP32 eFuse bits - espefuse.py.

   • components/efuse/include/esp_efuse.h

Functions
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
   Reads bits from EFUSE field and writes it into an array.
   The number of read bits will be limited to the minimum value from the description of the bits in “field”
   structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length
   of the field.
   Note Please note that reading in the batch mode does not show uncommitted changes.
   Return
      • ESP_OK: The operation was successfully completed.
      • ESP_ERR_INVALID_ARG: Error in the passed arguments.
   Parameters
      • [in] field: A pointer to the structure describing the fields of efuse.
      • [out] dst: A pointer to array that will contain the result of reading.
      • [in] dst_size_bits: The number of bits required to read. If the requested number of bits
         is greater than the field, the number will be limited to the field size.
bool esp_efuse_read_field_bit (const esp_efuse_desc_t *field[])  
Read a single bit eFuse field as a boolean value.

Note  The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.
Note  If assertions are enabled and the parameter is invalid, execution will abort
Note  Please note that reading in the batch mode does not show uncommitted changes.

Return  
• true: The field parameter is valid and the bit is set.
• false: The bit is not set, or the parameter is invalid and assertions are disabled.

Parameters  
• [in] field: A pointer to the structure describing the fields of efuse.

esp_err_t esp_efuse_read_field_cnt (const esp_efuse_desc_t *field[], size_t *out_cnt)  
Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

Note  Please note that reading in the batch mode does not show uncommitted changes.

Return  
• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.

Parameters  
• [in] field: A pointer to the structure describing the fields of efuse.
• [out] out_cnt: A pointer that will contain the number of programmed as “1” bits.

esp_err_t esp_efuse_write_field_blob (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)  
Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Return  
• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters  
• [in] field: A pointer to the structure describing the fields of efuse.
• [in] src: A pointer to array that contains the data for writing.
• [in] src_size_bits: The number of bits required to write.

esp_err_t esp_efuse_write_field_cnt (const espEfuse_desc_t *field[], size_t cnt)  
Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Return  
• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

Parameters  
• [in] field: A pointer to the structure describing the fields of efuse.
• [in] cnt: Required number of programmed as “1” bits.

esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])  
Write a single bit eFuse field to 1.
For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Return
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

Parameters
- [in] field: Pointer to the structure describing the efuse field.

esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)
Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
- [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)
Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
- [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])
Returns the number of bits used by field.

Parameters
- [in] field: A pointer to the structure describing the fields of efuse.

uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)
Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

Note Please note that reading in the batch mode does not show uncommitted changes.

Return Value of register

Parameters
- [in] blk: Block number of eFuse.

esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

Return
- ESP_OK: The operation was successfully completed.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**
- [in] blk: Block number of eFuse.
- [in] val: Value to write.

`esp_efuse_get_coding_scheme` (esp_efuse_block_t blk)
Returns eFuse coding scheme.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return**
Return eFuse coding scheme for blocks

**Parameters**
- [in] blk: Block number of eFuse.

`esp_efuse_read_block` (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
Read key to eFuse block starting at the offset and the required size.

**Note**
Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- [in] blk: Block number of eFuse.
- [in] dst_key: A pointer to array that will contain the result of reading.
- [in] size_bits: The number of bits required to read.

`esp_efuse_write_block` (esp_efuse_block_t blk, void *src_key, size_t offset_in_bits, size_t size_bits)
Write key to eFuse block starting at the offset and the required size.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

**Parameters**
- [in] blk: Block number of eFuse.
- [in] src_key: A pointer to array that contains the key for writing.
- [in] size_bits: The number of bits required to write.

```c
uint8_t esp_efuse_get_chip_ver (void)
Returns chip version from eFuse.
```

**Return**
chip version

```c
uint32_t esp_efuse_get_pkg_ver (void)
Returns chip package from eFuse.
```

**Return**
chip package

```c
void esp_efuse_reset (void)
Reset eFuse write registers.
```

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note**
This function is not threadsafe, if calling code updates eFuse values from multiple tasks then this is caller’s responsibility to serialise.
void **esp_efuse_disable_basic_rom_console**(void)

Disable BASIC ROM Console via efuse.

By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

Call this function (from bootloader or app) to permanently disable the console on this chip.

**esp_err_t esp_efuse_disable_rom_download_mode**(void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Return**

- **ESP_OK** If the eFuse was successfully burned, or had already been burned.
- **ESP_ERR_NOT_SUPPORTED** (ESP32 only) This SoC is not capable of disabling UART download mode
- **ESP_ERR_INVALID_STATE** (ESP32 only) This eFuse is write protected and cannot be written

**esp_err_t esp_efuse_set_rom_log_scheme**(esp_efuse_rom_log_scheme_t log_scheme)

Set boot ROM log scheme via eFuse.

**Note** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

**Return**

- **ESP_OK** If the eFuse was successfully burned, or had already been burned.
- **ESP_ERR_NOT_SUPPORTED** (ESP32 only) This SoC is not capable of setting ROM log scheme
- **ESP_ERR_INVALID_STATE** This eFuse is write protected or has been burned already

**Parameters**

- **log_scheme**: Supported ROM log scheme

uint32_t **esp_efuse_read_secure_version**(void)

Return secure_version from efuse field.

**Return** Secure version from efuse field

bool **esp_efuse_check_secure_version**(uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

**Return**

- True: If version of app is equal or more than secure_version from efuse.

**Parameters**

- **secure_version**: Secure version from app.

**esp_err_t esp_efuse_update_secure_version**(uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Return**

- **ESP_OK**: Successful.
- **ESP_FAIL**: secure version of app cannot be set to efuse field.
- **ESP_ERR_NOT_SUPPORTED**: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

**Parameters**

- [in] **secure_version**: Secure version from app.

**esp_err_t esp_efuse_batch_write_begin**(void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end
call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

Note Please note that reading in the batch mode does not show uncommitted changes.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new...
   --value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1...
   --because uncommitted changes are not readable, it will be available only...
   --after commit.

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be...
   --done in the last commit().

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

Return
- ESP_OK: Successful.

`esp_err_t esp_efuse_batch_write_cancel (void)`
Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit (void)`
Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

`bool esp_efuse_block_is_empty (esp_efuse_block_t block)`
Checks that the given block is empty.

Return
- True: The block is empty.
bool esp_efuse_get_key_dis_read(esp_efuse_block_t block)
Returns a read protection for the key block.

    Return  True: The key block is read protected     False: The key block is readable.

    Parameters
        • [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

esp_err_t esp_efuse_set_key_dis_read(esp_efuse_block_t block)
Sets a read protection for the key block.

    Parameters
        • [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

bool esp_efuse_get_key_dis_write(esp_efuse_block_t block)
Returns a write protection for the key block.

    Return  True: The key block is write protected     False: The key block is writeable.

    Parameters
        • [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

esp_err_t esp_efuse_set_key_dis_write(esp_efuse_block_t block)
Sets a write protection for the key block.

    Parameters
        • [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

bool esp_efuse_key_block_unused(esp_efuse_block_t block)
Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

    Return  • True if key block is unused,
            • False if key block is used or the specified block index is not a key block.

    Parameters
        • block: key block to check.

bool esp_efuse_find_purpose (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)
Find a key block with the particular purpose set.

    Return  • True: If found,
            • False: If not found (value at block pointer is unchanged).

    Parameters
        • [in] purpose: Purpose to search for.
        • [out] block: Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

bool esp_efuse_get_keypurpose_dis_write (esp_efuse_block_t block)
Returns a write protection of the key purpose field for an efuse key block.
Note: For ESP32: no key purpose, it returns always True.

Return: True: The key purpose is write protected. False: The key purpose is writeable.

Parameters:
- \[\text{[in]} \text{ block}\]: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

\texttt{esp_efuse\_get\_key\_purpose(esp\_efuse\_block\_t block)}

Returns the current purpose set for an efuse key block.

Return:
- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP\_EFUSE\_KEY\_PURPOSE\_MAX: Otherwise.

Parameters:
- \[\text{[in]} \text{ block}\]: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

\texttt{esp\_err\_t esp\_efuse\_write\_key(esp\_efuse\_block\_t block, esp\_efuse\_purpose\_t purpose, const void* key, size\_t key\_size\_bytes)}

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Return:
- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

Parameters:
- \[\text{[in]} \text{ block}\]: Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp\_efuse\_key\_block\_unused).
- \[\text{[in]} \text{ purpose}\]: Purpose to set for this key. Purpose must be already unset.
- \[\text{[in]} \text{ key}\]: Pointer to data to write.
- \[\text{[in]} \text{ key\_size\_bytes}\]: Bytes length of data to write.

\texttt{esp\_err\_t esp\_efuse\_write\_keys(const esp\_efuse\_purpose\_t purposes[], uint8\_t keys[][32], unsigned number\_of\_keys)}

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

Return:
- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS: Error not enough unused key blocks available
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

Parameters:
- \[\text{[in]} \text{ purposes}\]: Array of purposes (purpose[number\_of\_keys]).
- \[\text{[in]} \text{ keys}\]: Array of keys (uint8\_t keys[number\_of\_keys][32]). Each key is 32 bytes long.
- \[\text{[in]} \text{ number\_of\_keys}\]: The number of keys to write (up to 6 keys).

Structures:

\texttt{struct esp\_efuse\_desc\_t}

Type definition for an efuse field.
Public Members

```c
esp_efuse_block_t efuse_block : 8
Block of eFuse
```

```c
uint8_t bit_start
Start bit [0..255]
```

```c
uint16_t bit_count
Length of bit field [1..-]
```

Macros

```c
ESP_ERR_EFUSE
Base error code for efuse api.
```

```c
ESP_OK_EFUSE_CNT
OK the required number of bits is set.
```

```c
ESP_ERR_EFUSE_CNT_IS_FULL
Error field is full.
```

```c
ESP_ERR_EFUSE_REPEATED_PROG
Error repeated programming of programmed bits is strictly forbidden.
```

```c
ESP_ERR_CODING
Error while a encoding operation.
```

```c
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
Error not enough unused key blocks available
```

```c
ESP_ERR_DAMAGED_READING
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
```

Enumerations

```c
enum esp_efuse_rom_log_scheme_t
Type definition for ROM log scheme.
```

```c
Values:
```

```c
ESP_EFUSE_ROM_LOG_ALWAYS_ON
Always enable ROM logging
```

```c
ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
ROM logging is enabled when specific GPIO level is low during start up
```

```c
ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
ROM logging is enabled when specific GPIO level is high during start up
```

```c
ESP_EFUSE_ROM_LOG_ALWAYS_OFF
Disable ROM logging permanently
```

2.10.6 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see Error Handling.

For the full list of error codes defined in ESP-IDF, see Error Code Reference.
API Reference

Header File

- components/esp_common/include/esp_check.h

Macros

ESP_RETURN_ON_ERROR(x, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension ##__VA_ARGS___.

ESP_RETURN_ON_ERROR_ISR(x, log_tag, format, ...)
A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR(x, goto_tag, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_ERROR_ISR(x, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE(a, err_code, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

ESP_RETURN_ON_FALSE_ISR(a, err_code, log_tag, format, ...)
A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE(a, err_code, goto_tag, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR(a, err_code, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- components/esp_common/include/esp_err.h

Functions

const char *esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return string error message

Parameters
- code: esp_err_t error code

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)
Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.
Return buf containing the string error message

Parameters
- `code`: esp_err_t error code
- `[out] buf`: buffer where the error message should be written
- `buflen`: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Macros

**ESP_OK**
esp_err_t value indicating success (no error)

**ESP_FAIL**
Generic esp_err_t code indicating failure

**ESP_ERR_NO_MEM**
Out of memory

**ESP_ERR_INVALID_ARG**
Invalid argument

**ESP_ERR_INVALID_STATE**
Invalid state

**ESP_ERR_INVALID_SIZE**
Invalid size

**ESP_ERR_NOT_FOUND**
Requested resource not found

**ESP_ERR_NOT_SUPPORTED**
Operation or feature not supported

**ESP_ERR_TIMEOUT**
Operation timed out

**ESP_ERR_INVALID_RESPONSE**
Received response was invalid

**ESP_ERR_INVALID_CRC**
CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION**
Version was invalid

**ESP_ERR_INVALID_MAC**
MAC address was invalid

**ESP_ERR_NOT_FINISHED**
There are items remained to retrieve

**ESP_ERR_WIFI_BASE**
Starting number of WiFi error codes

**ESP_ERR_MESH_BASE**
Starting number of MESH error codes

**ESP_ERR_FLASH_BASE**
Starting number of flash error codes

**ESP_ERR_HW_CRYPTO_BASE**
Starting number of HW cryptography module error codes

**ESP_ERR_MEMPROT_BASE**
Starting number of Memory Protection API error codes
Chapter 2. API Reference

ESP_ERROR_CHECK (x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT (x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions
typedef int esp_err_t

2.10.7 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Partial Image Download over HTTPS

To use partial image download feature, enable partial_http_download configuration in esp_https_ota_config_t. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting max_http_request_size to required value.

This option is useful while fetching image from a service like AWS S3, where mbedtls Rx buffer size (CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedtls Rx buffer size is set to 16K. By using partial_http_download with max_http_request_size of 4K, size of mbedtls Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.
Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure boot

Advanced APIs

esp_https_ota also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS OTA APIs: system/ota/advanced_https_ota.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable CONFIG_ESP_HTTPS_OTA_DECRYPT_CB in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: system/ota/pre_encrypted_ota.

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

esp_err_t esp_https_ota (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of ota_config->http_config.

Note This API handles the entire OTA operation, so if this API is being used then no other APIs from esp_https_ota component should be called. If more information and control is needed during the HTTPS OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

Return

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters

- [in] ota_config: pointer to esp_https_ota_config_t structure.

esp_err_t esp_https_ota_begin (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then esp_https_ota_perform should be called to continue with the OTA process and there should be a call to esp_https_ota_finish on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of http_config, which is a part of ota_config. In case of error, this API explicitly sets handle to NULL.
Chapter 2. API Reference

Note  This API is blocking, so setting is_async member of http_config structure will result in an error.

Return
- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

Parameters
- [in] ota_config: pointer to esp_https_ota_config_t structure
- [out] handle: pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

esp_err_t esp_https_ota_perform (esp_https_ota_handle_t https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Return
- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP.OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR OTA_VALIDATE FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP.ERR_FLASH_OP_TIMEOUT or ESP.ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

bool esp_https_ota_is_complete_data_received (esp_https_ota_handle_t https_ota_handle)

Checks if complete data was received or not.

Note  This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

Return
- false
- true

Parameters
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_finish (esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

Note  If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

Return
- ESP_OK: Clean-up successful
- ESP.ERR_INVALID_STATE
- ESP.ERR_INVALID_ARG: Invalid argument
- ESP.ERR OTA_VALIDATE FAILED: Invalid app image

Parameters
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_abort (esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.
This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note** esp_https_ota_abort should not be called after calling esp_https_ota_finish

**Return**
- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
esp_err_t esp_https_ota_abort(esp_https_ota_handle_t https_ota_handle)
```

**esp_https_ota_get_img_desc**

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

**Return**
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure
- [out] new_app_info: pointer to an allocated esp_app_desc_t structure

```c
esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)
```

**esp_https_ota_get_image_len_read**

This function returns OTA image data read so far.

**Note** This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

**Return**
- -1 On failure
- total bytes read so far

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)
```

**esp_https_ota_get_image_size**

This function returns OTA image total size.

**Note** This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

**Return**
- -1 On failure or chunked encoding
- total bytes of image

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
int esp_https_ota_get_image_size(esp_https_ota_handle_t https_ota_handle)
```

**Structures**

```c
struct esp_https_ota_config_t
    ESP HTTPS OTA configuration.
```

**Public Members**

```c
const esp_http_client_config_t *http_config
    ESP HTTP client configuration
```

```c
http_client_init_cb_t http_client_init_cb
    Callback after ESP HTTP client is initialised
```
bool **bulk_flash_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size.

bool **partial_http_download**

Enable Firmware image to be downloaded over multiple HTTP requests.

int **max_http_request_size**

Maximum request size for partial HTTP download.

**Macros**

ESP_ERR_HTTPS_OTA_BASE

ESP_ERR_HTTPS_OTA_IN_PROGRESS

**Type Definitions**

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)

## 2.10.8 Event Loop Library

**Overview**

The event loop library allows components to declare events to which other components can register handlers – code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

**Using esp_event APIs**

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that here.
4. Event sources post an event to the loop using `esp_event_post_to()`. 
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void *handler_arg, esp_event_base_t base, int32_t id, void *event_data) {
    // Event handler logic
}
```

(continues on next page)
### Declaring and defining events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:
Event base definition:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

**Event ID:**

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

**Default Event Loop**

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loop equivalents.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to esp_event_handler_register_with(). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier ESP_EVENT_ANY_BASE and special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for esp_event_handler_register_with().

Therefore, the valid arguments to esp_event_handler_register_with() are:
1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...
                           ...
                        ...
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...
                           ...
                        ...
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...
                           ...
                        ...
```

If the hypothetical event `MY_EVENT_BASE, MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order**  The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- `components/esp_event/include/esp_event.h`
Chapter 2. API Reference

Functions

*esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args, esp_event_loop_handle_t *event_loop)*

Create a new event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**Parameters**

- [in] event_loop_args: configuration structure for the event loop to create
- [out] event_loop: handle to the created event loop

*esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)*

Delete an existing event loop.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- [in] event_loop: event loop to delete, must not be NULL

*esp_err_t esp_event_loop_create_default(void)*

Create default event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

*esp_err_t esp_event_loop_delete_default(void)*

Delete the default event loop.

**Return**

- ESP_OK: Success
- Others: Fail

*esp_err_t esp_event_loop_run(esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)*

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- [in] event_loop: event loop to dispatch posted events from, must not be NULL
- [in] ticks_to_run: number of ticks to run the loop

```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id,
                                   esp_event_handler_t event_handler, void *
                                   event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**

- [in] event_base: the base ID of the event to register the handler for
- [in] event_id: the ID of the event to register the handler for
- [in] event_handler: the handler function which gets called when the event is dispatched
- [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop,
                                         esp_event_base_t event_base, int32_t event_id,
                                         esp_event_handler_t event_handler, void *
                                         event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**

- [in] event_loop: the event loop to register this handler function to, must not be NULL
- [in] event_base: the base ID of the event to register the handler for
- [in] event_id: the ID of the event to register the handler for
- [in] event_handler: the handler function which gets called when the event is dispatched
- [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called
Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- **specific events**: specify exact event_base and event_id
- **all events of a certain base**: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- **all events known by the loop**: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

**Parameters**

- `[in] event_loop`: the event loop to register this handler function to, must not be NULL
- `[in] event_base`: the base ID of the event to register the handler for
- `[in] event_id`: the ID of the event to register the handler for
- `[in] event_handler`: the handler function which gets called when the event is dispatched
- `[in] event_handler_arg`: data, aside from event data, that is passed to the handler when it is called
- `[out] instance`: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

**Parameters**

- `[in] event_base`: the base ID of the event to register the handler for
• [in] event_id: the ID of the event to register the handler for
• [in] event_handler: the handler function which gets called when the event is dispatched
• [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called
• [out] instance: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

```c
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_register() when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

**Note** This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister() instead.

**Note** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] event_handler: the handler to unregister

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp_event_handler_unregister, except the additional specification of the event loop to unregister the handler with.

**Note** This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister_with() instead.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**
- [in] event_loop: the event loop with which to unregister this handler function, must not be NULL
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] event_handler: the handler to unregister

```c
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)
```

Unregister a handler instance from a specific event loop.
Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_instance_register() when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

Note When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_loop: the event loop with which to unregister this handler function, must not be NULL
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

esp_err_t esp_event_handler_instance_unregister (esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

esp_err_t esp_event_post (esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Return
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_base: the event base that identifies the event
- [in] event_id: the event ID that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event_data_size: the size of the event data
- [in] ticks_to_wait: number of ticks to block on a full event queue

esp_err_t esp_event_post_to (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the
copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Return**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**
- [in] event_loop: the event loop to post to, must not be NULL
- [in] event_base: the event base that identifies the event
- [in] event_id: the event ID that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event_data_size: the size of the event data
- [in] ticks_to_wait: number of ticks to block on a full event queue

**esp_err_t esp_event_isr_post**

```c
esp_err_t esp_event_isr_post (esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post for posting events from interrupt handlers.

**Note**
- this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled
- when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

**Return**
- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

**Parameters**
- [in] event_base: the event base that identifies the event
- [in] event_id: the event ID that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event_data_size: the size of the event data; max is 4 bytes
- [out] task_unblocked: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

**esp_err_t esp_event_isr_post_to**

```c
esp_err_t esp_event_isr_post_to (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post_to for posting events from interrupt handlers.

**Note**
- this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled
- when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

**Return**
- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

**Parameters**
- [in] event_loop: the event loop to post to, must not be NULL
- [in] event_base: the event base that identifies the event
- [in] event_id: the event ID that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
• [in] event_data_size: the size of the event data
• [out] task_unblocked: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

\textit{esp_err_t} \texttt{esp_event_dump} (FILE *\textit{file})

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
  event loop
  handler
  handler ...
  event loop
  handler
  handler ...
```

where:

- \textit{event loop format}: address, name \texttt{rx:total\_received dr:total\_dropped}
  where:
  - address - memory address of the event loop
  - name - name of the event loop, 'none' if no dedicated task
  - total\_received - number of successfully posted events
  - total\_dropped - number of events unsuccessfully posted due to queue being full

- \textit{handler format}: address \texttt{ev:base, id inv:total\_invoked run:total\_runtime}
  where:
  - address - address of the handler function
  - base, id - the event specified by event base and ID this handler executes
  - total\_invoked - number of times this handler has been invoked
  - total\_runtime - total amount of time used for invoking this handler

\textbf{Note} this function is a noop when \texttt{CONFIG\_ESP\_EVENT\_LOOP\_PROFILING} is disabled

\textbf{Return}
- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- Others: Fail

\textbf{Parameters}
- [in] \textit{file}: the file stream to output to

\textbf{Structures}

\texttt{struct esp\_event\_loop\_args\_t}

Configuration for creating event loops.

\textbf{Public Members}

- \texttt{int32\_t queue\_size}
  size of the event loop queue
- \texttt{const char *task\_name}
  name of the event loop task; if NULL, a dedicated task is not created for event loop
- \texttt{UBaseType\_t task\_priority}
  priority of the event loop task, ignored if task name is NULL
**Chapter 2. API Reference**

```
uint32_t task_stack_size
   stack size of the event loop task, ignored if task name is NULL

BaseType_t task_core_id
   core to which the event loop task is pinned to, ignored if task name is NULL
```

**Header File**

- components/esp_event/include/esp_event_base.h

**Macros**

- ESP_EVENT_DECLARE_BASE (id)
- ESP_EVENT_DEFINE_BASE (id)
- ESP_EVENT_ANY_BASE
   register handler for any event base
- ESP_EVENT_ANY_ID
   register handler for any event id

**Type Definitions**

- typedef void *esp_event_loop_handle_t
  a number that identifies an event with respect to a base
- typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
  function called when an event is posted to the queue
- typedef void *esp_event_handler_instance_t
  context identifying an instance of a registered event handler

### 2.10.9 FreeRTOS

**Overview**

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

**Note:** ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

- For more information about the SMP changes of ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS (SMP)
- For more information about the features added to ESP-IDF FreeRTOS, see FreeRTOS Supplemental Features.

**Configuration**

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various #define config... macros to FreeRTOSConfig.h. Through these macros, the kernel’s scheduling behavior and various kernel features can be enabled or disabled. However, in ESP-IDF FreeRTOS, the `FreeRTOSConfig.h` file is considered a private and must not be modified by users. Any FreeRTOS configuration that is exposed to the user will be done so via menuconfig.

ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see Project Configuration.
**Chapter 2. API Reference**

- **CONFIG_FREERTOS_UNICORE** will run ESP-IDF FreeRTOS only on CPU0. Note that this is **not equivalent to running Vanilla FreeRTOS**. Futhermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to **ESP-IDF FreeRTOS Single Core**. Alternatively, users can also search for occurrences of **CONFIG_FREERTOS_UNICORE** in the ESP-IDF components.

- **CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION** will trigger a halt in functions in ESP-IDF FreeRTOS that have not been fully tested in an SMP context.

- **CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER** will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

**ESP-IDF FreeRTOS Applications**

Unlike Vanilla FreeRTOS, users must not call `vTaskStartScheduler()`. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined `void app_main(void)` function.

- Typically, users would spawn the rest of their applications task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the main task.

The main task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Affinity</th>
<th>Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Task (main)</td>
<td>CPU0</td>
<td>1</td>
<td>Task that simply calls <code>app_main</code>. This task will self delete when <code>app_main</code> returns</td>
</tr>
<tr>
<td>Idle Tasks (IDLEX)</td>
<td>CPU0 and CPU1</td>
<td>0</td>
<td>Idle tasks created for (and pinned to) each CPU</td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>CPU0 and CPU1</td>
<td>24</td>
<td>IPC tasks created for (and pinned to) each CPU. IPC tasks are used to implement the IPC feature. See <strong>Inter-Processor Call</strong> for more details.</td>
</tr>
</tbody>
</table>

**Task API**

**Header File**

- `components/freertos/FreeRTOS-Kernel/include/freertos/task.h`

**Functions**

```c
BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t uxStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)
```

Create a new task with a specified affinity.

This function is similar to `xTaskCreate`, but allows setting task affinity in SMP system.

**Return** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**Parameters**

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
• **usStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
• **pvParameters**: Pointer that will be used as the parameter for the task being created.
• **uxPriority**: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
• **pvCreatedTask**: Used to pass back a handle by which the created task can be referenced.
• **xCOREID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

```c
static BaseType_t xTaskCreate(
    TaskFunction_t pvTaskCode, const *const pcName, const uint32_t usStackDepth, void * const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pxCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter...
    ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared...
    static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have...
    been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    // PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
```
Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Note If program uses thread local variables (ones specified with ‘_thread’ keyword) then storage for them will be allocated on the task’s stack.

Parameters
- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length defined by configMAX_TASK_NAME_LEN - default is 16.
- usStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- pvCreatedTask: Used to pass back a handle by which the created task can be referenced.

```c
TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackSizeBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)
```

Create a new task with a specified affinity. This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errorCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

Parameters
- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- xCoreID: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

```c
static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackSizeBuffer, StaticTask_t *const pxTaskBuffer)
```

Create a new task and add it to the list of tasks that are ready to run.
Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
#define STACK_SIZE 200

// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.

StaticTask_t xTaskBuffer;

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );
    for ( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( vTaskCode, // Function that implements the task.
                                 "NAME", // Text name for the task.
                                 STACK_SIZE, // Stack size in bytes, not words.
                                 ( void * ) 1, // Parameter passed into the task.
                                 tskIDLE_PRIORITY, // Priority at which the task is created.
                                 xStack, // Array to use as the task’s stack.
                                 &xTaskBuffer ); // Variable to hold the task’s data

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task’s handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}
```

**Return** If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errorCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

**Note** If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

**Parameters**
• **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.

• **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.

• **ulStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.

• **pvParameters**: Pointer that will be used as the parameter for the task being created.

• **uxPriority**: The priority at which the task will run.

• **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.

• **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskAllocateMPURegions(TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
```

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**Parameters**

- **pxTaskDefinition**: Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions.

- **pxCreatedTask**: Used to pass back a handle by which the created task can be referenced.

**Example usage:**

```c
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
  vATask, // pvTaskCode - the function that implements the task.
  "ATask", // pcName - just a text name for the task to assist debugging.
  100, // ulStackDepth - the stack size DEFINED IN WORDS.
  NULL, // pvParameters - passed into the task function as the function parameters.
  (1UL | portPRIVILEGE_BIT), // uxPriority - task priority, set the...
  cStackBuffer, // pxStackBuffer - the buffer to be used as the task stack.
  cRegions, // Allocate up to three separate memory regions for access by...
  // the task, with appropriate access permissions. Different processors have different memory alignment requirements - refer to the FreeRTOS...
  // documentation
  // for full information.
  { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
  { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
  { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_WRITE }
};

int main( void )
```

(continues on next page)
TaskHandle_t xHandle;

// Create a task from the const structure defined above. The task handle
// is requested (the second parameter is not NULL) but in this case just for
// demonstration purposes as its not actually used.
xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

// Start the scheduler.
vTaskStartScheduler();

// Will only get here if there was insufficient memory to create the idle
// and/or timer task. for( ;; );

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.
xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to
hold the task’s data structures. The second block is used by the task as its stack. If a task is created using
xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the
task’s data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a

task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used
to hold the task’s data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected
task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined
in the file projdefs.h

Parameters

- pxTaskDefinition: Pointer to a structure that contains a member for each of the normal
  xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer
  and the memory region definitions. If configSUPPORT_STATIC_ALLOCATION is set to 1 the
  structure contains an additional member, which is used to point to a variable of type StaticTask_t -
  which is then used to hold the task’s data structure.
- pxCreatedTask: Used to pass back a handle by which the created task can be referenced.

Example usage:

// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel’s privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters = {
  vATask,    // pvTaskCode - the function that implements the task.
  "ATask",  // pcName - just a text name for the task to assist debugging.
  100,      // usStackDepth - the stack size DEFINED IN BYTES.
  NULL,     // pvParameters - passed into the task function as the function...
  portPRIVILEGE_BIT, // uxPriority - task priority, set the_
  (1UL | portPRIVILEGE_BIT ), // cStackBuffer - the buffer to be used as the task stack.
  // xRegions - Allocate up to three separate memory regions for access by
  // the task, with appropriate access permissions. Different processors have
  // different memory alignment requirements - refer to the FreeRTOS_
  // documentation
  // for full information.
Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().
• pxRegions: A pointer to an MemoryRegion_t structure that contains the new memory region definitions.

void vTaskDelete (TaskHandle_t xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

Parameters
• xTaskToDelete: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void vTaskDelay (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```
Parameters

- xTicksToDelay: The amount of time, in tick periods, that the calling task should block.

BaseType_t xTaskDelayUntil(TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path through the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, xTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );
        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

Return Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task way delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

Parameters

- pxPreviousWakeTime: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil().
- xTimeIncrement: The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

BaseType_t xTaskAbortDelay (TaskHandle_t xTask)

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when
xQueueReceive() or uTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

**Return** If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

**Parameters**
- xTask: The handle of the task to remove from the Blocked state.

**Example usage:**

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Return** The priority of xTask.

**Parameters**
- xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Example usage:**

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Return** The priority of xTask.

**Parameters**
- xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Example usage:**

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```
• `xTask`: Handle of the task to be queried.

```c
void vTaskGetInfo( TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState )
```

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

**Parameters**

- `xTask`: Handle of the task being queried. If `xTask` is NULL then information will be returned about the calling task.
- `pxTaskStatus`: A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the `xTask` parameter.
- `xGetFreeStackSpace`: The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the `xGetFreeStackSpace` parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if `xGetFreeStackSpace` is not set to pdFALSE;
- `eState`: The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the `eState` parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set `eState` to eInvalid - otherwise the value passed in `eState` will be reported as the task state in the TaskStatus_t structure.

void `vTaskPrioritySet( TaskHandle_t xTask, UBaseType_t uxNewPriority )`

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );
}
```
Use the handle to raise the priority of the created task.

```c
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );
```

Use a NULL handle to raise our priority to the same value.

```c
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
```

### Parameters
- `xTask`: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- `uxNewPriority`: The priority to which the task will be set.

### void vTaskSuspend (TaskHandle_t xTaskToSuspend)

INCLUDE vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume() to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle);

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

### Parameters
- `xTaskToSuspend`: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

### void vTaskResume (TaskHandle_t xTaskToResume)

INCLUDE vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.
Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to vTaskResume().

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle... );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

Parameters
- xTaskToResume: Handle to the task being readied.

BaseType_t xTaskResumeFromISR( TaskHandle_t xTaskToResume )

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Return pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

Parameters
- xTaskToResume: Handle to the task being readied.

void vTaskStartScheduler( void )

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

NOTE: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();

    // Will not get here unless a task calls vTaskEndScheduler()
}

void vTaskEndScheduler( void )

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Starts the real time kernel tick. All created tasks will be automatically deleted and multitasking (either pre-emptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was called, as if vTaskStartScheduler () had just returned.

See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler ()

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler();
    }
}

void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();

    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}

void vTaskSuspendAll ( void )

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.
Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL () / taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}
```

BaseType_t xTaskResumeAll (void)
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskResumeSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL () / taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...
```

(continues on next page)
// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if( !xTaskResumeAll () )
{
    taskYIELD ();
}
}

Return If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is
returned.

TickType_t xTaskGetTickCount (void)

Return The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Return The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

Return The number of tasks that the real time kernel is currently managing. This includes all ready, blocked
and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included
in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)

Return The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can
query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Return The handle of the task that has the human readable name pcNameToQuery. NULL is returned if
no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for
pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be
available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their re-
turn type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.

Return The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS)
since the task referenced by xTask was created.

Parameters

• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check
the stack of the calling task.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the start of the stack associated with xTask.
include_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Return The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

Parameters

* xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

uint8_t* pxTaskGetStackStart(TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

include_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Return A pointer to the start of the stack.

Parameters

* xTask: Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

uint8_t pxTaskGetStackStart(TaskHandle_t xTask)

Return the lowest stack memory address, regardless of whether the stack grows up or down.

Return A pointer to the start of the stack.

Parameters

* xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

uint8_t pxTaskGetStackStart(TaskHandle_t xTask)

Sets pxHookFunction to be the hook function used by the task xTask.

Parameters

* xTask: Handle of the task to set the hook function for. Passing xTask as NULL has the effect of setting the calling tasks hook function.

* pxHookFunction: Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag(TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR(TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void* pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

* xTaskToSet: Task to set thread local storage pointer for

* xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

* pvValue: Pointer value to set.

uint8_t pxTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.
Return Pointer value

Parameters

- xTaskToQuery: Task to get thread local storage pointer for
- xIndex: The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallback Function_t pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task is deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

- xTaskToSet: Task to set thread local storage pointer for
- xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- pvValue: Pointer value to set.
- pvDelCallback: Function to call to dispose of the local storage pointer when the task is deleted.

void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

- ppxIdleTaskTCBBuffer: A handle to a statically allocated TCB buffer
- ppxIdleTaskStackBuffer: A handle to a statically allocated Stack buffer for the idle task
- pulIdleTaskStackSize: A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters

- xTask: Handle of the task to call the hook for.
- pvParameter: Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBasesType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total
amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```c
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter
                ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                    ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
                }
            }
        }
    }
}
```

(continues on next page)
pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
}
}
// The array is no longer needed, free the memory it consumes.
vPortFree( pxTaskStatusArray );
}
}

Return

The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

Parameters

• pxTaskStatusArray: A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
• uxArraySize: The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
• pulTotalRunTime: If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see https://www.FreeRTOS.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

void vTaskList (char *pcWriteBuffer)
List all the current tasks.
configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.
Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

PLEASE NOTE:
This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

Parameters

• pcWriteBuffer: A buffer into which the above mentioned details will be written, in ASCII form.
   This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void vTaskGetRunTimeStats (char *pcWriteBuffer)
Get the state of running tasks as a string
configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for port-
CONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter
should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime
use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being
stored for each task. The resolution of the accumulated time value depends on the frequency of the timer
configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRun-
TimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a
percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider
it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState()
output into a human readable table that displays the amount of time each task has spent in the Running state
in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size,
use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and
limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories
in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full sprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data,
rather than indirectly through a call to vTaskGetRunTimeStats().

Parameters

- pcWriteBuffer: A buffer into which the execution times will be written, in ASCII form. This
  buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per
task should be sufficient.

unsigned_t ulTaskGetIdleRunTimeCounter (void)

cfgGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for port-
CONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter
should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being
stored for each task. The resolution of the accumulated time value depends on the frequency of the timer
configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystem-
State() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetI-
dleRunTimeCounter() returns the total execution time of just the idle task.

Return The total run time of the idle task. This is the amount of time the idle task has actually
been executing. The unit of time is dependent on the frequency configured using the portCON-
FIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNo-
tify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘ notifications’), each of which is a 32-bit un-
signed integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number
of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS
V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores,
mutexes and event groups. Task notifications are a method of sending an event directly to a task without the
need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of
the task’s notification values. In that way task notifications can be used to send data to a task, or be used as
light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or
ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The
task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed()
or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state
to wait for a notification when the notification arrives then the task will automatically be removed from the
Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification
within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”
, and all task notification API functions operated on that value. Replacing the single notification value with
an array of notification values necessitated a new set of API functions that could address specific notifications
within the array. xTaskNotify() is the original API function, and remains backward compatible by always
operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTask-
NotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns
pdPASS in this case.

Parameters

- **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify**: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-
TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and al-
ways sends notifications to index 0.
- **ulValue**: Data that can be sent with the notification. How the data is used depends on the value
of the eAction parameter.
- **eAction**: Specifies how the notification updates the task’s notification value, if at all. Valid values
for eAction are as follows:

- **eIncrement**: The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.
- **eSetValueWithOverwrite**: The target notification value is set to the value of ulValue, even if the task being not-
tified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.
- **eSetValueWithoutOverwrite**: If the task being notified did not already have a notification pending at the same
array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS.
If the task being notified already had a notification pending at the same array index then no action is performed
and pdFAIL is returned.
- **eNoAction**: The task receives a notification at the specified array index without the notification value at that
index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.
- **pullPreviousNotificationValue**: Can be used to pass out the subject task’s notification value before any bits
are modified by the notify function.

Return Dependent on the value of eAction. See the description of the eAction parameter.
Chapter 2. API Reference

BaseType_t xTaskGenericNotifyFromISR(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

Parameters

- uxIndexToNotify: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- ulValue: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- eAction: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - eIncrement - The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithOverwrite - The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.
Chapter 2. API Reference

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

- pxHigherPriorityTaskWoken: xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskGenericNotifyWait (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications. See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

cfgUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

Return If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

Parameters

- uxIndexToWaitOn: The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
• **ulBitsToClearOnEntry**: Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task’s notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task’s notification value unchanged.

• **ulBitsToClearOnExit**: If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task’s notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task’s notification value (note `*pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task’s notification value).

• **pulNotificationValue**: Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.

• **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
void vTaskGenericNotifyGiveFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t* pxHigherPriorityTaskWoken )
```

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE**: Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.
Parameters

- **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify**: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken**: vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskGenericNotifyTake(UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Waits for a direct task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.
Return  The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

Parameters

- **uxIndexToWaitOn**: The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. **uxIndexToWaitOn** must be less than **configTASK_NOTIFICATION_ARRAY_ENTRIES**. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **xClearCountOnExit**: If `xClearCountOnExit` is **pdFALSE** then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If `xClearCountOnExit` is **not pdFALSE** then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when `xTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

```plaintext
BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear)

```

- **xTask**: The handle of the RTOS task that will have a notification state cleared. Set **xTask** to **NULL** to clear a notification state in the calling task. To obtain a task’s handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task’s name in a call to `xTaskGetHandle()`.
- **uxIndexToClear**: The index within the target task’s array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. **uxIndexToClear** must be less than **configTASK_NOTIFICATION_ARRAY_ENTRIES**. `ulTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

```plaintext
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

```

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant **configTASK_NOTIFICATION_ARRAY_ENTRIES** sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set **xTask** to **NULL** to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

Return  **pdTRUE** if the task’s notification state was set to `eNotWaitingNotification`, otherwise **pdFALSE**.

Parameters

- **xTask**: The handle of the RTOS task that will have a notification state cleared. Set **xTask** to **NULL** to clear a notification state in the calling task. To obtain a task’s handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task’s name in a call to `xTaskGetHandle()`.
- **uxIndexToClear**: The index within the target task’s array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. **uxIndexToClear** must be less than **configTASK_NOTIFICATION_ARRAY_ENTRIES**. `ulTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

```plaintext
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

```

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant **configTASK_NOTIFICATION_ARRAY_ENTRIES** sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.
ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

Return The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

Parameters

- xTask: The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- uxIndexToClear: The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- ulBitsToClear: Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

```c
void vTaskSetTimeOutState (TimeOut_t *const pxTimeOut)

BaseType_t xTaskCheckForTimeOut (TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)
```

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflown.

Example Usage:

```c
size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // Driver library function used to receive uxWantedBytes from an Rx buffer
        // that is filled by a UART interrupt. If there are not enough bytes in the
        // Rx buffer then the task enters the Blocked state until it is notified that
        // more data has been placed into the buffer. If there is still not enough
        // data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
        // is used to re-calculate the Block time to ensure the total amount of time
        // spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
        // continues until either the buffer contains at least uxWantedBytes bytes,
        // or the total amount of time spent in the Blocked state reaches
        // MAX_TIME_TO_WAIT – at which point the task reads however many bytes are
        // available up to a maximum of uxWantedBytes.
```

(continues on next page)
// The buffer didn't contain enough data so this task is going to
// enter the Blocked state. Adjusting xTicksToWait to account for
// any time that has been spent in the Blocked state within this
// function so far to ensure the total amount of time spent in the
// Blocked state does not exceed MAX_TIME_TO_WAIT.
if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
{
    // Timed out before the wanted number of bytes were available,
    // exit the loop.
    break;
}

// Wait for a maximum of xTicksToWait ticks to be notified that the
// receive interrupt has placed more data into the buffer.
ulTaskNotifyTake( pdTRUE, xTicksToWait );

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                          pucBuffer,
                                          uxWantedBytes );

return uxReceived;

Return If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait
is updated to reflect the number of remaining ticks.

See https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters
• pxTimeOut: The time status as captured previously using vTaskSetTimeOutState. If the timeout
  has not yet occurred, it is updated to reflect the current time status.
• pxTicksToWait: The number of ticks to check for timeout i.e. if pxTicksToWait ticks have
  passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckFor-
  TimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated
  to reflect the number of remaining ticks.

Chapter 2. API Reference

**taskYIELD()**
Macro for forcing a context switch.

**taskENTER_CRITICAL()**
Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

*Note* This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER_CRITICAL_FROM_ISR()**

**taskEXIT_CRITICAL()**
Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

*Note* This may alter the stack (depending on the portable implementation) so must be used with care!

**taskEXIT_CRITICAL_FROM_ISR(x)**

**taskDISABLE_INTERRUPTS()**
Macro to disable all maskable interrupts.

**taskENABLE_INTERRUPTS()**
Macro to enable microcontroller interrupts.

**taskSCHEDULER_SUSPENDED**

**taskSCHEDULER_NOT_STARTED**

**taskSCHEDULER_RUNNING**

**vTaskDelayUntil**(pxPreviousWakeTime, xTimeIncrement)

**xTaskNotify**(xTaskToNotify, ulValue, eAction)

**xTaskNotifyIndexed**(xTaskToNotify, uxIndexToNotify, ulValue, eAction)

**xTaskNotifyAndQuery**(xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

**xTaskNotifyAndQueryIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)**

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.
xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQueryFromISR(xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGive (xTaskToNotify)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

**Type Definitions**

typedef struct tskTaskControlBlock *TaskHandle_t

typedef BaseType_t (*TaskHookFunction_t)(void *)

typedef void (*TlsDeleteCallbackFunction_t)(int, void *)

Prototype of local storage pointer deletion callback.

**Enumerations**

enum eTaskState

Task states returned by eTaskGetState.

Values:

eRunning = 0

eReady

eBlocked

eSuspended

eDeleted

eInvalid

enum eNotifyAction

Values:

eNoAction = 0

eSetBits

eIncrement

eSetValueWithOverwrite

eSetValueWithoutOverwrite

enum eSleepModeStatus

Possible return values for eTaskConfirmSleepModeStatus().

Values:

eAbortSleep = 0

eStandardSleep

eNoTasksWaitingTimeout

**Queue API**

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h
Functions

** BaseType\_t xQueueGenericSend\(\textit{QueueHandle\_t xQueue, const void*const pvItemToQueue, Tick\_Type\_t xTicksToWait, const BaseType\_t xCopyPosition}\)\)**

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;
uint32\_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle\_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32\_t values.
    xQueue1 = xQueueCreate(10, sizeof( uint32\_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate(10, sizeof( struct AMessage * ) );

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32\_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * )&ulVar, ( TickType\_t )10, _
                        queueSEND\_TO\_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * )pxMessage, ( TickType\_t )0, _
                        queueSEND\_TO\_BACK );
    }

    // ... Rest of task code.
}
```

Return pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become
available on the queue, should it already be full. The call will return immediately if this is set to 0
and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
should be used to convert to real time if this is required.

• xCopyPosition: Can take the value queueSEND_TO_BACK to place the item at the back of
the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority
messages).

BaseType_t  xQueuePeek (QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)
Receive an item from a queue without removing the item from the queue. The item is received by copy so a
buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the
queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to
xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that
can be called from an interrupt service routine.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{

    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pxRxedMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }
```

(continues on next page)
Return  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

BaseType_t xQueuePeekFromISR(QueueHandle_t xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Return  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.

BaseType_t xQueueReceive(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask(void *pvParameters)
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate(10, sizeof(struct AMessage *));
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ... Rest of task code.
}
```
Send a pointer to a struct AMessage object. Don't block if the queue is already full.

```c
pxMessage = &xMessage;
xQueueSend( xQueue, ( void * ) pxMessage, ( TickType_t ) 0 );
```

Task to receive from the queue.

```c
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxedMessage;

if( xQueue != 0 )
{
    // Receive a message on the created queue. Block for 10 ticks if a message is not immediately available.
    if( xQueueReceive( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
    {
        // pcRxedMessage now points to the struct AMessage variable posted by vATask.
    }
}
```

Return: pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters:
- `xQueue`: The handle to the queue from which the item is to be received.
- `pvBuffer`: Pointer to the buffer into which the received item will be copied.
- `xTicksToWait`: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

```c
UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
```

Return: The number of messages stored in a queue.

Parameters:
- `xQueue`: A handle to the queue being queried.

```c
UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )
```

Return: The number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

Parameters:
- `xQueue`: A handle to the queue being queried.

```c
void vQueueDelete( QueueHandle_t xQueue )
```

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters:
- `xQueue`: A handle to the queue to be deleted.

```c
BaseType_t xQueueGenericSendFromISR( QueueHandle_t xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition )
```

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` are used instead of calling the function directly.
BackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
                                  queueSEND_TO_BACK );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        taskYIELD_YIELD_FROM_ISR();
    }
}
```

Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- `xCopyPosition`: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

`BaseType_t xQueueGiveFromISR( QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken )`

`BaseType_t xQueueReceiveFromISR( QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken )`

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
```
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * )&cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * )&cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.
    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * )&cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while( xQueueReceiveFromISR( xQueue, ( void * )&cRxedChar, &
                                &xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }

    if( cTaskWokenByPost != ( char ) pdFALSE;)
    {
        taskYIELD ();
    }
}

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters

• xQueue: The handle to the queue from which the item is to be received.
• pvBuffer: Pointer to the buffer into which the received item will be copied.
• [out] pxHigherPriorityTaskWoken: A task may be blocked waiting for space to become
  available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken
  will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

BaseType_t xQueueIsQueueEmptyFromISR( const QueueHandle_t xQueue )
BaseType_t xQueueIsQueueFullFromISR(const QueueHandle_t xQueue)

UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)

void vQueueAddToRegistry(QueueHandle_t xQueue, const char* pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

Parameters
• xQueue: The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
• pcQueueName: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void vQueueUnregisterQueue(QueueHandle_t xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

Parameters
• xQueue: The handle of the queue being removed from the registry.

const char* pcQueueGetName(QueueHandle_t xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

Return If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

Parameters
• xQueue: The handle of the queue the name of which will be returned.

QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.
Chapter 2. API Reference

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

Parameters

• uxEventQueueLength: Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
  - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
  - If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 ), or 3.
  - If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to (5 + 3), or 8.

BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

Parameters

• xQueueOrSemaphore: The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
• xQueueSet: The handle of the queue set to which the queue or semaphore is being added.

BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Return If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

Parameters

• xQueueOrSemaphore: The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
• xQueueSet: The handle of the queue set in which the queue or semaphore is included.

QueueSetMemberHandle_t xQueueSelectFromSet (QueueHandle_t xQueueSet, const TickType_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet()
effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return  xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

Parameters
• xQueueSet: The queue set on which the task will (potentially) block.
• xTicksToWait: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

QueueSetMemberHandle_t xQueueSelectFromSetFromISR(QueueSetHandle_t xQueueSet)
A version of xQueueSelectFromSet() that can be used from an ISR.

Macros
xQueueCreate (uxQueueLength, uxItemSize)
Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
}
```

(continues on next page)
if ( xQueue2 == 0 )
{
    // Queue was not created and must not be used.
}
// ... Rest of task code.

Return If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

Parameters
• uxQueueLength: The maximum number of items that the queue can contain.
• uxItemSize: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

xQueueCreateStatic(uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)
Create a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [ (queue length) * (queue item size) ] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
    ITEM_SIZE // The size of each item in the queue...
    & ucQueueStorage[ 0 ], // The buffer that will...
    &xQueueBuffer ); // The buffer that will hold the...
    // The queue is guaranteed to be created successfully as no dynamic memory...
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

(continues on next page)
Return  If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

Parameters
- uxQueueLength: The maximum number of items the queue can contain.
- uxItemSize: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- pucQueueStorage: If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- pxQueueBuffer: Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

xQueueSendToFront (xQueue, pvItemToQueue, xTicksToWait)
Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    ... 

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
```
// queue is already full.
pxMessage = &xMessage;
xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
  char ucMessageID;
  char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void * pvParameters )
{
  QueueHandle_t xQueue1, xQueue2;
  struct AMessage * pxMessage;

  // Create a queue capable of containing 10 uint32_t values.
  xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

  // ...
  if( xQueue1 != 0 )
  {
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
      // Failed to post the message, even after 10 ticks.
    }
  }
```

(continues on next page)
if ( xQueue2 != 0 ) {
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueueSend( xQueue, pvItemToQueue, xTicksToWait )

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if ( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS_)
```
// Failed to post the message, even after 10 ticks.
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Return  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

`xQueueOverwrite( xQueue, pvItemToQueue )`

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }
}
```
The queue is still full. Use xQueueOverwrite() to overwrite the value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

This time read from the queue, leaving the queue empty once more.
A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

The value read should be the last value written, even though the queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

...
Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the un-
  blocked task has a priority higher than the currently running task. If xQueueSendToFrontFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR();
    }
}
```

Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the un-
  blocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
**xQueueOverwriteFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
// Create a queue to hold one uint32_t value. It is strongly
// recommended NOT to use xQueueOverwriteFromISR() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
// xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    // ...
    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a
        // context switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}
```

**Return**

xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**Parameters**

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out]** **pxHigherPriorityTaskWoken**: xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked
task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### xQueueSendFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
        {
            // Obtain a byte from the buffer.
            cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

            // Post the byte.
            xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
        } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
        {
            // Actual macro used here is port specific.
            portYIELD_FROM_ISR();
        }
}
```

**Return** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

**Parameters**

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: xQueueSendFromISR() will set `pxHigherPriorityTaskWoken` to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### xQueueReset(xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

**Type Definitions**

- `typedef struct QueueDefinition *QueueHandle_t`
- `typedef struct QueueDefinition *QueueSetHandle_t`

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an `xQueueSet` variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.
typedef struct QueueDefinition *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH
semSEMAPHORE_QUEUE_ITEM_LENGTH
semGIVE_BLOCK_TIME

vSemaphoreCreateBinary(xSemaphore)

xSemaphoreCreateBinary()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Return Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.
**xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

 Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

 NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

 Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

 This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

 Example usage:

 ```c
 SemaphoreHandle_t xSemaphore = NULL;
 StaticSemaphore_t xSemaphoreBuffer;

 void vATask( void * pvParameters )
 {
   // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or xSemaphoreCreateBinaryStatic().
   // The semaphore's data structures will be placed in the xSemaphoreBuffer variable, the address of which is passed into the function. The function's parameter is not NULL, so the function will not attempt any dynamic memory allocation, and therefore the function will not return.
   xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

   // Rest of task code goes here.
 }
```

 **Return** If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

 **Parameters**

 - **pxStaticSemaphore**: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreTake** (xSemaphore, xBlockTime)

 *Macro* to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

 param xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

 param xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

 Example usage:

 ```c
 SemaphoreHandle_t xSemaphore = NULL;

 // A task that creates a semaphore.
 void vATask( void * pvParameters )
 {
   // Rest of task code goes here.
 }
```

(continues on next page)
Create the semaphore to guard a shared resource.

```c
vSemaphoreCreateBinary( xSemaphore );
```

A task that uses the semaphore.

```c
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}
```

**Return** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

`xSemaphoreTakeRecursive(xMutex, xBlockTime)`

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

**Example usage:**

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{  
```
// ... Do other things.

if( xMutex != NULL ){
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t )10 ) == pdTRUE ){
        // We were able to obtain the mutex and can now access the
        // shared resource.
        // ...
        // For some reason due to the nature of the code further calls to
        xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t )10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t )10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, but instead buried in a more complex
        // call structure. This is just for illustrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    } else{
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}
}

Return pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore
becoming available.

Parameters

- **xMutex**: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- **xBlockTime**: The time in ticks to wait for the semaphore to become available. The macro
  portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used
to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will
return immediately no matter what the value of xBlockTime.

**xSemaphoreGive(xSemaphore)**

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using
xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}

Return pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

Parameters

• xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

xSemaphoreGiveRecursive(xMutex)

Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

cfg USE RECURSIVE MutexES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
void vAnotherTask( void * pvParameters )
{
    // Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ... For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

Return pdTRUE if the semaphore was given.

Parameters
- xMutex: A handle to the mutex being released, or ‘given’. This is the handle returned by
  xSemaphoreCreateMutex();

xSemaphoreGiveFromISR( xSemaphore, pxHigherPriorityTaskWoken )

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutext type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro.

This macro can be used from an ISR.

Example usage:
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.
        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...
            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;
    // A timer tick has occurred.
    // ... Do other time functions.
    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );
        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}

Return  pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.
Parameters
  • xSemaphore: A handle to the semaphore being released. This is the handle returned when the
    semaphore was created.
  • pxHigherPriorityTaskWoken: xSemaphoreGiveFromISR() will set *pxHigherPriority-
TaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreTakeFromISR(xSemaphore, pxHigherPriorityTaskWoken)**

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Return** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**Parameters**

- **xSemaphore**: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **[out] pxHigherPriorityTaskWoken**: xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreCreateMutex()**

 Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void *pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.
**xSemaphoreCreateMutexStatic**(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced. Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using `xSemaphoreCreateMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateMutex()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provide the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Return** If the mutex was successfully created then a handle to the created mutex is returned. If `pxMutexBuffer` was `NULL` then `NULL` is returned.

**Parameters**

- `pxMutexBuffer`: Must point to a variable of type `StaticSemaphore_t`, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreCreateCounting**(uxMaxCount, uxInitialCount)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.
This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void *pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

**Return** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void *pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // A recursive semaphore cannot be used before it is created. Here a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    
    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```
The address of xMutexBuffer is passed into the function, and will hold the mutexes data structures - so no dynamic memory allocation will be attempted.

```c
xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );
```

As no dynamic memory allocation was performed, xSemaphore cannot be NULL, so there is no need to check it.

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

**Return** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Parameters**

- `pxStaticSemaphore`: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

**Example usage**:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The address of xMutexBuffer is passed into the function, and will hold
        // the mutexes data structures - so no dynamic memory allocation will be
        // attempted.
        xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

        // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
        // so there is no need to check it.
    }
```

(continues on next page)
The semaphore was created successfully.
// The semaphore can now be used.
}

Return Handle to the created semaphore. Null if the semaphore could not be created.

Parameters

- **uxMaxCount**: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount**: The count value assigned to the semaphore when it is created.

### xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );
}
```

(continues on next page)
No memory allocation was attempted so xSemaphore cannot be NULL, so there is no need to check its value.

Return If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

Parameters

- uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- uxInitialCount: The count value assigned to the semaphore when it is created.
- pxSemaphoreBuffer: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters

- xSemaphore: A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

Type Definitions

typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/timers.h

Functions

TimerHandle_t xTimerCreate (const char * const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void * const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)

TimerHandle_t xTimerCreate( const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction );

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.
html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the
memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be
created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimer-
ResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used
to transition a timer into the active state.

Example usage:

```c
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[ NUM_TIMERS ];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the has expired
// 10 times.
void vTimerCallback( TimerHandle_t pxTimer )
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT( pxTimer );

    // Which timer expired?
    lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[ lArrayIndex ] += 1;

    // If the timer has expired 10 times then stop it from running.
    if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop( pxTimer, 0 );
    }
}

void main( void )
{
    int32_t x;

    // Create then start some timers. Starting the timers before the
    // scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
                             ( 100 * x ), // The timer period.
                             pdTRUE, // The timers will
                             auto-reload themselves when they expire.
                         ( void * ) x, // Assign each timer
                             // a unique id equal to its array index.
```
* vTimerCallback // Each timer calls...
  *
  *
  * if( xTimers[ x ] == NULL )
  * {
  *   // The timer was not created.
  * }
  * else
  * {
  *   // Start the timer. No block time is specified, and even if one...
  *   if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
  *   {
  *     // The timer could not be set into the Active state.
  *   }
  * }
  * }
  *
  * // ...
  * // Create tasks here.
  * // ...
  *
  * // Starting the scheduler will start the timers running as they have...
  * // already
  * // been set into the active state.
  * vTaskStartScheduler();
  *
  * // Should not reach here.
  * for( ;; );
  * }
  *

Return If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

Parameters

- pcTimerName: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- xTimerPeriodInTicks: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timerperiodmustbegreaterthan0.
- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- pvTimerID: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- pxCallbackFunction: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);".

```
TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer)
```
TimerHandle_t xTimerCreateStatic(const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t*pxTimerBuffer);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c

static StaticTimer_t xTimerBuffer;

static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
  UBaseType_t pxuVariableToIncrement;
  BaseType_t xReturned;

  // Obtain the address of the variable to increment from the timer ID.
  pxuVariableToIncrement = ( UBaseType_t * )pvTimerGetTimerID(xExpiredTimer);

  // Increment the variable to show the timer callback has executed.
  ( pxuVariableToIncrement )++;

  // If this callback has executed the required number of times, stop the timer.
  if ( pxuVariableToIncrement == 5 )
  {
    // This is called from a timer callback so must not block.
    xTimerStop( xExpiredTimer, staticDONT_BLOCK );
  }

  // Create the software time. xTimerCreateStatic() has an extra parameter
  // than the normal xTimerCreate() API function. The parameter is a
  // pointer to the StaticTimer_t structure that will hold the software timer
  // structure. If the parameter is passed as NULL then the structure
  // will be allocated dynamically, just as if xTimerCreate() had been called.
  xTimer = xTimerCreateStatic( "T1", // Text name for the task.
    // Helps debugging only. Not used by FreeRTOS
(continues on next page)```
Return  If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

Parameters

- pcTimerName: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- xTimerPeriodInTicks: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- pvTimerID: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- pxCallbackFunction: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);”.
- pxTimerBuffer: Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

```c

Return  If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

Parameters

- pcTimerName: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- xTimerPeriodInTicks: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- pvTimerID: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- pxCallbackFunction: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);”.
- pxTimerBuffer: Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

void *pvTimerGetTimerID(const TimerHandle_t xTimer)
void *pvTimerGetTimerID(TimerHandle_t xTimer);

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer
local) storage.

Example usage:

**Return** The ID assigned to the timer being queried.

**Parameters**

- `xTimer`: The timer being queried.

See the xTimerCreate() API function example usage scenario.

```c
void vTimerSetTimerID( TimerHandle_t xTimer, void* pvNewID );
```

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

**Parameters**

- `xTimer`: The timer being updated.
- `pvNewID`: The ID to assign to the timer.

See the xTimerCreate() API function example usage scenario.

```c
BaseType_t xTimerIsTimerActive( TimerHandle_t xTimer );
```

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
/* // This function assumes xTimer has already been created.
 void vAFunction( TimerHandle_t xTimer )
 {
   if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
   { // xTimer is active, do something.
   }
   else
   { // xTimer is not active, do something else.
   }
   /*
   */
   /*
   */
   */
*/
```

**Return** `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

**Parameters**

- `xTimer`: The timer being queried.

```c
TaskHandle_t xTimerGetTimerDaemonTaskHandle( void )
```

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.
BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken);

BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken);

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
/*
 * // The callback function that will execute in the context of the daemon...
 * -task.
 * // Note callback functions must all use this same prototype.
 * void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
 * {
 *     BaseType_t xInterfaceToService;
 *     // The interface that requires servicing is passed in the second
 *     // parameter. The first parameter is not used in this case.
 *     xInterfaceToService = ( BaseType_t ) ulParameter2;
 *     // ...Perform the processing here...
 * }
 *
 * // An ISR that receives data packets from multiple interfaces
 * void vAnISR( void )
 * {
 *     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
 *     // Query the hardware to determine which interface needs processing.
 *     xInterfaceToService = prvCheckInterfaces();
 *     // The actual processing is to be deferred to a task. Request the
 *     // vProcessInterface() callback function is executed, passing in the
 *     // number of the interface that needs processing. The interface to
 *     // service is passed in the second parameter. The first parameter is
 *     // not used in this case.
 *     xHigherPriorityTaskWoken = pdFALSE;
 *     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
 *         xInterfaceToService, &xHigherPriorityTaskWoken );
 *     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
 *     // switch should be requested. The macro used is port specific and will
 *     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
 *     // the documentation page for the port being used.
 *     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
 * }
 */

Return pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

Parameters
• `xFunctionToPend`: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
• `pvParameter1`: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
• `ulParameter2`: The value of the callback function’s second parameter.
• `pxHigherPriorityTaskWoken`: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

```c
BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait);
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

**Parameters**
• `xFunctionToPend`: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
• `pvParameter1`: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
• `ulParameter2`: The value of the callback function’s second parameter.
• `xTicksToWait`: Calling this function will result in a message being sent to the timer daemon task on a queue. `xTicksToWait` is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

```c
const char *pcTimerGetName( TimerHandle_t xTimer );
```

Returns the name that was assigned to a timer when the timer was created.

**Return** The name assigned to the timer specified by the xTimer parameter.

**Parameters**
• `xTimer`: The handle of the timer being queried.

```c
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );
```

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**
• `xTimer`: The handle of the timer being updated.
• `uxAutoReload`: If `uxAutoReload` is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the `xTimerPeriodInTicks` parameter of the `xTimerCreate()` API function). If `uxAutoReload` is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```c
UBaseType_t uxTimerGetReloadMode( TimerHandle_t xTimer );
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.
**Return** If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

**Parameters**

- xTimer: The handle of the timer being queried.

**TickType_t**

**xTimerGetPeriod** *(TimerHandle_t xTimer)*  

TickType_t xTimerGetPeriod(TimerHandle_t xTimer);

Returns the period of a timer.

**Return** The period of the timer in ticks.

**Parameters**

- xTimer: The handle of the timer being queried.

**TickType_t**

**xTimerGetExpiryTime** *(TimerHandle_t xTimer)*  

TickType_t xTimerGetExpiryTime( TimerHandle_t xTimer );

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Return** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

**Parameters**

- xTimer: The handle of the timer being queried.

**void**

**vApplicationGetTimerTaskMemory** *(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)*

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

**Parameters**

- ppxTimerTaskTCBBuffer: A handle to a statically allocated TCB buffer
- ppxTimerTaskStackBuffer: A handle to a statically allocated Stack buffer for the idle task
- pulTimerTaskStackSize: A pointer to the number of elements that will fit in the allocated stack buffer

**Macros**

- **tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR**
- **tmrCOMMAND_EXECUTE_CALLBACK**
- **tmrCOMMAND_START_DONT_TRACE**
- **tmrCOMMAND_START**
- **tmrCOMMAND_RESET**
- **tmrCOMMAND_STOP**
- **tmrCOMMAND_CHANGE_PERIOD**
- **tmrCOMMAND_DELETE**
- **tmrFIRST_FROM_ISR_COMMAND**
- **tmrCOMMAND_START_FROM_ISR**
- **tmrCOMMAND_RESET_FROM_ISR**
- **tmrCOMMAND_STOP_FROM_ISR**
- **tmrCOMMAND_CHANGE_PERIOD_FROM_ISR**

**xTimerStart** *(xTimer, xTicksToWait)*  

BaseType_t xTimerStart( TimerHandle_t xTimer, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The
timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the config\_TIMER\_QUEUE\_LENGTH configuration constant. xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called `n` ticks after xTimerStart() was called, where `n` is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The config\_USE\_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

Return pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the config\_TIMER\_TASK\_PRIORITY configuration constant.

Parameters

- xTimer: The handle of the timer being started/restarted.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

**xTimerStop(xTimer, xTicksToWait)**

BaseType\_t xTimerStop( TimerHandle\_t xTimer, TickType\_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the config\_TIMER\_QUEUE\_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The config\_USE\_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

Return pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the config\_TIMER\_TASK\_PRIORITY configuration constant.

Parameters

- xTimer: The handle of the timer being stopped.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.
**xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

```c
BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the **configTIMER_QUEUE_LENGTH** configuration constant.

**xTimerChangePeriod()** changes the period of a timer that was previously created using the **xTimerCreate()** API function.

**xTimerChangePeriod()** can be called to change the period of an active or dormant state timer.

The **configUSE_TIMERS** configuration constant must be set to 1 for **xTimerChangePeriod()** to be available.

Example usage:

```c
// This function assumes xTimer has already been created. If the timer referenced by xTimer is already active when it is called, then the timer is deleted. If the timer referenced by xTimer is not active when it is called, then the period of the timer is set to 500ms and the timer is started.

void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    }
    else
    {
        // xTimer is not active, change its period to 500ms. This will also cause the timer to start. Block for a maximum of 100 ticks if the change period command cannot immediately be sent to the timer command queue.
        if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS )
        {
            // The command was successfully sent.
        }
        else
        {
            // The command could not be sent, even after waiting for 100 ticks to pass. Take appropriate action here.
        }
    }
}
```

**Return**  
`pdFAIL` will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the **configTIMER_TASK_PRIORITY** configuration constant.

**Parameters**
- **xTimer**: The handle of the timer that is having its period changed.
- **xNewPeriod**: The new period for xTimer. Timer periods are specified in tick periods, so the constant **portTICK_PERIOD_MS** can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to \(( 500 / \text{portTICK\_PERIOD\_MS} )\) provided **configTICK\_RATE\_HZ** is less than or equal to 1000.
• **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when `xTimerChangePeriod()` was called. `xTicksToWait` is ignored if `xTimerChangePeriod()` is called before the scheduler is started.

### `xTimerDelete` (xTimer, xTicksToWait)

```c
BaseType_t xTimerDelete( TimerHandle_t xTimer, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerDelete()` deletes a timer that was previously created using the `xTimerCreate()` API function.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerDelete()` to be available.

#### Example usage:

- **Return** `pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

- **Parameters**
  - `xTimer`: The handle of the timer being deleted.
  - `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

See the `xTimerChangePeriod()` API function example usage scenario.

### `xTimerReset` (xTimer, xTicksToWait)

```c
BaseType_t xTimerReset( TimerHandle_t xTimer, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after `xTimerReset()` was called, where ‘n’ is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerReset()` to be available.

#### Example usage:

```
/* // When a key **is** pressed, an LCD back-light **is** switched on. If 5 seconds...
   pass
/* // without a key being pressed, then the LCD back-light **is** switched off. In
   /* // this case, the timer **is** a one-shot timer.
   */
/* TimerHandle_t xBacklightTimer = NULL;
*/

(continues on next page)
The callback function assigned to the one-shot timer. In this case the parameter is not used.

```c
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{      // The timer expired, therefore 5 seconds must have passed since a key
      // was pressed. Switch off the LCD back-light.
      vSetBacklightState( BACKLIGHT_OFF );
}
```

The key press event handler.

```c
void vKeyPressEventHandler( char cKey )
{      // Ensure the LCD back-light is on, then reset the timer that is
      // responsible for turning the back-light off after 5 seconds of
      // key inactivity. Wait 10 ticks for the command to be successfully sent
      // if it cannot be sent immediately.
      vSetBacklightState( BACKLIGHT_ON );
      if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
      {
        // The reset command was not executed successfully. Take appropriate
        // action here.
      }
      // Perform the rest of the key processing here.
    }
}
```

```c
void main( void )
{
  int32_t x;

  // Create then start the one-shot timer that is responsible for turning
  // the back-light off if no keys are pressed within a 5 second period.
  xBacklightTimer = xTimerCreate( "BacklightTimer",     // Just a_
                                 ( 5000 / portTICK_PERIOD_MS), // The_
                                 pdFALSE,                   // The timer_
                                 0,                        // The id is_
                                 vBacklightTimerCallback    // The_
                                 );                        // callback function that switches the LCD back-light off.

  if( xBacklightTimer == NULL )
  {
    // The timer was not created.
  } else
  {
    // Start the timer. No block time is specified, and even if one was
    // it would be ignored because the scheduler has not yet been
    // started.
    if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
    {
      // The timer could not be set into the Active state.
    }
  }
  // ...
  // Create tasks here.
```
Starting the scheduler will start the timer running as it has already been set into the active state.

```c
vTaskStartScheduler();
```

Should not reach here.

```c
for(;;);
```

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- `xTimer`: The handle of the timer being reset/started/restarted.
- `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

### xTimerStartFromISR

```c
BaseType_t xTimerStartFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);
```

A version of xTimerStart() that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xBacklightTimer has already been created. When a key is pressed, an LCD back-light is switched on. If 5 seconds pass without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer, and unlike the example given for the xTimerReset() function, the key press event handler is an interrupt service routine.

void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then restart the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time.
    xHigherPriorityTaskWoken was initialised to pdFALSE when it was
```

(continues on next page)
if ( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS ) {
  // The start command was not executed successfully. Take appropriate
  // action here.
}

// Perform the rest of the key processing here.

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if ( xHigherPriorityTaskWoken != pdFALSE ) {
  // Call the interrupt safe yield function here (actual function
  // depends on the FreeRTOS port being used).
}

Return pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being started/restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerStopFromISR( xTimer, pxHigherPriorityTaskWoken )
BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );
A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the timer should be simply stopped.

// The interrupt service routine that stops the timer.
void vAnExampleInterruptServiceRoutine( void ) {
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;

  // The interrupt has occurred - simply stop the timer.
  // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
  // (within this function). As this is an interrupt service routine, only
  // FreeRTOS API functions that end in "FromISR" can be used.
  if ( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
The stop command was not executed successfully. Take appropriate action here.

If \texttt{xHigherPriorityTaskWoken} equals \texttt{pdTRUE}, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

\begin{verbatim}
if ( xHigherPriorityTaskWoken != pdFALSE ) {
    // Call the interrupt safe \texttt{yield} function here (actual function depends on the FreeRTOS port being used).
}
\end{verbatim}

Return \texttt{pdFAIL} will be returned if the stop command could not be sent to the timer command queue. \texttt{pdPASS} will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the \texttt{configTIMER_TASK_PRIORITY} configuration constant.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{xTimer}: The handle of the timer being stopped.
    \item \texttt{pxHigherPriorityTaskWoken}: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling \texttt{xTimerStopFromISR()} writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling \texttt{xTimerStopFromISR()} causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \texttt{pxHigherPriorityTaskWoken} will get set to \texttt{pdTRUE} internally within the \texttt{xTimerStopFromISR()} function. If \texttt{xTimerStopFromISR()} sets this value to \texttt{pdTRUE} then a context switch should be performed before the interrupt exits.
\end{itemize}

\texttt{xTimerChangePeriodFromISR( xTimer, xNewPeriod, pxHigherPriorityTaskWoken )}

BaseType_t \texttt{xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t \*pxHigherPriorityTaskWoken );}

A version of \texttt{xTimerChangePeriod()} that can be called from an interrupt service routine.

\textbf{Example usage:}
\begin{verbatim}
if ( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS ) {
    // The command to change the timers period was not executed successfully. Take appropriate action here.
}
\end{verbatim}

(continues on next page)
If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

```c
if( xHigherPriorityTaskWoken != pdFALSE ) {
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}
```

Return pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

- `xTimer`: The handle of the timer that is having its period changed.
- `xNewPeriod`: The new period for `xTimer`. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xNewPeriod` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xNewPeriod` can be set to `(500 / portTICK_PERIOD_MS)` provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `pxHigherPriorityTaskWoken`: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerChangePeriodFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to pdTRUE internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

```c
xTimerResetFromISR( xTimer, pxHigherPriorityTaskWoken )
BaseType_t xTimerResetFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );
```

A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```c
void vBacklightTimerCallback( TimerHandle_t pxTimer ) {
    // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}
```

(continues on next page)
* void vKeyPressEventInterruptHandler( void )
  *
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;
  *
  // Ensure the LCD back-light is on, then reset the timer that is
  // responsible for turning the back-light off after 5 seconds of
  // key inactivity.  This is an interrupt service routine so can only
  // call FreeRTOS API functions that end in "FromISR".
  vSetBacklightState( BACKLIGHT_ON );
  *
  // xTimerStartFromISR() or xTimerResetFromISR() could be called here
  // as both cause the timer to re-calculate its expiry time.
  // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
  // declared (in this function).
  if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=-pdPASS )
    {
    // The reset command was not executed successfully.  Take appropriate
    // action here.
    }
    *
    // Perform the rest of the key processing here.
    *
    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed.  The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler.  Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
      {
      // Call the interrupt safe yield function here (actual function
      // depends on the FreeRTOS port being used).
      }
    *

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS
will be returned if the command was successfully sent to the timer command queue. When the command
is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in
the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called.
The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration
constant.

Parameters
  • xTimer: The handle of the timer that is to be started, reset, or restarted.
  • pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in
    the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimer-
    ResetFromISR() writes a message to the timer command queue, so has the potential to transition
    the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes
    the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has
    a priority equal to or greater than the currently executing task (the task that was interrupted), then
    "pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be
    performed before the interrupt exits.

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h

Functions

**EventGroupHandle_t xEventGroupCreate (void)**

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

**Return**  If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See https://www.FreeRTOS.org/a00111.html

**EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)**

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:
StaticEventGroup_t is a publicly accessible structure that has the same size and alignment requirements as the real event group structure. It provides a mechanism for applications to know the size of the event group (which is dependent on the architecture and configuration file settings) without breaking the strict data hiding policy by exposing the real event group internals. This StaticEventGroup_t variable is passed into the xSemaphoreCreateEventGroupStatic() function and is used to store the event group’s data structures.

StaticEventGroup_t xEventGroupBuffer;

Create the event group without dynamically allocating any memory.

xEventGroup = xEventGroupCreateStatic( xEventGroupBuffer );

Return If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

Parameters
- pxEventGroupBuffer: pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits( xEventGroup, // The event group being tested.
                                  BIT_0 | BIT_4, // The bits within the event group to wait for.
                                  pdTRUE, // BIT_0 and BIT_4 should be cleared before returning.
                                  pdFALSE, // Don’t wait for both bits, either bit will do.
                                  xTicksToWait ); // Wait a maximum of 100ms for either bit to be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
}
```

(continues on next page)
else
{
    // xEventGroupWaitBits() returned because xTicksToWait ticks passed
    // without either BIT_0 or BIT_4 becoming set.
}
}

Return The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

Parameters
- **xEventGroup**: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor**: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit**: If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- **xWaitForAllBits**: If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- **xTicksToWait**: The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

EventBits_t xEventGroupClearBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( xEventGroup, // The event group being updated.
                                    BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
    }
}
```

(continues on next page)
{  
  // Bit 4 was set before xEventGroupClearBits() was called. It will 
  // now be clear.
}  
else  
{  
  // Neither bit 0 nor bit 4 were set in the first place.
}

Return  The value of the event group before the specified bits were cleared.

Parameters  
- xEventGroup: The event group in which the bits are to be cleared.
- uxBitsToClear: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

EventBits_t xEventGroupSetBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
  EventBits_t uxBits;

  // Set bit 0 and bit 4 in xEventGroup.
  uxBits = xEventGroupSetBits(
    xEventGroup,      // The event group being updated.
    BIT_0 | BIT_4 );   // The bits being set.

  if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
  {  
    // Both bit 0 and bit 4 remained set when the function returned.
  }
  else if( ( uxBits & BIT_0 ) != 0 )
  {  
    // Bit 0 remained set when the function returned, but bit 4 was 
    // cleared. It might be that bit 4 was cleared automatically as a 
    // task that was waiting for bit 4 was removed from the Blocked 
    // state.
  }
  else if( ( uxBits & BIT_4 ) != 0 )
  {  
    // Bit 4 remained set when the function returned, but bit 0 was 
    // cleared. It might be that bit 0 was cleared automatically as a 
    // task that was waiting for bit 0 was removed from the Blocked 
    // state.
  }
  else
  {  
    // Neither bit 0 nor bit 4 remained set. It might be that a task 
    // was waiting for both of the bits to be set, and the bits were 
    // cleared as the task left the Blocked state.
  }
}  
```
Return The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

Parameters
- xEventGroup: The event group in which the bits are to be set.
- uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

EventBits_t xEventGroupSync(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT ( 1 << 0 )
#define TASK_1_BIT ( 1 << 1 )
#define TASK_2_BIT ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the // sync point. The other two tasks will set the other two bits defined // by ALL_SYNC_BITS. All three tasks have reached the synchronisation // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call // to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
```

(continues on next page)
{  
  for( ;; )  
  {  
    // Perform task functionality here.  
    // Set bit 1 in the event flag to note this task has reached the  
    // synchronisation point. The other two tasks will set the other two  
    // bits defined by ALL_SYNC_BITS. All three tasks have reached the  
    // synchronisation point when all the ALL_SYNC_BITS are set. Wait  
    // indefinitely for this to happen.  
    xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );  
    // xEventGroupSync() was called with an indefinite block time, so  
    // this task will only reach here if the synchronisation was made by all  
    // three tasks, so there is no need to test the return value.  
  }  
}
void vTask2( void *pvParameters )  
{  
  for( ;; )  
  {  
    // Perform task functionality here.  
    // Set bit 2 in the event flag to note this task has reached the  
    // synchronisation point. The other two tasks will set the other two  
    // bits defined by ALL_SYNC_BITS. All three tasks have reached the  
    // synchronisation point when all the ALL_SYNC_BITS are set. Wait  
    // indefinitely for this to happen.  
    xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );  
    // xEventGroupSync() was called with an indefinite block time, so  
    // this task will only reach here if the synchronisation was made by all  
    // three tasks, so there is no need to test the return value.  
  }  
}

Return  The value of the event group at the time either the bits being waited for became set, or the block time  
expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its  
timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because  
all the bits it was waiting for were set then the returned value is the event group value before any bits were  
automatically cleared.

Parameters  
• xEventGroup: The event group in which the bits are being tested. The event group must have  
  previously been created using a call to xEventGroupCreate().  
• uxBitsToSet: The bits to set in the event group before determining if, and possibly waiting for,  
  all the bits specified by the uxBitsToWait parameter are set.  
• uxBitsToWaitFor: A bitwise value that indicates the bit or bits to test inside the event group.  
  For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1  
  and bit 2 set uxBitsToWaitFor to 0x07. Etc.  
• xTicksToWait: The maximum amount of time (specified in ‘ticks’) to wait for all of the bits  
  specified by uxBitsToWaitFor to become set.

EventBits_t xEventGroupGetBitsFromISR( EventGroupHandle_t xEventGroup )  
A version of xEventGroupGetBits() that can be called from an ISR.

Return  The event group bits at the time xEventGroupGetBitsFromISR() was called.

Parameters  
• xEventGroup: The event group being queried.

void vEventGroupDelete ( EventGroupHandle_t xEventGroup )
Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

**Parameters**
- xEventGroup: The event group being deleted.

**Macros**

**xEventGroupClearBitsFromISR(xEventGroup, uxBitsToClear)**

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

**Example usage:**

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR( xEventGroup, // The event group being updated.
                                           BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

**Return** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**Parameters**
- xEventGroup: The event group in which the bits are to be cleared.
- uxBitsToClear: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

**xEventGroupSetBitsFromISR(xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)**

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

**Example usage:**

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to xEventGroupCreate().
EventGroupHandle_t xEventGroup;
```
void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,       // The event group being updated.
        BIT_0 | BIT_4     // The bits being set.
        &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}

Return  If the request to execute the function was posted successfully then pdPASS is returned, otherwise
         pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

Parameters
•  xEventGroup: The event group in which the bits are to be set.
•  uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only,
    set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
•  pxHigherPriorityTaskWoken: As mentioned above, calling this function will result in a
    message being sent to the timer daemon task. If the priority of the timer daemon task is higher
    than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPrior-
    ityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context
    switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken
    must be initialised to pdFALSE. See the example code below.

xEventGroupGetBits(xEventGroup)
Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Return  The event group bits at the time xEventGroupGetBits() was called.
Parameters
•  xEventGroup: The event group being queried.

Type Definitions
typedef struct EventGroupDef_t *EventGroupHandle_t
typedef TickType_t EventBits_t

Stream Buffer API

Functions
size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, sizeof( ucArrayToSend ), x100ms );
    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, strlen( pcStringToSend ), 0 );
    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

Return The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

Parameters

- xStreamBuffer: The handle of the stream buffer to which a stream is being sent.
- pvTxData: A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- xDataLengthBytes: The maximum number of bytes to copy from pvTxData into the stream buffer.
- xTicksToWait: The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTick-
sToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

```c
size_t xStreamBufferSendFromISR (StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Return**  The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn’t have enough free space for all the bytes to be written.

**Parameters**

- **xStreamBuffer**: The handle of the stream buffer to which a stream is being sent.
- **pvTxData**: A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes**: The maximum number of bytes to copy from pvTxData into the stream buffer.
pxHigherPriorityTaskWoken: It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

size_t xStreamBufferReceive(StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
  uint8_t ucRxData[ 20 ];
  size_t xReceivedBytes;
  const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

  // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
  // Wait in the Blocked state (so not using any CPU processing time) for a
  // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
  // available.
  xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                      ( void * ) ucRxData,
                                      sizeof( ucRxData ),
                                      xBlockTime );

  if( xReceivedBytes > 0 )
  {
    // ucRxData contains another xRecievedBytes bytes of data, which can
    // be processed here....
  }
}
```

Return The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

Parameters

- xStreamBuffer: The handle of the stream buffer from which bytes are to be received.
- pvRxData: A pointer to the buffer into which the received bytes will be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- xTicksToWait: The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return
immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute
time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used
to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait
to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided IN-
CLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when
it is in the Blocked state.

size_t xStreamBufferReceiveFromISR(StreamBufferHandle_t xStreamBuffer, void *pvRxData,
size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceive-
FromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                                ( void * ) ucRxData,
                                                sizeof( ucRxData ),
                                                &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Return  The number of bytes read from the stream buffer, if any.

Parameters

- **xStreamBuffer**: The handle of the stream buffer from which a stream is being received.
- **pvRxData**: A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes**: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many
  bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken**: It is possible that a stream buffer will have a task blocked
  on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make
  space available, and so cause a task that is waiting for space to leave the Blocked state. If call-
  ing xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked
  task has a priority higher than the currently executing task (the task that was interrupted), then,
  internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If
  xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should...
be performed before the interrupt is exited. That will ensure the interrupt returns directly to the
highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before
it is passed into the function. See the code example below for an example.

void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)
Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBuffer-
CreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()),
then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

Parameters
• xStreamBuffer: The handle of the stream buffer to be deleted.

BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore
cannot accept any more data.

Return If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters
• xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

Return If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters
• xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)
Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream
buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

Return If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to
or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

Parameters
• xStreamBuffer: The handle of the stream buffer being reset.

size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can
be sent to the stream buffer before it is full.

Return The number of bytes that can be written to the stream buffer before the stream buffer would be full.

Parameters
• xStreamBuffer: The handle of the stream buffer being queried.

size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be
read from the stream buffer before the stream buffer would be empty.

Return The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

Parameters
• xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTrigger
Level)
A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is
blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked
on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single
byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a
read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream
buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before
the trigger level is reached then the task will still receive however many bytes are actually available. Setting
a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is
greater than the buffer size.
A trigger level is set when the stream buffer is created, and can be modified using `xStreamBufferSetTriggerLevel()`.

**Return** If `xTriggerLevel` was less than or equal to the stream buffer’s length then the trigger level will be updated and `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xStreamBuffer`: The handle of the stream buffer being updated.
- `xTriggerLevel`: The new trigger level for the stream buffer.

BaseType_t `xStreamBufferSendCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t* pxHigherPriorityTaskWoken)`

For advanced users only.

The `sbSEND_COMPLETED()` macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbSEND_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xStreamBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbSEND_COMPLETED()`, and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xStreamBuffer`: The handle of the stream buffer to which data was written.
- `pxHigherPriorityTaskWoken`: `*pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into `xStreamBufferSendCompletedFromISR()`. If calling `xStreamBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

BaseType_t `xStreamBufferReceiveCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t* pxHigherPriorityTaskWoken)`

For advanced users only.

The `sbRECEIVE_COMPLETED()` macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbRECEIVE_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xStreamBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbRECEIVE_COMPLETED()`, and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xStreamBuffer`: The handle of the stream buffer from which data was read.
- `pxHigherPriorityTaskWoken`: `*pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into `xStreamBufferReceiveCompletedFromISR()`. If calling `xStreamBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**Macros**

`xStreamBufferCreate(xBufferSizeBytes, xTriggerLevelBytes)`

Creates a new stream buffer using dynamically allocated memory. See `xStreamBufferCreateStatic()` for a version that uses statically allocated memory (memory that is allocated at compile time).

`configSUPPORT_DYNAMIC_ALLOCATION` must be set to 1 or left undefined in `FreeRTOSConfig.h` for `xStreamBufferCreate()` to be available.
Example use:

```c
void vAFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

    // Create a stream buffer that can hold 100 bytes. The memory used to hold
    // both the stream buffer structure and the data in the stream buffer is
    // allocated dynamically.
    xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

    if( xStreamBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // stream buffer.
    }
    else
    {
        // The stream buffer was created successfully and can now be used.
    }
}
```

Return If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

Parameters
- `xBufferSizeBytes`: The total number of bytes the stream buffer will be able to hold at any one time.
- `xTriggerLevelBytes`: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

`xStreamBufferCreateStatic(xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)`

Creates a new stream buffer using statically allocated memory. See `xStreamBufferCreate()` for a version that uses dynamically allocated memory.

`configSUPPORT_STATIC_ALLOCATION` must be set to 1 in FreeRTOSConfig.h for `xStreamBufferCreateStatic()` to be available.

Example use:

```c
#define STORAGE_SIZE_BYTES 1000

// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;
void MyFunction( void )
```

(continues on next page)
```c
{  
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
        xTriggerLevel,
        ucBufferStorage,
        &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.

    // Other code that uses the stream buffer can go here.
}
```

**Return** If the stream buffer is created successfully then a handle to the created stream buffer is returned. If
either `pucStreamBufferStorageArea` or `pxStaticstreamBuffer` are NULL then NULL is returned.

**Parameters**

- `xBufferSizeBytes`: The size, in bytes, of the buffer pointed to by the `pucStreamBufferStorageArea` parameter.
- `xTriggerLevelBytes`: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than

  the buffer size.
- `pucStreamBufferStorageArea`: Must point to a uint8_t array that is at least `xBUFFERSize-Bytes + 1` big. This is the array to which streams are copied when they are written to the stream buffer.
- `pxStaticStreamBuffer`: Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.

**Type Definitions**

```c
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

**Message Buffer API**

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h

**Macros**

```c
#define xMessageBufferCreate(xBufferSizeBytes)  
        Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a
        version that uses statically allocated memory (memory that is allocated at compile time).

        configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for
        xMessageBufferCreate() to be available.

        Example use:
```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
        // There was not enough heap memory space available to create the
        // message buffer.
    else
        // The message buffer was created successfully and can now be used.

Return If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

Parameters

- **xBufferSizeBytes**: The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

xMessageBufferCreateStatic(xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                             ucBufferStorage,
                                             &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

(continues on next page)
// Other code that uses the message buffer can go here.

Return If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticmessageBuffer are NULL then NULL is returned.

Parameters

- **xBufferSizeBytes**: The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).
- **pucMessageBufferStorageArea**: Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer**: Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

**xMessageBufferSend(xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)**

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
                                    sizeof( ucArrayToSend ), x100ms );
    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
                                    strlen( pcStringToSend ), 0 );
}
```

(continues on next page)
if( xBytesSent != strlen( pcStringToSend ) )
{
  // The string could not be added to the message buffer because there was
  // not enough free space in the buffer.
}
}

Return The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

Parameters
- xMessageBuffer: The handle of the message buffer to which a message is being sent.
- pvTxData: A pointer to the message that is to be copied into the message buffer.
- xDataLengthBytes: The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- xTicksToWait: The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

xMessageBufferSendFromISR( xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken )

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
  size_t xBytesSent;
  char *pcStringToSend = "String to send";
  BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

  // Attempt to send the string to the message buffer.
  xBytesSent = xMessageBufferSendFromISR( xMessageBuffer, ( void * ) pcStringToSend,
printf( pcStringToSend ),
&xHigherPriorityTaskWoken );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );

Return  The number of bytes actually written to the message buffer. If the message buffer didn’t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

Parameters

- xMessageBuffer: The handle of the message buffer to which a message is being sent.
- pvTxData: A pointer to the message that is to be copied into the message buffer.
- xDataLengthBytes: The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                           ( void * ) ucRxData,
                                           sizeof( ucRxData ),
                                           xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}

Return  The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive()
times out before a message became available then zero is returned. If the length of the message is greater
than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

Parameters  
- xMessageBuffer: The handle of the message buffer from which a message is being received.
- pvRxData: A pointer to the buffer into which the received message is to be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum length of the message that can be received. If xBufferLengthBytes is too small
  to hold the next message then the message will be left in the message buffer and 0 will be returned.
- xTicksToWait: The maximum amount of time the task should remain in the Blocked state to
  wait for a message, should the message buffer be empty. xMessageBufferReceive() will return im-
  mediately if xTicksToWait is zero and the message buffer is empty and 0 will be returned.

Example use:  
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

(continues on next page)
void vAnInterruptServiceRoutine( void )
{
  uint8_t ucRxData[ 20 ];
  size_t xReceivedBytes;
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

  // Receive the next message from the message buffer.
  xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
    ( void * ) ucRxData,
    sizeof( ucRxData ),
    &xHigherPriorityTaskWoken );

  if( xReceivedBytes > 0 )
  {
    // ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
  }

  // If xHigherPriorityTaskWoken was set to pdTRUE inside
  // xMessageBufferReceiveFromISR() then a task that has a priority above the
  // priority of the currently executing task was unblocked and a context
  // switch should be performed to ensure the ISR returns to the unblocked
  // task. In most FreeRTOS ports this is done by simply passing
  // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
  // variables value, and perform the context switch if necessary. Check the
  // documentation for the port in use for port specific instructions.
  portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

Return The length, in bytes, of the message read from the message buffer, if any.
Parameters
- xMessageBuffer: The handle of the message buffer from which a message is being received.
- pvRxData: A pointer to the buffer into which the received message is to be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum length of the message that can be received. If xBufferLengthBytes is too small
  to hold the next message then the message will be left in the message buffer and 0 will be returned.
- pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked
  on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make
  space available, and so cause a task that is waiting for space to leave the Blocked state. If call-
  ing xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked
  task has a priority higher than the currently executing task (the task that was interrupted), then,
  internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE.
  If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch
  should be performed before the interrupt is exited. That will ensure the interrupt returns directly
  to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE
  before it is passed into the function. See the code example below for an example.

vMessageBufferDelete(xMessageBuffer)
Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-
BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBuffer-
Create()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.
Parameters
- xMessageBuffer: The handle of the message buffer to be deleted.

xMessageBufferIsFull(xMessageBuffer)
Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any
size, until space is made available by a message being removed from the message buffer.
**Return** If the message buffer referenced by `xMessageBuffer` is full then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer being queried.

**xMessageBufferIsEmpty** (`xMessageBuffer`)
Tests to see if a message buffer is empty (does not contain any messages).

**Return** If the message buffer referenced by `xMessageBuffer` is empty then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer being queried.

**xMessageBufferReset** (`xMessageBuffer`)
Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Return** If the message buffer was reset then `pdPASS` is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then `pdFAIL` is returned.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer being reset.

**xMessageBufferSpaceAvailable** (`xMessageBuffer`)
Returns the number of bytes of free space in the message buffer.

**Return** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if `xMessageBufferSpaceAvailable()` returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer being queried.

**xMessageBufferNextLengthBytes** (`xMessageBuffer`)
Returns the length (in bytes) of the next message in a message buffer. Useful if `xMessageBufferReceive()` returned 0 because the size of the buffer passed into `xMessageBufferReceive()` was too small to hold the next message.

**Return** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer being queried.

**xMessageBufferSendCompletedFromISR** (`xMessageBuffer`, `pxHigherPriorityTaskWoken`)
For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Parameters**
- `xMessageBuffer`: The handle of the stream buffer to which data was written.
- `pxHigherPriorityTaskWoken`: *pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferSendCompletedFromISR()`*. If calling `xMessageBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority
above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to
pdTRUE indicating that a context switch should be performed before exiting the ISR.

**xMessageBufferReceiveCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of
a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting
for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it
from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to
enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT
BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is
returned.

**Parameters**

- **xMessageBuffer**: The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken**: *pxHigherPriorityTaskWoken should be initialised to
pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMes-
sageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a
priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get
set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Type Definitions**

```
typedef void *MessageBufferHandle_t
```

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an
MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessage-
BufferReceive(), etc.

### 2.10.10 FreeRTOS Supplemental Features

ESP-IDF uses a modified version of FreeRTOS v10.4.3 that contains significant changes for SMP compatibility (see
ESP-IDF FreeRTOS SMP Changes). However, in addition to ESP-IDF FreeRTOS, various features are also provided
by ESP-IDF to supplement the features offered by FreeRTOS.

This document describes these supplemental features added to ESP-IDF. This document is split into the following
sections:

**Contents**

- **FreeRTOS Supplemental Features**
  - Overview
  - Ring Buffers
  - ESP-IDF Tick and Idle Hooks
  - TLS Deletion Callbacks
  - Component Specific Properties
  - API Reference

**Overview**

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modi-
fications for SMP compatibility (see ESP-IDF FreeRTOS SMP Changes). However, various new features specific to
ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
• **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.

• **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.

• **Component Specific Properties**: Currently added only one component specific property ORIG_INCLUDE_PATH.

### Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, items are always retrieved from the ring buffer by reference. As a result, all retrieved items must also be returned to the ring buffer by using vRingbufferReturnItem() or vRingbufferReturnItemFromISR(), in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

- **No-Split buffers** will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. Only this buffer type allows you to get the data item address and write to the item by yourself. Refer to the documentation of the functions xRingbufferSendAcquire() and xRingbufferSendComplete() for more details.

- **Allow-Split buffers** will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

- **Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

**Note**: No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

**Note**: Each item stored in No-Split or Allow-Split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

### Usage

The following example demonstrates the usage of xRingbufferCreate() and xRingbufferSend() to create a ring buffer and then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

   //Create ring buffer
   RingbufHandle_t buf_handle;
   buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
   if (buf_handle == NULL) {
      printf("Failed to create ring buffer\n");
   }

   //Send an item
   UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS-_TO_TICKS(1000));
```

(continues on next page)
The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RING-BUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/ldesc.h"

typedef struct {
  lldesc_t dma_desc;
  uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))

... //Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when
//we copy
  dma_item_t item;
  UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
  if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
  }
  item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
  };
  //Actually send to the ring buffer for consumer to use
  res = xRingbufferSendComplete(buf_handle, &item);
  if (res != pdTRUE) {
    printf("Failed to send item\n");
  }
```

The following example demonstrates retrieving and returning an item from a No-Split ring buffer using `xRingbufferReceive()` and `vRingbufferReturnItem()`.

```c
... //Receive an item from no-split ring buffer
  size_t item_size;
  char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

  //Check received item
  if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
      printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
```

(continues on next page)
The following example demonstrates retrieving and returning an item from an Allow-Split ring buffer using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

```c
//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
}
else { //Failed to receive item
    printf("Failed to receive item\n");
}
```

The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```c
//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else { //Failed to receive item
    printf("Failed to receive item\n");
}
```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceive-
Chapter 2. API Reference

**UpToFromISR()**, and **vRingbufferReturnItemFromISR()**

**Note:** Two calls to RingbufferReceive[UpTo][FromISR]() are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes **18, 3, and 27 bytes** are sent respectively to a buffer of **128 bytes**.

![Fig. 29: Sending items to No-Split or Allow-Split ring buffers](image)

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

![Fig. 30: Sending items to byte buffers](image)

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

**Using SendAcquire and SendComplete** Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if
**Fig. 31:** SendAcquire/SendComplete items in No-Split ring buffers

SendComplete is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using SendAcquire or SendComplete since acquired buffers are required to be complete (not wrapped).

### Wrap Around

The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes** with **56 bytes of free space that wraps around** and a sent item of **28 bytes**.

#### Fig. 32: Wrap around in No-Split buffers

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

#### Fig. 33: Wrap around in Allow-Split buffers
Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Note:** Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

---

![Diagram 34](image)

Fig. 34: Wrap around in byte buffers

Byte buffers will **store as much data as possible into the free space at the tail of buffer.** The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

---

![Diagram 35](image)

Fig. 35: Retrieving/Returning items in No-Split and Allow-Split ring buffers

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order.** However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.
Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return before another retrieval is permitted). When using \texttt{xRingbufferReceive()} or \texttt{xRingbufferReceiveFromISR()}, all continuous stored data will be retrieved. \texttt{xRingbufferReceiveUpTo()} or \texttt{xRingbufferReceiveUpToFromISR()} can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to \texttt{xRingbufferReceive()} or \texttt{xRingbufferReceiveFromISR()} then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets** Ring buffers can be added to FreeRTOS queue sets using \texttt{xRingbufferAddToQueueSetRead()} such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to \texttt{xQueueSelectFromSet()}. To check whether the selected queue set member is the ring buffer, call \texttt{xRingbufferCanRead()}.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...
//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item
    ...
```

(continues on next page)
Ring Buffers with Static Allocation  The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand and passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`
- The ring buffer’s storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the user's requirements (e.g., all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE 400 //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t) * BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

Priority Inversion  Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.
However, in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second-highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

**ESP-IDF Tick and Idle Hooks**

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the `void vApplicationTickHook( void )` callback.
- FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following drawbacks:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each CPU’s tick interrupt and idle tasks ends up calling the same hook.

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per CPU)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each CPU

ESP-IDF hooks can be registered and deregistered using the following API:

- For tick hooks:
  - Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()`
  - Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`

- For idle hooks:
  - Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()`
  - Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`

**Note:** The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the SPI flash API documentation for more details.

**TLSP Deletion Callbacks**

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task’s TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task’s TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task’s lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.
However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP’s associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible
- The callback is called shortly before a deleted task’s memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

**Component Specific Properties**

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include freertos/FreeRTOS.h` you can refer to headers directly: `#include "FreeRTOS.h` .

**API Reference**

**Ring Buffer API**

**Header File**

- `components/esp_ringbuf/include/freertos/ringbuf.h`

**Functions**

`RingbufHandle_t xRingbufferCreate(size_t xBufferSize, RingbufferType_t xBufferType)`

Create a ring buffer.

**Note** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

**Return** A handle to the created ring buffer, or NULL in case of error.

**Parameters**

- [in] `xBufferSize`: Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- [in] `xBufferType`: Type of ring buffer, see documentation.

`RingbufHandle_t xRingbufferCreateNoSplit(size_t xItemSize, size_t xItemNum)`

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

**Return** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

**Parameters**

- [in] `xItemSize`: Size of each item to be put into the ring buffer
- [in] `xItemNum`: Maximum number of items the buffer needs to hold simultaneously

`RingbufHandle_t xRingbufferCreateStatic(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)`

Create a ring buffer but manually provide the required memory.

**Note** xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.
Return  A handle to the created ring buffer

Parameters
  • [in] xBufferSize: Size of the buffer in bytes.
  • [in] xBufferType: Type of ring buffer, see documentation
  • [in] pucRingbufferStorage: Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by xBufferSize
  • [in] pxStaticRingbuffer: Pointer to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

BaseType_t xRingbufferSend(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, 
  TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

Note  For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return  • pdTRUE if succeeded
  • pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

Parameters
  • [in] xRingbuffer: Ring buffer to insert the item into
  • [in] pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
  • [in] xItemSize: Size of data to insert.
  • [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType_t xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, 
  BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

Note  For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return  • pdTRUE if succeeded
  • pdFALSE when the ring buffer does not have space.

Parameters
  • [in] xRingbuffer: Ring buffer to insert the item into
  • [in] pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
  • [in] xItemSize: Size of data to insert.
  • [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

BaseType_t xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, 
  TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note  Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return  • pdTRUE if succeeded
  • pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer
Parameters
- [in] xRingbuffer: Ring buffer to allocate the memory
- [out] ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
- [in] xItemSize: Size of item to acquire.
- [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)
Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

Note Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

Return
- pdTRUE if succeeded
- pdFALSE if fail for some reason.

Parameters
- [in] xRingbuffer: Ring buffer to insert the item into
- [in] pvItem: Pointer to item in allocated memory to insert.

void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
Retrieve an item from the ring buffer.

Note A call to vRingbufferReturnItem() is required after this to free the item retrieved.

Return
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

Parameters
- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- [in] xTicksToWait: Ticks to wait for items in the ring buffer.

void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)
Retrieve an item from the ring buffer in an ISR.

Note A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.
Note Byte buffers do not allow multiple retrievals before returning an item
Note Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

Return
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

Parameters
- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.

BaseType_t xRingbufferReceiveSplit (RingbufHandle_t xRingbuffer, void **ppvHeadItem,
void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)
Retrieve a split item from an allow-split ring buffer.

Note(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.
Note This function should only be called on allow-split buffers

Return
- pdTRUE if an item (split or unsplit) was retrieved
Chapter 2. API Reference

• pdFALSE when no item was retrieved

Parameters
  • [in] xRingbuffer: Ring buffer to retrieve the item from
  • [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
  • [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
  • [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
  • [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)
  • [in] xTicksToWait: Ticks to wait for items in the ring buffer.

BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

Note Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

Note This function should only be called on allow-split buffers

Return
  • pdTRUE if an item (split or unsplit) was retrieved
  • pdFALSE when no item was retrieved

Parameters
  • [in] xRingbuffer: Ring buffer to retrieve the item from
  • [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
  • [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
  • [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
  • [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)
  • [in] xTicksToWait: Ticks to wait for items in the ring buffer.

void *xRingbufferReceiveUpTo(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note A call to vRingbufferReturnItem() is required after this to free up the data retrieved.

Note This function should only be called on byte buffers

Note Byte buffers do not allow multiple retrievals before returning an item

Note Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

Return
  • Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
  • NULL on timeout, *pxItemSize is untouched in that case.

Parameters
  • [in] xRingbuffer: Ring buffer to retrieve the item from
  • [out] pxItemSize: Pointer to a variable to which the size of the retrieved data will be written.
  • [in] xTicksToWait: Ticks to wait for items in the ring buffer.
  • [in] xMaxSize: Maximum number of bytes to return.

void *xRingbufferReceiveUpToFoFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

Note This function should only be called on byte buffers

Note Byte buffers do not allow multiple retrievals before returning an item

Return
  • Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
  • NULL when the ring buffer is empty, *pxItemSize is untouched in that case.
Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
• [in] xMaxSize: Maximum number of bytes to return.

void vRingbufferReturnItem (RingbufHandle_t xRingbuffer, void *pvItem)
Return a previously-retrieved item to the ring buffer.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• [in] xRingbuffer: Ring buffer the item was retrieved from
• [in] pvItem: Item that was received earlier

void vRingbufferReturnItemFromISR (RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)
Return a previously-retrieved item to the ring buffer from an ISR.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• [in] xRingbuffer: Ring buffer the item was retrieved from
• [in] pvItem: Item that was received earlier
• [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void vRingbufferDelete (RingbufHandle_t xRingbuffer)
Delete a ring buffer.

Note This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually by the user.

Parameters
• [in] xRingbuffer: Ring buffer to delete

size_t xRingbufferGetMaxItemSize (RingbufHandle_t xRingbuffer)
Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note The max item size for a no-split buffer is limited to ((buffer_size/2)-header_size). This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Return Maximum size, in bytes, of an item that can be placed in a ring buffer.

Parameters
• [in] xRingbuffer: Ring buffer to query

size_t xRingbufferGetCurFreeSize (RingbufHandle_t xRingbuffer)
Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Warning This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

Note An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2)-header_size). See API reference for xRingbufferGetMaxItemSize().

Return Current free size, in bytes, available for an entry

Parameters
• [in] xRingbuffer: Ring buffer to query

BaseType_t xRingbufferAddToQueueSetRead (RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

Return
Chapter 2. API Reference

• pdTRUE on success, pdFALSE otherwise

Parameters
• [in] xRingbuffer: Ring buffer to add to the queue set
• [in] xQueueSet: Queue set to add the ring buffer’s read semaphore to

BaseType_t xRingbufferCanRead (RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)

Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

Return
• pdTRUE when semaphore belongs to ring buffer
• pdFALSE otherwise.

Parameters
• [in] xRingbuffer: Ring buffer which should be checked
• [in] xMember: Member returned from xQueueSelectFromSet

BaseType_t xRingbufferRemoveFromQueueSetRead (RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)

Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer.

Return
• pdTRUE on success
• pdFALSE otherwise

Parameters
• [in] xRingbuffer: Ring buffer to remove from the queue set
• [in] xQueueSet: Queue set to remove the ring buffer’s read semaphore from

void vRingbufferGetInfo (RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)

Get information about ring buffer status.

Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

Parameters
• [in] xRingbuffer: Ring buffer to remove from the queue set
• [out] uxFree: Pointer use to store free pointer position
• [out] uxRead: Pointer use to store read pointer position
• [out] uxWrite: Pointer use to store write pointer position
• [out] uxAcquire: Pointer use to store acquire pointer position
• [out] uxItemsWaiting: Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

Parameters
• xRingbuffer: Ring buffer to show

Structures

struct xSTATIC_RINGBUFFER

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.
Type Definitions

typedef void *RingbufHandle_t
Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
Struct that is equivalent in size to the ring buffer’s data structure.
The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

Enumerations

enum RingbufferType_t
Values:

RINGBUF_TYPE_NOSPLIT = 0
No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

RINGBUF_TYPE_ALLOWSPLIT
Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

RINGBUF_TYPE_BYTEBUF
Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

RINGBUF_TYPE_MAX

Hooks API

Header File

- components/esp_system/include/esp_freertos_hooks.h

Functions

esp_err_t esp_register_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Return

- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters

- [in] new_idle_cb: Callback to be called
- [in] cpuid: id of the core

esp_err_t esp_register_freertos_idle_hook (esp_freertos_idle_cb_t new_idle_cb)
Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.
Return
- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

Parameters
- [in] new_idle_cb: Callback to be called

void esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
Register a callback to be called from the specified core’s idle hook.

Return
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters
- [in] new_tick_cb: Callback to be called
- [in] cpuid: id of the core

void esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)
Register a callback to be called from the calling core’s tick hook.

Parameters
- [in] new_tick_cb: Callback to be called

void esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)
Unregister an idle callback from the idle hook of the specified core.

Parameters
- [in] old_idle_cb: Callback to be unregistered
- [in] cpuid: id of the core

void esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)
Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

Parameters
- [in] old_idle_cb: Callback to be unregistered

void esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)
Unregister a tick callback from the tick hook of the specified core.

Parameters
- [in] old_tick_cb: Callback to be unregistered
- [in] cpuid: id of the core

void esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)
Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

Parameters
- [in] old_tick_cb: Callback to be unregistered

Type Definitions
typedef bool (*esp_freertos_idle_cb_t)(void)
typedef void (*esp_freertos_tick_cb_t)(void)

2.10.11 Heap Memory Allocation
Stack and Heap

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See xTaskCreateStatic() for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc malloc() and free() functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to heap_caps_malloc().

Memory Capabilities

The ESP32 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be 32-bit aligned.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see Memory Types.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability MALLOC_CAP_8BIT (accessible in single byte reads and writes). When calling malloc(), the ESP-IDF malloc() implementation internally calls heap_caps_malloc(size, MALLOC_CAP_8BIT) in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT).

Because malloc uses the capabilities-based allocation system, memory allocated using heap_caps_malloc() can be freed by calling the standard free() function.

Available Heap

DRAM  At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the idf.py size command.

Note: Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

Note: At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).
IRAM  At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

D/IRAM  Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes  At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>Heap Address</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>3FFAE6E0</td>
<td>6 KiB</td>
</tr>
<tr>
<td>3FFB2EC8</td>
<td>180 KiB</td>
</tr>
<tr>
<td>3FFE0440</td>
<td>14 KiB</td>
</tr>
<tr>
<td>3FFE4350</td>
<td>111 KiB</td>
</tr>
<tr>
<td>4008944C</td>
<td>90 KiB</td>
</tr>
</tbody>
</table>

Finding available heap  See Heap Information.

Special Capabilities

DMA-Capable Memory  Use the MALLOC_CAP_DMA flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory  If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the MALLOC_CAP_32BIT flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with MALLOC_CAP_32BIT can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory  When external RAM is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on configuration. See Configuring External RAM for more details.

To use the region above the 4MiB limit, you can use the himem API.

API Reference - Heap Allocation

Header File  
- components/heap/include/esp_heap_caps.h

Functions

```c
esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)
```
registers a callback function to be invoked if a memory allocation operation fails

**Return**  ESP_OK if callback was registered.

**Parameters**
- callback: caller defined callback to be invoked

```c
void *heap_caps_malloc (size_t size, uint32_t caps)
```
Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, `malloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT).`
Return A pointer to the memory allocated on success, NULL on failure

Parameters
  • size: Size, in bytes, of the amount of memory to allocate
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void heap_caps_free (void *ptr)
Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().
Equivalent semantics to libc free(), for capability-aware memory.
In IDF, free (p) is equivalent to heap_caps_free (p).

Parameters
  • ptr: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void *heap_caps_realloc (void *ptr, size_t size, uint32_t caps)
Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().
Equivalent semantics to libc realloc(), for capability-aware memory.
In IDF, realloc (p, s) is equivalent to heap_caps_realloc (p, s, MALLOC_CAP_8BIT).
‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

Return Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

Parameters
  • ptr: Pointer to previously allocated memory, or NULL for a new allocation.
  • size: Size of the new buffer requested, or 0 to free the buffer.
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

void *heap_caps_aligned_alloc (size_t alignment, size_t size, uint32_t caps)
Allocate an aligned chunk of memory which has the given capabilities.
Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
  • alignment: How the pointer received needs to be aligned must be a power of two
  • size: Size, in bytes, of the amount of memory to allocate
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void heap_caps_aligned_free (void *ptr)
Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

Note This function is deprecated, please consider using heap_caps_free() instead

Parameters
  • ptr: Pointer to the memory allocated

void *heap_caps_aligned_calloc (size_t alignment, size_t n, size_t size, uint32_t caps)
Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
  • alignment: How the pointer received needs to be aligned must be a power of two
  • n: Number of continuing chunks of memory to allocate
  • size: Size, in bytes, of a chunk of memory to allocate
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void *heap_caps_calloc (size_t n, size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.
Equivalent semantics to libc calloc(), for capability-aware memory.
In IDF, `calloc(p)` is equivalent to `heap_caps calloc(p, MALLOC_CAP_8BIT)`.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**
- `n`: Number of continuing chunks of memory to allocate
- `size`: Size, in bytes, of a chunk of memory to allocate
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

```c
size_t heap_caps_get_total_size (uint32_t caps)
```
Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**Return** total size in bytes

**Parameters**
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
size_t heap_caps_get_free_size (uint32_t caps)
```
Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

**Note** Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

**Return** Amount of free bytes in the regions

**Parameters**
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
size_t heap_caps_get_minimum_free_size (uint32_t caps)
```
Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

**Note** Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

**Return** Amount of free bytes in the regions

**Parameters**
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
size_t heap_caps_get_largest_free_block (uint32_t caps)
```
Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps malloc(s, caps)` will succeed.

**Return** Size of the largest free block in bytes.

**Parameters**
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_get_info (multi_heap_info_t *info, uint32_t caps)
```
Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**
- `info`: Pointer to a structure which will be filled with relevant heap metadata.
- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_print_heap_info (uint32_t caps)
```
Print a summary of all memory with the given capabilities.
Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
bool heap_caps_check_integrity_all (bool print_errors)
```
Check integrity of all heap memory in the system.

Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- **print_errors**: Print specific errors if heap corruption is found.

```c
bool heap_caps_check_integrity (uint32_t caps, bool print_errors)
```
Check integrity of all heaps with the given capabilities.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- **print_errors**: Print specific errors if heap corruption is found.

```c
bool heap_caps_check_integrity_addr (intptr_t addr, bool print_errors)
```
Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note** The entire heap region around the address is checked, not only the adjacent heap blocks.

**Return** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

**Parameters**
- **addr**: Address in memory. Check for corruption in region containing this address.
- **print_errors**: Print specific errors if heap corruption is found.

```c
void heap_caps_malloc_extmem_enable (size_t limit)
```
Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**
- **limit**: Limit, in bytes.

```c
void *heap_caps_malloc_prefer (size_t size, size_t num, ...)
```
Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory.

This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.
Return A pointer to the memory allocated on success, NULL on failure

Parameters
- size: Size, in bytes, of the amount of memory to allocate
- num: Number of variable parameters

void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)
Reallocate a chunk of memory as preference in decreasing order.

Return Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

Parameters
- ptr: Pointer to previously allocated memory, or NULL for a new allocation.
- size: Size of the new buffer requested, or 0 to free the buffer.
- num: Number of variable parameters

void *heap_caps_calloc_prefer (size_t n, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- n: Number of continuing chunks of memory to allocate
- size: Size, in bytes, of a chunk of memory to allocate
- num: Number of variable parameters

void heap_caps_dump (uint32_t caps)
Dump the full structure of all heap(s) with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr).
For each (variable sized) block in each matching heap, the following output is printed on a single line:
- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_dump_all (void)
Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t heap_caps_get_allocated_size (void *ptr)
Return the size that a particular pointer was allocated with.

Note The app will crash with an assertion failure if the pointer is not valid.

Return Size of the memory allocated at this block.

Parameters
- ptr: Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

Macros

MALLOC_CAP_EXEC
Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT
Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT
Memory must allow for 8/16/---bit data accesses.
MALLOC_CAP_DMA
Memory must be able to accessed by DMA.

MALLOC_CAP_PID2
Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3
Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4
Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5
Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6
Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7
Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM
Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT
Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RTCRAM
Memory must be in RTC fast memory.

MALLOC_CAP_INVALID
Memory can’t be used / list end marker.

Type Definitions

typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
callback called when an allocation operation fails, if registered

Parameters
• size: in bytes of failed allocation
• caps: capabilities requested of failed allocation
• function_name: function which generated the failure

Thread Safety
Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

• Heap Information (free space, etc.)
• **Heap Corruption Detection**
• **Heap Tracing** (memory leak detection, monitoring, etc.)

### API Reference - Initialisation

#### Header File

- components/heap/include/esp_heap_caps_init.h

#### Functions

**void heap_caps_init (void)**

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

**void heap_caps_enable_nonos_stack_heaps (void)**

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

**esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)**

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions cannot be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

**Note** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

<table>
<thead>
<tr>
<th>Existing region: 0x1000 &lt;-&gt; 0x3000</th>
</tr>
</thead>
<tbody>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x3000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x2000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x1000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x3000 &lt;-&gt; 0x4000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x2000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x2000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
</tbody>
</table>

**Return** ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

**Parameters**

- **start**: Start address of new region.
- **end**: End address of new region.

**esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)**

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.
Note Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

<table>
<thead>
<tr>
<th>Existing region:</th>
<th>0x1000 &lt;-&gt; 0x3000</th>
</tr>
</thead>
<tbody>
<tr>
<td>New region:</td>
<td>0x1000 &lt;-&gt; 0x3000 (Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x1000 &lt;-&gt; 0x2000 (Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x0000 &lt;-&gt; 0x1000 (Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x3000 &lt;-&gt; 0x4000 (Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x0000 &lt;-&gt; 0x2000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x0000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x1000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region:</td>
<td>0x2000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
</tbody>
</table>

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

Parameters

- **caps**: Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start**: Start address of new region.
- **end**: End address of new region.

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling multi_heap_free() on that particular multi_heap instance.

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- components/heap/include/multi_heap.h

Functions

void *multi_heap_aligned_alloc(multi_heap_handle_t heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

Return pointer to the memory allocated, NULL on failure

Parameters

- **heap**: Handle to a registered heap.
multi_heap_malloc (multi_heap_handle_t heap, size_t size)

- **size**: size in bytes of memory chunk
- **alignment**: how the memory must be aligned

void *multi_heap_malloc (multi_heap_handle_t heap, size_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

**Return** Pointer to new memory, or NULL if allocation fails.

**Parameters**

- **heap**: Handle to a registered heap.
- **size**: Size of desired buffer.

multi_heap_aligned_free (multi_heap_handle_t heap, void *p)

free() a buffer aligned in a given heap.

**Note** This function is deprecated, consider using multi_heap_free() instead

**Parameters**

- **heap**: Handle to a registered heap.
- **p**: NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

multi_heap_free (multi_heap_handle_t heap, void *p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap**: Handle to a registered heap.
- **p**: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void *multi_heap_realloc (multi_heap_handle_t heap, void *p, size_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Return** New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

**Parameters**

- **heap**: Handle to a registered heap.
- **p**: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
- **size**: Desired new size for buffer.

size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)

Return the size that a particular pointer was allocated with.

**Return** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

**Parameters**

- **heap**: Handle to a registered heap.
- **p**: Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

multi_heap_handle_t multi_heap_register (void *start, size_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Return** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

**Parameters**

- **start**: Start address of the memory to use for a new heap.
- **size**: Size (in bytes) of the new heap.
void **multi_heap_set_lock** (**multi_heap_handle_t** heap, **void** *lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

**Parameters**

- **heap**: Handle to a registered heap.
- **lock**: Optional pointer to a locking structure to associate with this heap.

void **multi_heap_dump** (**multi_heap_handle_t** heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters**

- **heap**: Handle to a registered heap.

bool **multi_heap_check** (**multi_heap_handle_t** heap, bool print_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

**Return** true if heap is valid, false otherwise.

**Parameters**

- **heap**: Handle to a registered heap.
- **print_errors**: If true, errors will be printed to stderr.

size_t **multi_heap_free_size** (**multi_heap_handle_t** heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

**Return** Number of free bytes.

**Parameters**

- **heap**: Handle to a registered heap.

size_t **multi_heap_minimum_free_size** (**multi_heap_handle_t** heap)

Return the lifetime minimum free heap size.

Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returns the lifetime “low watermark” of possible values returned from multi_free_heap_size(), for the specified heap.

**Return** Number of free bytes.

**Parameters**

- **heap**: Handle to a registered heap.

void **multi_heap_get_info** (**multi_heap_handle_t** heap, **multi_heap_info_t** *info)

Return metadata about a given heap.

Fills a multi_heap_info_t structure with information about the specified heap.

**Parameters**

- **heap**: Handle to a registered heap.
- **info**: Pointer to a structure to fill with heap metadata.
Chapter 2. API Reference

Structures

**struct multi_heap_info_t**

Structure to access heap metadata via multi_heap_get_info.

**Public Members**

- `size_t total_free_bytes`
  - Total free bytes in the heap. Equivalent to multi_free_heap_size().
- `size_t total_allocated_bytes`
  - Total bytes allocated to data in the heap.
- `size_t largest_free_block`
  - Size of the largest free block in the heap. This is the largest malloc-able size.
- `size_t minimum_free_bytes`
  - Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().
- `size_t allocated_blocks`
  - Number of (variable size) blocks allocated in the heap.
- `size_t free_blocks`
  - Number of (variable size) free blocks in the heap.
- `size_t total_blocks`
  - Total number of (variable size) blocks in the heap.

**Type Definitions**

`typedef struct multi_heap_info *multi_heap_handle_t`

Opaque handle to a registered heap.

2.10.12 Heap Memory Debugging

**Overview**

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the Heap Memory Allocation page.

**Heap Information**

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_heap_size()` can be used to track the heap “low watermark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.
Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,

Assertions The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL.

If a heap integrity assertion fails, a line will be printed like CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling heap_caps_check_integrity_all() or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use heap_caps_register_failed_alloc_callback() to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS).

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char* function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to heap_caps_check_integrity_all() or heap_caps_check_integrity_addr() in your code will help you pin down the exact time.
that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.

- Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function `- esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, heap tracing in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See Heap Tracing To Find Heap Corruption for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting configur config HEAP_MEMORY_DEBUGGING can be set to one of three levels:

- **Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

  If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

  Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

- **Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

  The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

  “Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

  Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

  Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

  When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

  In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

  Different values usually indicate buffer underrun or overrun, respectively.
Comprehensive  This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

Crashes in Comprehensive Mode  If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode  Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks  If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the xPortGetFreeHeapSize(), heap_caps_get_free_size(), or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.
**Standalone Mode** Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see CONFIG_HEAP_TRACING_DEST).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"
#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in internal RAM
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller...
    0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller...
    0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.
In **HEAP_TRACE_LEAKS** mode, for each traced memory allocation which has not already been freed a line is printed with:

- **XX bytes** is the number of bytes allocated
- **@ 0x...** is the heap address returned from malloc/calloc.
- **CPU x**... is the CPU (0 or 1) running when the allocation was made.
- **ccount 0x...** is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- **caller 0x...** gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under *Heap Memory Debugging -> Enable heap tracing -> Heap tracing stack depth*. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each `heap_trace_record_t` record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

### Host-Based Mode

Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to *Component settings -> Heap Memory Debugging -> CONFIG_HEAP_TRACING_DEST* and select Host-Based.
- In the project configuration menu, navigate to *Component settings -> Application Level Tracing -> CONFIG_APPTRACE_DESTINATION1* and select Trace memory.
- In the project configuration menu, navigate to *Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing* and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```
To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in Getting Started Guide.
2. Run OpenOCD (see JTAG Debugging).

**Note:** In order to use this feature you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```plaintext
target remote :3333
mon reset halt
flushregs

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
c
```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:
   ```plaintext
   xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>
   ```
5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script:
   ```plaintext
   $IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b
   </path/to/program/elf> /tmp/heap.svdat
   ```

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '[/tmp/heap.svdat]'...

[0.002244575] HEAP: Allocated 1 bytes @ 0x3ffaffd8 from task "alloc" on core 0 by:

(continues on next page)
Heap Tracing To Find Heap Corruption  Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact  Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks  Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- `components/heap/include/esp_heap_trace.h`
Functions

*esp_err_t heap_trace_init_standalone (heap_trace_record_t *record_buffer, size_t num_records)*

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);`

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**Parameters**

- `record_buffer`: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- `num_records`: Size of the heap trace buffer, as number of record structures.

*esp_err_t heap_trace_init_tohost (void)*

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Return**

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

*esp_err_t heap_trace_start (heap_trace_mode_t mode)*

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

**Note** heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

**Note** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

**Parameters**

- `mode`: Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

*esp_err_t heap_trace_stop (void)*

Stop heap tracing.

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped..

*esp_err_t heap_trace_resume (void)*

Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

*size_t heap_trace_get_count (void)*

Return number of records in the heap trace buffer.
It is safe to call this function while heap tracing is running.

```c
esp_err_t heap_trace_get (size_t index, heap_trace_record_t *record)
```

Return a raw record from the heap trace buffer.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

**Parameters**
- `index`: Index (zero-based) of the record to return.
- `[out] record`: Record where the heap trace record will be copied.

void `heap_trace_dump` (void)

Dump heap trace record data to stdout.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

**Structures**

```c
struct heap_trace_record_t
```

Trace record data type. Stores information about an allocated region of memory.

**Public Members**

- `uint32_t ccount`
  
  CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

- `void *address`
  
  Address which was allocated.

- `size_t size`
  
  Size of the allocation.

- `void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]`
  
  Call stack of the caller which allocated the memory.

- `void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]`
  
  Call stack of the caller which freed the memory (all zero if not freed.)

**Macros**

`CONFIG_HEAP_TRACING_STACK_DEPTH`

**Enumerations**

```c
enum heap_trace_mode_t
```

**Values**

- **HEAP_TRACE_ALL**
- **HEAP_TRACE_LEAKS**

### 2.10.13 High Resolution Timer

**Overview**

Although FreeRTOS provides software timers, these timers have a few limitations:
• Maximum resolution is equal to RTOS tick period
• Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the `CONFIG_ESPTIMER_INTERRUPT_LEVEL` option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

`esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, `esp_timer` uses a 64-bit hardware timer, where the implementation depends on the target. LAC timer is used for ESP32.

Timer callbacks can be dispatched by two methods:
• `ESP_TIMER_TASK`
• `ESP_TIMER_ISR`. Available only if `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD` is enabled (by default disabled).

`ESP_TIMER_TASK`. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if an SPI Flash operation is in progress.

`ESP_TIMER_ISR`. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

**Using `esp_timer` APIs**

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

• To create a timer, call `esp_timer_create()`.
• To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

• To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
• To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.
Chapter 2. API Reference

Callback functions

Note: Keep the callback functions as short as possible otherwise it will affect all timers.

Timer callbacks which are processed by ESP_TIMER_ISR method should not call the context switch call - portYIELD_FROM_ISR(), instead of this you should use the esp_timer_isr_dispatch_need_yield() function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

esp_timer during the light sleep

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling esp_timer_stop() before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the skip_unhandled_events option during esp_timer_create(). When the skip_unhandled_events is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the skip_unhandled_events option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with skip_unhandled_events option will not wake up the system.

Handling callbacks

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the skip_unhandled_events option was introduced to eliminate this behavior. If skip_unhandled_events is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

Obtaining Current Time

esp_timer also provides a convenience function to obtain the time passed since start-up, with microsecond precision: esp_timer_get_time(). This function returns the number of microseconds since esp_timer was initialized, which usually happens shortly before app_main function is called.

Unlike gettimeofday function, values returned by esp_timer_get_time():

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of esp_timer APIs: system/esp_timer.

API Reference

Header File
Chapter 2. API Reference

- components/esp_timer/include/esp_timer.h

Functions

**esp_err_t esp_timer_early_init (void)**

Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

**Note** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

**Return**

- ESP_OK on success

**esp_err_t esp_timer_init (void)**

Initialize esp_timer library.

**Note** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

**esp_err_t esp_timer_deinit (void)**

De-initialize esp_timer library.

**Note** Normally this function should not be called from applications

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

**esp_err_t esp_timer_create (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)**

Create an esp_timer instance.

**Note** When done using the timer, delete it with esp_timer_delete function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

**Parameters**

- create_args: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- [out] out_handle: Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

**esp_err_t esp_timer_start_once (esp_timer_handle_t timer, uint64_t timeout_us)**

Start one-shot timer.

Timer should not be running when this function is called.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**Parameters**

- timer: timer handle created using esp_timer_create
- timeout_us: timer timeout, in microseconds relative to the current moment
**esp_err_t esp_timer_start_periodic** *(esp_timer_handle_t timer, uint64_t period)*

Start a periodic timer.

- Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**Parameters**
- timer: timer handle created using esp_timer_create
- period: timer period, in microseconds

**esp_err_t esp_timer_stop** *(esp_timer_handle_t timer)*

Stop the timer.

- This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

**Parameters**
- timer: timer handle created using esp_timer_create

**esp_err_t esp_timer_delete** *(esp_timer_handle_t timer)*

Delete an esp_timer instance.

- The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

**Parameters**
- timer: timer handle allocated using esp_timer_create

**int64_t esp_timer_get_time** *(void)*

Get time in microseconds since boot.

**Return** number of microseconds since underlying timer has been started

**int64_t esp_timer_get_next_alarm** *(void)*

Get the timestamp when the next timeout is expected to occur.

**Return** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

**int64_t esp_timer_get_next_alarm_for_wake_up** *(void)*

Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

**Return** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

**esp_err_t esp_timer_get_period** *(esp_timer_handle_t timer, uint64_t *period)*

Get the period of a timer.

- This function fetches the timeout period of a timer.

**Note** The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

**Parameters**
- timer: timer handle allocated using esp_timer_create
- period: memory to store the timer period value in microseconds
Chapter 2. API Reference

*esp_err_t* esp_timer_get_expiry_time (*esp_timer_handle_t* timer, uint64_t* expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

**Note** This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

**Parameters**
- `timer`: timer handle allocated using esp_timer_create
- `expiry`: memory to store the timeout value in microseconds

*esp_err_t* esp_timer_dump (*FILE* *stream*)

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times_armed times_triggered total_callback_run_time

where:

name — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period — period of timer, in microseconds, or 0 for one-shot timer alarm — time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

times_armed — number of times the timer was armed via esp_timer_start_X times_triggered — number of times the callback was called total_callback_run_time — total time taken by callback to execute, across all calls

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

**Parameters**
- `stream`: stream (such as stdout) to dump the information to

void esp_timer_isr_dispatch_need_yield (void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

bool esp_timer_is_active (*esp_timer_handle_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Return**
- 1 if timer is still active
- 0 if timer is not active.

**Parameters**
- `timer`: timer handle created using esp_timer_create

**Structures**

struct esp_timer_create_args_t

Timer configuration passed to esp_timer_create.
Public Members

*esp_timer_cb_t* **callback**
Function to call when timer expires.

*void* **arg**
Argument to pass to the callback.

*esp_timer_dispatch_t* **dispatch_method**
Call the callback from task or from ISR.

*const char* **name**
Timer name, used in esp_timer_dump function.

*bool* **skip_unhandled_events**
Skip unhandled events for periodic timers.

Type Definitions

typedef struct esp_timer *esp_timer_handle_t
Opaque type representing a single esp_timer.

typedef void(*esp_timer_cb_t)(void *arg)
Timer callback function type.

Parameters
- *arg: pointer to opaque user-specific data*

Enumerations

enum esp_timer_dispatch_t
Method for dispatching timer callback.

Values:

- **ESP_TIMER_TASK**
  Callback is called from timer task.

- **ESP_TIMER_MAX**
  Count of the methods for dispatching timer callback.

2.10.14 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

API Reference

Header File

- components/esp_rom/include/esp_rom_sys.h

Functions

int esp_rom_printf(const char *fmt, ...)
Print formatted string to console device.

Note: float and long long data are not supported!

Return: int: Total number of characters written on success; A negative number on failure.

Parameters
- *fmt: Format string*
- ...: Additional arguments, depending on the format string

void esp_rom_delay_us(uint32_t us)
Pauses execution for us microseconds.
Parameters

• **us**: Number of microseconds to pause

```c
void esp_rom_install_channel_putchar(int channel, void (*putc)) char c
```

esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

**Parameters**

• **channel**: Channel number (starting from 1)
• **putc**: Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

```c
void esp_rom_install_UART_putchar(void)
```

Install UART1 as the default console channel, equivalent to `esp_rom_install_channel_putchar(1, esp_rom_UART_putchar)`

```c
soc_reason_t esp_rom_get_reset_reason(int cpu_no)
```

Get reset reason of CPU.

**Return**
Reset reason code (see in soc/reset_reasons.h)

**Parameters**

• **cpu_no**: CPU number

```c
void esp_rom_route_intr_matrix(int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)
```

Route peripheral interrupt source to CPU’s interrupt port by matrix.

Usually there are 4 steps to use an interrupt:

1. Route peripheral interrupt source to CPU. e.g. `esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)`
2. Set interrupt handler for CPU
3. Enable CPU interrupt
4. Enable peripheral interrupt

**Parameters**

• **cpu_core**: The CPU number, which the peripheral interrupt will inform to
• **periph_intr_id**: The peripheral interrupt source number
• **cpu_intr_num**: The CPU interrupt number

```c
uint32_t esp_rom_get_cpu_ticks_per_us(void)
```

Get the real CPU ticks per us.

**Return**
CPU ticks per us

### 2.10.15 Inter-Processor Call

**Note**: The IPC is an **Inter-Processor Call** and **NOT Inter-Process Communication** as found on other operating systems.

**Overview**

Due to the dual core nature of the ESP32, there are instances where a certain callback must be run in the context of a particular CPU such as:

• When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU’s interrupt source as well).
• On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
• Reading the registers/state of another CPU.
The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see High-Level Interrupts for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

**IPC in Task Context**

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU’s IPC task.

When using IPCs in a task context, users need to consider the following:

- **IPC callbacks should ideally be simple and short.** The callback should avoid attempting to block or yield.
- **The IPC tasks are created at the highest possible priority (i.e., configMAX_PRIORITIES - 1) thus the callback should also run at that priority as a result.** However, CONFIG_ESP_IPC_USES_CALLERS_PRIORITY is enabled by default which will temporarily lower the priority of the target CPU’s IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via CONFIG_ESP_IPC_TASK_STACK_SIZE.
- **The IPC feature is internally protected by a mutex.** Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

**API Usage**  
Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`.
- The callback should avoid attempting to block or yield as this will result in the target CPU’s IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling vTaskPrioritySet(NULL, x)).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback’s execution has completed, or return immediately once the callback’s execution has started.

- **esp_ipc_call()** will trigger an IPC call on the target CPU. This function will block until the target CPU’s IPC task begins execution of the callback.
- **esp_ipc_call_blocking()** will trigger an IPC on the target CPU. This function will block until the target CPU’s IPC task completes execution of the callback.

**IPC in ISR Context**

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a High Priority Interrupt context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL option.
- **When the callback executes:**
  - The calling CPU will disable interrupts of level 3 and lower
Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

### API Usage

High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
- The callback is invoked via the `CALLX0` instruction with register windowing disabled, thus the callback:
  - Must not call any register window related instructions (e.g., `entry` and `retw`).
  - Must not call other C functions as register windowing is disabled
- The callback should be placed in IRAM at a 4-byte aligned address
- (On invocation of/after returning from) the callback, the registers `a2`, `a3`, `a4` are (saved/restored) automatically thus:
  - `a2` will contain the `void *arg` of the callback
  - `a3/a4` are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU’s cycle count.

```assembly
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret

unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void *)cycle_count);
```

**Note:** The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the `system/ipc/ipc_isr`.

**Note:** For more examples of High Priority Interrupt IPC callbacks, see `components/esp_system/port/arch/xtensa/esp_ipc_isr_routines.S` and `components/esp_system/test/test_ipc_isr.S`

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU
will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.
- `esp_ipc_isr_release_other_cpu()` resumes the target CPU.

**API Reference**

**Header File**
- `components/esp_system/include/esp_ipc.h`

**Functions**

- `esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`
  Execute a callback on a given CPU.

  Execute a given callback on a particular CPU. The callback must be of type `esp_ipc_func_t` and will be invoked in the context of the target CPU’s IPC task.

  - This function will block the target CPU’s IPC task has begun execution of the callback
  - If another IPC call is ongoing, this function will block until the ongoing IPC call completes
  - The stack size of the IPC task can be configured via the CONFIG_ESP_IPC_TASK_STACK_SIZE option

  **Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

  **Return**
  - ESP_ERR_INVALID_ARG if cpu_id is invalid
  - ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
  - ESP_OK otherwise

  **Parameters**
  - `[in] cpu_id`: CPU where the given function should be executed (0 or 1)
  - `[in] func`: Pointer to a function of type `void func(void* arg)` to be executed
  - `[in] arg`: Arbitrary argument of type `void*` to be passed into the function

- `esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`
  Execute a callback on a given CPU until and block until it completes.

  This function is identical to esp_ipc_call() except that this function will block until the execution of the callback completes.

  **Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

  **Return**
  - ESP_ERR_INVALID_ARG if cpu_id is invalid
  - ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
  - ESP_OK otherwise

  **Parameters**
  - `[in] cpu_id`: CPU where the given function should be executed (0 or 1)
  - `[in] func`: Pointer to a function of type `void func(void* arg)` to be executed
  - `[in] arg`: Arbitrary argument of type `void*` to be passed into the function

**Type Definitions**

- `typedef void (*esp_ipc_func_t)(void *arg)`
  IPC Callback.

  A callback of this type should be provided as an argument when calling esp_ipc_call() or esp_ipc_call_blocking().

**Header File**
- `components/esp_system/include/esp_ipc_isr.h`
Functions

```c
void esp_ipc_isr_asm_call(esp_ipc_isr_func_t func, void *arg)
```
Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

**Note** This function is not available in single-core mode.

**Parameters**
- `[in] func`: Pointer to a function of type void func(void* arg) to be executed
- `[in] arg`: Arbitrary argument of type void* to be passed into the function

```c
void esp_ipc_isr_asm_call_blocking(esp_ipc_isr_func_t func, void *arg)
```
Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

**Note** This function is not available in single-core mode.

**Parameters**
- `[in] func`: Pointer to a function of type void func(void* arg) to be executed
- `[in] arg`: Arbitrary argument of type void* to be passed into the function

```c
void esp_ipc_isr_stall_other_cpu(void)
```
Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

- This function is internally implemented using IPC ISR
- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

**Note** This function is not available in single-core mode.

```c
void esp_ipc_isr_release_other_cpu(void)
```
Release the other CPU.

This function will release the other CPU that was previously stalled from calling esp_ipc_isr_stall_other_cpu()

- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

**Note** This function is not available in single-core mode.

```c
void esp_ipc_isr_stall_pause(void)
```
Pause the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

```c
void esp_ipc_isr_stall_abort(void)
```
Abort a CPU stall.

This function will abort any stalling routine of the other CPU due to a pervious call to esp_ipc_isr_stall_other_cpu(). This function aborts the stall in a non-recoverable manner, thus should only be called in case of a panic().

- This function is used in panic handling code

```c
void esp_ipc_isr_stall_resume(void)
```
Resume the CPU stall feature.
This function will resume the CPU stall feature that was previously paused by calling esp_ipc_isr_stall_pause(). Once resumed, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have effect again.

**Type Definitions**

```c
typedef void (*esp_ipc_isr_func_t)(void *arg)
```

IPC ISR Callback.

A callback of this type should be provided as an argument when calling esp_ipc_isr_asm_call() or esp_ipc_isr_asm_call_blocking().

## 2.10.16 Interrupt allocation

**Overview**

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The `esp_intr_alloc()` abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling `esp_intr_alloc()` (or `esp_intr_alloc_intrstatus()`). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc()` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let’s say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB’s ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

**Multicore issues**

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

**Internal peripheral interrupts** Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.
Internal interrupt sources are defined in `esp_intr_alloc.h` as `ETS_INTERNAL_*_INTR_SOURCE`. These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc()` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts** The remaining interrupt sources are from external peripherals. These are defined in `soc/soc.h` as `ETS_*_INTR_SOURCE`.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

**IRAM-Safe Interrupt Handlers**

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses. Refer to the SPI flash API documentation for more details.

**Multiple Handlers Sharing A Source**

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist two ways to stop an interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt. Please note that leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.
API Reference

Header File

- components/esp_hw_support/include/esp_intr_alloc.h

Functions

```c
esp_err_t esp_intr_mark_shared(int intno, int cpu, bool is_in_iram)
```
Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- **intno**: The number of the interrupt (0-31)
- **cpu**: CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram**: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

```c
esp_err_t esp_intr_reserve(int intno, int cpu)
```
Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- **intno**: The number of the interrupt (0-31)
- **cpu**: CPU on which the interrupt should be marked as shared (0 or 1)

```c
esp_err_t esp_intr_alloc(int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)
```
Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**Parameters**

- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAGINTRDISABLED will return from this function with the interrupt disabled.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’ t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_alloc_intrstatus(int source, int flags, uint32_t intrstatusreg, uint32_t intrstatu
```
This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Return**
ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND if no free interrupt found with the specified flags ESP_OK otherwise.

**Parameters**
- `source`: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- `flags`: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- `intrstatusreg`: The address of an interrupt status register
- `intrstatusmask`: A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- `handler`: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- `arg`: Optional argument for passed to the interrupt handler
- `ret_handle`: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_free(intr_handle_t handle)
```
Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. See esp_intr_disable for more details. Please do not call this function in esp_ipc_call_blocking.

**Return**
ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise.

**Parameters**
- `handle`: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_cpu(intr_handle_t handle)
```
Get CPU number an interrupt is tied to.

**Return**
The core number where the interrupt is allocated

**Parameters**
- `handle`: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_intno(intr_handle_t handle)
```
Get the allocated interrupt for a certain handle.

**Return**
The interrupt number

**Parameters**
- `handle`: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
esp_err_t esp_intr_disable(intr_handle_t handle)
```
Disable the interrupt associated with the handle.

**Note**
1. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts.
properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters
- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_enable (intr_handle_t handle)
Enable the interrupt associated with the handle.

Note For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters
- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_set_in_iram (intr_handle_t handle, bool is_in_iram)
Set the “in IRAM” status of the handler.

Note Does not work on shared interrupts.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters
- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- is_in_iram: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

void esp_intr_noniram_disable (void)
Disable interrupts that aren’t specifically marked as running from IRAM.

void esp_intr_noniram_enable (void)
Re-enable interrupts disabled by esp_intr_noniram_disable.

void esp_intr_enable_source (int inum)
enable the interrupt source based on its number

Parameters
- inum: interrupt number from 0 to 31

void esp_intr_disable_source (int inum)
disable the interrupt source based on its number

Parameters
- inum: interrupt number from 0 to 31

static int esp_intr_flags_to_level (int flags)
Get the lowest interrupt level from the flags.

Parameters
- flags: The same flags that pass to esp_intr_alloc_intrstatus API

Macros

ESP_INTR_FLAG_LEVEL1
Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4
Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5
Accept a Level 5 interrupt vector.
Chapter 2. API Reference

ESP_INTR_FLAG_LEVEL6
Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI
Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
Low and medium priority interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are
routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do
not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the
functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE
Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE
Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)
Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)
Disable interrupt by interrupt number

Type Definitions
typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function
typedef struct intr_handle_data_t intr_handle_data_t
Interrupt handler associated data structure
typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler
2.10.17 Logging library

Overview

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note**: The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char *TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. `ESP_DRAM_LOGE`. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**Note**: Inside critical sections interrupts are disabled so it’s only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.
To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g.:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_...VERBOSE")
```

To configure logging output per module at runtime, add calls to the function esp_log_level_set() as follows:

```c
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling esp_log_level("*", level).

**Logging to Host via JTAG** By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

**Application Example**

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- `system/ota`
- `storage/sd_card`
- `protocols/https_request`

**API Reference**

**Header File**

- `components/log/include/esp_log.h`

**Functions**

`void esp_log_level_set(const char *tag, esp_log_level_t level)`

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Note** Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

**Parameters**

- `tag`: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- `level`: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`esp_log_level_t esp_log_level_get(const char *tag)`

Get log level for a given tag, can be used to avoid expensive log statements.
Return  The current log level for the given tag

Parameters
- **tag**: Tag of the log to query current level. Must be a non-NULL zero terminated string.

```c
vprintf_like_t esp_log_set_vprintf (vprintf_like_t func)
```

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Note**  Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

Return  func old Function used for output.

Parameters
- **func**: new Function used for output. Must have same signature as vprintf.

```c
uint32_t esp_log_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler starts running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

Return  timestamp, in milliseconds

```c
char *esp_log_system_timestamp (void)
```

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

Return  timestamp, in “HH:MM:SS.sss”

```c
uint32_t esp_log_early_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

Return  timestamp, in milliseconds

```c
void esp_log_write (esp_log_level_t level, const char *tag, const char *format, ...)
```

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

```c
void esp_log_writev (esp_log_level_t level, const char *tag, const char *format, va_list args)
```

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See  esp_log_write()

**Macros**

```c
ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)
```

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.
Parameters

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOGBUFFER_CHAR (tag, buffer, buff_len, level)**

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

Parameters

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOGBUFFER_HEX (tag, buffer, buff_len, level)**

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```
ESP_LOG_BUFFER_HEX
```

It is highly recommended to use terminals with over 102 text width.

Parameters

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOGBUFFER_HEX逻**

Log a buffer of hex bytes at Info level.

See esp_log_buffer_hex_level

Parameters

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes

**ESP_LOGBUFFER_CHAR_LOG**

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See esp_log_buffer_char_level

Parameters

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes

**ESP_EARLY_LOGE (tag, format, ...)**

Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See printf, ESP_LOGE, ESP_DRAM_LOGE

In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension ##__VA_ARGS__. The second one is using the C++20 feature VA_OPT(). This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using ##__VA_ARGS__.
ESP_EARLY_LOGW (tag, format, ...)  
macro to output logs in startup code at ESP_LOG_WARN level.
See ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGI (tag, format, ...)  
macro to output logs in startup code at ESP_LOG_INFO level.
See ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGD (tag, format, ...)  
macro to output logs in startup code at ESP_LOG_DEBUG level.
See ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGV (tag, format, ...)  
macro to output logs in startup code at ESP_LOG_VERBOSE level.
See ESP_EARLY_LOGE, ESP_LOGE, printf

_ESP_LOG_EARLY_ENABLED (log_level)

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)

ESP_LOGW (tag, format, ...)

ESP_LOGI (tag, format, ...)

ESP_LOGD (tag, format, ...)

ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)
runtime macro to output logs at a specified level.
See printf

Parameters
• tag: tag of the log, which can be used to change the log level by esp_log_level_set at runtime.
• level: level of the output log.
• format: format of the output log. See printf
• ...: variables to be replaced into the log. See printf

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)
runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.
See printf, ESP_LOG_LEVEL

ESP_DRAM_LOGE (tag, format, ...)
Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage: ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, “format”, ...), where TAG is a char* that points to a str in the DRAM.

Note Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.
See ESP_EARLY_LOGE, the log level cannot be changed per-tag, however esp_log_level_set( “*”, level) will set the default level which controls these log lines also.

Note Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.
See esp_rom_printf, ESP_LOGE

ESP_DRAM_LOGW (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_WARN level.
See ESP_DRAM_LOGW, ESP_LOGW, esp_rom_printf
Chapter 2. API Reference

**ESP_DRAM_LOGI** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_INFO level.

**ESP_DRAM_LOGD** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

**ESP_DRAM_LOGV** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

### 2.10.18 Miscellaneous System APIs

#### Software Reset

To perform software reset of the chip, the `esp_restart()` function is provided. When the function is called, execution of the program stops, both CPUs are reset, and the application is loaded by the bootloader and starts execution again.

Additionally, the `esp_register_shutdown_handler()` function can register a routine that will be automatically called before a restart (that is triggered by `esp_restart()`) occurs. This is similar to the functionality of `atexit` POSIX function.

#### Reset Reason

ESP-IDF applications can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.
Heap Memory

Two heap-memory-related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory.
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that has ever been available (i.e., the smallest size of free heap memory in the applications lifetime).

Note that ESP-IDF supports multiple heaps with different capabilities. The functions mentioned in this section return the size of heap memory that can be allocated using the `malloc` family of functions. For further information about heap memory, see *Heap Memory Allocation*.

MAC Address

These APIs allow querying and customizing MAC addresses for different supported network interfaces (e.g., Wi-Fi, Bluetooth, Ethernet).

To fetch the MAC address for a specific network interface (e.g., Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()`.

In ESP-IDF, the MAC addresses for the various network interfaces are calculated from a single *base MAC address*. By default, the Espressif base MAC address is used. This base MAC address is pre-programmed into the ESP32 eFuse in the factory during production.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address (4 universally administered, default)</th>
<th>MAC Address (2 universally administered)</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Bluetooth</td>
<td>base_mac</td>
<td>Local MAC (derived from Bluetooth MAC)</td>
</tr>
<tr>
<td>Ethernet</td>
<td>base_mac, +3 to the last octet</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The *configuration* configures the number of universally administered MAC addresses that are provided by Espressif.

**Custom Base MAC** The default base MAC is pre-programmed by Espressif in eFuse BLK0. To set a custom base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The custom MAC address can be stored in any supported storage device (e.g., flash, NVS).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Based on the table above, users can configure the option `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC.

**Note:** It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface after network initialization. But it is recommended to use the base MAC approach documented here to avoid the possibility of the original MAC address briefly appearing on the network before being changed.

**Custom MAC Address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others — valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

**Note:** If the 3/4 coding scheme is enabled, all eFuse fields in this block must be burnt at the same time.

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Local vs Universal MAC Addresses** ESP32 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The table above shows how to calculate and derive the MAC address for a specific interface according to the base MAC address.

When using a custom MAC address scheme, it is possible that not all interfaces can be assigned with a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network only.

See this article for the definition of locally and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (i.e., the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

**Chip Version**

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

**SDK Version**

`esp_get_idf_version()` returns a string describing the ESP-IDF version which is used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on the ESP-IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

  ```c
  #include "esp_idf_version.h"
  
  #if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in ESP-IDF v4.0
  #endif
  ```

**App Version**

The application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and
esp_image_segment_header_t structures. The type of the field version is string and it has a maximum length of 32 chars.

To set the version in your project manually, you need to set the PROJECT_VER variable in the CMakeLists.txt of your project. In application CMakeLists.txt put set (PROJECT_VER "0.1.0.1") before including project.cmake.

If the CONFIG_APP_PROJECT_VER_FROM_CONFIG option is set, the value of CONFIG_APP_PROJECT_VER will be used. Otherwise, if the PROJECT_VER variable is not set in the project, it will be retrieved either from the $(PROJECT_PATH)/version.txt file (if present) or using git command git describe. If neither is available, PROJECT_VER will be set to “1”. Application can make use of this by calling esp_ota_get_app_description() or esp_ota_get_partition_description() functions.

API Reference

Header File

- components/esp_system/include/esp_system.h

Functions

esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

Parameters

- handle: function to execute on restart

esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

void esp_restart (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

esp_reset_reason_t esp_reset_reason (void)

Get reason of last reset.

Return See description of esp_reset_reason_t for explanation of each value.

uint32_t esp_get_free_heap_size (void)

Get the size of available heap.

Note Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Return Available heap size, in bytes.

uint32_t esp_get_free_internal_heap_size (void)

Get the size of available internal heap.

Note Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Return Available internal heap size, in bytes.
uint32_t esp_get_mininum_free_heap_size (void)
    Get the minimum heap that has ever been available.

Return Minimum free heap ever available

void esp_system_abort (const char *details)
    Trigger a software abort.

Parameters
    • details: Details that will be displayed during panic handling.

Type Definitions
typedef void (*shutdown_handler_t) (void)
    Shutdown handler type

Enumerations
eenum esp_reset_reason_t
    Reset reasons.

Values:

ESP_RST_UNKNOWN
    Reset reason can not be determined.

ESP_RST_POWERON
    Reset due to power-on event.

ESP_RST_EXT
    Reset by external pin (not applicable for ESP32)

ESP_RST_SW
    Software reset via esp_restart.

ESP_RST_PANIC
    Software reset due to exception/panic.

ESP_RST_INT_WDT
    Reset (software or hardware) due to interrupt watchdog.

ESP_RST_TASK_WDT
    Reset due to task watchdog.

ESP_RST_WDT
    Reset due to other watchdogs.

ESP_RST_DEEPSLEEP
    Reset after exiting deep sleep mode.

ESP_RST_BROWNOUT
    Brownout reset (software or hardware)

ESP_RST_SDIO
    Reset over SDIO.

Header File
    • components/esp_common/include/esp_idf_version.h

Functions
const char *esp_get_idf_version (void)
    Return full IDF version string, same as ‘git describe’ output.
Note If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

Return constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR
Major version number (X.x.x)

ESP_IDF_VERSION_MINOR
Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH
Patch version number (x.x.X)

ESP_IDF_VERSION_VAL (major, minor, patch)
Macro to convert IDF version number into an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

ESP_IDF_VERSION
Current IDF version, as an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

Header File

- components/esp_hw_support/include/esp_mac.h

Functions

esp_err_t esp_base_mac_addr_set (const uint8_t *mac)
Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

Note Base MAC must be a unicast MAC (least significant bit of first byte must be zero).
Note If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions.

Return ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

Parameters

- mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI64 (used for IEEE 802.15.4)

esp_err_t esp_base_mac_addr_get (uint8_t *mac)
Return base MAC address which is set using esp_base_mac_addr_set.

Note If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

Return ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC base MAC address has not been set

Parameters

- mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI64 (used for IEEE 802.15.4)

esp_err_t esp_efuse_mac_get_custom (uint8_t *mac)
Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.
Chapter 2. API Reference

Note This function is currently only supported on ESP32.

Return ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set, all zeros (for esp32-xx) ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32) ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

Parameters

• mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

\texttt{esp_err_t esp_efuse_mac_get_default (uint8_t \*mac)}

Return base MAC address which is factory-programmed by Espressif in EFUSE.

Return ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

Parameters

• mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

\texttt{esp_err_t esp_read_mac (uint8_t \*mac, esp_mac_type_t type)}

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using esp_base_mac_addr_get(). Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

Return ESP_OK on success

Parameters

• mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

• type: Type of MAC address to return

\texttt{esp_err_t esp_derive_local_mac (uint8_t \*local_mac, const uint8_t \*universal_mac)}

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the “locally administered” bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

Return ESP_OK on success

Parameters

• mac: base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

• universal_mac: Source universal MAC address, length: 6 bytes.

Macros

MACSTR

Enumerations

\texttt{enum esp_mac_type_t}

Values:

ESP_MAC_WIFI_STA

ESP_MAC_WIFI_SOFTAP

ESP_MAC_BT

ESP_MAC_ETH

ESP_MAC_IEEE802154
Header File

- components/esp_hw_support/include/esp_chip_info.h

Functions

```c
void esp_chip_info(esp_chip_info_t *out_info)
```

Fill an `esp_chip_info_t` structure with information about the chip.

**Parameters**

- `[out]` `out_info`: structure to be filled

Structures

```c
struct esp_chip_info_t
```

The structure represents information about the chip.

Public Members

```c
esp_chip_model_t model
```

chip model, one of `esp_chip_model_t`

```c
uint32_t features
```

bit mask of `CHIP_FEATURE_x` feature flags

```c
uint8_t cores
```

number of CPU cores

```c
uint8_t revision
```

chip revision number

Macros

- `CHIP_FEATURE_EMB_FLASH`
  Chip has embedded flash memory.

- `CHIP_FEATURE_WIFI_BGN`
  Chip has 2.4GHz WiFi.

- `CHIP_FEATURE_BLE`
  Chip has Bluetooth LE.

- `CHIP_FEATURE_BT`
  Chip has Bluetooth Classic.

- `CHIP_FEATURE_IEEE802154`
  Chip has IEEE 802.15.4.

- `CHIP_FEATURE_EMB_PSRAM`
  Chip has embedded psram.

Enumerations

```c
enum esp_chip_model_t
```

Chip models.

**Values:**

- `CHIP_ESP32 = 1`
  ESP32.

- `CHIP_ESP32S2 = 2`
  ESP32-S2.

- `CHIP_ESP32S3 = 9`
  ESP32-S3.
CHIP_ESP32C3 = 5
ESP32-C3.

CHIP_ESP32H2 = 6
ESP32-H2.

CHIP_ESP32C2 = 12
ESP32-C2.

Header File

- components/esp_hw_support/include/esp_cpu.h

Functions

static void *esp_cpu_get_sp (void)
Read current stack pointer address.

void esp_cpu_stall (int cpu_id)
Stall CPU using RTC controller.

Parameters

- cpu_id: ID of the CPU to stall (0 = PRO, 1 = APP)

void esp_cpu_unstall (int cpu_id)
Un-stall CPU using RTC controller.

Parameters

- cpu_id: ID of the CPU to un-stall (0 = PRO, 1 = APP)

void esp_cpu_reset (int cpu_id)
Reset CPU using RTC controller.

Parameters

- cpu_id: ID of the CPU to reset (0 = PRO, 1 = APP)

bool esp_cpu_in_ocd_debug_mode (void)
Returns true if a JTAG debugger is attached to CPU OCD (on chip debug) port.

Note If “Make exception and panic handlers JTAG/OCD aware” is disabled, this function always returns false.

static esp_cpuccount_t esp_cpu_get_ccount (void)

static void esp_cpu_set_ccount (esp_cpuccount_t val)

void esp_cpu_configure_region_protection (void)
Configure CPU to disable access to invalid memory regions.

esp_err_t esp_cpu_set_watchpoint (int no, void *adr, int size, int flags)
Set a watchpoint to break/panic when a certain memory range is accessed.

Return ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

Warning The ESP32 watchpoint hardware watches a region of bytes by effectively masking away the lower n bits for a region with size 2^n. If adr does not have zero for these lower n bits, you may not be watching the region you intended.

Parameters

- no: Watchpoint number. On the ESP32, this can be 0 or 1.
- adr: Base address to watch
- size: Size of the region, starting at the base address, to watch. Must be one of 2^n, with n in [0..6].
- flags: One of ESP_CPU_WATCHPOINT_* flags

void esp_cpu_clear_watchpoint (int no)
Clear a watchpoint.

Parameters

- no: Watchpoint to clear

2.10.19 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the Partition Table of the device with at least two “OTA app slot” partitions (i.e. ota_0 and ota_1) and an “OTA Data Partition”.

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

OTA Data Partition

An OTA data partition (type data, subtype ota) must be included in the Partition Table of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the partition table. If no factory app is included in the partition table, the first available OTA slot (usually ota_0) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, esp_ota_mark_app_valid_cancel_rollback() marks the running application with the state ESP_OTA_IMG_VALID. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, esp_ota_mark_app_invalid_rollback_and_reboot() marks the running application with the state ESP_OTA_IMG_INVALID and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application but rather to the ota data partition. The partition contains a ota_seq counter which is a pointer to the slot (ota_0, ota_1, …) from which the application will be selected for boot.
### App OTA State
States control the process of selecting a boot app:

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
</table>
| ESP_OTA_IMG_VALID    | No restriction. Will be selected.
| ESP_OTA_IMG_UNDEFINED| No restriction. Will be selected.
| ESP_OTA_IMG_INVALID  | Will not be selected.
| ESP_OTA_IMG_ABORTED  | Will not be selected.
| ESP_OTA_IMG_NEW      | If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.
| ESP_OTA_IMG_PENDING_VERIFY | If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will not be selected, and the state will change to ESP_OTA_IMG_ABORTED. |

If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING_VERIFY states are not used.

An option in Kconfig CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

### Rollback Process
The description of the rollback process when CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled:

- The new application is successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state ESP_OTA_IMG_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the ESP_OTA_IMG_PENDING_VERIFY state if it is set, then it will be written to ESP_OTA_IMG_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED.
- The bootloader checks the selected application for ESP_OTA_IMG_NEW state if it is set, then it will be written to ESP_OTA_IMG_PENDING_VERIFY. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous working application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED. That will prevent re-boot of this application. There will be a rollback to the previous working application.

### Unexpected Reset
If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.
Booting invalid/aborted apps  Booting an application which was previously set to ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED is possible:

- Get the last invalid application partition esp_ota_get_last_invalid_partition().
- Pass the received partition to esp_ota_set_boot_partition(), this will update the odata.
- Restart esp_restart(). The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the esp_ota_get_state_partition() function. If result is ESP_OTA_IMG_PENDING_VERIFY then self-testing and subsequent confirmation of operability is required.

Where the states are set  A brief description of where the states are set:

- ESP_OTA_IMG_VALID state is set by esp_ota_mark_app_valid_cancel_rollback() function.
- ESP_OTA_IMG_UNDEFINED state is set by esp_ota_set_boot_partition() function if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is not enabled.
- ESP_OTA_IMG_NEW state is set by esp_ota_set_boot_partition() function if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled.
- ESP_OTA_IMG_INVALID state is set by esp_ota_mark_app_invalid_rollback_and_reboot() function.
- ESP_OTA_IMG_ABORTED state is set if there was no confirmation of the application operability and occurs reboots (if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled).
- ESP_OTA_IMG_PENDING_VERIFY state is set in a bootloader if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled and selected app has ESP_OTA_IMG_NEW state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK and CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function esp_ota_set_boot_partition(). If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If odata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call esp_ota_mark_app_valid_cancel_rollback() function to mark the running application with the ESP_OTA_IMG_VALID state and update the secure version on chip. Note that if was called esp_ota_mark_app_invalid_rollback_and_reboot() function a rollback may not happen as the device may not have any bootable apps. It will then return ESP_ERR_OTA_ROLLBACK_FAILED error and stay in the ESP_OTA_IMG_PENDING_VERIFY state.
- The next update of app is possible if a running app is in the ESP_OTA_IMG_VALID state.
Chapter 2. API Reference

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than the running app, you have to get new_app_info.secure_version from the first package of an image and compare it with the secure version of efuse. Use esp_efuse_check_secure_version(new_app_info. secure_version) function if it is true then continue downloading otherwise abort.

```c
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }
            }
        }
        image_header_was_checked = true;
        esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
    }
    esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
}
```

Restrictions:

- The number of bits in the secure_version field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field using CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option.
- Anti-rollback works only if the encoding scheme for efuse is set to NONE.
- Factory and Test partitions are not supported in anti rollback scheme and hence partition table should not have partition with SubType set to factory or test.

security_version:

- In application image it is stored in esp_app_desc structure. The number is set CONFIG_BOOTLOADER_APP_SECURE_VERSION.
- In ESP32 it is stored in efuse EFUSE_BLK3_RDATA4_REG. (when a eFuse bit is programmed to 1, it can never be reverted to 0). The number of bits set in this register is the security_version from app.

Secure OTA Updates Without Secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT and CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

For more information refer to Signed App Verification Without Hardware Secure Boot
Chapter 2. API Reference

OTA Tool (otatool.py)

The component `app_update` provides a tool `otatool.py` for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (read_otadata)
- erase otadata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

Python API

Before anything else, make sure that the `otatool` module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py__lives in $IDF_PATH/components/app_update
sys.path.append(notatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```

The starting point for using the tool’s Python API to do is create an `OttolTarget` object:

```python
# Create a partsol.py target device connected on serial port /dev/ttyUSB1
target = OttolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

Command-line Interface

The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args` - these are arguments that are needed for executing the main_
- `command` (parttool.py), mostly pertaining to the target device
- `subcommand` - this is the operation to be performed
- `subcommand-args` - these are arguments that are specific to the chosen operation
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin

More information can be obtained by specifying --help as argument:

# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help

Application Example

End-to-end example of OTA firmware update workflow: system/ota.

API Reference

Header File

- components/app_update/include/esp_ota_ops.h

Functions

- `const esp_app_desc_t*esp_ota_get_app_description(void)`
  - Return esp_app_desc structure. This structure includes app version.
  - Return description for running app.

- `esp_err_tesp_ota_begin(const esp_partition_t*partition, size_t image_size, esp_ota_handle_t*out_handle)`
  - Commence an OTA update writing to the specified partition.
  - The specified partition is erased to the specified image size.
If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

Return
- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state.

Before performing an update, the application must be valid.

Parameters
- partition: Pointer to info for partition which will receive the OTA update. Required.
- image_size: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- out_handle: On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

### esp_err_t esp_ota_write(esp_ota_handle_t handle, const void *data, size_t size)
Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Return
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

Parameters
- handle: Handle obtained from esp_ota_begin
- data: Data buffer to write
- size: Size of data buffer in bytes.

### esp_err_t esp_ota_write_with_offset(esp_ota_handle_t handle, const void *data, size_t size, uint32_t offset)
Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

Note While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non-contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write() is not recommended.

Return
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
Chapter 2. API Reference

- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**
- **handle**: Handle obtained from esp_ota_begin
- **data**: Data buffer to write
- **size**: Size of data buffer in bytes
- **offset**: Offset in flash partition

**esp_err_t esp_ota_end** (esp_ota_handle_t handle)
Finish OTA update and validate newly written app image.

**Note** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**
- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**
- **handle**: Handle obtained from esp_ota_begin().

**esp_err_t esp_ota_abort** (esp_ota_handle_t handle)
Abort OTA update, free the handle and memory associated with it.

**Return**
- ESP_OK: Handle and its associated memory is freed successfully.
- ESP_ERR_NOT_FOUND: OTA handle was not found.

**Parameters**
- **handle**: obtained from esp_ota_begin().

**esp_err_t esp_ota_set_boot_partition** (const esp_partition_t *partition)
Configure OTA data for a new boot partition.

**Note** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Return**
- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

**Parameters**
- **partition**: Pointer to info for partition containing app image to boot.

**const esp_partition_t *esp_ota_get_boot_partition** (void)
Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.
**Return** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_ota_get_running_partition (void)
```

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Return** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
```

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

**Return** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

**Parameters**

- *start_from*: If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition.

The result of this function is never the same as this argument.

```c
esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
```

Returns `esp_app_desc` structure for app partition. This structure includes app version.

**Return**

- **ESP_OK**: Successful.
- **ESP_ERR_NOT_FOUND**: `app_desc` structure is not found. Magic word is incorrect.
- **ESP_ERR_NOT_SUPPORTED**: Partition is not application.
- **ESP_ERR_INVALID_ARG**: Arguments is NULL or if partition’s offset exceeds partition size.
- **ESP_ERR_INVALID_SIZE**: Read would go out of bounds of the partition.
- One of error codes from lower-level flash driver.

**Parameters**

- [in] partition: Pointer to app partition. (only app partition)
- [out] app_desc: Structure of info about app.

```c
uint8_t esp_ota_get_app_partition_count (void)
```

Returns number of OTA partitions provided in partition table.

**Return**

- Number of OTA partitions

```c
esp_err_t esp_ota_mark_app_valid_cancel_rollback (void)
```

This function is called to indicate that the running app is working well.

**Return**

- **ESP_OK**: if successful.

```c
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot (void)
```

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.
Return

- ESP_FAIL: if not successful.
- ESP_ERR_OTA.Rollback_FAILED: The rollback is not possible due to flash does not have any apps.

```c
const esp_partition_t *esp_ota_get_last_invalid_partition(void)
```

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Return

```c
esp_err_t esp_ota_get_state_partition(const esp_partition_t *partition, esp_ota_img_states_t *ota_state)
```

Returns state for given partition.

Return

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

Parameters

- [in] partition: Pointer to partition.
- [out] ota_state: state of partition (if this partition has a record in otadata).

```c
esp_err_t esp_ota_erase_last_boot_app_partition(void)
```

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Return

- ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible(void)
```

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Return

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

Macros

- **OTA_SIZE_UNKNOWN**
  Used for esp_ota_begin() if new image size is unknown

- **OTA_WITH_SEQUENTIAL_WRITES**
  Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

- **ESP_ERR_OTA_BASE**
  Base error code for ota_ops api

- **ESP_ERR_OTA_PARTITION_CONFLICT**
  Error if request was to write or erase the current running partition

- **ESP_ERR_OTA_SELECT_INFO_INVALID**
  Error if OTA data partition contains invalid content

- **ESP_ERR_OTA_VALIDATE_FAILED**
  Error if OTA app image is invalid

- **ESP_ERR_OTA_SMALL_SEC_VER**
  Error if the firmware has a secure version less than the running firmware.

- **ESP_ERR_OTA_ROLLBACK_FAILED**
  Error if flash does not have valid firmware in passive partition and hence rollback is not possible
**Chapter 2. API Reference**

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE**
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible.

**Type Definitions**

```c
typedef uint32_t esp_ota_handle_t
```
Opaque handle for an application OTA update.

`esp_ota_begin()` returns a handle which is then used for subsequent calls to `esp_ota_write()` and `esp_ota_end()`.

**Debugging OTA Failure**

![Diagram](image)

Fig. 37: How to Debug When OTA Fails (click to enlarge)

**2.10.20 Performance Monitor**

The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

**Application Example**

An example which combines performance monitor is provided in the `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.
High level API Reference

Header Files

- perfmon/include/perfmon.h

API Reference

Header File

- components/perfmon/include/xtensa_perfmon_access.h

Functions

**esp_err_t xtensa_perfmon_init** (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)

Init Performance Monitor.

Initialize performance monitor register with define values

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

**Parameters**

- [in] id: performance counter number
- [in] select: select value from PMCTRLx register
- [in] mask: mask value from PMCTRLx register
- [in] kernelcnt: kernelcnt value from PMCTRLx register
- [in] tracelevel: tracelevel value from PMCTRLx register

**esp_err_t xtensa_perfmon_reset** (int id)

Reset PM counter.

Reset PM counter. Writes 0 to the PMX register.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

**Parameters**

- [in] id: performance counter number

**void xtensa_perfmon_start** (void)

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

**void xtensa_perfmon_stop** (void)

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

**uint32_t xtensa_perfmon_value** (int id)

Read PM counter.

Read value of defined PM counter.

**Return**

- Performance counter value

**Parameters**

- [in] id: performance counter number

**esp_err_t xtensa_perfmon_overflow** (int id)

Read PM overflow state.

Read overflow value of defined PM counter.

**Return**

- ESP_OK if there is no overflow (overflow = 0)
Chapter 2. API Reference

- ESP_FAIL if overflow occure (overflow = 1)

Parameters
- [in] id: performance counter number

void xtensa_perfmon_dump (void)
Dump PM values.
Dump all PM register to the console.

Header File
- components/perfmon/include/xtensa_perfmon_apis.h

Functions

esp_err_t xtensa_perfmon_exec (const xtensa_perfmon_config_t *config)
Execute PM.
Execute performance counter for dedicated function with defined parameters

  Return
- ESP_OK if no errors
- ESP_ERR_INVALID_ARG if one of the required parameters not defined
- ESP_FAIL - counter overflow

Parameters
- [in] config: pointer to the configuration structure

void xtensa_perfmon_view_cb (void *params, uint32_t select, uint32_t mask, uint32_t value)
Dump PM results.
Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

Parameters
- [in] params: used parameters passed from configuration (callback_params). This parameter expected as FILE* hanle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- [in] select: select value for current counter
- [in] mask: mask value for current counter
- [in] value: counter value for current counter

Structures

struct xtensa_perfmon_config
Performance monitor configuration structure.
Structure to configure performance counter to measure dedicated function

Public Members

int repeat_count
how much times function will be called before the callback will be repeated

float max_deviation
Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void *call_params
This pointer will be passed to the call_function as a parameter

void (*call_function) (void *params)
pointer to the function that have to be called

void (*callback) (void *params, uint32_t select, uint32_t mask, uint32_t value)
pointer to the function that will be called with result parameters
void *callback_params
    parameter that will be passed to the callback

int tracelevel
    trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

uint32_t counters_size
    amount of counter in the list

const uint32_t *select_mask
    list of the select/mask parameters

Type Definitions
typedef struct xtensa_perfmon_config xtensa_perfmon_config_t
    Performance monitor configuration structure.
    Structure to configure performance counter to measure dedicated function

2.10.21 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

• Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
• RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
• A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option CONFIG_PM_ENABLE.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function esp_pm_configure(). Its argument is a structure defining the frequency scaling settings, esp_pm_config_esp32_t. In this structure, three fields need to be initialized:

• max_freq_mhz: Maximum CPU frequency in MHz, i.e., the frequency used when the ESP_PM_CPU_FREQ_MAX lock is acquired. This field will usually be set to the default CPU frequency.
• min_freq_mhz: Minimum CPU frequency in MHz, i.e., the frequency used when only the ESP_PM_APB_FREQ_MAX lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
• `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (true/false).
  Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the *Sleep Modes* documentation can be used to trigger wakeup from the light sleep state.

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

### Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESP_PM_CPU_FREQ_MAX</code></td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code>. For ESP32, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td><code>ESP_PM_APB_FREQ_MAX</code></td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32, this is 80 MHz.</td>
</tr>
<tr>
<td><code>ESP_PM_NO_LIGHT_SLEEP</code></td>
<td>Disables automatic switching to light sleep.</td>
</tr>
</tbody>
</table>

### ESP32 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`. 
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Max CPU Frequency Set</th>
<th>Lock Acquisition</th>
<th>CPU and APB Frequencies</th>
</tr>
</thead>
</table>
| 240                   | Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired | CPU: 240 MHz  
APB: 80 MHz  
None | Min values for both frequencies set with esp_pm_configure() |
| 160                   | ESP_PM_CPU_FREQ_MAX acquired | CPU: 160 MHz  
APB: 80 MHz  
None | Min values for both frequencies set with esp_pm_configure() |
| 80                    | Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired | CPU: 80 MHz  
APB: 80 MHz  
None | Min values for both frequencies set with esp_pm_configure() |

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with `High resolution timer` APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

To skip unnecessary wake-up, you can consider initializing an esp_timer with the `skip_unhandled_events` option as true. Timers with this flag will not wake up the system and it helps to reduce consumption.

### Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK is used as a clock source. See `uart_config_t::use_ref_tick`.  
- **LED**: if REF_TICK is used as a clock source. See `ledc_timer_config()` function.  
- **RMT**: if REF_TICK or XTAL is used as a clock source. See `rmt_config_t::flags` and macro `RMT_CHANNEL_FLAGS_AWARE_DFS`.  
- **GPTimer**: if APB is used as the clock source. See `gptimer_config_t::clk_src`.  
- **TSENS**: XTAL or RTC_8M is used as a clock source. So, APB frequency changing will not influence it.
Currently, the following peripheral drivers are aware of DFS and will use the `ESP_PM_APB_FREQ_MAX` lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APPLL clock is used, then it will use the `ESP_PM_NO_LIGHT_SLEEP` lock)
- SDMMC

The following drivers will hold the `ESP_PM_APB_FREQ_MAX` lock while the driver is enabled:

- **SPI slave**: between calls to `spi_slave_initialize()` and `spi_slave_free()`.
- **Ethernet**: between calls to `esp_eth_driver_install()` and `esp_eth_driver_uninstall()`.
- **WiFi**: between calls to `esp_wifi_start()` and `esp_wifi_stop()`. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **TWAI**: between calls to `twai_driver_install()` and `twai_driver_uninstall()`.
- **Bluetooth**: between calls to `esp_bt_controller_enable()` and `esp_bt_controller_disable()`.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- The legacy timer group driver
- MCPWM

### API Reference

**Header File**

- `components/esp_pm/include/esp_pm.h`

**Functions**

```c
esp_err_t esp_pm_configure(const void *config)
```

Set implementation-specific power management configuration.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**

- `config`: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

```c
esp_err_t esp_pm_get_configuration(void *config)
```

Get implementation-specific power management configuration.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

**Parameters**

- `config`: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

```c
esp_err_t esp_pm_lock_create(esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)
```

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.
Return
- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure can not be allocated
- ESP_ERR_INVALID_ARG if out_handle is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
- lock_type: Power management constraint which the lock should control
- arg: argument, value depends on lock_type, see esp_pm_lock_type_t
- name: arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- [out] out_handle: handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

esp_err_t esp_pm_lock_acquire(esp_pm_lock_handle_t handle)
Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.
This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
- handle: handle obtained from esp_pm_lock_create function

esp_err_t esp_pm_lock_release(esp_pm_lock_handle_t handle)
Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.
Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.
This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
- handle: handle obtained from esp_pm_lock_create function

esp_err_t esp_pm_lock_delete (esp_pm_lock_handle_t handle)
Delete a lock created using esp_pm_lock.

The lock must be released before calling this function.
This function must not be called from an ISR.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig
Chapter 2. API Reference

Parameters
- handle: handle obtained from esp_pm_lock_create function

`esp_err_t esp_pm_dump_locks(FILE *stream)`

Dump the list of all locks to stderr

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream.

This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

Return
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
- stream: stream to print information to; use stdout or stderr to print to the console; use fmemo-
pen/open_memstream to print to a string buffer.

Type Definitions

typedef struct esp_pm_lock *esp_pm_lock_handle_t

Opaque handle to the power management lock.

Enumerations

typedef enum esp_pm_lock_type_t

Power management constraints.

Values:

- **ESP_PM_CPU_FREQ_MAX**
  Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

- **ESP_PM_APB_FREQ_MAX**
  Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

- **ESP_PM_NO_LIGHT_SLEEP**
  Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- components/esp_pm/include/esp32/pm.h

Structures

typedef struct esp_pm_config_esp32_t

Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.

Public Members

- **int max_freq_mhz**
  Maximum CPU frequency, in MHz

- **int min_freq_mhz**
  Minimum CPU frequency to use when no locks are taken, in MHz

- **bool light_sleep_enable**
  Enter light sleep when no locks are taken
2.10.22 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard pthread.h header, which is included in the toolchain libc. An additional ESP-IDF specific header, esp_pthread.h, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for std::thread, std::mutex, std::condition_variable, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions sleep, vTaskDelay(), or usleep.

**Note:** If calling a standard libc or C++ sleep function, such as usleep defined in unistd.h, then the task will only block and yield the CPU if the sleep time is longer than one FreeRTOS tick period. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or pthread.h, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- **pthread_create()** - The attr argument is supported for setting stack size and detach state only. Other attribute fields are ignored. Unlike FreeRTOS task functions, the start_routine function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until pthread_join() is called on it.
- **pthread_join()**
- **pthread_detach()**
- **pthread_exit()**
- **sched_yield()**
- **pthread_self()** - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
- **pthread_equal()**

Thread Attributes

- **pthread_attr_init()**
- **pthread_attr_destroy()** - This function doesn’t need to free any resources and instead resets the attr structure to defaults (implementation is same as pthread_attr_init()).
Chapter 2. API Reference

- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

**Once**
- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

**Note:** This function can be called from tasks created using either pthread or FreeRTOS APIs

**Mutexes**
POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Condition Variables**

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see `CONFIG_FREERTOS_HZ`). Timeouts may be delayed up to one tick period after the requested timeout.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Read/Write Locks**

- `pthread_rwlock_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_unlock()`
Static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Thread-Specific Data**

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Note:** There are other options for thread local storage in ESP-IDF, including options with higher performance. See `Thread Local Storage`.

**Not Implemented**

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub <https://github.com/espressif/esp-idf/issues> with the details.

**ESP-IDF Extensions**

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

**Examples**

- `system/pthread` demonstrates using the pthreads API to create threads
- `cxx/pthread` demonstrates using C++ Standard Library functions with threads
API Reference

Header File

- components/pthread/include/esp_pthread.h

Functions

**esp_pthread_cfg_t esp_pthread_get_default_config (void)**

Creates a default pthread configuration based on the values set via menuconfig.

**Return** A default configuration structure.

**esp_err_t esp_pthread_set_cfg (const esp_pthread_cfg_t *cfg)**

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

**Note** Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

**Return**

- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

**Parameters**

- **cfg**: The pthread config parameters

**esp_err_t esp_pthread_get_cfg (esp_pthread_cfg_t *p)**

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

**Return**

- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

**Parameters**

- **p**: Pointer to the pthread config structure that will be updated with the currently configured parameters

**esp_err_t esp_pthread_init (void)**

Initialize pthread library.

Structures

**struct esp_pthread_cfg_t**

pthread configuration structure that influences pthread creation

Public Members

- **size_t stack_size**
  The stack size of the pthread.

- **size_t prio**
  The thread’s priority.

- **bool inherit_cfg**
  Inherit this configuration further.

- **const char *thread_name**
  The thread name.
int pin_to_core
The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros
PTHREAD_STACK_MIN

2.10.23 Random Number Generation

ESP32 contains a hardware random number generator, values from it can be obtained using the APIs esp_random() and esp_fill_random().

The hardware RNG produces true random numbers under any of the following conditions:

• RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
• An internal entropy source has been enabled by calling bootloader_random_enable() and not yet disabled by calling bootloader_random_disable().
• While the ESP-IDF Second stage bootloader is running. This is because the default ESP-IDF bootloader implementation calls bootloader_random_enable() when the bootloader starts, and bootloader_random_disable() before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the ESP32 Technical Reference Manual > Random Number Generator (RNG) [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function bootloader_random_enable() to re-enable the internal entropy source. The function bootloader_random_disable() must be called to disable the entropy source again before using ADC, I2S, Wi-Fi or Bluetooth.

Note: The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

Note: If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

API Reference

Header File
- components/esp_hw_support/include/esp_random.h
Chapter 2. API Reference

**Functions**

```c
uint32_t esp_random(void)
```
Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

**Return** Random value between 0 and UINT32_MAX

```c
void esp_fill_random(void *buf, size_t len)
```
Fill a buffer with random bytes from hardware RNG.

**Note** This function is implemented via calls to esp_random(), so the same constraints apply.

**Parameters**

- `buf`: Pointer to buffer to fill with random numbers.
- `len`: Length of buffer in bytes

**Header File**

- `components/bootloader_support/include/bootloader_random.h`

**Functions**

```c
void bootloader_random_enable(void)
```
Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

**Warning** This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

```c
void bootloader_random_disable(void)
```
Disable entropy source for RNG.

Disables internal entropy source. Must be called after bootloader_random_enable() and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

```c
void bootloader_fill_random(void *buffer, size_t length)
```
Fill buffer with `length` random bytes.

**Note** If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

**Parameters**

- `buffer`: Pointer to buffer
- `length`: This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux getrandom() function is also provided for ease of porting:
#include <sys/random.h>

ssize_t getrandom (void *buf, size_t buflen, unsigned int flags);

This function is implemented by calling esp_fill_random() internally.

The flags argument is ignored, this function is always non-blocking but the strength of any random numbers is
dependent on the same conditions described above.

Return value is -1 (with errno set toEFAULT) if the buf argument is NULL, and equal to buflen otherwise.

2.10.24 Sleep Modes

Overview

ESP32 contains the following power saving modes: Light-sleep, and Deep-sleep.

In Light-sleep mode, the digital peripherals, most of the RAM, and CPUs are clock-gated and their supply voltage is
reduced. Upon exit from Light-sleep, the digital peripherals, RAM, and CPUs resume operation and their internal
states are preserved.

In Deep-sleep mode, the CPUs, most of the RAM, and all digital peripherals that are clocked from APB_CLK are
powered off. The only parts of the chip that remain powered on are:

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory
- RTC slow memory

There are several wakeup sources in Deep-sleep and Light-sleep modes. These sources can also
be combined so that the chip will wake up when any of the sources are triggered. Wakeup
sources can be enabled using esp_sleep_enable_X_wakeup APIs and can be disabled using
esp_sleep_disable_wakeup_source() API. Next section describes these APIs in detail. Wakeup
sources can be configured at any moment before entering Light-sleep or Deep-sleep mode.

Additionally, the application can force specific powerdown modes for RTC peripherals and RTC memories using
esp_sleep_pd_config() API.

Once wakeup sources are configured, the application can enter sleep mode using esp_light_sleep_start()
or esp_deep_sleep_start() APIs. At this point, the hardware will be configured according to the requested
wakeup sources, and the RTC controller will either power down or power off the CPUs and digital peripherals.

If Wi-Fi connections need to be maintained, enable Wi-Fi Modem-sleep mode and automatic Light-sleep feature
(see Power Management APIs). This will allow the system to wake up from sleep automatically when required by the
Wi-Fi driver, thereby maintaining a connection to the AP.

Wi-Fi/Bluetooth and Sleep Modes

In Deep-sleep and Light-sleep modes, the wireless peripherals are powered down. Before entering Deep-
sleep or Light-sleep modes, the application must disable Wi-Fi and Bluetooth using the appropriate calls (i.e.,
esp_bluedroid_disable(), esp_bt_controller_disable(), esp_wifi_stop()). Wi-Fi and
Bluetooth connections will not be maintained in Deep-sleep or Light-sleep mode, even if these functions are not
called.

Wakeup Sources

Timer     The RTC controller has a built-in timer which can be used to wake up the chip after a predefined amount
of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected
for RTC SLOW_CLK.
For details on RTC clock options, see *[ESP32 Technical Reference Manual > ULP Coprocessor]* [PDF].

RTC peripherals or RTC memories don’t need to be powered on during sleep in this wakeup mode. The `esp_sleep_enable_timer_wakeup()` function can be used to enable sleep wakeup using a timer.

**Touchpad** The RTC IO module contains the logic to trigger wakeup when a touch sensor interrupt occurs. To wakeup from a touch sensor interrupt, users need to configure the touch pad interrupt before the chip enters Deep-sleep or Light-sleep modes.

Revisions 0 and 1 of ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e., ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO).

The `esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External Wakeup (ext0)** The RTC IO module contains the logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of the RTC peripherals power domain, so RTC peripherals will be kept powered on during Deep-sleep if this wakeup source is requested.

The RTC IO module is enabled in this mode, so internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions before calling `esp_deep_sleep_start()`.

In revisions 0 and 1 of ESP32, this wakeup source is incompatible with ULP and touch wakeup sources. The `esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

**Warning:** After waking up from sleep, the IO pad used for wakeup will be configured as RTC IO. Therefore, before using this pad as digital GPIO, users need to reconfigure it using `rtc_gpio_deinit()` function.

**External Wakeup (ext1)** The RTC controller contains the logic to trigger wakeup using multiple RTC GPIOs. One of the following two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if all the selected pins are low (ESP_EXT1_WAKEUP_ALL_LOW)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request the RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using `rtc_gpio_` functions before entering sleep:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

**Warning:** After waking up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using `rtc_gpio_deinit()` function.

The `esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

**ULP Coprocessor Wakeup** ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of the RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.
Revisions 0 and 1 of ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e., ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO).

```
esp_sleep_enable_ulp_wakeup() function can be used to enable this wakeup source.
```

**GPIO Wakeup (Light-sleep Only)**  In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in Light-sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

```
esp_sleep_enable_gpio_wakeup() function can be used to enable this wakeup source.
```

**Warning:** Before entering Light-sleep mode, check if any GPIO pin to be driven is part of the VDD_SDIO power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SDIO power domain. If they are configured to remain high during Light-sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

**UART Wakeup (Light-sleep Only)**  When ESP32 receives UART input from external devices, it is often necessary to wake up the chip when input data is available. The UART peripheral contains a feature which allows waking up the chip from Light-sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup before sending the data.

```
esp_sleep_enable_uart_wakeup() function can be used to enable this wakeup source.
```

**Power-down of RTC Peripherals and Memories**

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

Note: in revision 0 of ESP32, RTC fast memory will always be kept enabled in Deep-sleep, so that the Deep-sleep stub can run after reset. This can be overridden, if the application doesn’t need clean reset behaviour after Deep-sleep.

If some variables in the program are placed into RTC slow memory (for example, using RTC_DATA_ATTR attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

**Entering Light-sleep**

`esp_light_sleep_start()` function can be used to enter Light-sleep once wakeup sources are configured. It is also possible to enter Light-sleep with no wakeup sources configured. In this case, the chip will be in Light-sleep mode indefinitely until external reset is applied.

**Entering Deep-sleep**

`esp_deep_sleep_start()` function can be used to enter Deep-sleep once wakeup sources are configured. It is also possible to enter Deep-sleep with no wakeup sources configured. In this case, the chip will be in Deep-sleep mode indefinitely until external reset is applied.
**Configuring IOs**

Some ESP32 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in Deep-sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin to prevent extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally, and it also has an internal pulldown in the ESP32 chip. This means that in Deep-sleep, some current will flow through these external and internal resistors, increasing Deep-sleep current above the minimal possible value.

Add the following code before `esp_deep_sleep_start()` to remove such extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

**UART Output Handling**

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering Light-sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from Light-sleep.

**Checking Sleep Wakeup Cause**

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touchpad, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

**Disable Sleep Wakeup Source**

Previously configured wakeup sources can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally, it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

**Application Example**

- **protocols/sntp**: the implementation of basic functionality of Deep-sleep, where ESP module is periodically waken up to retrieve time from NTP server.
- **wifi/power_save**: the implementation of modem sleep example.
- **system/deep_sleep**: the usage of various Deep-sleep wakeup triggers and ULP coprocessor programming.

**API Reference**

**Header File**

- `components/esp_hw_support/include/esp_sleep.h`
Functions

`esp_err_t esp_sleep_disable_wakeup_source (esp_sleep_source_t source)`

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in esp_deep_sleep_start/esp_light_sleep_start function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**Parameters**

- `source`: - number of source to disable of type esp_sleep_source_t

`esp_err_t esp_sleep_enable_ulp_wakeup (void)`

Enable wakeup by ULP coprocessor.

**Note** In revisions 0 and 1 of the ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

`esp_err_t esp_sleep_enable_timer_wakeup (uint64_t time_in_us)`

Enable wakeup by timer.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

**Parameters**

- `time_in_us`: time before wakeup, in microseconds

`esp_err_t esp_sleep_enable_touchpad_wakeup (void)`

Enable wakeup by touch sensor.

**Note** In revisions 0 and 1 of the ESP32, touch wakeup source can not be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note** The FSM mode of the touch button should be configured as the timer trigger mode.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

`touch_pad_t esp_sleep_get_touchpad_wakeup_status (void)`

Get the touchpad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

**Return** touch pad which caused wakeup

`bool esp_sleep_is_valid_wakeup_gpio (gpio_num_t gpio_num)`

Returns true if a GPIO number is valid for use as wakeup source.

**Note** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Return** True if this GPIO number will be accepted as a sleep wakeup source.

**Parameters**

- `gpio_num`: Number of the GPIO to test for wakeup source capability

`esp_err_t esp_sleep_enable_ext0_wakeup (gpio_num_t gpio_num, int level)`

Enable wakeup using a pin.
This function uses external wakeup feature of RTC IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pin is configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

**Note** In revisions 0 and 1 of the ESP32, ext0 wakeup source cannot be used together with touch or ULP wakeup sources.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

**Parameters**
- gpio_num: GPIO number used as wakeup source. Only GPIOs which have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- level: input level which will trigger wakeup (0=low, 1=high)

### esp_err_t esp_sleep_enable_ext1_wakeup (uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pins are configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

**Note** Internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

**Parameters**
- mask: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- mode: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

### esp_err_t esp_sleep_enable_gpio_wakeup (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

**Note** In revisions 0 and 1 of the ESP32, GPIO wakeup source cannot be used together with touch or ULP wakeup sources.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

**Parameters**
- mask: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- mode: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

### esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.
Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note** ESP32 does not support wakeup from UART2.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

**Parameters**
- `uart_num`: UART port to wake up from

```c
esp_err_t esp_sleep_enable_wifi_wakeup (void)
```
Enable wakeup by WiFi MAC.

**Return**
- ESP_OK on success

```c
esp_err_t esp_sleep_disable_wifi_wakeup (void)
```
Disable wakeup by WiFi MAC.

**Return**
- ESP_OK on success

```c
uint64_t esp_sleep_get_ext1_wakeup_status (void)
```
Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

**Return** bit mask, if GPIO caused wakeup, BIT(n) will be set

```c
esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)
```
Set power down mode for an RTC power domain in sleep mode.

If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

**Parameters**
- `domain`: power domain to configure
- `option`: power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

```c
void esp_deep_sleep_start (void)
```
Enter deep sleep with the configured wakeup options.

This function does not return.

```c
esp_err_t esp_light_sleep_start (void)
```
Enter light sleep with the configured wakeup options.

**Return**
- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped

```c
void esp_deep_sleep (uint64_t time_in_us)
```
Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

`esp_deep_sleep` does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp_bluedroid_disable
• esp_bt_controller_disable
• esp_wifi_stop

This function does not return.

**Note** The device will wake up immediately if the deep-sleep time is set to 0

**Parameters**
- **time_in_us**: deep-sleep time, unit: microsecond

`esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause(void)`

Get the wakeup source which caused wakeup from sleep.

**Return** cause of wake up from last sleep (deep sleep or light sleep)

```c
void esp_wake_deep_sleep(void)
```

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

```c
void esp_set_deep_sleep_wake_stub(esp_deep_sleep_wake_stub_fn_t new_stub)
```

Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

```c
esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub(void)
```

Get current wake from deep sleep stub.

**Return** Return current wake from deep sleep stub, or NULL if no stub is installed.

```c
void esp_default_wake_deep_sleep(void)
```

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

```c
void esp_deep_sleep_disable_rom_logging(void)
```

Disable logging from the ROM code after deep sleep.

Using LSB of RTC_Store4.

```c
void esp_sleep_config_gpio_isolate(void)
```

Configure to isolate all GPIO pins in sleep state.

```c
void esp_sleep_enable_gpio_switch(bool enable)
```

Enable or disable GPIO pins status switching between slept status and waked status.

**Parameters**
- **enable**: decide whether to switch status or not

**Type Definitions**

```c
typedef esp_sleep_source_t esp_sleep_wakeup_cause_t

typedef void (*esp_deep_sleep_wake_stub_fn_t)(void)
```

Function type for stub to run on wake from sleep.

**Enumerations**
enum esp_sleep_ext1_wakeup_mode_t
   Logic function used for EXT1 wakeup mode.
   Values:
   ESP_EXT1_WAKEUP_ALL_LOW = 0
      Wake the chip when all selected GPIOs go low.
   ESP_EXT1_WAKEUP_ANY_HIGH = 1
      Wake the chip when any of the selected GPIOs go high.
enum esp_sleep_pd_domain_t
   Power domains which can be powered down in sleep mode.
   Values:
   ESP_PD_DOMAIN_RTC_PERIPH
      RTC IO, sensors and ULP co-processor.
   ESP_PD_DOMAIN_RTC_SLOW_MEM
      RTC slow memory.
   ESP_PD_DOMAIN_RTC_FAST_MEM
      RTC fast memory.
   ESP_PD_DOMAIN_XTAL
      XTAL oscillator.
   ESP_PD_DOMAIN_RTC8M
      Internal 8M oscillator.
   ESP_PD_DOMAIN_VDDSDIO
      VDD_SDIO.
   ESP_PD_DOMAIN_MAX
      Number of domains.
enum esp_sleep_pd_option_t
   Power down options.
   Values:
   ESP_PD_OPTION_OFF
      Power down the power domain in sleep mode.
   ESP_PD_OPTION_ON
      Keep power domain enabled during sleep mode.
   ESP_PD_OPTION_AUTO
      Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.
enum esp_sleep_source_t
   Sleep wakeup cause.
   Values:
   ESP_SLEEP_WAKEUP_UNDEFINED
      In case of deep sleep, reset was not caused by exit from deep sleep.
   ESP_SLEEP_WAKEUP_ALL
      Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.
   ESP_SLEEP_WAKEUP_EXT0
      Wakeup caused by external signal using RTC_IO.
   ESP_SLEEP_WAKEUP_EXT1
      Wakeup caused by external signal using RTC_CNTL.
   ESP_SLEEP_WAKEUP_TIMER
      Wakeup caused by timer.
Chapter 2. API Reference

ESP_SLEEP_WAKEUP_TOUCHPAD
Wakeup caused by touchpad.

ESP_SLEEP_WAKEUP_ULP
Wakeup caused by ULP program.

ESP_SLEEP_WAKEUP_GPIO
Wakeup caused by GPIO (light sleep only)

ESP_SLEEP_WAKEUP_UART
Wakeup caused by UART (light sleep only)

ESP_SLEEP_WAKEUP_WIFI
Wakeup caused by WIFI (light sleep only)

ESP_SLEEP_WAKEUP_COCPU
Wakeup caused by COCPU int.

ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG
Wakeup caused by COCPU crash.

ESP_SLEEP_WAKEUP_BT
Wakeup caused by BT (light sleep only)

2.10.25 SoC Capabilities

This section lists definitions of the ESP32's SoC hardware capabilities. These definitions are commonly used in IDF to control which hardware dependent features are supported and thus compiled into the binary.

Note: These defines are currently not considered to be part of the public API, and may be changed at any time.

2.10.26 System Time

Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an RTC Clock Source and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.

- **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_NEWLIB_TIME_SYSCALL` in project configuration.

RTC Clock Source

The RTC timer has the following clock sources:

- Internal 150kHz RC oscillator (default): Features the lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
• **External 32kHz crystal**: Requires a 32kHz crystal to be connected to the 32K_XP and 32K_XN pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) deep sleep current consumption.

• **External 32kHz oscillator at 32K_XN pin**: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of 0.1 < Vcm < 0.5xVamp, where Vamp is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin.

• **Internal 8.5MHz oscillator, divided by 256 (~33kHz)**: Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K_XN pin sources can be found in Section *Crystal Oscillator* of ESP32 Hardware Design Guidelines.

### Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
#include <time.h>

void get_current_time(void)
{
    struct tm timeinfo;
    time_t now;
    char strftime_buf[64];
    strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
    ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
}
```

*To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```c
#include <time.h>

void get_one_second_time(void)
{
    struct timeval tv_now;
    struct tm *timeinfo;
    char strftime_buf[64];
    time_t now;
    gettimeofday(&tv_now, NULL);
    // Set timezone to China Standard Time
    setenv("TZ", "CST-8", 1);
    tzset();
    localtime_r(&now, &timeinfo);
    strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
    ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
}
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```c
#include <time.h>

int64_t get_one_microsecond_time(void)
{
    struct timeval tv_now;
    gettimeofday(&tv_now, NULL);
    int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
    return time_us;
}
```
SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH` updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in `protocols/sntp` directory.

Timezones

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the TZ environment variable to the correct value depending on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

64-bit time_t

ESP-IDF uses 32-bit `time_t` type by default. To address Y2K38 issue, you may need to use 64-bit `time_t` type when building the application.

Currently this requires building the cross-compiler toolchain from scratch. See the instructions for building the toolchain in *Standard Toolchain Setup for Linux and macOS*. To enable 64-bit `time_t` support in the toolchain, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file before building the toolchain.

If you need to make the program compatible with both 32-bit and 64-bit `time_t`, you may use the following methods:
In C or C++ source files, \_USE_LONG\_TIME\_T preprocessor macro will be defined if 32-bit \texttt{time\_t} is used. You need to include \texttt{<sys/types.h>} to make this macro available.

In CMake files, \texttt{TIME\_T\_SIZE} IDF build property will be set to the size of \texttt{time\_t}, in bytes. You may call \texttt{idf\_build\_get\_property(var TIME\_T\_SIZE)} to get the value of this property into a CMake variable \texttt{var}. See \textit{build system API reference} for more information about \texttt{idf\_build\_get\_property}.

Note that the size of \texttt{time\_t} type also affects the sizes of other types, for example \texttt{struct timeval}, \texttt{struct stat}, \texttt{struct utimbuf}.

API Reference

Header File

- components/lwip/include/apps/esp_sntp.h

Functions

\texttt{void sntp\_sync\_time(struct timeval *tv)}

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a \texttt{sntp\_sync\_time()} function in the app firmware source. If the default implementation is used, calling \texttt{sntp\_set\_sync\_mode()} allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via \texttt{sntp\_set\_time\_sync\_notification\_cb()}, it will be called following time synchronization.

**Parameters**

- \texttt{tv}: Time received from SNTP server.

\texttt{void sntp\_set\_sync\_mode(sntp\_sync\_mode\_t sync\_mode)}

Set the sync mode.

Modes allowed: \texttt{SNTP\_SYNC\_MODE\_IMMED} and \texttt{SNTP\_SYNC\_MODE\_SMOOTH}.

**Parameters**

- \texttt{sync\_mode}: Sync mode.

\texttt{sntp\_sync\_mode\_t sntp\_get\_sync\_mode(void)}

Get set sync mode.

**Return** \texttt{SNTP\_SYNC\_MODE\_IMMED}: Update time immediately. \texttt{SNTP\_SYNC\_MODE\_SMOOTH}: Smooth time updating.

\texttt{sntp\_sync\_status\_t sntp\_get\_sync\_status(void)}

Get status of time sync.

After the update is completed, the status will be returned as \texttt{SNTP\_SYNC\_STATUS\_COMPLETED}. After that, the status will be reset to \texttt{SNTP\_SYNC\_STATUS\_RESET}. If the update operation is not completed yet, the status will be \texttt{SNTP\_SYNC\_STATUS\_RESET}. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be \texttt{SNTP\_SYNC\_STATUS\_IN\_PROGRESS}.

**Return** \texttt{SNTP\_SYNC\_STATUS\_RESET}: Reset status. \texttt{SNTP\_SYNC\_STATUS\_COMPLETED}: Time is synchronized. \texttt{SNTP\_SYNC\_STATUS\_IN\_PROGRESS}: Smooth time sync in progress.

\texttt{void sntp\_set\_sync\_status(sntp\_sync\_status\_t sync\_status)}

Set status of time sync.

**Parameters**

- \texttt{sync\_status}: status of time sync (see \texttt{sntp\_sync\_status\_t})

\texttt{void sntp\_set\_time\_sync\_notification\_cb(sntp\_sync\_time\_cb\_t \texttt{callback})}

Set a callback function for time synchronization notification.

**Parameters**

- \texttt{callback}: a callback function
Chapter 2. API Reference

void sntp_set_sync_interval (uint32_t interval_ms)
Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in
the next attempt update time through SNTP. To apply the new sync interval call the sntp_restart() function,
otherwise, it will be applied after the last interval expired.

Parameters
• interval_ms: The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds
will be set.

uint32_t sntp_get_sync_interval (void)
Get the sync interval of SNTP operation.

Return the sync interval

bool sntp_restart (void)
Restart SNTP.

Return True - Restart False - SNTP was not initialized yet

Type Definitions
typedef void (*sntp_sync_time_cb_t)(struct timeval *tv)
SNTP callback function for notifying about time sync event.

Parameters
• tv: Time received from SNTP server.

Enumerations
eenum sntp_sync_mode_t
SNTP time update mode.

Values:
SNTP_SYNC_MODE_IMMED
Update system time immediately when receiving a response from the SNTP server.

SNTP_SYNC_MODE_SMOOTH
Smooth time updating. Time error is gradually reduced using adtime function. If the difference between
SNTP response time and system time is large (more than 35 minutes) then update immediately.

eenum sntp_sync_status_t
SNTP sync status.

Values:
SNTP_SYNC_STATUS_RESET
SNTP_SYNC_STATUS_COMPLETED
SNTP_SYNC_STATUS_IN_PROGRESS

2.10.27 The himem allocation API

Overview

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code.
However, because the address space for external memory is limited in size, only the first 4MiB can be used as such.
Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled
by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region
for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page
of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories
that are $\leq 4\text{MiB}$, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.

In order to use the himem API, you have to enable it in the menuconfig using `CONFIG_SPIRAM_BANKSWITCH_ENABLE`, as well as set the amount of banks reserved for this in `CONFIG_SPIRAM_BANKSWITCH_RESERVE`. This decreases the amount of external memory allocated by functions like `malloc()`, but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.

**Example**

An example doing a simple memory test of the high memory range is available in esp-idf: `system/himem`

**API Reference**

**Header File**

- components/esp_hw_support/include/esp_himem.h

**Functions**

`esp_err_t esp_himem_alloc(size_t size, esp_himem_handle_t *handle_out)`

Allocate a block in high memory.

**Return** - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

**Parameters**
- `size`: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_alloc_map_range(size_t size, esp_himem_rangehandle_t *handle_out)`

Allocate a memory region to map blocks into.

This allocates a contiguous CPU memory region that can be used to map blocks of physical memory into.

**Return** - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory or address space
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

**Parameters**
- `size`: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_map(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)`

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

**Note** The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

**Return** - ESP_OK if the memory could be mapped
- ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
- ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
- ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

**Parameters**
- `handle`: Handle to the block of memory, as given by esp_himem_alloc
- `range`: Range handle to map the memory in
• ram_offset: Offset into the block of physical memory of the block to map
• range_offset: Offset into the address range where the block will be mapped
• len: Length of region to map
• flags: One of ESP_HIMEM_MAPFLAG_ *
• [out] out_ptr: Pointer to variable to store resulting memory pointer in

`esp_err_t esp_himem_free (esp_himem_handle_t handle)`
Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.

**Return** - ESP_OK if the memory is successfully freed
• ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

**Parameters**
• handle: Handle to the block of memory, as given by esp_himem_alloc

`esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)`
Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

**Return** - ESP_OK if the memory is succesfully freed
• ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

**Parameters**
• handle: Handle to the range block, as given by esp_himem_alloc_map_range

`esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)`
Unmap a region.

**Return** - ESP_OK if the memory is succesfully unmapped,
• ESP_ERR_INVALID_ARG if ptr or len are invalid.

**Parameters**
• range: Range handle
• ptr: Pointer returned by esp_himem_map
• len: Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

`size_t esp_himem_get_phys_size (void)`
Get total amount of memory under control of himem API.

**Return** Amount of memory, in bytes

`size_t esp_himem_get_free_size (void)`
Get free amount of memory under control of himem API.

**Return** Amount of free memory, in bytes

`size_t esp_himem_reserved_area_size (void)`
Get amount of SPI memory address space needed for bankswitching.

**Note** This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is used, no memory is reserved.

**Return** Amount of reserved area, in bytes

**Macros**

ESP_HIMEM_BLKSZ
ESP_HIMEM_MAPFLAG_RO
Indicates that a mapping will only be read from. Note that this is unused for now.

**Type Definitions**

typedef struct esp_himem_ramdata_t *esp_himem_handle_t
typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t
2.10.28 ULP Coprocessor programming

The Ultra Low Power (ULP) coprocessor is a simple finite state machine (FSM) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in the RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers. This coprocessor is referred to as ULP FSM in ESP-IDF.

Installing the Toolchain

The ULP FSM coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain. If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then the ULP FSM toolchain will already be installed.

Programming ULP FSM

The ULP FSM can be programmed using the supported instruction set. Alternatively, the ULP FSM coprocessor can also be programmed using C Macros on the main CPU. These two methods are described in the following section:

ESP32 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

Note about addressing

ESP32 ULP FSM coprocessor’s JUMP, ST, LD family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

• When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

Consider the following example program:

```
entry:
  NOP
  NOP
  NOP
  NOP
loop:
  MOVE R1, loop
  JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However JUMP instruction expects the address stored in register R1 to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label `loop` from bytes to words, when generating the MOVE instruction. Hence, the code generated code will be equivalent to:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Address</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>NOP</td>
</tr>
<tr>
<td>0004</td>
<td>NOP</td>
</tr>
<tr>
<td>0008</td>
<td>NOP</td>
</tr>
<tr>
<td>000c</td>
<td>NOP</td>
</tr>
<tr>
<td>0010</td>
<td>MOVE R1, 4</td>
</tr>
<tr>
<td>0014</td>
<td>JUMP R1</td>
</tr>
</tbody>
</table>

- The other case is when the argument of MOVE instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```
.set val, 0x10
MOVE R1, val
```

In this case, value loaded into R1 will be 0x10.

However, when an immediate value is used as an offset in LD and ST instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

```
ST R1, R2, 4 // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

In this case, the value in R1 is stored at the memory location pointed by [R2 + offset / 4].

Consider the following code:

```
.global array
array: .long 0
      .long 0
      .long 0
      .long 0
MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0  // write value of R2 into the first array element, i.e. array[0]
      ST R2, R1, 4  // (4 byte offset), i.e. array[1]
      ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
      ST R2, R1, 0  // write value of R2 into the third array element, i.e. array[2]
```

**Note about instruction execution time**  ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:
Chapter 2. API Reference

**NOP - no operation**

**Syntax** NOP

**Operands** None

**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction

**Description** No operation is performed. Only the PC is incremented.

**Example:**

```
1:   NOP
```

**ADD - Add to register**

**Syntax** ADD Rdst, Rsrc1, Rsrc2

ADD Rdst, Rsrc1, imm

**Operands**
- Rdst - Register R[0..3]
- Rsrc1 - Register R[0..3]
- Rsrc2 - Register R[0..3]
- Imm - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples:**

```
1:   ADD R1, R2, R3  // R1 = R2 + R3
2:   Add R1, R2, 0x1234  // R1 = R2 + 0x1234
3:   .set value1, 0x03  // constant value1 = 0x03
    Add R1, R2, value1 // R1 = R2 + value1
4:   .global label  // declaration of variable label
    add R1, R2, label // R1 = R2 + label
    ...
    label: nop  // definition of variable label
```

**SUB - Subtract from register**

**Syntax** SUB Rdst, Rsrc1, Rsrc2

SUB Rdst, Rsrc1, imm

**Operands**
- Rdst - Register R[0..3]
- Rsrc1 - Register R[0..3]
- Rsrc2 - Register R[0..3]
- Imm - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

**Examples:**

```
1:   SUB R1, R2, R3  // R1 = R2 - R3
2:   sub R1, R2, 0x1234  // R1 = R2 - 0x1234
3:   .set value1, 0x03  // constant value1 = 0x03
    SUB R1, R2, value1 // R1 = R2 - value1
4:   .global label  // declaration of variable label
```

(continues on next page)
SUB R1, R2, label  // R1 = R2 - label
....
label: nop  // definition of variable label

AND - Logical AND of two operands

Syntax  AND Rdst, Rsrl, Rsr2
       AND Rdst, Rsrl, imm

Operands
- Rdst - Register R[0..3]
- Rsrl - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does a logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:
1:  AND R1, R2, R3  // R1 = R2 & R3
2:  AND R1, R2, 0x1234  // R1 = R2 & 0x1234
3:  .set value1, 0x03  // constant value1=0x03
    AND R1, R2, value1  // R1 = R2 & value1
4:  .global label  // declaration of variable label
    AND R1, R2, label  // R1 = R2 & label
    ...
label: nop  // definition of variable label

OR - Logical OR of two operands

Syntax  OR Rdst, Rsrl, Rsr2
        OR Rdst, Rsrl, imm

Operands
- Rdst - Register R[0..3]
- Rsrl - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does a logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:
1:  OR R1, R2, R3  // R1 = R2 | R3
2:  OR R1, R2, 0x1234  // R1 = R2 | 0x1234
3:  .set value1, 0x03  // constant value1=0x03
    OR R1, R2, value1  // R1 = R2 | value1
4:  .global label  // declaration of variable label
    OR R1, R2, label  // R1 = R2 | label
    ...
label: nop  // definition of variable label
LSH - Logical Shift Left

**Syntax**

LSH Rsdt, Rscl, Rsce

LSH Rsdt, Rscl, imm

**Operands**

- Rsdt - Register R[0..3]
- Rscl - Register R[0..3]
- Rsce - Register R[0..3]
- imm - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1: LSH R1, R2, R3 // R1 = R2 << R3
2: LSH R1, R2, 0x03 // R1 = R2 << 0x03
3: .set value1, 0x03 // constant value1=0x03
   LSH R1, R2, value1 // R1 = R2 << value1
4: .global label // declaration of variable label
   LSH R1, R2, label // R1 = R2 << label
   ... // definition of variable label

RSH - Logical Shift Right

**Syntax**

RSH Rsdt, Rscl, Rsce

RSH Rsdt, Rscl, imm

**Operands**

- Rsdt - Register R[0..3]
- Rscl - Register R[0..3]
- Rsce - Register R[0..3]
- imm - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1: RSH R1, R2, R3 // R1 = R2 >> R3
2: RSH R1, R2, 0x03 // R1 = R2 >> 0x03
3: .set value1, 0x03 // constant value1=0x03
   RSH R1, R2, value1 // R1 = R2 >> value1
4: .global label // declaration of variable label
   RSH R1, R2, label // R1 = R2 >> label
   label: nop // definition of variable label

MOVE – Move to register

**Syntax**

MOVE Rdst, Rscl

MOVE Rdst, imm

**Operands**

- Rdst – Register R[0..3]
- Rscl – Register R[0..3]
- imm – 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction moves the value from the source register or a 16-bit signed value to the destination register.
Chapter 2. API Reference

Note: Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. See the section Note about addressing for more details.

Examples:

1: MOVE R1, R2  // R1 = R2
2: MOVE R1, 0x03  // R1 = 0x03
3: move value1, 0x03  // constant value1=0x03
    MOVE R1, value1  // R1 = value1
4: .global label  // declaration of label
    MOVE R1, label  // R1 = address_of(label) / 4
    label: nop  // definition of label

ST –Store data to the memory
Syntax: ST Rs, Rd, offset
Operands
- Rs – Register R[0..3], holds the 16-bit value to store
- Rd – Register R[0..3], address of the destination, in 32-bit words
- Offset – 13-bit signed value, offset in bytes
Cycles: 4 cycles to execute, 4 cycles to fetch next instruction
Description: The instruction stores the 16-bit value of Rs to the lower half-word of memory with address Rd+offset. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with Rd[0..3]:

\[
\text{Mem}[\text{Rd} + \text{offset} / 4][31:0] = (\text{PC}[10:0], 3'b0, \text{Rd}, \text{Rs}[15:0])
\]

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note about addressing for more details.

Examples:

1: ST R1, R2, 0x12  // MEM[R2 + 0x12 / 4] = R1
2: .data  // Data section definition
    Addr1: .word 123  // Define label Addr1 16 bit
        .set offs, 0x00  // Define constant offs
        .text  // Text section definition
        MOVE R1, 1  // R1 = 1
        MOVE R2, Addr1  // R2 = Addr1
        ST R1, R2, offs  // MEM[R2 + 0 / 4] = R1
        // MEM[Addr1 + 0] will be 32'h600001

LD –Load data from the memory
Syntax: LD Rd, Rs, offset
Operands
- Rd – Register R[0..3], destination
- Rs – Register R[0..3], holds address of destination, in 32-bit words
Chapter 2. API Reference

- Offset – 13-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction loads the lower 16-bit half-word from memory with address \([Rsrc + \text{offset} / 4]\) into the destination register \(Rdst\):

\[
Rdst[15:0] = \text{Mem}[Rsrc + \text{offset} / 4][15:0]
\]

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note about addressing for more details.

Examples:

1: \text{LD R1, R2, 0x12} \quad // R1 = \text{MEM}[R2 + 0x12 / 4]

2: \text{.data} \quad // Data section definition
   \text{Addr1: .word 123} \quad // Define label Addr1 16 bit
   \text{.set offs, 0x00} \quad // Define constant offs
   \text{.text} \quad // Text section definition
   \text{MOVE R1, 1} \quad // R1 = 1
   \text{MOVE R2, Addr1} \quad // R2 = Addr1 / 4 (address of label is... converted into words)
   \text{LD R1, R2, offs} \quad // R1 = \text{MEM}[R2 + 0x0] \quad // R1 will be 123

\textbf{JUMP} – Jump to an absolute address

Syntax \textbf{JUMP} \(Rdst\)
   \textbf{JUMP} \(Rdst\), \textbf{Condition}
\textbf{JUMP} \(ImmAddr\), \textbf{Condition}

Operands
- \(Rdst\) – Register [R[0..3]] containing address to jump to (expressed in 32-bit words)
- \(ImmAddr\) – 13 bits address (expressed in bytes), aligned to 4 bytes
- \textbf{Condition}:
  - EQ – jump if last ALU operation result was zero
  - OV – jump if last ALU has set overflow flag

Cycles 2 cycles to execute, 2 cycles to fetch next instruction

Description The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

Examples:

1: \text{JUMP R1} \quad // Jump to address \text{in R1 (address in R1 is in... 32-bit words)}

2: \text{JUMP 0x120, EQ} \quad // Jump to address 0x120 \text{ (in bytes) if ALU result is zero}

3: \text{JUMP label} \quad // Jump to label
   \text{label: nop} \quad // Definition of label

4: \text{global label} \quad // Declaration of \text{global} label
   \text{MOVE R1, label} \quad // R1 = label (value loaded into R1 is in words)
   \text{JUMP R1} \quad // Jump to label
   \text{label: nop} \quad // Definition of label
**JUMPR** — Jump to a relative offset (condition based on R0)

**Syntax** JUMPR Step, Threshold, Condition

**Operands**
- **Step** — relative shift from current position, in bytes
- **Threshold** — threshold value for branch condition
- **Condition**:
  - **EQ** (equal) — jump if value in R0 == threshold
  - **LT** (less than) — jump if value in R0 < threshold
  - **LE** (less or equal) — jump if value in R0 <= threshold
  - **GT** (greater than) — jump if value in R0 > threshold
  - **GE** (greater or equal) — jump if value in R0 >= threshold

**Cycles** Conditions **EQ**, **GT** and **LT**: 2 cycles to execute, 2 cycles to fetch next instruction. Conditions **LE** and **GE** are implemented in the assembler using two JUMPR instructions:

```assembly
// JUMPR target, threshold, LE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, GT
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples**:

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if value in R0 >= 20

2: // Down counting loop using R0 register
   MOVE R0, 16 // load 16 into R0
   label: SUB R0, R0, 1 // R0--
      NOP // do something
   JUMPR label, 1, GE // jump to label if R0 >= 1

**JUMPS** — Jump to a relative address (condition based on stage count)

**Syntax** JUMPS Step, Threshold, Condition

**Operands**
- **Step** — relative shift from current position, in bytes
- **Threshold** — threshold value for branch condition
- **Condition**:
  - **EQ** (equal) — jump if value in stage_cnt == threshold
  - **LT** (less than) — jump if value in stage_cnt < threshold
  - **LE** (less or equal) — jump if value in stage_cnt <= threshold
  - **GT** (greater than) — jump if value in stage_cnt > threshold
  - **GE** (greater or equal) — jump if value in stage_cnt >= threshold

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction:

```assembly
// JUMPS target, threshold, EQ is implemented as:
JUMPS next, threshold, LT
JUMPS target, threshold, LE
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
// JUMPS target, threshold, GT is implemented as:
JUMPS next, threshold, LE
JUMPS target, threshold, GE
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

```c
1: pos: JUMPS 16, 20, EQ  // Jump to (position + 16 bytes) if stage_cnt_ <= 20
2: // Up counting loop using stage count register
   label: STAGE_RST  // set stage_cnt to 0
   STAGE_INC 1  // stage_cnt++
   NOP  // do something
   JUMPS label, 16, LT  // jump to label if stage_cnt < 16
```

**STAGE_RST** –Reset stage count register

**Syntax** STAGE_RST

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

```c
1: STAGE_RST  // Reset stage count register
```

**STAGE_INC** –Increment stage count register

**Syntax** STAGE_INC

**Operands**

- Value –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments the stage count register by the given value.

**Examples:**

```c
1: STAGE_INC 10  // stage_cnt += 10
2: // Up counting loop example:
   STAGE_RST  // set stage_cnt to 0
   label: STAGE_INC 1  // stage_cnt++
   NOP  // do something
   JUMPS label, 16, LT  // jump to label if stage_cnt < 16
```

**STAGE_DEC** –Decrement stage count register

**Syntax** STAGE_DEC

**Operands**

- Value –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements the stage count register by the given value.

**Examples:**
1: STAGE_DEC 10 // stage_cnt -- 10;

2: // Down counting loop example
STAGE_RST // set stage_cnt to 0
STAGE_INC 16 // increment stage_cnt to 16
label: STAGE_DEC 1 // stage_cnt--;
NOP // do something
JUMPS label, 0, GT // jump to label if stage_cnt > 0

HALT –End the program

Syntax  HALT
Operands No operands
Cycles 2 cycles to execute
Description The instruction halts the ULP coprocessor and restarts the ULP wake up timer, if it is enabled.

Examples:

1: HALT // Halt the coprocessor

WAKE –Wake up the chip

Syntax  WAKE
Operands No operands
Cycles 2 cycles to execute, 4 cycles to fetch next instruction
Description The instruction sends an interrupt from the ULP coprocessor to the RTC controller.
- If the SoC is in deep sleep mode, and ULP wake up is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

Examples:

1: is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
AND r0, r0, 1
JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
WAKE // Trigger wake up
REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP__SLP_TIMER_EN)
HALT // Stop the ULP program
// After these instructions, SoC will wake up,
// and ULP will not run again until started by the main program.

SLEEP –set ULP wake up timer period

Syntax  SLEEP sleep_reg
Operands
- sleep_reg 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.
Cycles 2 cycles to execute, 4 cycles to fetch next instruction
Description The instruction selects which of the SENS_ULP_CP_SLEEP_CYCx_REG (x = 0..4) register values is to be used by the ULP wake up timer as wake up period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

Examples:
### API Reference

**Chapter 2.**

```plaintext
1: SLEEP 1 // Use period set in SENS_UPL_CP_SLEEP_CYC1_REG
2: .set sleep_reg, 4 // Set constant
    SLEEP sleep_reg // Use period set in SENS_UPL_CP_SLEEP_CYC4_REG
```

#### WAIT – wait some number of cycles

**Syntax**  
`WAIT Cycles`

**Operands**
- `Cycles` – number of cycles for wait

**Cycles**  
2 + `Cycles` cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction delays for given number of cycles.

**Examples:**

```plaintext
1: WAIT 10 // Do nothing for 10 cycles
2: .set wait_cnt, 10 // Set a constant
    WAIT wait_cnt // wait for 10 cycles
```

#### TSENS – do measurement with temperature sensor

**Syntax**  
- `TSENS Rdst, Wait_Delay`
- `TSENS Rdst, Sar_sel, Mux`

**Operands**
- `Rdst` – Destination Register R[0..3], result will be stored to this register
- `Sar_sel` – Select ADC: 0 = SARADC1, 1 = SARADC2
- `Mux` - Enable ADC channel. Channel number is [Mux-1]. If the user passes Mux value 1, then ADC channel 0 gets used.

**Cycles**  
2 + `Wait_Delay` + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction

**Description**  
The instruction performs measurement using TSENS and stores the result into a general purpose register.

**Examples:**

```plaintext
1: TSENS R1, 1000 // Measure temperature sensor for 1000 cycles, and store result to R1
```

#### ADC – do measurement with ADC

**Syntax**
- `ADC Rdst, Sar_sel, Mux`
- `ADC Rdst, Sar_sel, Mux, 0` — deprecated form

**Operands**
- `Rdst` – Destination Register R[0..3], result will be stored to this register
- `Sar_sel` – Select ADC: 0 = SARADC1, 1 = SARADC2
- `Mux` - Enable ADC channel. Channel number is [Mux-1]. If the user passes Mux value 1, then ADC channel 0 gets used.

**Cycles**  
23 + max(1, SAR_AMP_WAIT1) + max(1, SAR_AMP_WAIT2) + max(1, SAR_AMP_WAIT3) + SARx_SAMPLE_CYCLE + SARx_SAMPLE_BIT cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction makes measurements from ADC.

**Examples:**

```plaintext
.. only:: esp32
1: ADC R1, 0, 1 // Measure value using ADC1 channel 0 and store result into R1
```
I2C_RD - read single byte from I2C slave

Syntax
• I2C_RD Sub_addr, High, Low, Slave_sel

Operands
• Sub_addr - Address within the I2C slave to read.
• High, Low — Define range of bits to read. Bits outside of [High, Low] range are masked.
• Slave_sel - Index of I2C slave address to use.

Cycles Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description I2C_RD instruction reads one byte from I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == Slave_sel. 8 bits of read result is stored into R0 register.

Examples:

```
1: I2C_RD 0x10, 7, 0, 0 // Read byte from sub-address 0x10 of...
   ←slave with address set in SENS_I2C_SLAVE_ADDR0
```

I2C_WR - write single byte to I2C slave

Syntax
• I2C_WR Sub_addr, Value, High, Low, Slave_sel

Operands
• Sub_addr - Address within the I2C slave to write.
• Value — 8-bit value to be written.
• High, Low — Define range of bits to write. Bits outside of [High, Low] range are masked.
• Slave_sel - Index of I2C slave address to use.

Cycles Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description I2C_WR instruction writes one byte to I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == Slave_sel.

Examples:

```
1: I2C_WR 0x20, 0x33, 7, 0, 1 // Write byte 0x33 to sub-address...
   ←0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.
```

REG_RD – read from peripheral register

Syntax REG_RD Addr, High, Low

Operands
• Addr - Register address, in 32-bit words
• High - Register end bit number
• Low - Register start bit number

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction reads up to 16 bits from a peripheral register into a general purpose register: R0 = REG[Addr][High:Low].

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

Examples:

```
1: REG_RD 0x120, 7, 4 // load 4 bits: R0 = 0x120[7:4]
```

REG_WR – write to peripheral register
**Syntax**  
**REG_WR**  
**Addr, High, Low, Data**

**Operands**

- **Addr** – Register address, in 32-bit words.
- **High** – Register end bit number
- **Low** – Register start bit number
- **Data** – Value to write, 8 bits

**Cycles** 8 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction writes up to 8 bits from an immediate data value into a peripheral register:  
\[
\text{REG}[\text{Addr}][\text{High:Low}] = \text{data}.
\]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

\[
\text{addr}_\text{ulp} = (\text{addr}_\text{dport} - \text{DR}_\text{REG_RTC_CNTL_BASE}) / 4
\]

**Examples:**

1: \( \text{REG_WR} 0x120, 7, 0, 0x10 \)  // set 8 bits: \( \text{REG}[0x120][7:0] = 0x10 \)

**Convenience macros for peripheral registers access**  
ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ_RTC_REG**  
**rtc_reg, low_bit, bit_width**  
Read up to 16 bits from **rtc_reg[low_bit + bit_width - 1 : low_bit]** into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"
/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**WRITE_RTC_REG**  
**rtc_reg, low_bit, bit_width, value**  
Write immediate value into **rtc_reg[low_bit + bit_width - 1 : low_bit]**, bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"
/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**READ_RTC_FIELD**  
**rtc_reg, field**  
Read from a field in **rtc_reg** into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"
/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE_RTC_FIELD**  
**rtc_reg, field, value**  
Write immediate value into a field in **rtc_reg**, up to 8 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"
/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```
Programming ULP FSM coprocessor using C macros (legacy)  In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    {I_MOVI(R3, 16)},  // R3 <- 16
    {I_LD(R0, R3, 0)},  // R0 <- RTC_SLOW_MEM[R3 + 0]
    {I_LD(R1, R3, 1)},  // R1 <- RTC_SLOW_MEM[R3 + 1]
    {I_ADDR(R2, R0, R1)},  // R2 <- R0 + R1
    {I_ST(R2, R3, 2)},  // R2 -> RTC_SLOW_MEM[R2 + 2]
    {I_HALT()}
};
size_t load_addr = 0;
size_t size = sizeof(program) / sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0—R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

**Note:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

**Note:** Load, store and move instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM. This is different to how address arguments are handled in assembly code of the same instructions. See the section Note about addressing for more details for reference.

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    {I_MOVI(R0, 34)},  // R0 <- 34
    {M_LABEL(1)},  // label_1
    {I_MOVI(R1, 32)},  // R1 <- 32
    {I_LD(R1, R1, 0)},  // R1 <- RTC_SLOW_MEM[R1]
    {I_MOVI(R2, 33)},  // R2 <- 33
    {I_LD(R2, R2, 0)},  // R2 <- RTC_SLOW_MEM[R2]
    {I_SUBR(R3, R1, R2)},  // R3 <- R1 - R2
    {I_ST(R3, R0, 0)},  // R3 -> RTC_SLOW_MEM[R0 + 0]
    {I_ADDI(R0, R0, 1)},  // R0++
    {M_BL(1, 64)},  // if (R0 < 64) goto label_1
    {I_HALT()},  
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program) / sizeof(ulp_insn_t);
```

(continues on next page)
ulp_process_macros_and_load(load_addr, program, size);
ulp_run(load_addr);

API Reference

Header File

- components/ulp/ulp_fsm/include/esp32/ulp.h

Functions

static uint32_t SOC_REG_TO_ULP_PERIPH_SEL(uint32_t reg)
Map SoC peripheral register to periph_sel field of RD_REG and WR_REG instructions.

Return
periph_sel value for the peripheral to which this register belongs.

Parameters
- reg: peripheral register in RTC_CNTL_, RTC_IO_, SENS_, RTC_I2C peripherals.

Unions

union ulpInsn
#include <ulp.h> Instruction format structure.

All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions. This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed by the CPU. It acts as a token which is removed from the program by the ulp_process_macros_and_load function.

These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of these structure with the right arguments.

Public Members

uint32_t cycles : 16
Number of cycles to sleep
TBD, cycles used for measurement

SUB_OPCODE_MACRO_LABELPC
```

**struct ulp_insn::[anonymous]** st
Format of ST instruction

**struct ulp_insn::[anonymous]** ld
Format of LD instruction

**struct ulp_insn::[anonymous]** halt
Format of HALT instruction

```c
uint32_t addr : 11
Target PC, expressed in words (used if .reg == 0)
Address within either RTC_CNTL, RTC_IO, or SARADC
```
```
uint32_t reg : 1
    Target PC in register (1) or immediate (0)

uint32_t type : 3
    Jump condition (BX_JUMP_TYPE_xxx)

struct ulp_insn::[anonymous] bx
    Format of BRANCH instruction (absolute address)

uint32_t imm : 16
    Immediate value to compare against
    Immediate value of operand
    Immediate value of operand B

uint32_t cmp : 1
    Comparison to perform: B_CMP_L or B_CMP_GE
    Comparison to perform: JUMPS_LT, JUMPS_GE or JUMPS_LE

uint32_t sign : 1
    Sign of target PC offset: 0: positive, 1: negative

struct ulp_insn::[anonymous] b
    Format of BRANCH instruction (relative address, conditional on R0)

struct ulp_insn::[anonymous] bs
    Format of BRANCH instruction (relative address, conditional on the stage counter)

uint32_t treg : 2
    Register with operand B

uint32_t sel : 4
    Operation to perform, one of ALU_SEL_xxx
    Operation to perform, one of ALU_SEL_Sxxx

struct ulp_insn::[anonymous] alu_reg
    Format of ALU instruction (both sources are registers)

struct ulp_insn::[anonymous] alu_reg_s
    Format of ALU instruction (stage counter and an immediate)

struct ulp_insn::[anonymous] alu_imm
    Format of ALU instruction (one source is an immediate)

uint32_t periph_sel : 2
    Select peripheral: RTC_CNTL (0), RTC_IO(1), SARADC(2)

uint32_t data : 8
    8 bits of data to write
    8 bits of data for write operation

uint32_t low : 5
    Low bit

uint32_t high : 5
    High bit

struct ulp_insn::[anonymous] wr_reg
    Format of WR_REG instruction

struct ulp_insn::[anonymous] rd_reg
    Format of RD_REG instruction

uint32_t mux : 4
    Select SARADC pad (mux + 1)
```
uint32_t sar_sel: 1
    Select SARADC0 (0) or SARADC1 (1)

struct ulp_insn::[anonymous] adc
    Format of ADC instruction

uint32_t wait_delay: 14
    Cycles to wait after measurement is done

uint32_t reserved: 12
    Reserved, set to 0

struct ulp_insn::[anonymous] tsens
    Format of TSENS instruction

uint32_t i2c_addr: 8
    I2C slave address

uint32_t low_bits: 3
    low bit of range for write operation (lower bits are masked)

uint32_t high_bits: 3
    high bit of range for write operation (higher bits are masked)

uint32_t i2c_sel: 4
    index of slave address register [7:0]

uint32_t rw: 1
    Write (1) or read (0)

struct ulp_insn::[anonymous] i2c
    Format of I2C instruction

uint32_t wakeup: 1
    Set to 1 to wake up chip

struct ulp_insn::[anonymous] end
    Format of END instruction with wakeup

uint32_t cycle_sel: 4
    Select which one of SARADC_ULP_CP_SLEEP_CYCx_REG to get the sleep duration from

struct ulp_insn::[anonymous] sleep
    Format of END instruction with sleep

uint32_t label: 16
    Label number

struct ulp_insn::[anonymous] macro
    Format of tokens used by MACROs

uint32_t instruction
    Encoded instruction for ULP coprocessor

**Macros**

R0
    general purpose register 0

R1
    general purpose register 1

R2
    general purpose register 2

R3
    general purpose register 3
Chapter 2. API Reference

**OPCODE_WR_REG**
Instruction: write peripheral register (RTC_CNTL/RTC_IO/SARADC)

**OPCODE_RD_REG**
Instruction: read peripheral register (RTC_CNTL/RTC_IO/SARADC)

**RD_REG_PERIPH_RTC_CNTL**
Identifier of RTC_CNTL peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_IO**
Identifier of RTC_IO peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_SENS**
Identifier of SARADC peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_I2C**
Identifier of RTC_I2C peripheral for RD_REG and WR_REG instructions

**OPCODE_I2C**
Instruction: read/write I2C

**SUB_OPCODE_I2C_RD**
I2C read

**SUB_OPCODE_I2C_WR**
I2C write

**OPCODE_DELAY**
Instruction: delay (nop) for a given number of cycles

**OPCODE_ADC**
Instruction: SAR ADC measurement

**OPCODE_ST**
Instruction: store indirect to RTC memory

**SUB_OPCODE_ST**
Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

**OPCODE_ALU**
Arithmetic instructions

**SUB_OPCODE_ALU_REG**
Arithmetic instruction, both source values are in register

**SUB_OPCODE_ALU_IMM**
Arithmetic instruction, one source value is an immediate

**SUB_OPCODE_ALU_CNT**
Arithmetic instruction, stage counter and an immediate

**ALU_SEL_ADD**
Addition

**ALU_SEL_SUB**
Subtraction

**ALU_SEL_AND**
Logical AND

**ALU_SEL_OR**
Logical OR

**ALU_SEL_MOV**
Copy value (immediate to destination register or source register to destination register)

**ALU_SEL_LSH**
Shift left by given number of bits
**Chapter 2. API Reference**

- **ALU_SEL_RSH**
  - Shift right by given number of bits

- **ALU_SEL_SINC**
  - Increment the stage counter

- **ALU_SEL_SDEC**
  - Decrement the stage counter

- **ALU_SEL_SRST**
  - Reset the stage counter

- **OPCODE_BRANCH**
  - Branch instructions

  - **SUB_OPCODE_BX**
    - Branch to absolute PC (immediate or in register)

  - **SUB_OPCODE_BR**
    - Branch to relative PC, conditional on R0

  - **SUB_OPCODE_BS**
    - Branch to relative PC, conditional on the stage counter

  - **BX_JUMP_TYPE_DIRECT**
    - Unconditional jump

  - **BX_JUMP_TYPE_ZERO**
    - Branch if last ALU result is zero

  - **BX_JUMP_TYPE_OVF**
    - Branch if last ALU operation caused and overflow

- **SUB_OPCODE_B**
  - Branch to a relative offset

- **B_CMP_L**
  - Branch if R0 is less than an immediate

- **B_CMP_GE**
  - Branch if R0 is greater than or equal to an immediate

- **JUMPS_LT**
  - Branch if the stage counter <

- **JUMPS_GE**
  - Branch if the stage counter >=

- **JUMPS_LE**
  - Branch if the stage counter <=

- **OPCODE_END**
  - Stop executing the program

  - **SUB_OPCODE_END**
    - Stop executing the program and optionally wake up the chip

  - **SUB_OPCODE_SLEEP**
    - Stop executing the program and run it again after selected interval

- **OPCODE_TSENS**
  - Instruction: temperature sensor measurement

- **OPCODE_HALT**
  - Halt the coprocessor

- **OPCODE_LD**
  - Indirect load lower 16 bits from RTC memory
Chapter 2. API Reference

**OPCODE_MACRO**
Not a real opcode. Used to identify labels and branches in the program

**SUB_OPCODE_MACRO_LABEL**
Label macro

**SUB_OPCODE_MACRO_BRANCH**
Branch macro

**SUB_OPCODE_MACRO_LABELPC**
Label pointer macro

**I_DELAY** *(cycles_)*
Delay (nop) for a given number of cycles

**I_HALT** *
Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use **I_END(0)** instruction.

**I_WR_REG** *(reg, low_bit, high_bit, val)*
Write literal value to a peripheral register

reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_RD_REG** *(reg, low_bit, high_bit)*
Read from peripheral register into R0

R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_WR_REG_BIT** *(reg, shift, val)*
Set or clear a bit in the peripheral register.

Sets bit (1 << shift) of register reg to value val. This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_WAKE** *
Wake the SoC from deep sleep.

This instruction initiates wake up from deep sleep. Use esp_deep_sleep_enable_ulp_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.

To stop the ULP program, use **I_HALT** instruction.

To disable the timer which start ULP program, use **I_END(0)** instruction. **I_END** instruction clears the RTC_CNTL_ULP_CP_SLP_TIMER_EN_S bit of RTC_CNTL_STATE0_REG register, which controls the ULP timer.

**I_END** *
Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use **I_HALT**.

**I_SLEEP_CYCLE_SEL** *(timer_idx)*
Select the time interval used to run ULP program.

This instructions selects which of the SENS_SLEEP_CYCLES_Sx registers’ value is used by the ULP program timer. When the ULP program stops at **I_HALT** instruction, ULP program timer start counting. When
the counter reaches the value of the selected SENS_SLEEP_CYCLES_Sx register, ULP program start running again from the start address (passed to the ulp_run function). There are 5 SENS_SLEEP_CYCLES_Sx registers, so 0 <= timer_idx < 5.

By default, SENS_SLEEP_CYCLES_S0 register is used by the ULP program timer.

**I_TSENS (reg_dest, delay)**

Perform temperature sensor measurement and store it into reg_dest.

Delay can be set between 1 and ((1 << 14) - 1). Higher values give higher measurement resolution.

**I_ADC (reg_dest, adc_idx, pad_idx)**

Perform ADC measurement and store result in reg_dest.

adc_idx selects ADC (0 or 1). pad_idx selects ADC pad (0 - 7).

**I_ST (reg_val, reg_addr, offset_)**

Store value from register reg_val into RTC memory.

The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:

- bits [31:21] hold the PC of current instruction, expressed in 32-bit words
- bits [20:18] = 3’b0
- bits [17:16] reg_addr (0..3)
- bits [15:0] are assigned the contents of reg_val

RTC_SLOW_MEM[addr + offset_] = { insn_PC[10:0], 3’b0, reg_addr, reg_val[15:0] }

**I_LD (reg_dest, reg_addr, offset_)**

Load value from RTC memory into reg_dest register.

 Loads 16 LSBs from RTC memory word given by the sum of value in reg_addr and value of offset_.

**I_BL (pc_offset, imm_value)**

Branch relative if R0 less than immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BGE (pc_offset, imm_value)**

Branch relative if R0 greater or equal than immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BXR (reg_pc)**

Unconditional branch to absolute PC, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXI (imm_pc)**

Unconditional branch to absolute PC, immediate address.

Address imm_pc is expressed in 32-bit words.

**I_BXZR (reg_pc)**

Branch to absolute PC if ALU result is zero, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXZI (imm_pc)**

Branch to absolute PC if ALU result is zero, immediate address.

Address imm_pc is expressed in 32-bit words.

**I_BXFR (reg_pc)**

Branch to absolute PC if ALU overflow, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.
I_BXFI (imm_pc)
   Branch to absolute PC if ALU overflow, immediate address
   Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
   Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)
   Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)
   Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)
   Logical OR: dest = src1 | src2

I_MOVR (reg_dest, reg_src)
   Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)
   Logical shift left: dest = src << shift

I_RSHR (reg_dest, reg_src, reg_shift)
   Logical shift right: dest = src >> shift

I_ADDI (reg_dest, reg_src, imm_)
   Add register and an immediate value: dest = src1 + imm

I_SUBI (reg_dest, reg_src, imm_)
   Subtract register and an immediate value: dest = src - imm

I_ANDI (reg_dest, reg_src, imm_)
   Logical AND register and an immediate value: dest = src & imm

I_ORI (reg_dest, reg_src, imm_)
   Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)
   Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)
   Logical shift left register value by an immediate: dest = src << imm

I_RSHI (reg_dest, reg_src, imm_)
   Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
   Define a label with number label_num.
   This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.

M_BRANCH (label_num)
   Token macro used by M_B and M_BX macros. Not to be used directly.

M_LABELPC (label_num)
   Token macro used by M_MOVL macro. Not to be used directly.

M_MOVL (reg_dest, label_num)
   Macro: Move the program counter at the given label into the register. This address can then be used with I_BXR, I_BXZR, I_BXFR, etc.
   This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.
M_BL (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BGE (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)
Macro: unconditional branch to label

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)
Macro: branch to label if ALU result is zero

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)
Macro: branch to label if ALU overflow

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

I_STAGE_INC (imm_)
Increment the stage counter by immediate value

I_STAGE_DEC (imm_)
Decrement the stage counter by immediate value

I_STAGE_RST ()
Reset the stage counter

M_BSLT (label_num, imm_value)
Macro: branch to label if the stage counter is less than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSGE (label_num, imm_value)
Macro: branch to label if the stage counter is greater than or equal to immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSLE (label_num, imm_value)
Macro: branch to label if the stage counter is less than or equal to immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSEQ (label_num, imm_value)
Macro: branch to label if the stage counter is equal to immediate value. Implemented using two JUMPS instructions: JUMPS next, imm_value, LT JUMPS label_num, imm_value, LE
This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulp_insn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSGT (label_num, imm_value)
Macro: branch to label if the stage counter is greater than immediate value. Implemented using two instructions: JUMPS next, imm_value, LE JUMPS label_num, imm_value, GE
This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulpInsn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

I_JUMPS (pc_offset, imm_value, comp_type)
Branch relative if (stage counter [comp_type] [imm_value]) evaluates to true.

I_I2C_RW (sub_addr, val, low_bit, high_bit, slave_sel, rw_bit)
Perform an I2C transaction with a slave device. I_I2C_READ and I_I2C_WRITE are provided for convenience, instead of using this directly.
Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel. For read operations, 8 bits of read result is stored into R0 register. For write operations, val will be written to sub_addr at [high_bit:low_bit]. Bits outside of this range are masked.

I_I2C_READ (slave_sel, sub_addr)
Read a byte from the sub address of an I2C slave, and store the result in R0.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

I_I2C_WRITE (slave_sel, sub_addr, val)
Write a byte to the sub address of an I2C slave.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

Compiling the ULP Code

To compile the ULP FSM code as part of the component, the following steps must be taken:

1. The ULP FSM code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance, ulp/

2. Call ulp_embed_binary from the component CMakeLists.txt after registration. For example:

```cmake
... idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")
ulp_embed_binary("${ulp_app_name}" "${ulp_s_sources}" "${ulp_exp_dep_srcs}"
```

The first argument to ulp_embed_binary specifies the ULP FSM binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP FSM assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See the section below for the concept of generated header files for ULP applications.
3. Build the application as usual (e.g. `idf.py app`).
   Inside, the build system will take the following steps to build ULP FSM program:
   1. **Run each assembly file (foo.S) through the C preprocessor.** This step generates the preprocessed assembly files (foo.ulp.S) in the component build directory. This step also generates dependency files (foo.ulp.d).
   2. **Run preprocessed assembly sources through the assembler.** This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
   3. **Run the linker script template through the C preprocessor.** The template is located in the `components/ulp/ld` directory.
   4. **Link the object files into an output ELF file** (`ulp_app_name.elf`). The Map file (`ulp_app_name.map`) generated at this stage may be useful for debugging purposes.
   5. **Dump the contents of the ELF file into a binary** (`ulp_app_name.bin`) which can then be embedded into the application.
   6. **Generate a list of global symbols** (`ulp_app_name.sym`) in the ELF file using `esp32ulp-elf-nm`.
   7. **Create a linker script and header file** (`ulp_app_name.ld` and `ulp_app_name.h`) containing the symbols from `ulp_app_name.sym`. This is done using `esp32ulp_mapgen.py` utility.
   8. **Add the generated binary to the list of binary files** to be embedded into the application.

### Accessing the ULP FSM Program Variables

Global symbols defined in the ULP FSM program may be used inside the main program.

For example, the ULP FSM program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:

```assembly
.globl measurement_count
measurement_count:       .long 0

// later, use measurement_count
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the `${ULP_APP_NAME}.h` and `${ULP_APP_NAME}.ld` files which define the global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with `ulp_`.

The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in `RTC_SLOW_MEM`:

```c
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `include` statement. This will allow the ULP program variables to be accessed as regular variables:

```c
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
  ulp_measurement_count = 64;
}
```
Note that the ULP FSM program can only use the lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word. Likewise, the ULP store instruction writes register values into the lower 16 bits of the 32-bit word in RTC memory. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP coprocessor, the main application needs to mask the upper 16 bits, e.g.:

\[
\text{printf("Last measurement value: \%d\n", ulp_last_measurement \& UINT16_MAX);}
\]

Starting the ULP FSM Program

To run a ULP FSM program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary()` function, and then start it using the `ulp_run()` function.

Note that the Enable Ultra Low Power (ULP) Coprocessor option must be enabled in menuconfig to work with ULP. To select the type of ULP to be used, the ULP Co-processor type option must be set. To reserve memory for the ULP, the RTC slow memory reserved for coprocessor option must be set to a value big enough to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to ulp_app_name):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(0

    // load address, set to 0 when using default linker scripts
    bin_start,
    (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

Once the program is loaded into RTC memory, the application can start it by passing the address of the entry point to the `ulp_run()` function:

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

Declaration of the entry point symbol comes from the generated header file mentioned above, `${ULP_APP_NAME}.h`. In the assembly source of the ULP FSM application, this symbol must be marked as `.global`:

```assembly
.globl entry
entry:
    // code starts here
```

ESP32 ULP program flow

ESP32 ULP coprocessor is started by a timer. The timer is started once `ulp_run()` is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of ticks is set using SENS_ULP_CP_SLEEP_CYCx_REG registers (x = 0..4). When starting the ULP for the first time, SENS_ULP_CP_SLEEP_CYC0_REG will be used to set the number of timer ticks. Later the ULP program can select another SENS_ULP_CP_SLEEP_CYCx_REG register using sleep instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) using `ulp_set_wakeup_period` function.

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCx_REG register, ULP coprocessor powers up and starts running the program from the entry point set in the call to `ulp_run()`.
Chapter 2. API Reference

The program runs until it encounters a **halt** instruction or an illegal instruction. Once the program halts the ULP coprocessor powers down and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the **RTC_CNTL_ULP_CP_SLP_TIMER_EN** bit in the **RTC_CNTL_STATE0_REG** register. This can be done both from ULP code and from the main program.

### Application Examples

- ULP FSM Coprocessor counts pulses on an IO while main CPU is in deep sleep: `system/ulp FSM/ulp`
- ULP FSM Coprocessor polls ADC in while main CPU is in deep sleep: `system/ulp FSM/ulp_adc`

### API Reference

#### Header File

- `components/ulp FSM/include/ulp FSM_common.h`

#### Functions

- **esp_err_t ulp_process_macros_and_load** `(uint32_t load_addr, const ulp_insn_t *program, size_t *size)`

  Resolve all macro references in a program and load it into RTC memory.

  **Return**

  - ESP_OK on success
  - ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
  - one of ESP_ERR_ULP_xxx if program is not valid or can not be loaded

  **Parameters**

  - **load_addr**: address where the program should be loaded, expressed in 32-bit words
  - **program**: ulp_insn_t array with the program
  - **size**: size of the program, expressed in 32-bit words

- **esp_err_t ulp_load_binary** `(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)`

  Load ULP program binary into RTC memory.

  ULP program binary should have the following format (all values little-endian):

  1. MAGIC, (value 0x00706c75, 4 bytes)
  2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
  3. TEXT_SIZE, size of .text section (2 bytes)
  4. DATA_SIZE, size of .data section (2 bytes)
  5. BSS_SIZE, size of .bss section (2 bytes)
  6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
  7. .text section
  8. .data section

  Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if load_addr is out of range
  - ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
  - ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

  **Parameters**

  - **load_addr**: address where the program should be loaded, expressed in 32-bit words
  - **program_binary**: pointer to program binary
  - **program_size**: size of the program binary
**esp_err_t ulp_run(uint32_t entry_point)**

Run the program loaded into RTC memory.

**Return** ESP_OK on success

**Parameters**

- entry_point: entry point, expressed in 32-bit words

---

**Macros**

- **ESP_ERR_ULP_BASE**
  Offset for ULP-related error codes

- **ESP_ERR_ULP_SIZE_TOO_BIG**
  Program doesn’t fit into RTC memory reserved for the ULP

- **ESP_ERR_ULP_INVALID_LOAD_ADDR**
  Load address is outside of RTC memory reserved for the ULP

- **ESP_ERR_ULP_DUPLICATE_LABEL**
  More than one label with the same number was defined

- **ESP_ERR_ULP_UNDEFINED_LABEL**
  Branch instructions references an undefined label

- **ESP_ERR_ULP_BRANCH_OUT_OF_RANGE**
  Branch target is out of range of B instruction (try replacing with BX)

---

**Type Definitions**

```c
typedef union ulp_insn ulp_insn_t
```

---

**Header File**

- components/ulp/ulp_common/include/ulp_common.h

---

**Functions**

- **esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)**

  Set one of ULP wakeup period values.

  ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC_CNTL_ULP_CP_TIMER_1_REG register for ESP32-S2/S3. By default, for ESP32, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

  However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

  For ESP32-S2/S3 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

  **Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if period_index is out of range

  **Parameters**

  - period_index: wakeup period setting number (0 - 4)
  - period_us: wakeup period, us
void **ulp_timer_stop**(void)
  Stop the ULP timer.

  **Note** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

void **ulp_timer_resume**(void)
  Resume the ULP timer.

  **Note** This will resume an already configured timer, but does no other configuration.

**Header File**

- `components/ulp/ulp_common/include/esp32/ulp_common_defs.h`

**Macros**

- `RTC_SLOW_MEM`
  RTC slow memory, 8k size

---

### 2.10.29 Watchdogs

#### Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using the `Project Configuration Menu`, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

**Interrupt watchdog**  The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn’t blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can’t get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as “Interrupt wdt timeout on CPU0” or “Interrupt wdt timeout on CPU1” (as applicable).

**Configuration**  The interrupt watchdog is enabled by default via the `CONFIG_ESP_INT_WDT` configuration flag. The timeout is configured by setting `CONFIG_ESP_INT_WDT_TIMEOUT_MS`. The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see `CONFIG_FREERTOS_HZ`).

**Tuning**  If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.
If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` setting instead.

**Task Watchdog Timer** The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. Each watched task must ‘reset’ the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling `esp_task_wdt_init()` which will configure the hardware timer. A task can then subscribe to the TWDT using `esp_task_wdt_add()` in order to be watched. Each subscribed task must periodically call `esp_task_wdt_reset()` to reset the TWDT. Failure by any subscribed tasks to periodically call `esp_task_wdt_reset()` indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using `esp_task_wdt_delete()`. A task that has been unsubscribed should no longer call `esp_task_wdt_reset()`. Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling `esp_task_wdt_deinit()`.

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolise the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

**Note:** It might cause severe watchdog timeout issue when erasing large flash areas. Here are two methods to avoid this issue:

- Increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period.
- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.

For more information, you can refer to **SPI Flash**.

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_add()` at any time.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.
Interrupt Watchdog API Reference

Header File

- esp_system/include/esp_int_wdt.h

Functions

void esp_int_wdt_init (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

Task Watchdog API Reference

A full example using the Task Watchdog is available in esp-idf: system/task_watchdog

Header File

- components/esp_system/include/esp_task_wdt.h

Functions

esp_err_t esp_task_wdt_init (uint32_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using esp_task_wdt_add().

Parameters

- [in] timeout: Timeout period of TWDT in seconds
- [in] panic: Flag that controls whether the panic handler will be executed when the TWDT times out

esp_err_t esp_task_wdt_deinit (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

Parameters

- [out] ESP_OK: TWDT successfully deinitialized
- [out] ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
- [out] ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

esp_err_t esp_task_wdt_add (TaskHandle_t handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable esp_task_wdt_reset() to called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

Parameters

- [in] ESP_OK: Successfully subscribed the task to the TWDT
- [in] ESP_ERR_INVALID_ARG: Error, the task is already subscribed
- [in] ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters
• [in] handle: Handle of the task. Input NULL to subscribe the current running task to the TWDT

```c
esp_err_t esp_task_wdt_reset(void)
```

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

Return
• ESP_OK: Successfully reset the TWDT on behalf of the currently running task
• ESP_ERR_NOT_FOUND: Error, the current running task has not subscribed to the TWDT
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

```c
esp_err_t esp_task_wdt_delete(TaskHandle_t handle)
```

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset(). If the task is an IDLE task, this function will automatically disable the calling of esp_task_wdt_reset() from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

Return
• ESP_OK: Successfully unsubscribed the task from the TWDT
• ESP_ERR_INVALID_ARG: Error, the task is already unsubscribed
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters
• [in] handle: Handle of the task. Input NULL to unsubscribe the current running task.

```c
esp_err_t esp_task_wdt_status(TaskHandle_t handle)
```

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

Return:
• ESP_OK: The task is currently subscribed to the TWDT
• ESP_ERR_NOT_FOUND: The task is currently not subscribed to the TWDT
• ESP_ERR_INVALID_STATE: The TWDT is not initialized, therefore no tasks can be subscribed

Parameters
• [in] handle: Handle of the task. Input NULL to query the current running task.

Code examples for this API section are provided in the system directory of ESP-IDF examples.

API Guides

4.1 Application Level Tracing library

4.1.1 Overview

ESP-IDF provides a useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG, UART, or USB interfaces with small overhead on program execution. It is possible to use JTAG and UART interfaces simultaneously. The UART interface is mostly used for connection with SEGGER SystemView tool (see SystemView).

Developers can use this library to send application-specific state of execution to the host and receive commands or other types of information from the opposite direction at runtime. The main use cases of this library are:

1. Collecting application-specific data. See Application Specific Tracing.
2. Lightweight logging to the host. See Logging to Host.

Tracing components used when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode:** This is the default mode. The mode does not need interaction with the host side. In this mode, tracing module does not check whether the host has read all the data from **HW UP BUFFER**, but directly overwrites old data with the new ones. This mode is useful when only the latest trace data is interesting to the user, e.g., for analyzing program’s behavior just before the crash. The host can read the data later on upon user request, e.g., via special OpenOCD command in case of working via JTAG interface.

**Streaming mode:** Tracing module enters this mode when the host connects to ESP32. In this mode, before writing new data to **HW UP BUFFER**, the tracing module checks that whether there is enough space in it and if necessary, waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to the trace buffer using the finite value of the maximum waiting time, it is possible that this data will be dropped. This is especially true for tracing from time critical code (ISRs, OS scheduler code, etc.) where infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data, developers can enable additional data buffering via menuconfig option **CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**. This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g., due to USB bus congestions. But it will not help when the average bitrate of the trace data stream exceeds the hardware interface capabilities.
4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side**: Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see JTAG Debugging for details.

2. **Target side**: Application tracing functionality can be enabled in menuconfig. Please go to Component config > Application Level Tracing menu, which allows selecting destination for the trace data (hardware interface for transport: JTAG or/and UART). Choosing any of the destinations automatically enables the `CONFIG_APPTRACE_ENABLE` option. For UART interfaces, users have to define baud rate, TX and RX pins numbers, and additional UART-related parameters.

**Note**: In order to achieve higher data rates and minimize the number of dropped packets, it is recommended to optimize the setting of JTAG clock frequency, so that it is at maximum and still provides stable operation of JTAG. See Optimize JTAG speed.

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic** (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In this mode, trace data is exposed to the host in 16 KB blocks. In post-mortem mode, when one block is filled, it is exposed to the host and the previous one becomes unavailable. In other words, the trace data is overwritten in 16 KB granularity. On panic, the latest data from the current input block is exposed to the host and the host can read them for post-analysis. System panic may occur when a very small amount of data are not exposed to the host yet. In this case, the previous 16 KB of collected data will be lost and the host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of a panic. For example, users can decide that it needs no less than 512 bytes of the recent trace data, so if there is less than 512 bytes of pending data at the moment of panic, they will not be flushed and will not overwrite the previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic** (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`).
The option is only meaningful in streaming mode and it controls the maximum time that the tracing module will wait for the host to read the last data in case of panic.

3. **UART RX/TX ring buffer size** (**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**). The size of the buffer depends on the amount of data transferred through the UART.

4. **UART TX message size** (**CONFIG_APPTRACE_UART_TX_MSG_SIZE**). The maximum size of the single message to transfer.

### 4.1.4 How to Use This Library

This library provides APIs for transferring arbitrary data between the host and ESP32. When enabled in menuconfig, the target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding APIs to send, receive or flush the data.

#### Application Specific Tracing

In general, users should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between the target and the host:

1. On the target side, users should implement algorithms for writing trace data to the host. Piece of code below shows an example on how to do this.

   ```c
   #include "esp_app_trace.h"
   ...
   char buf[] = "Hello World!";
   esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf), ESP_APPTRACE_TMO_INFINITE);
   if (res != ESP_OK) {
       ESP_LOGE(TAG, "Failed to write data to host!");
       return res;
   }
   esp_apptrace_write() function uses memcpy to copy user data to the internal buffer. In some cases, it can be more optimal to use esp_apptrace_buffer_get() and esp_apptrace_buffer_put() functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.
   ```
   ```c
   #include "esp_app_trace.h"
   ...
   int number = 10;
   char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/"tmo in us*/);
   if (ptr == NULL) {
       ESP_LOGE(TAG, "Failed to get buffer!");
       return ESP_FAIL;
   }
   sprintf(ptr, "Here is the number %d", number);
   esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/"tmo in us*/);
   if (res != ESP_OK) {
       /* in case of error host tracing tool (e.g., OpenOCD) will report incomplete user buffer */
       ESP_LOGE(TAG, "Failed to put buffer!");
       return res;
   }
   ```

   Also according to his needs, the user may want to receive data from the host. Piece of code below shows an example on how to do this.

   ```c
   #include "esp_app_trace.h"
   ...
   ```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

```c
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/
/*do not wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
   ...
}
```

esp_apptrace_read() function uses memcpy to copy host data to user buffer. In some casesm it can be more optimal to use esp_apptrace_down_buffer_get() and esp_apptrace_down_buffer_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_/
~TRAX, &sz, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX,/
~ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g., OpenOCD) will report...
    incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the Getting Started Guide.
3. Run OpenOCD (see JTAG Debugging).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal:
telnet <oocd_host> 4444. If telnet session is opened on the same machine which runs OpenOCD, you can
use localhost as <oocd_host> in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and
redirect them to the specified file or socket (currently only files are supported as trace data destination). For
description of the corresponding commands, see OpenOCD Application Level Tracing Commands.
6. The final step is to process received data. Since the format of data is defined by users, the processing stage is out
of the scope of this document. Good starting points for data processor are python scripts in $IDF_PATH/tools/esp_app_trace: aptrace_proc.py (used for feature tests) and logtrace_proc.py (see more details in section Logging to Host).

OpenOCD Application Level Tracing Commands  

HW UP BUFFER is shared between user data blocks and the filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment, it can happen that the task/ISR which fills the buffer is preempted by another high priority task/ISR. So it is possible that the user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions, the tracing module prepends all user data chunks with header which contains the allocated user buffer size (2 bytes) and the length of the actually written data (2 bytes). So the total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case, it puts the contents of the whole user chunk (including unfilled area) to the output file.

Below is the description of available OpenOCD application tracing commands.

---

**Note:** Currently, OpenOCD does not provide commands to send arbitrary user data to the target.

---

**Command usage:**

```
esp aptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

**Sub-commands:**

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

**Start command syntax:**

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.
- **wait4halt** If 0, start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default, 0.
- **skip_size** Number of bytes to skip at the start. By default, 0.

**Note:** If `poll_period` is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point, tracing stops automatically.

**Command usage examples:**

1. Collect 2048 bytes of tracing data to the file `trace.log`. The file will be saved in the `openocd-esp32` directory.

```
esp aptrace start file://trace.log 1 2048 5 0 0
```
The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

**Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then it is likely that the target is not sending enough data to empty the buffer to OpenOCD before the timeout. Either increase the timeout or use the function `esp_apptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

```
esp apptrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no data timeout set. This process may be stopped by issuing `esp apptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp apptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

4. Wait for the target to be halted. Then resume the target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset, use the OpenOCD `reset halt` command.

**Logging to Host**

ESP-IDF implements a useful feature: logging to the host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. Most part of the work is done on the host.

By default, ESP-IDF’s logging library uses vprintf-like function to write formatted output to dedicated UART. In general, it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type, every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though the implementation of the vprintf-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced. And in the worst cases, the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or to move string formatting procedure to the host.

The application level tracing feature can be used to transfer log information to the host using `esp_apptrace_vprintf` function. This function does not perform full parsing of the format string and arguments. Instead, it just calculates the number of arguments passed and sends them along with the format string address to the host. On the host, log data is processed and printed out by a special Python script.

**Limitations** Current implementation of logging over JTAG has some limitations:

1. No support for tracing from `ESP_EARLY_LOGx` macros.
2. No support for printf arguments whose size exceeds 4 bytes (e.g., `double` and `uint64_t`).
3. Only strings from the .rodata section are supported as format strings and arguments.
4. The maximum number of printf arguments is 256.
How To Use It  In order to use logging via trace module, users need to perform the following steps:

1. On the target side, the special vprintf-like function `esp_apptrace_vprintf` needs to be installed. It sends log data to the host. Example code is provided in `system/app_trace_to_host`.

2. Follow instructions in items 2-5 in Application Specific Tracing.

3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`.

Log Trace Processor Command Options  Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

- **trace_file** Path to log trace file.
- **elf_file** Path to program ELF file.

Optional arguments:

- `-h, --help` Show this help message and exit.
- `--no-errors, -n` Do not print errors.

System Behavior Analysis with SEGGER SystemView

Another useful ESP-IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application. It is possible to view events in real-time through the UART interface.

How To Use It  Support for this feature is enabled by Component config > Application Level Tracing > FreeRTOS SystemView Tracing (`CONFIG_APPTRACE_SV_ENABLE`) menuconfig option. There are several other options enabled under the same menu:

1. SystemView destination. Select the destination interface: JTAG or UART. In case of UART, it will be possible to connect SystemView application to the ESP32 directly and receive data in real-time.

2. ESP32 timer to use as SystemView timestamp source: (`CONFIG_APPTRACE_SV_TS_SOURCE`) selects the source of timestamps for SystemView events. In the single core mode, timestamps are generated using ESP32 internal cycle counter running at maximum 240 MHz (~4 ns granularity). In the dual-core mode, external timer working at 40 MHz is used, so the timestamp granularity is 25 ns.

3. Individually enabled or disabled collection of SystemView events (`CONFIG_APPTRACE_SV_EVT_XXX`):
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Start Ready State Event
   - Task Stop Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

ESP-IDF has all the code required to produce SystemView compatible traces, so users can just configure necessary project options (see above), build, download the image to target, and use OpenOCD to collect data as described in the previous sections.
4. Select Pro or App CPU in menuconfig options Component config > Application Level Tracing > FreeRTOS SystemView Tracing to trace over the UART interface in real-time.

**OpenOCD SystemView Tracing Command Options**

Command usage:

```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1** Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.
- **outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger).

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in the OpenOCD window (not the one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point, tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files `pro-cpu.SVDat` and `app-cpu.SVDat`. The files will be saved in `openocd-esp32` directory.

   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
   ```

   The tracing data will be retrieved and saved in non-blocking mode. To stop this process, enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in the OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
   ```

   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

**Data Visualization**

After trace data are collected, users can use a special tool to visualize the results and inspect behavior of the program.

Unfortunately, SystemView does not support tracing from multiple cores. So when tracing from ESP32 with JTAG interfaces in the dual-core mode, two files are generated: one for PRO CPU and another for APP CPU. Users can load each file into separate instances of the tool. For tracing over UART, users can select Component config > Application Level Tracing > FreeRTOS SystemView Tracing in menuconfig Pro or App to choose which CPU has to be traced.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately, there is an Eclipse plugin called *Impulse* which can load several trace files, thus making it possible to inspect events from both cores in one view. Also, this plugin has no limitation of 1,000,000 events as compared to the free version of SystemView.
Chapter 4. API Guides

Good instructions on how to install, configure, and visualize data in Impulse from one core can be found here.

**Note:** ESP-IDF uses its own mapping for SystemView FreeRTOS events IDs, so users need to replace the original file mapping $SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt with $IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt. Also, contents of that IDF-specific file should be used when configuring SystemView serializer using the above link.

**Configure Impulse for Dual Core Traces**  After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs, users can add special Multi Adapter port and load both files into one view. To do this, users need to do the following steps in Eclipse:

1. [Open the Signal Ports view. Go to Windows > Show View > Other menu. Find the Signal Ports view in Impulse folder and double-click it.]
2. [In the Signal Ports view, right-click Ports and select Add > New Multi Adapter Port.]
3. [In the open dialog box, click Add and select New Pipe/File.]
4. [In the open dialog box, select SystemView Serializer as Serializer and set path to PRO CPU trace file. Click OK.]
5. [Repeat the steps 3-4 for APP CPU trace file.]
6. [Double-click the created port. View for this port should open.]
7. [Click the Start/Stop Streaming button. Data should be loaded.]
8. [Use the Zoom Out, Zoom In and Zoom Fit buttons to inspect data.]
9. [For settings measurement cursors and other features, please see Impulse documentation.]

**Note:** If you have problems with visualization (no data is shown or strange behaviors of zoom action are observed), you can try to delete current signal hierarchy and double-click on the necessary file or port. Eclipse will ask you to create a new signal hierarchy.

**Gcov (Source Code Coverage)**

**Basics of Gcov and Gcovr**  Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’s runtime. Gcov is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The Gcovr tool is a utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a .gcno notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have its own .gcno file of the same name (e.g., a `main.c` will generate a `main.gcno` when compiled).
2. Execute the program. During execution, the program should generate .gcda data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a .gcda file for each source file compiled with the `--coverage` option (e.g., `main.c` will generate `main.gcda`).
3. Gcov or Gcovr can be used to generate a code coverage based on the .gcno, .gcda, and source files. Gcov will generate a text-based coverage report for each source file in the form of a .gcov file, whilst Gcovr will generate a coverage report in HTML format.

**Gcov and Gcovr in ESP-IDF**  Using Gcov in ESP-IDF is complicated due to the fact that the program is running remotely from the host (i.e., on the target). The code coverage data (i.e., the .gcda files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps:

1. [Setting Up a Project for Gcov]
2. [Dumping Code Coverage Data]
3. Generating Coverage Report

Setting Up a Project for Gcov

Compiler Option  In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

- To cause all source files in a component to be compiled with the `--coverage` option, you can add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the CMakeLists.txt file of the component.
- To cause a select number of source files (e.g., `source1.c` and `source2.c`) in the same component to be compiled with the `--coverage` option, you can add `set_source_files_properties(source1.c source2.c PROPERTIES COMPIL_FLAGS --coverage)` to the CMakeLists.txt file of the component.

When a source file is compiled with the `--coverage` option (e.g., `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project’s build directory.

Project Configuration  Before building a project with source code coverage, make sure that the following project configuration options are enabled by running `idf.py menuconfig`.

- Enable the application tracing module by selecting `Trace Memory` for the `CONFIG_APPTRACE_DESTINATION1` option.
- Enable Gcov to the host via the `CONFIG_APPTRACE_GCOV_ENABLE`.

Dumping Code Coverage Data  Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the host is known as dumping.

The dumping of coverage data is done via OpenOCD (see `JTAG Debugging` on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <oocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project’s build directory. For example, if `gcov_example_main.c` of the main component is compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda`. Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application’s lifetime. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application’s entire lifetime.

ESP-IDF supports two methods of dumping code coverage data form the target to the host:

- Instant Run-Time Dump
- Hard-coded Dump

**Instant Run-Time Dump**  An Instant Run-Time Dump is triggered by calling the `ESP32 gcov OpenOCD` command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32’s current state and execute a built-in ESP-IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the host. Upon completion, the ESP32 will resume its current state.
**Hard-coded Dump**  A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the host must execute the `esp gcov dump` OpenOCD command (via a telnet session). The `esp gcov dump` command will cause OpenOCD to connect to the ESP32, retrieve the code coverage data, then disconnect from the ESP32, thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application’s lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application’s lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application’s main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp gcov dump` automatically via the use a gdbinit script (see Using GDB from Command Line).

The following GDB script will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp gcov dump` OpenOCD command.

```gdb
b esp_gcov_dump
commands
mon esp gcov dump
end
```

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.

**Generating Coverage Report**  Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to Gcov documentation and Gcovr documentation.

**Adding Gcovr Build Target to Project**  To make report generation more convenient, users can define additional build targets in their projects such that the report generation can be done with a single build command.

Add the following lines to the CMakeLists.txt file of your project.

```cmake
include(${IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `$BUILD_DIR_BASE/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

**4.2 Application Startup Flow**

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. **First stage bootloader** in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. **Second stage bootloader** loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. **Application startup** executes. At this point the second CPU and RTOS scheduler are started.
This process is explained in detail in the following sections.

4.2.1 First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the call_start_cpu0 function of application startup code. Reset vector code is located in the mask ROM of the ESP32 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking GPIO Strap_REG register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in RTC_CNTL_STORE6_REG is non-zero, and CRC value of RTC memory in RTC_CNTL_STORE7_REG is valid, use RTC_CNTL_STORE6_REG as an entry point address and jump immediately to it. If RTC_CNTL_STORE6_REG is zero, or RTC_CNTL_STORE7_REG contains invalid CRC, or once the code called via RTC_CNTL_STORE6_REG returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.

2. For power-on reset, software SOC reset, and watchdog SOC reset: check the GPIO Strap_REG register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32 datasheet for a description of SoC boot modes and how to execute them.

3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

**Note:** During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

Second stage bootloader binary image is loaded from flash starting at address 0x1000. If Secure Boot is in use then the first 4 KB sector of flash is used to store secure boot IV and digest of the bootloader image. Otherwise, this sector is unused.

4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in components/bootloader directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (configurable value). See partition tables documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the otadata partition to determine which one should be booted. See Over The Air Updates (OTA) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see **Bootloader**.

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal IRAM (Instruction RAM) or DRAM (Data RAM), the contents are copied from flash to the load address.
- For segments which have load addresses in DROM (data stored in flash) or IROM (code executed from flash) regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.
Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

### 4.2.3 Application startup

Application startup covers everything that happens after the app starts executing and before the `app_main` function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling `app_main`.

**Note:** Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer’s perspective only, skip forward to *Running the main task.*

#### Port Initialization

ESP-IDF application entry point is `call_start_cpu0` function found in `components/esp_system/port/cpu_start.c`. This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment ("CRT") and performs initial configuration of the SoC’s internal hardware:

- Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing Fatal Errors to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
- If the option `CONFIG_BOOTLOADER_WDT_ENABLE` is not set then the RTC watchdog timer is disabled.
- Initialize internal memory (data & bss).
- Finish configuring the MMU cache.
- Enable PSRAM if configured.
- Set the CPU clocks to the frequencies configured for the project.
- Reconfigure the main SPI flash based on the app header settings (necessary for compatibility with bootloader versions before ESP-IDF V4.0, see *Bootloader compatibility*).
- If the app is configured to run on multiple cores, start the other core and wait for it to initialize as well (inside the similar “port layer” initialization function `call_start_cpu1`).

Once `call_start_cpu0` completes running, it calls the “system layer” initialization function `start_cpu0` found in `components/esp_system/startup.c`. Other cores will also complete port-layer initialization and call `start_other_cores` found in the same file.

#### System Initialization

The main system initialization function is `start_cpu0`. By default, this function is weak-linked to the function `start_cpu0_default`. This means that it’s possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

- Log information about this application (project name, *App Version*, etc.) if default log level enables this.
- Initialize the heap allocator (before this point all allocations must be static or on the stack).
- Initialize newlib component syscalls and time functions.
- Configure the brownout detector.
- Setup libc stdin, stdout, and stderr according to the *serial console configuration*.
- Perform any security-related checks, including burning efuses that should be burned for this configuration (including *disabling ROM download mode on ESP32 V3, CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE*).
- Initialize SPI flash API support.
- Call global C++ constructors and any C functions marked with __attribute__((constructor)).

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the ESP_SYSTEM_INIT_FN macro, it will be called as part of secondary initialization.

### Running the main task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function app_main in the firmware.

The main task that runs app_main has a fixed RTOS priority (one higher than the minimum) and a configurable stack size.

The main task core affinity is also configurable: CONFIG_ESP_MAIN_TASK_AFFINITY.

Unlike normal FreeRTOS tasks (or embedded C main functions), the app_main task is allowed to return. If this happens, The task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement app_main as either a function that creates other application tasks and then returns, or as a main application task itself.

### Second core startup

A similar but simpler startup process happens on the APP CPU:

When running system initialization, the code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, APP CPU jumps to call_start_cpu1 function in components/esp_system/port/cpu_start.c.

While PRO CPU does initialization in start_cpu0 function, APP CPU runs start_cpu_other_cores function. Similar to start_cpu0, this function is weak-linked and defaults to the start_cpu_other_cores_default function but can be replaced with a different function by the application.

The start_cpu_other_cores_default function does some core-specific system initialization and then waits for the PRO CPU to start the FreeRTOS scheduler, at which point it executes esp_startup_start_app_other_cores which is another weak-linked function defaulting to esp_startup_start_app_other_cores_default.

By default esp_startup_start_app_other_cores_default does nothing but spin in a busy-waiting loop until the scheduler of the PRO CPU triggers an interrupt to start the RTOS scheduler on the APP CPU.

### 4.3 BluFi

#### 4.3.1 Overview

The BluFi for ESP32 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32. Using this information ESP32 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.
4.3.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32 into GATT Server mode and then it will send broadcasts with specific advertising data. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32 (see the section The Frame Formats Defined in BluFi for details).
4. After ESP32 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32.
7. When receiving this control frame, ESP32 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of The Frame Formats Defined in BluFi, with the Wi-Fi configuration information to ESP32, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32. When receiving this control frame, ESP32 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

Note:

1. After ESP32 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

4.3.3 The Flow Chart of BluFi

4.3.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32 are defined as follows:

The frame format with no fragment (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type (Least Significant Bit)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td></td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>$[Data Length]$</td>
</tr>
<tr>
<td>CheckSum (Most Significant Bit)</td>
<td>2</td>
</tr>
</tbody>
</table>

If the Frame Ctrl bit is enabled, the Total length bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit):

<td>Send the SSID for SoftAP mode.</td>
<td></td>
<td>Please refer to Note 1 below.</td>
</tr>
<tr>
<td>0x5 (b' 000101)</td>
<td>Send the password for SoftAP mode.</td>
<td></td>
<td>Please refer to Note 1 below.</td>
</tr>
<tr>
<td>0x6 (b' 001000)</td>
<td>Set the maximum connection number for SoftAP mode.</td>
<td></td>
<td>data[0] represents the value of the connection number, ranging from 1 to 4. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.</td>
</tr>
</tbody>
</table>
| 0x7 (b' 001001) | Set the authentication mode for the SoftAP. |  | data[0]:  
  - 0x00: OPEN  
  - 0x01: WEP  
  - 0x02: WPA_PSK  
  - 0x03: WPA2_PSK  
  - 0x04: WPA_WPA2_PSK  
  When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information. |
| 0x8 (b' 001010) | Set the number of channels for SoftAP mode. |  | data[0] represents the quantity of the supported channels, ranging from 1 to 14. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information. |
| 0x9 (b' 001011) | Username | It provides the username of the GATT client when using encryption of enterprise level. | The length of the data depends on the length field. |
| 0xa (b' 001100) | CA Certification | It provides the CA Certification when using encryption of enterprise level. | Please refer to Note 2 below. |
| 0xb (b' 001101) | Client Certification | It provides the client certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification. | Please refer to Note 2 below. |
| 0xc (b' 001110) | Server Certification | It provides the server certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification. | Please refer to Note 2 below. |
| 0xd (b' 001111) | Client Private Key | It provides the private key of the client when using encryption of enterprise level. | Please refer to Note 2 below. |
| 0xe (b' 001000) | Server Private Key | It provides the private key of the server when using encryption of enterprise level. | Please refer to Note 2 below. |
Note:

- Note 1: The length of the data depends on the length field. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
- Note 2: The length of the data depends on the length field. The frame supports to be fragmented if the data length is not enough.

2. Frame Control
   Control field, takes 1 byte and each bit has a different meaning.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0x01  | Indicates whether the frame is encrypted.  
      | • 1 means encryption  
      | • 0 means unencrypted  
      | The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum). Control frame is not encrypted, so this bit is 0. |
| 0x02  | The data field that indicates whether a frame contains a checksum (such as SHA1, MD5, CRC, etc.) for the end of the frame. Data field includes sequence + data length + clear text. Both the control frame and the data frame can contain a check bit or not. |
| 0x04  | Represents the data direction.  
      | • 0 means the mobile phone to ESP device;  
      | • 1 means ESP device to the mobile phone. |
| 0x08  | Indicates whether the other person is required to reply to an ACK.  
      | • 0 indicates no requirement;  
      | • 1 indicates to reply ACK. |
| 0x10  | Indicates whether there are subsequent data fragments.  
      | • 0 indicates that there are no subsequent data fragments for this frame;  
      | • 1 indicates that there are subsequent data fragments and used to transmit longer data.  
      | In the case of a frag frame, the total length of the current content section + subsequent content section is given, in the first 2 bytes of the data field (that is, the content data of the maximum support 64 K). |
| 0x10-0x80 | reserved |

3. Sequence Control
   Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

4.4.3.5 The Security Implementation of ESP32

1. Securing data
   To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

2. Ensuring data integrity
To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

3. Securing identity (signature)
   Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as a companion for signature.

4. Replay attack prevention
   It is added to the Sequence field and used during the checksum verification.
   For the coding of ESP32, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.

The application layer needs to register several security-related functions to BluFi:

```c
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)
```

This function is for ESP32 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output_data and Output_len.

BluFi will send output_data from Negotiate_data_handler after Negotiate_data_handler is called.

Here are two "*", because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED_FREE.

```c
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

### 4.3.6 GATT Related Instructions

**UUID**

BluFi Service UUID: 0xFFFF, 16 bit
BluFi (the mobile -> ESP32): 0xFF01, writable
Blufi (ESP32 -> the mobile phone): 0xFF02, readable and callable

### 4.4 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Initialize Flash Encryption and/or Secure features, if configured;
3. Select the application partition to boot, based on the partition table and ota_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to the image that was just loaded.
Bootloader is located at the address 0x1000 in the flash.

For a full description of the startup process including the the ESP-IDF bootloader, see Application Startup Flow.

### 4.4.1 Bootloader compatibility

It is recommended to update to newer versions of ESP-IDF: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

**Note:** If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

#### Before ESP-IDF V2.1

Bootloaders built from very old versions of ESP-IDF (before ESP-IDF V2.1) perform less hardware configuration than newer versions. When using a bootloader from these early ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS`.

#### Before ESP-IDF V3.1

Bootloaders built from versions of ESP-IDF before V3.1 do not support MD5 checksums in the partition table binary. When using a bootloader from these ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`.

#### SPI Flash Configuration

Each ESP-IDF application or bootloader .bin file contains a header with `CONFIG_ESPTOOLPY_FLASHMODE`, `CONFIG_ESPTOOLPY_FLASHFREQ`, `CONFIG_ESPTOOLPY_FLASHSIZE` embedded in it. These are used to configure the SPI flash during boot.

The *First stage bootloader* in ROM reads the *Second stage bootloader* header information from flash and uses this information to load the rest of the *Second stage bootloader* from flash. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the *Second stage bootloader* then runs, it will reconfigure the flash using values read from the currently selected app binary’s header (and NOT from the *Second stage bootloader* header). This allows an OTA update to change the SPI flash settings in use.

Bootloaders prior to ESP-IDF V4.0 used the bootloader’s own header to configure the SPI flash, meaning these values could not be changed in an update. To maintain compatibility with older bootloaders, the app re-initializes the flash settings during app startup using the configuration found in the app header.

#### 4.4.2 Log Level

The default bootloader log level is “Info”. By setting the `CONFIG_BOOTLOADER_LOG_LEVEL` option, it’s possible to increase or decrease this level. This log level is separate from the log level used in the app (see Logging library).

Reducing bootloader log verbosity can improve the overall project boot time by a small amount.
4.4.3 Factory reset

Sometimes it is desirable to have a way for the device to fall back to a known-good state, in case of some problem with an update.

To roll back to the original “factory” device configuration and clear any user settings, configure the config item `CONFIG_BOOTLOADER_FACTORY_RESET` in the bootloader.

The factory reset mechanism allows the device to be factory reset in two ways:

- Clear one or more data partitions. The `CONFIG_BOOTLOADER_DATA_FACTORY_RESET` option allows users to specify which data partitions will be erased when the factory reset is executed. Users can specify the names of partitions as a comma-delimited list with optional spaces for readability. (Like this: `nvs, phy_init, nvs_custom`). Make sure that the names of partitions specified in the option are the same as those found in the partition table. Partitions of type “app” cannot be specified here.

- Boot from “factory” app partition. Enabling the `CONFIG_BOOTLOADER_OTA_DATA_ERASE` option will cause the device to boot from the default “factory” app partition after a factory reset (or if there is no factory app partition in the partition table then the default ota app partition is selected instead). This reset process involves erasing the OTA data partition which holds the currently selected OTA partition slot. The “factory” app partition slot (if it exists) is never updated via OTA, so resetting to this allows reverting to a “known good” firmware application.

Either or both of these configuration options can be enabled independently.

In addition, the following configuration options control the reset condition:

- `CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET` - The input GPIO number used to trigger a factory reset. This GPIO must be pulled low or high (configurable) on reset to trigger this.

- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

- `CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL` - configure whether a factory reset should trigger on a high or low level of the GPIO. If the GPIO has an internal pullup then this is enabled before the pin is sampled, consult the ESP32 datasheet for details on pin internal pullups.

4.4.4 Boot from Test Firmware

It’s possible to write a special firmware app for testing in production, and boot this firmware when needed. The project partition table will need a dedicated app partition entry for this testing app, type `app` and subtype `test` (see Partition Tables).

Implementing a dedicated test app firmware requires creating a totally separate ESP-IDF project for the test app (each project in ESP-IDF only builds one app). The test app can be developed and tested independently of the main project, and then integrated at production testing time as a pre-compiled .bin file which is flashed to the address of the main project’s test app partition.

To support this functionality in the main project’s bootloader, set the configuration item `CONFIG_BOOTLOADER_APP_TEST` and configure the following two items:

- `CONFIG_BOOTLOADER_NUM_PIN_APP_TEST` - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. Once the GPIO input is released (allowing it to be pulled up) and the device has been reboot, the normally configured application will boot (factory or any OTA app partition slot).

- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
4.4.5 Rollback

Rollback and anti-rollback features must be configured in the bootloader as well.

Consult the App rollback and Anti-rollback sections in the OTA API reference document.

4.4.6 Watchdog

By default, the hardware RTC Watchdog timer remains running while the bootloader is running and will automatically reset the chip if no app has successfully started after 9 seconds.

- The timeout period can be adjusted by setting `CONFIG_BOOTLOADER_WDT_TIME_MS` and recompiling the bootloader.
- The app’s behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset (i.e., fed) by the app to avoid a reset. To do this, set the `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` option, modify the app as needed, and then recompile the app.
- The RTC Watchdog can be disabled in the bootloader by disabling the `CONFIG_BOOTLOADER_WDT_ENABLE` setting and recompiling the bootloader. This is not recommended.

4.4.7 Bootloader Size

When enabling additional bootloader functions, including Flash Encryption or Secure Boot, and especially if setting a high `CONFIG_BOOTLOADER_LOG_LEVEL` level, then it is important to monitor the bootloader .bin file’s size.

When using the default `CONFIG_PARTITION_TABLE_OFFSET` value 0x8000, the size limit is 0x7000 (28672) bytes.

If the bootloader binary is too large, then the bootloader build will fail with an error “Bootloader binary size […] is too large for partition table offset”. If the bootloader binary is flashed anyhow then the ESP32 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

Options to work around this are:

- Set bootloader compiler optimization back to “Size” if it has been changed from this default value.
- Reduce bootloader log level. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set `CONFIG_PARTITION_TABLE_OFFSET` to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the partition table CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.)

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 48KB (0xC000 bytes) (excluding the 4 KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

4.4.8 Fast boot from Deep Sleep

The bootloader has the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` option which allows the wake-up time from deep sleep to be reduced (useful for reducing power consumption). This option is available when `CONFIG_SECURE_BOOT` option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

4.4.9 Custom bootloader

The current bootloader implementation allows a project to extend it or modify it. There are two ways of doing it: by implementing hooks or by overriding it. Both ways are presented in custom_bootloader folder in ESP-IDF examples:
Chapter 4. API Guides

- bootloader_hooks which presents how to connect some hooks to the bootloader initialization
- bootloader_override which presents how to override the bootloader implementation

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project’s bootloader_components directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the partition table offset value to place the partition table later in the flash. This increases the space available for the bootloader.

4.5 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organize and build a new ESP-IDF project or component.

4.5.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called sdkconfig in the root directory of the project. This configuration file is modified via idf.py menuconfig to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. A full list of supported targets in your version of ESP-IDF can be seen by running idf.py –list-targets.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the IDF_PATH environment variable which holds the path of the esp-idf directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH.
4.5.2 Using the Build System

idf.py

The idf.py command-line tool provides a front-end for easily managing your project builds. It manages the following tools:

- **CMake**, which configures the project to be built
- A command-line build tool (either **Ninja** build or **GNU Make**)
- **esptool.py** for flashing the target.

The [getting started guide](#) contains a brief introduction to how to set up idf.py to configure, build, and flash projects. idf.py should be run in an ESP-IDF “project” directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a Makefile will not work with idf.py.

Type `idf.py --help` for a list of commands. Here are a summary of the most useful ones:

- **idf.py set-target <target>** sets the target (chip) for which the project is built. See [Selecting the Target](#).
- **idf.py menuconfig** runs the “menuconfig” tool to configure the project.
- **idf.py build** will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
  - Run **CMake** as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool (**Ninja** or **GNU Make**). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to idf.py.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- **idf.py clean** will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete CMake configuration output and some other files.
- **idf.py fullclean** will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes all files in the build directory, so use with care. Project configuration is not deleted.
- **idf.py flash** will automatically build the project if necessary, and then flash it to the target. The `-p` and `-b` options can be used to set serial port name and flasher baud rate, respectively.
- **idf.py monitor** will display serial output from the target. The `-p` option can be used to set the serial port name. Type `Ctrl-`] to exit the monitor. See [IDF Monitor](#) for more details about using the monitor.

Multiple idf.py commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to idf.py an attempt to execute them as a build system target will be made.

The command idf.py supports shell autocompletion for bash, zsh and fish shells.

In order to make shell autocompletion supported, please make sure you have at least Python 3.5 and [click](https://click.palletsprojects.com) 7.1 or newer ([see also](#)).

To enable autocompletion for idf.py use the `export` command ([see this](#)). Autocompletion is initiated by pressing the TAB key. Type “idf.py -” and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

---

**Note:** The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

---

**Advanced Commands**

- **idf.py app, idf.py bootloader, idf.py partition-table** can be used to build only the app, bootloader, or partition table from the project as applicable.
There are matching commands `idf.py app-flash`, etc. to flash only that single part of the project to the target.

`idf.py -p PORT erase-flash` will use `esptool.py` to erase the target’s entire flash chip.

`idf.py size` prints some size information about the app. `size-components` and `size-files` are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable `-DOUTPUT_JSON=1` when running CMake (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.

`idf.py reconfigure` re-runs CMake even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.

`idf.py python-clean` deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

`idf.py docs` will open direct link to documentation for project’s chip target and version in browser. To see all options use `idf.py docs --help`.

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

### `idf.py` options

To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `--C <dir>` allows overriding the project directory from the default current working directory.
- `--B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable CCache when compiling source files, if the CCache tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling CCache and build again. CCache can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `--v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.

### Start a new project

Use the command `idf.py create-project` for starting a new project. Execute `idf.py create-project --help` for more information.

Example:

```
$ idf.py create-project --path my_projects my_new_project
```

This example will create a new project called `my_new_project` directly into the directory `my_projects`.

### Using CMake Directly

`idf.py` is a wrapper around CMake for convenience. However, you can also invoke CMake directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):
In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is `Ninja`: running `ninja` actually builds the project.

It’s not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

**Note:** If you’re already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake’s functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more “CMake style” components.

### Flashing with ninja or make

It’s possible to build and flash directly from `ninja` or `make` by running a target like:

```
ninja flash
```

Or:
```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:
```
ESPPORT=/dev/ttyUSB0 ninja flash
```

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

Or:
```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

**Note:** Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute `idf.py` for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).
Chapter 4. API Guides

Setting up the Python Interpreter

ESP-IDF works well with Python version 3.7+.

idf.py and other Python scripts will run with the default Python interpreter, i.e. python. You can switch to a different one like python3 $IDF_PATH/tools/idf.py ..., or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running cmake -D PYTHON=python3 ... will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the PYTHON value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools pyenv or virtualenv. These let you change the default Python version.

Possible issues The user of idf.py may sometimes experience ImportError described below.

Possible issues

The user of idf.py may sometimes experience ImportError described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in <module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r

The exception is often caused by .pyc files generated by different Python versions. To solve the issue run the following command:

idf.py python-clean
```

4.5.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/ - component1/ - CMakeLists.txt
    - Kconfig
    - src1.c
    - component2/ - CMakeLists.txt
      - Kconfig
      - src2.c
  - include/ - component2.h
  - main/ - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project CMakeLists.txt file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file /tools/cmake/project.cmake which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “sdkconfig” project configuration file. This file is created/updated when idf.py menuconfig runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “sdkconfig” file may or may not be added to the source control system of the project.
- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, EXTRA_COMPONENT_DIRS can be set in
Chapter 4. API Guides

the top-level CMakeLists.txt to look for components in other places. See the renaming main section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “main”.

- “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable COMPONENT_DIRS includes this component but you can modify this variable.
- “build” directory is where build output is created. This directory is created by idf.py if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component CMakeLists.txt file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See Component CMakeLists Files for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via menuconfig. Some components may also include Kconfig projbuild and project include cmake files, which are special files for overriding parts of the project.

4.5.4 Project CMakeLists File

Each project has a single top-level CMakeLists.txt file that contains build settings for the entire project. By default, the project CMakeLists can be quite minimal.

Minimal Example CMakeLists

Minimal project:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

- cmake_minimum_required(VERSION 3.5) tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the CMakeLists.txt file.
- include($ENV{IDF_PATH}/tools/cmake/project.cmake) pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- project(myProject) creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie myProject.elf, myProject.bin. Only one project can be defined per CMakeLists file.

Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in /tools/cmake/project.cmake for all of the implementation details.

- COMPONENT_DIRS: Directories to search for components. Defaults to IDF_PATH/components, PROJECT_DIR/components, and EXTRA_COMPONENT_DIRS. Override this variable if you don’t want to search for components in these places.
- EXTRA_COMPONENT_DIRS: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
- COMPONENTS: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the REQUIREs or PRIV_REQUIRES arguments
on component registration will automatically have it added to this list, so the COMPONENTS list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` i.e `set(VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...) line but before the `include(...) line.

### Renaming main component

The build system provides special treatment to the main component. It is a component that gets automatically added to the build provided that it is in the expected location, PROJECT_DIR/main. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the main component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming main are as follows:

1. Rename main directory.
2. Set EXTRA_COMPONENT_DIRS in the project CMakeLists.txt to include the renamed main directory.
3. Specify the dependencies in the renamed component’s CMakeLists.txt file via REQUIRES or PRIV_REQUIRES arguments on component registration.

### Overriding default build specifications

The build sets some global build specifications (compile flags, definitions, etc.) that gets used in compiling all sources from all components.

For example, one of the default build specifications set is the compile option `-Wextra`. Suppose a user wants to use override this with `-Wno-extra`, it should be done after `project()`:

```cmake
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
idf_build_set_property(COMPILE_OPTIONS "-Wno-error" APPEND)
```

This ensures that the compile options set by the user won’t be overridden by the default build specifications, since the latter are set inside `project()`.

### 4.5.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project’s own components directory, or added from custom component directories (see above).

A component is any directory in the COMPONENT_DIRS list which contains a CMakeLists.txt file.

### Searching for Components

The list of directories in COMPONENT_DIRS is searched for the project’s components. Directories in this list can either be components themselves (i.e., they contain a CMakeLists.txt file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.
Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by COMPONENT_DIRS; by default, this means ESP-IDF’s internal components first (IDF_PATH/components), then any components in directories specified in EXTRA_COMPONENT_DIRS, and finally the project’s components (PROJECT_DIR/components). If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

Note: If a component is overridden in an existing project by moving it to a new location, the project will not automatically see the new component path. Run idf.py reconfigure (or delete the project build folder) and then build again.

Minimal Component CMakeLists

The minimal component CMakeLists.txt file simply registers the component to the build system using idf_component_register:

```
idf_component_register(
    SRCS "foo.c" "bar.c"
    INCLUDE_DIRS "include"
    REQUIRES mbedtls
)
```

- SRCS is a list of source files (*.c, *.cpp, *.cc, *.S). These source files will be compiled into the component library.
- INCLUDE_DIRS is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- REQUIRES is not actually required, but it is very often required to declare what other components this component will use. See Component Requirements.

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the CMakeLists.txt file itself, although they can be absolute.

There are other arguments that can be passed to idf_component_register. These arguments are discussed here.

See example component requirements and example component CMakeLists for more complete component CMakeLists.txt examples.

Create a new component

Use the command idf.py create-component for creating a new component. The new component will contain set of files necessary for building a component. You may include the component’s header file into your project and use its functionality. For more information execute idf.py create-component --help.

Example:

```
idf.py -C components create-component my_component
```

The example will create a new component in the subdirectory components under the current working directory. For more information about components follow the documentation page see above.

Preset Component Variables

The following component-specific variables are available for use inside component CMakeLists, but should not be modified:
Chapter 4. API Guides

- COMPONENT_DIR: The component directory. Evaluates to the absolute path of the directory containing CMakeLists.txt. The component path cannot contain spaces. This is the same as the CMAKE_CURRENT_SOURCE_DIR variable.
- COMPONENT_NAME: Name of the component. Same as the name of the component directory.
- COMPONENT_ALIAS: Alias of the library created internally by the build system for the component.
- COMPONENT_LIB: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- CONFIG_*: Each value in the project configuration has a corresponding variable available in cmake. All names begin with CONFIG_. More information here.
- ESP_PLATFORM: Set to 1 when the CMake file is processed within ESP-IDF build system.

Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using idf_build_get_property from the component CMakeLists.txt:

- PROJECT_NAME: Name of the project, as set in project CMakeLists.txt file.
- PROJECT_DIR: Absolute path of the project directory containing the project CMakeLists. Same as the CMAKE_SOURCE_DIR variable.
- COMPONENTS: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- IDF_VER: Git version of ESP-IDF (produced by git describe)
- IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by IDF_VER variable. v4.0-dev-*, v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of IDF_VERSION_* variables, but different IDF_VER values.
- IDF_TARGET: Name of the target for which the project is being built.
- PROJECT_VER: Project version.
  - If CONFIG_APP_PROJECT_VER_FROM_CONFIG option is set, the value of CONFIG_APP_PROJECT_VER will be used.
  - Else, if PROJECT_VER variable is set in project CMakeLists.txt file, its value will be used.
  - Else, if the PROJECT_DIR/version.txt exists, its contents will be used as PROJECT_VER.
  - Else, if the project is located inside a Git repository, the output of git describe will be used.
  - Otherwise, PROJECT_VER will be “1”.

Other build properties are listed here.

Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the target_compile_options function:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake set_source_files_properties command:

```cmake
set_source_files_properties(mysrc.c
  PROPERTIES COMPILIE_FLAGS
  -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to idf_component_register in the component CMakeLists file.
4.5.6 Component Configuration

Each component can also have a Kconfig file, alongside CMakeLists.txt. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see Adding conditional configuration.

4.5.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- **ESP_PLATFORM**: Can be used to detect that build happens within ESP-IDF.
- **IDF_VER**: Defined to a git version string. E.g. v2.0 for a tagged release or v1.0-275-g0efaa4f for an arbitrary commit.

4.5.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on (“requires”).

When writing a component

```c
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- **REQUIRES** should be set to all components whose header files are #included from the public header files of this component.
- **PRIV_REQUIRES** should be set to all components whose header files are #included from any source files in this component, unless already listed in **REQUIRES**. Also any component which is required to be linked in order for this component to function correctly.
- The values of **REQUIRES** and **PRIV_REQUIRES** should not depend on any configuration choices (**CONFIG_xxx** macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both **REQUIRES** variables is fine. If the component has no requirements except for the **Common component requirements** needed for RTOS, libc, etc.

If a components only supports some target chips (values of **IDF_TARGET**) then it can specify **REQUIRED_IDF_TARGETS** in the **idf_component_register** call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

**Note:** In CMake terms, **REQUIRES** & **PRIV_REQUIRES** are approximate wrappers around the CMake functions **target_link_libraries(**... **PUBLIC **...)** and **target_link_libraries(**... **PRIVATE **...).**

**Example of component requirements**

Imagine there is a car component, which uses the engine component, which uses the spark_plug component:
Car component  The car.h header file is the public interface for the car component. This header includes engine.h directly because it uses some declarations from this header:

```c
/* car.h */
#include "engine.h"
#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

And car.c includes car.h as well:

```c
/* car.c */
#include "car.h"
```

This means the car/CMakeLists.txt file needs to declare that car requires engine:

```c
idf_component_register(SRCS "car.c"
  INCLUDE_DIRS "."
  REQUIRES engine)
```

- SRCS gives the list of source files in the car component.
- INCLUDE_DIRS gives the list of public include directories for this component. Because the public interface is car.h, the directory containing car.h is listed here.
- REQUIRES gives the list of components required by the public interface of this component. Because car.h is a public header and includes a header from engine, we include engine here. This makes sure that any other component which includes car.h will be able to recursively include the required engine.h also.

Engine component  The engine component also has a public header file include/engine.h, but this header is simpler:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start (void);
```

The implementation is in engine.c:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

In this component, engine depends on spark_plug but this is a private dependency. spark_plug.h is needed to compile engine.c, but not needed to include engine.h.

This means that the engine/CMakeLists.txt file can use PRIV_REQUIRES:
idf_component_register(SRCS "engine.c"
    INCLUDE_DIRS "include"
    PRIV_REQUIRES spark_plug)

As a result, source files in the car component don’t need the spark_plug include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

**Spark Plug Component** The spark_plug component doesn’t depend on anything else. It has a public header file spark_plug.h, but this doesn’t include headers from any other components.

This means that the spark_plug/CMakeLists.txt file doesn’t need any REQUIRES or PRIV_REQUIRES clauses:

idf_component_register(SRCS "spark_plug.c"
    INCLUDE_DIRS ".")

### Source File Include Directories

Each component’s source file is compiled with these include path directories, as specified in the passed arguments to `idf_component_register`:

idf_component_register(.
    INCLUDE_DIRS "include"
    PRIV_INCLUDE_DIRS "other")

- The current component’s INCLUDE_DIRS and PRIV_INCLUDE_DIRS.
- The INCLUDE_DIRS belonging to all other components listed in the REQUIRES and PRIV_REQUIRES parameters (i.e. all the current component’s public and private dependencies).
- Recursively, all of the INCLUDE_DIRS of those components REQUIRES lists (i.e. all public dependencies of this component’s dependencies, recursively expanded).

### Main component requirements

The component named main is special because it automatically requires all other components in the build. So it’s not necessary to pass REQUIRES or PRIV_REQUIRES to this component. See **renaming main** for a description of what needs to be changed if no longer using the main component.

### Common component requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: cxx, newlib, freertos, esp_hw_support, heap, log, lwip, soc, hal, esp_rom, esp_common, esp_system.

### Including components in the build

- By default, every component is included in the build.
- If you set the COMPONENTS variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  - Components mentioned explicitly in COMPONENTS.
  - Those components’ requirements (evaluated recursively).
  - The “common” components that every component depends on.
- Setting COMPONENTS to the minimal list of required components can significantly reduce compile times.
Circular Dependencies

It’s possible for a project to contain Component A that requires (REQUIRES or PRIV_REQUIRES) Component B, and Component B that requires Component A. This is known as a dependency cycle or a circular dependency.

CMake will usually handle circular dependencies automatically by repeating the component library names twice on the linker command line. However, this strategy doesn’t always work, and it’s possible the build will fail with a linker error about “Undefined reference to …”, referencing a symbol defined by one of the components inside the circular dependency. This is particularly likely if there is a large circular dependency, i.e. A–>B–>C–>D–>A.

The best solution is to restructure the components to remove the circular dependency. In most cases, a software architecture without circular dependencies has desirable properties of modularity and clean layering and will be more maintainable in the long term. However, removing circular dependencies is not always possible.

To bypass a linker error caused by a circular dependency, the simplest workaround is to increase the CMake LINK_INTERFACE_MULTIPLICITY property of one of the component libraries. This causes CMake to repeat this library and its dependencies more than twice on the linker command line.

For example:

```cmake
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- This line should be placed after idf_component_register in the component CMakeLists.txt file.
- If possible, place this line in the component that creates the circular dependency by depending on a lot of other components. However, the line can be placed inside any component that is part of the cycle. Choosing the component that owns the source file shown in the linker error message, or the component that defines the symbol(s) mentioned in the linker error message, is a good place to start.
- Usually increasing the value to 3 (default is 2) is enough, but if this doesn’t work then try increasing the number further.
- Adding this option will make the linker command line longer, and the linking stage slower.

Advanced Workaround: Undefined Symbols  If only one or two symbols is causing a circular dependency, and all other dependencies are linear, then there is an alternative method to avoid linker errors: Specify the specific symbols required for the “reverse” dependency as undefined symbols at link time.

For example, if component A depends on component B but component B also needs to reference reverse_ops from component A (but nothing else), then you can add a line like the following to the component B CMakeLists.txt to resolve the cycle at link time:

```cmake
# This symbol is provided by 'Component A' at link time
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- The -u argument means that the linker will always include this symbol in the link, regardless of dependency ordering.
- This line should be placed after idf_component_register in the component CMakeLists.txt file.
- If ‘Component B’ doesn’t need to access any headers of ‘Component A’, only link to a few symbol(s), then this line can be used instead of any REQUIREs from B to A. This further simplifies the component structure in the build system.

See the target_link_libraries documentation for more information about this CMake function.

Requirements in the build system implementation

- Very early in the CMake configuration process, the script expand_requirements.cmake is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this graph may have cycles). The graph is used to generate a file component_depends.cmake in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal BUILD_COMPONENTS variable). The BUILD_COMPONENTS variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed.
for all components. The order should be deterministic given the same set of components and component dependencies.

- The value of BUILD_COMPONENTS is logged by CMake as "Component names:
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the CMakeLists.txt file is evaluated again to add the component libraries to the build.

**Component Dependency Order** The order of components in the BUILD_COMPONENTS variable determines other orderings during the build:

- Order that project_include.cmake files are included into the project.
- Order that the list of header paths is generated for compilation (via -I argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

### 4.5.9 Overriding Parts of the Project

**project_include.cmake**

For components that have build requirements which must be evaluated before any component CMakeLists files are evaluated, you can create a file called project_include.cmake in the component directory. This CMake file is included when project.cmake is evaluating the entire project.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

Unlike component CMakeLists.txt files, when including a project_include.cmake file the current source directory (MAKE_CURRENT_SOURCE_DIR and working directory) is the project directory. Use the variable COMPONENT_DIR for the absolute directory of the component.

Note that project_include.cmake isn’t necessary for the most common component uses - such as adding include directories to the project, or LDFLAGS to the final linking step. These values can be customised via the CMakeLists.txt file itself. See [Optional Project Variables](#) for details.

project_include.cmake files are included in the order given in BUILD_COMPONENTS variable (as logged by CMake). This means that a component’s project_include.cmake file will be included after it’s all dependencies’ project_include.cmake files, unless both components are part of a dependency cycle. This is important if a project_include.cmake file relies on variables set by another component. See also above.

Take great care when setting variables or targets in a project_include.cmake file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

**KConfig.projbuild**

This is an equivalent to project_include.cmake for Component Configuration KConfig files. If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the KConfig.projbuild file alongside the CMakeLists.txt file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a KConfig file for Component Configuration.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

### 4.5.10 Configuration-Only Components

Special components which contain no source files, only Kconfig.projbuild and KConfig, can have a one-line CMakeLists.txt file which calls the function idf_component_register() with no arguments specified. This function will include the component in the project build, but no library will be built and no header files will be added to any include paths.
4.5.11 Debugging CMake

For full details about CMake and CMake commands, see the CMake v3.5 documentation.

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the `cmake command line documentation`.

When included from a project CMakeLists file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in CMake `project` function. This function is overridden to add all of the ESP-IDF specific project functionality.

Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to CMake so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don’t want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the `/tools/cmake/project.cmake` file and supporting functions in `/tools/cmake/` for more details.

4.5.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component `CMakeLists.txt` can be very small or even empty (see `Minimal Component CMakeLists`). However, overriding `component variables` is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

Adding conditional configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
    This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")
if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c")
endif()
idf_component_register(SRCS 
  "$\{\texttt{srcs}\}$
  ...
)
```

This example makes use of the CMake if function and list `APPEND` function.

This can also be used to select or stub out an implementation, as such:
Chapter 4. API Guides

Kconfig:

```c
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
    Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output debugging output to the lcd
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output temperature plots
```

CMakeLists.txt:

```cmake
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()

# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
  list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
                         ...
```

Conditions which depend on the target

The current target is available to CMake files via IDF_TARGET variable.

In addition to that, if target xyz is used (IDF_TARGET=xyz), then Kconfig variable CONFIG_IDF_TARGET_XYZ will be set.

Note that component dependencies may depend on IDF_TARGET variable, but not on Kconfig variables. Also one can not use Kconfig variables in include statements in CMake files, but IDF_TARGET can be used in such context.

Source Code Generation

Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```cmake
add_custom_command(OPTIONAL
  COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
  DEPENDS ${COMPONENT_DIR}/logo.bmp
                  VERBATIM)
add_custom_target(logo DEPENDS log.h)
add_dependencies(${COMPONENT_LIB} logo)
```

(continues on next page)
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY ADDITIONAL_MAKE_CLEAN_FILES logo.h)

This answer is adapted from the CMake FAQ entry, which contains some other examples that will also work with ESP-IDF builds.

In this example, logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the ADDITIONAL_MAKE_CLEAN_FILES property.

Note: If generating files as part of the project CMakeLists.txt file, not a component CMakeLists.txt, then use build property PROJECT_DIR instead of ${COMPONENT_DIR} and ${PROJECT_NAME}.elf instead of ${COMPONENT_LIB}.)

If a source file from another component included logo.h, then add_dependencies would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

**Embedding Binary Data**

Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can specify argument EMBED_FILES in the component registration, giving space-delimited names of the files to embed:

```cpp
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable EMBED_TXTFILES. This will embed the contents of the text file as a null-terminated string:

```cpp
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```cpp
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
          pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_
          pem_end");
```

The names are generated from the full name of the file, as given in EMBED_FILES. Characters /., etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function target_add_binary_data like this:

```cpp
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the project() line in your project CMakeLists.txt file. Replace myproject.elf with your project name. The final argument can be TEXT to embed a null-terminated string, or BINARY to embed the content as-is.

For an example of using this technique, see the “main” component of the file_serving example protocols/http_server/file_serving/main/CMakeLists.txt - two files are loaded at build time and linked into the firmware.

It is also possible embed a generated file:
Chapter 4. API Guides

```plaintext
add_custom_command(OUTPUT my_processed_file.bin
     COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

In the example above, `my_processed_file.bin` is generated from `my_unprocessed_file.bin` through some command `my_process_file_cmd`, then embedded into the target.

To specify a dependence on a target, use the `DEPENDS` argument:

```plaintext
add_custom_target(my_process COMMAND ...
     target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

The `DEPENDS` argument to `target_add_binary_data` ensures that the target executes first.

**Code and Data Placements**

ESP-IDF has a feature called linkerscript generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See *Linker Script Generation* for a quick start guide as well as a detailed discussion of the mechanism.

**Fully Overriding The Component Build Process**

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the ESP-IDF build system entirely by using a CMake feature called ExternalProject. Example component CMakeLists:

```cmake
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
)
# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named quirc that builds the quirc project using its own Makefile.)

- `externalproject_add` defines an external build system.
  - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
  - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise you can set `BUILD_DIR`. 
Consult the ExternalProject documentation for more details about externalproject_add().

- The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
- Finally, the generated library is added to ADDITIONAL_MAKE_CLEAN_FILES. This means make clean will delete this library. (Note that the other object files from the build won’t be deleted.)

Note: When using an external build process with PSRAM, remember to add -mfix-esp32-psram-cache-issue to the C compiler arguments. See CONFIG_SPIRAM_CACHE_WORKAROUND for details of this flag.

ExternalProject dependencies, clean builds

CMake has some unusual behaviour around external project builds:

- ADDITIONAL_MAKE_CLEAN_FILES only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won’t delete these files when cleaning.
- However, the ExternalProject configure & build commands will always be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external BUILD_COMMAND run a full clean compile of all sources. The build command will be run if any of the dependencies passed to externalproject_add with DEPENDS have changed, or if this is a clean build (i.e., any of idf.py clean, ninja clean, or make clean was run.)
  2. Have the external BUILD_COMMAND be an incremental build command. Pass the parameter BUILD_ALWAYS 1 to externalproject_add. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn’t take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

4.5.13 Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file sdkconfig.defaults in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn’t yet been set in the sdkconfig file.

To override the name of this file or to specify multiple files, set the SDKCONFIG_DEFAULTS environment variable or set SDKCONFIG_DEFAULTS in top-level CMakeLists.txt. If specifying multiple files, use semicolon as the list separator. File names not specified as full paths are resolved relative to current project.

Some of the IDF examples include a sdkconfig.ci file. This is part of the continuous integration (CI) test framework and is ignored by the normal build process.

Target-dependent sdkconfig defaults

In addition to sdkconfig.defaults file, build system will also load defaults from sdkconfig.defaults. TARGET_NAME file, where TARGET_NAME is the value of IDF_TARGET. For example, for esp32 target, default settings will be taken from sdkconfig.defaults first, and then from sdkconfig.defaults.esp32.

If SDKCONFIG_DEFAULTS is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from SDKCONFIG_DEFAULTS value/values using the rule above.

4.5.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py.
After running a project build, the build directory contains binary output files (.bin files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.5.15 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMake-Lists.txt file and builds separate .ELF and .BIN files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.5.16 Selecting the Target

ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py ⚶ list-targets`.

To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

**Important:** `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

**Note:** The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`
2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)

It is also possible to pass the desired IDF_TARGET as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the _default_ value of IDF_TARGET for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if
IDF_TARGET is not specified by other method: using an environment variable, CMake variable, or idf.py set-target command.

If the target has not been set by any of these methods, the build system will default to esp32 target.

### 4.5.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named json:

```cmake
cmake_minimum_required(VERSION 3.12)
project(json)
add_library(json STATIC cJSON/cJSON.c cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF json component /components/json/CMakeLists.txt.
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.5.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects — code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library foo to be used in the main component:

```cmake
# Register the component
idf_component_register(...)  
# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at build_system/cmake/import_lib. Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the mbedtls component is a wrapper for Espressif’s fork of mbedtls. See its component CMakeLists.txt.

The CMake variable ESP_PLATFORM is set to 1 whenever the ESP-IDF build system is being used. Tests such as if (ESP_PLATFORM) can be used in generic CMake code if special IDF-specific logic is required.
Using ESP-IDF components from external libraries

The above example assumes that the external library foo (or tinyxml in the case of the import_lib example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as libc, libstdc++, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target idf::<componentname>.

For example, in the foo/CMakeLists.txt file:

```cpp
add_library(foo bar.c fizz.cpp buzz.cpp)
if(ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.5.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (.a file), built by some other build process.

The ESP-IDF build system provides a utility function add_prebuilt_library for users to be able to easily import and use prebuilt libraries:

```cpp
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...) [PRIV_REQUIRES req1 req2 ...])
```

where:

- target_name- name that can be used to reference the imported library, such as when linking to other targets
- lib_path- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments REQUIRES and PRIV_REQUIRES specify dependency on other components. These have the same meaning as the arguments for idf_component_register.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at build_system/cmake/import_prebuilt.

4.5.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user’s targets (libraries/ executables).

It is possible to do so by using the build system APIs provided by tools/cmake/idf.cmake. For example:

```cpp
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF_
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
```

(continues on next page)
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets, dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)

The example in build_system/cmake/idf_as_lib demonstrates the creation of an application equivalent to hello world application using a custom CMake project.

**Note:** The IDF build system can only set compiler flags for source files that it builds. When an external CMakeLists.txt file is used and PSRAM is enabled, remember to add -mfix-esp32-psram-cache-issue to the C compiler arguments. See CONFIG_SPIRAM_CACHE_WORKAROUND for details of this flag.

## 4.5.21 ESP-IDF CMake Build System API

**idf-build-commands**

```cmake
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a build property `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```cmake
idf_build_set_property(property val [APPEND])
```

Set a build property `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```cmake
idf_build_component(component_dir)
```

Present a directory `component_dir` that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before `idf_build_process`.

This command does not guarantee that the component will be processed during build (see the `COMPONENTS` argument description for `idf_build_process`)

```cmake
idf_build_process(target
[PROJECT_DIR project_dir]
[PROJECT_VER project_ver]
[PROJECT_NAME project_name]
[SDKCONFIG sdkconfig]
[SDKCONFIG_DEFAULTS sdkconfig_defaults]
[BUILD_DIR build_dir]
[COMPONENTS component1 component2 ...])
```

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user’s perspective is the libraries creation by calling each component’s `idf_component_register`. This command creates the libraries for each component, which are accessible using aliases in the form idf::component_name. These aliases can be used to link the components to the user’s own targets, either libraries or executables.

The call requires the target chip to be specified with `target` argument. Optional arguments for the call include:

- PROJECT_DIR - directory of the project; defaults to CMAKE_SOURCE_DIR
• PROJECT_NAME - name of the project; defaults to CMAKE_PROJECT_NAME
• PROJECT_VER - version/revision of the project; defaults to “1”
• SDKCONFIG - output path of generated sdkconfig file; defaults to PROJECT_DIR/sdkconfig or CMAKE_SOURCE_DIR/sdkconfig depending if PROJECT_DIR is set
• SDKCONFIG_DEFAULTS - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value filename in the list, the config from file filename.target, if it exists, is also loaded.
• BUILD_DIR - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to CMAKE_BINARY_DIR
• COMPONENTS - select components to process among the components known by the build system (added via idf_build_component). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

idf_build_executable(executable)

Specify the executable executable for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after idf_build_process.

idf_build_get_config(var config [GENERATOR_EXPRESSION])

Get the value of the specified config. Much like build properties, specifying GENERATOR_EXPRESSION will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to idf_build_process, however.

idf-build-properties

These are properties that describe the build. Values of build properties can be retrieved by using the build command idf_build_get_property. For example, to get the Python interpreter used for the build:

idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
- PROJECT_VER - version of the project; set from \texttt{idf\_build\_process PROJECT\_VER} argument
- PYTHON - Python interpreter used for the build; set from \texttt{PYTHON} environment variable if available, if not “python” is used
- SDKCONFIG - full path to output config file; set from \texttt{idf\_build\_process SDKCONFIG} argument
- SDKCONFIG_DEFAULTS - list of files containing default config to use in the build; set from \texttt{idf\_build\_process SDKCONFIG\_DEFAULTS} argument
- SDKCONFIG_HEADER - full path to C/C++ header file containing component configuration; set by \texttt{idf\_build\_process}
- SDKCONFIG_CMAKE - full path to CMake file containing component configuration; set by \texttt{idf\_build\_process}
- SDKCONFIG_JSON - full path to JSON file containing component configuration; set by \texttt{idf\_build\_process}
- SDKCONFIG_JSON_MENUS - full path to JSON file containing config menus; set by \texttt{idf\_build\_process}

\texttt{idf\_component\_commands}

\texttt{idf\_component\_get\_property(var component property [GENERATOR\_EXPRESSION])}

Retrieve a specified component’s component property, property and store it in var accessible from the current scope. Specifying \texttt{GENERATOR\_EXPRESSION} will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

\texttt{idf\_component\_set\_property(component property val [APPEND])}

Set a specified component’s component property, property with value val. Specifying \texttt{APPEND} will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

\texttt{idf\_component\_register([SRCS src1 src2 ...] [SRC\_DIRS dir1 dir2 ...] [EXCLUDE\_SRCS src1 src2 ...] [INCLUDE\_DIRS dir1 dir2 ...] [PRIV\_INCLUDE\_DIRS dir1 dir2 ...] [REQUIRES component1 component2 ...] [PRIV\_REQUIRES component1 component2 ...] [LDFRAGMENTS ldfragment1 ldfragment2 ...] [REQUIRED\_IDF\_TARGETS target1 target2 ...] [EMBED\_FILES file1 file2 ...] [EMBED\_TXTFILES file1 file2 ...] [KCONFIG kconfig] [KCONFIG\_PROJBUILD kconfig\_projobuild] [WHOLE\_ARCHIVE])

Register a component to the build system. Much like the \texttt{project()} CMake command, this should be called from the component’s CMakeLists.txt directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can \textbf{not} be called before \texttt{idf\_component\_register}:

- commands that are not valid in CMake script mode
- custom commands defined in \texttt{project\_include.cmake}
- build system API commands except \texttt{idf\_build\_get\_property}; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before \texttt{idf\_component\_register}.

The arguments for \texttt{idf\_component\_register} include:

- SRCS - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
• SRC_DIRS, EXCLUDE_SRCS - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via SRCS. Note that this is subject to the limitations of globbing in CMake. Source files specified in EXCLUDE_SRCS are removed from the globbed files.
• INCLUDE_DIRS - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
• PRIV_INCLUDE_DIRS - directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only
• REQUIRES - public component requirements for the component
• PRIV_REQUIRES - private component requirements for the component; ignored on config-only components
• LDFRAGMENTS - component linker fragment files
• REQUIRED_IDF_TARGETS - specify the only target the component supports
• KCONFIG - override the default Kconfig file
• KCONFIG_PROJBUILD - override the default Kconfig projbuild file
• WHOLE_ARCHIVE - if specified, the component library is surrounded by -Wl,--whole-archive, -Wl,--no-whole-archive when linked. This has the same effect as setting WHOLE_ARCHIVE component property.

The following are used for embedding data into the component, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:
• EMBED_FILES - binary files to be embedded in the component
• EMBED_TXTFILES - text files to be embedded in the component

idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command idf_component_get_property. For example, to get the directory of the freertos component:

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

• COMPONENT_ALIAS - alias for COMPONENT_LIB used for linking the component to external targets; set by idf_build_component and alias library itself is created by idf_component_register
• COMPONENT_DIR - component directory; set by idf_build_component
• COMPONENT_OVERRIDEN_DIR - contains the directory of the original component if this component overrides another component
• COMPONENT_LIB - name for created component static/interface library; set by idf_build_component and library itself is created by idf_component_register
• COMPONENT_NAME - name of the component; set by idf_build_component based on the component directory name
• COMPONENT_TYPE - type of the component, whether LIBRARY or CONFIG_ONLY. A component is of type LIBRARY if it specifies source files or embeds a file
• EMBED_FILES - list of files to embed in component; set from idf_component_register EMBED_FILES argument
• EMBED_TXTFILES - list of text files to embed in component; set from idf_component_register EMBED_TXTFILES argument
• INCLUDE_DIRS - list of component include directories; set from idf_component_register INCLUDE_DIRS argument
• KCONFIG - component Kconfig file; set by idf_build_component
• KCONFIG_PROJBUILD - component Kconfig projbuild; set by idf_build_component
• LDFRAGMENTS - list of component linker fragment files; set from idf_component_register LDFRAGMENTS argument
• PRIV_INCLUDE_DIRS - list of component private include directories; set from idf_component_register PRIV_INCLUDE_DIRS on components of type LIBRARY
• PRIV_REQUIRES - list of private component dependencies; set from idf_component_register PRIV_REQUIRES argument
• REQUIRED_IDF_TARGETS - list of targets the component supports; set from idf_component_register EMBED_TXTFILES argument
Chapter 4. API Guides

- **REQUIRES** - list of public component dependencies; set from `idf_component_register` REQUIRES argument
- **SRCS** - list of component source files; set from SRCS or SRC_DIRS/EXCLUDE_SRCS argument of `idf_component_register`
- **WHOLE_ARCHIVE** - if this property is set to TRUE (or any boolean “true” CMake value: I, ON, YES, Y), the component library is surrounded by `-Wl,--whole-archive, -Wl,--no-whole-archive` when linked. This can be used to force the linker to include every object file into the executable, even if the object file doesn’t resolve any references from the rest of the application. This is commonly used when a component contains plugins or modules which rely on link-time registration. This property is FALSE by default. It can be set to TRUE from the component CMakeLists.txt file.

### 4.5.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via SRCS argument to `idf_component_register`:

```markdown
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...
```

This preference reflects the CMake best practice of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using SRC_DIRS:

```markdown
idf_component_register(SRC_DIRS library platform ...
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won’t know to automatically re-run and this file won’t be added to the build.

The trade-off is acceptable when you’re adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git... For components which are part of ESP-IDF, we use a third party Git CMake integration module (/tools/cmake/third_party/GetGitRevisionDescription.cmake) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use `SRCS` argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

### 4.5.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
• `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
• `flasher_args.json` contains `esptool.py` arguments to flash the project’s binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See Flash arguments.
• `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
• `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
• `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in menuconfig, for use in external IDE UIs.

### JSON Configuration Server

A tool called `confserver.py` is provided to allow IDEs to easily integrate with the configuration system logic. `confserver.py` is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run `confserver.py` from a project via `idf.py confserver` or `ninja confserver`, or a similar target triggered from a different build generator.

For more information about `confserver.py`, see `tools/kconfig_new/README.md`.

#### 4.5.24 Build System Internals

### Build Scripts

The list files for the ESP-IDF build system reside in `/tools/cmake`. The modules which implement core build system functionality are as follows:

- `build.cmake` - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- `component.cmake` - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- `kconfig.cmake` - Generation of configuration files (sdkconfig, sdkconfig.h, sdkconfig.cmake, etc.) from Kconfig files.
- `ldgen.cmake` - Generation of final linker script from linker fragment files.
- `target.cmake` - Setting build target and toolchain file.
- `utilities.cmake` - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in `/tools/cmake`:

- `idf.cmake` - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- `project.cmake` - Includes `idf.cmake` and provides a custom `project()` command that takes care of all the heavy lifting of building an executable. Included in the top-level CMakeLists.txt of standard ESP-IDF projects.

The rest of the files in `/tools/cmake` are support or third-party scripts used in the build process.

### Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

#### Initialization

This phase sets up necessary parameters for the build.

- Upon inclusion of `idf.cmake` in `project.cmake`, the following steps are performed:
  - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level CMakeLists.txt.
Chapter 4. API Guides

Fig. 3: ESP-IDF Build System Process

- Add /tools/cmake to CMAKE_MODULE_PATH and include core modules plus the various helper/third-party scripts.
- Set build tools/executables such as default Python interpreter.
- Get ESP-IDF git revision and store as IDF_VER.
- Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
- Add components in components to the build.

• The initial part of the custom project() command performs the following steps:
  - Set IDF_TARGET from environment variable or CMake cache and the corresponding CMAKE_TOOLCHAIN_FILE to be used.
  - Add components in EXTRA_COMPONENTS_DIRS to the build.
  - Prepare arguments for calling command idf_build_process() from variables such as COMPONENTS/EXCLUDE_COMPONENTS, SDKCONFIG, SDKCONFIG_DEFAULTS.

The call to idf_build_process() command marks the end of this phase.

Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of idf_build_process().

• Retrieve each component’s public and private requirements. A child process is created which executes each component’s CMakeLists.txt in script mode. The values of idf_component_register REQUIRES and PRIV_REQUIRES argument is returned to the parent build process. This is called early expansion. The variable CMAKE_BUILD_EARLY_EXPANSION is defined during this step.
• Recursively include components based on public and private requirements.

Processing

This phase processes the components in the build, and is the second half of idf_build_process().

• Load project configuration from sdkconfig file and generate an sdkconfig.cmake and sdkconfig.h header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
• Include each component’s project_include.cmake.
• Add each component as a subdirectory, processing its CMakeLists.txt. The component CMakeLists.txt calls the registration command, idf_component_register which adds source files, include directories, creates component library, links dependencies, etc.

Finalization

This phase is everything after idf_build_process().

• Create executable and link the component libraries to it.
• Generate project metadata files such as project_description.json and display relevant information about the project built.

Browse /tools/cmake/project.cmake for more details.
4.5.25 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, `idf_component_register`.

Automatic Conversion Tool

An automatic project conversion tool is available in `tools/make/convert_to_cmake.py` in ESP-IDF v4.x releases. The script was removed in v5.0 because of its `make` build system dependency.

No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- **COMPONENT_BUILD_DIR**: Use `CMAKE_CURRENT_BINARY_DIR` instead.
- **COMPONENT_LIBRARY**: Defaulted to `${COMPONENT_NAME}.a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- **CC, LD, AR, OBJCOPY**: Full paths to each tool from the gcc xtensa cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. [Full list here](#).
- **HOSTCC, HOSTLD, HOSTAR**: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- **COMPONENT_ADD_LDFLAGS**: Used to override linker flags. Use the CMake `target_link_libraries` command instead.
- **COMPONENT_ADD_LINKER_DEPS**: List of files that linking should depend on. `target_link_libraries` will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- **COMPONENT_SUBMODULES**: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- **COMPONENT_EXTRA_INCLUDES**: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- **COMPONENT_OBJS**: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCS` argument to `idf_component_register`.
- **COMPONENT_OBJEXCLUDE**: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- **COMPONENT_EXTRA_CLEAN**: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note CMake has some restrictions around this functionality.
- **COMPONENT_OWNBUILDTARGET & COMPONENT_OWNCLEANTARGET**: Use CMake `ExternalProject` instead. See [Fully Overriding The Component Build Process](#) for full details.
- **COMPONENT_CONFIG_ONLY**: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](#).
- **CFLAGS, CPPFLAGS, CXXFLAGS**: Use equivalent CMake commands instead. See [Controlling Component Compilation](#).

No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- **Source directories** (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)
- **Include directories** (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)
No Longer Necessary

- In the legacy Make-based build system, it is required to also set COMPONENT_SRDIRS if COMPONENT_SRCS is set. In CMake, the equivalent is not necessary i.e. specifying SRC_DIRS to idf_component_register if SRCS is also specified (in fact, SRCS is ignored if SRC_DIRS is specified).

Flashing from make

make flash and similar targets still work to build and flash. However, project sdkconfig no longer specifies serial port and baud rate. Environment variables can be used to override these. See Flashing with ninja or make for more details.

4.6 Core Dump

4.6.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script espcoredump.py to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- info_corefile - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- dbg_corefile - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

4.6.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (idf.py menuconfig).

Core dump data destination (Components -> Core dump -> Data destination)

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

Core dump data format (Components -> Core dump -> Core dump data format)

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)
• Use CRC32 for core dump integrity verification
• Use SHA256 for core dump integrity verification (only work in ELF format)

The CRC32 option provides better calculation performance and consumes less memory for storage.
The SHA256 hash algorithm provides greater probability of detecting corruption than a CRC32 with multiple bit errors.

Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)

Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)
The value is in ms.

Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)
The value is base64 encoded.
• Decode and show summary (info_corefile)
  • Don’t decode

4.6.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash. But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>
<td>0x6000</td>
</tr>
<tr>
<td>phy_init</td>
<td>data</td>
<td>phy</td>
<td>0xf000</td>
<td>0x1000</td>
</tr>
<tr>
<td>factory</td>
<td>app</td>
<td>factory</td>
<td>0x10000</td>
<td>1M</td>
</tr>
<tr>
<td>coredump</td>
<td>data</td>
<td>coredump</td>
<td>64K</td>
<td></td>
</tr>
</tbody>
</table>

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is:

```
espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file>
```
or

```
espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>
```

4.6.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command:

```
espcoredump.py --chip esp32 info_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>
```
or

```
espcoredump.py --chip esp32 dbg_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>
```
Base64-encoded body of core dump will be between the following header and footer:

```
== CORE DUMP START ==
<body of base64-encoded core dump, save it to file on disk>
== CORE DUMP END ==
```

The `CORE DUMP START` and `CORE DUMP END` lines must not be included in core dump text file.

### 4.6.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32_rom.elf) and pass it to ‘espcoredump.py’.

### 4.6.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

**Supported notations and RAM regions**

- `COREDUMP_DRAM_ATTR` places variable into DRAM area which will be included into dump.
- `COREDUMP_RTC_ATTR` places variable into RTC area which will be included into dump.
- `COREDUMP_RTC_FAST_ATTR` places variable into RTC_FAST area which will be included into dump.

**Example**

1. In *Project Configuration Menu*, enable `COREDUMP TO FLASH`, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

   ```c
   // uint8_t global_var;
   COREDUMP_DRAM_ATTR uint8_t global_var;
   ```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

   ```c
   global_var = 25;
   assert(0);
   ```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where `PORT` is the device USB port:

   ```bash
   espcoredump.py -p PORT dbg_corefile <path/to/elf>
   ```

6. In GDB shell, type `p global_var` to get the variable content:

   ```gdb
   (gdb) p global_var
   $1 = 25 '\031'
   ```

### 4.6.7 Running espcoredump.py

**Generic command syntax:** espcoredump.py [options] command [args]

**Script Options**

- `--chip [auto,esp32,esp32s2,esp32s3,esp32c3]` Target chip type. Default value is “auto”
Chapter 4. API Guides

--port PORT, -p PORT Serial port device. Either “chip” or “port” need to be specified to determine the port when you have multi-target connected at the same time.

--baud BAUD, -b BAUD Serial port baud rate used when flashing/reading

--gdb-timeout-sec GDB_TIMEOUT_SEC Overwrite the default internal delay for gdb responses

Commands
dbg_corefile Starts GDB debugging session with specified corefile
info_corefile Print core dump info from file

Command Arguments
--debug DEBUG, -d DEBUG Log level (0..3)
--gdb GDB, -g GDB Path to gdb
--core CORE, -c CORE Path to core dump file (if skipped core dump will be read from flash)

--core-format {b64,elf,raw}, -t {b64,elf,raw} File specified with “-c” is an ELF (“elf”) raw (raw) or base64-encoded (b64) binary

--off OFF, -o OFF Offset of coredump partition in flash (type “idf.py partition-table” to see).

--save-core SAVE_CORE, -s SAVE_CORE Save core to file. Otherwise temporary core file will be deleted. Does not work with “-c”

--rom-elf ROM_ELF, -r ROM_ELF Path to ROM ELF file. Will use “<target>_rom.elf” if not specified

--print-mem, -m Print memory dump. Only valid when info_corefile.

<prog> Path to program ELF file.

Related Documents

Anatomy of core dump image Core dump component can be configured to use old legacy binary format or the new ELF one. The ELF format is recommended for new designs. It provides more information about the CPU and memory state of a program at the moment when panic handler is entered. The memory state embeds a snapshot of all tasks mapped in the memory space of the program. The CPU state contains register values when the core dump has been generated. Core dump file uses a subset of the ELF structures to register these information. Loadable ELF segments are used for the memory state of the process while ELF notes (ELF.PT_NOTE) are used for process metadata (pid, registers, signal, ⋅⋅⋅). Especially, the CPU status is stored in a note with a special name and type (CORE, NT_PRSTATUS type).

Here is an overview of coredump layout:

Note: The format of image file showed on the above pictures represents current version of image and can be changed in future releases.

Overview of implementation The figure below describes some basic aspects related to implementation of core dump:

Note: The diagram above hide some details and represents current implementation of the core dump and can be changed later.

4.7 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.
Chapter 4. API Guides

Fig. 4: Core dump ELF image format

Fig. 5: Core dump binary image format
4.7.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.7.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.
All of these functions are declared in the `esp_sleep.h` header under components/esp32.

### 4.7.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.7.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count \n";
    esp_rom_printf(fmt_str, wake_count);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named `CONFIG_ESP32_RTCDATA_IN_FAST_MEM`. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the `CONFIG_FREERTOS_unicore` because RTC fast memory can be accessed only by PRO_CPU.

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with `RTC_FAST_ATTR` is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_FAST_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```c
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count \n", wake_count);
}
```
Chapter 4. API Guides

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` Kconfig option, see more information in *Fast boot from Deep Sleep*.

### 4.7.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

**Note:** When the `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

### 4.8 Error Handling

#### 4.8.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using `throw` keyword
- Unrecoverable (fatal) errors:
  - Failed assertions (using `assert` macro and equivalent methods, see *Assertions*) and `abort()` calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see *Fatal Errors*.

#### 4.8.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with `ESP_OK` code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR_` prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see *Error Code Reference*.

#### 4.8.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing 0x101 to `esp_err_to_name()` will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.
Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a standard POSIX error code, if no matching ESP_ERR_ value is found. This is done using `strerror_r` function. POSIX error codes (such as ENOENT,ENOMEM) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See `CONFIG_ESP_ERR_TO_NAME_LOOKUP`. When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return `UNKNOWN_ERROR`, and `esp_err_to_name_r()` will return `Unknown error 0xXXXX(YYYYY)`, where `0xXXXX` and `YYYYY` are the hexadecimal and decimal representations of the error code, respectively.

### 4.8.4 ESP_ERROR_CHECK macro

`ESP_ERROR_CHECK` macro serves similar purpose as `assert`, except that it checks `esp_err_t` value rather than a bool condition. If the argument of `ESP_ERROR_CHECK` is not equal `ESP_OK`, then an error message is printed on the console, and `abort()` is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)
Backtrace: 0x40086e7c:0x3ffb4ff0
0x40087328:0x3ffb5010
0x400d1fdf:0x3ffb5030...
→0x400d0816:0x3ffb5050
```

**Note:** If `IDF monitor` is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on `CONFIG_ESP_ERR_TO_NAME_LOOKUP` option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where `ESP_ERROR_CHECK` macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See `Fatal Errors` for more information about the backtrace.

### 4.8.5 ESP_ERROR_CHECK_WITHOUT_ABORT macro

`ESP_ERROR_CHECK_WITHOUT_ABORT` macro serves similar purpose as `ESP_ERROR_CHECK`, except that it won’t call `abort()`.

### 4.8.6 ESP_RETURN_ON_ERROR macro

`ESP_RETURN_ON_ERROR` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message and returns.

### 4.8.7 ESP_GOTO_ON_ERROR macro

`ESP_GOTO_ON_ERROR` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message, sets the local variable `ret` to the code, and then exits by jumping to `goto_tag`.
4.8.8 **ESP_RETURN_ON_FALSE** macro

**ESP_RETURN_ON_FALSE** macro checks the condition, if the condition is not equal *true*, it prints the message and returns with the supplied *err_code*.

4.8.9 **ESP_GOTO_ON_FALSE** macro

**ESP_GOTO_ON_FALSE** macro checks the condition, if the condition is not equal *true*, it prints the message, sets the local variable *ret* to the supplied *err_code*, and then exits by jumping to *goto_tag*.

4.8.10 **CHECK MACROS** Examples

Some examples:

```c
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message.
    → printed if 'x' is not 'ESP_OK', and then 'abort()'.
    ESP_ERROR_CHECK WITHOUT_ABORT(x); // err message.
    → printed if 'x' is not 'ESP_OK', without 'abort()'.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message.
    → printed if 'x' is not 'ESP_OK', and then function returns with code 'x'.
    ESP_GOTO_ON_ERROR(x, TAG, "fail reason 2"); // err message.
    → printed if 'x' is not 'ESP_OK', 'ret' is set to 'x', and then jumps to 'err'.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message.
    → printed if 'a' is not 'true', and then function returns with code 'err_code'.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message.
    → printed if 'a' is not 'true', 'ret' is set to 'err_code', and then jumps too.

    err:
    // clean up
    return ret;
}
```

**Note:** If the option `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` in Kconfig is enabled, the err message will be discarded, while the other action works as is.

The **ESP_RETURN_XX** and **ESP_GOTO_XX** macros can’t be called from ISR. While there are **xx_ISR** versions for each of them, e.g., **ESP_RETURN_ON_ERROR_ISR**, these macros could be used in ISR.

4.8.11 **Error handling patterns**

1. Attempt to recover. Depending on the situation, we may try the following methods:
   - retry the call after some time;
   - attempt to de-initialize the driver and re-initialize it again;
   - fix the error condition using an out-of-band mechanism (e.g. reset an external peripheral which is not responding).

   Example:
```c
esp_err_t err;
    do {
        err = sdio_slave_send_queue(addr, len, arg, timeout);
        // keep retrying while the sending queue is full
    } while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}
```

2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.
Example:

```c
dmcc_card_t* card = calloc(1, sizeof(dmcc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
```

3. Convert into unrecoverable error, for example using ESP_ERROR_CHECK. See ESP_ERROR_CHECK macro section for details.
Terminating the application in case of an error is usually undesirable behavior for middleware components, but is sometimes acceptable at application level.
Many ESP-IDF examples use ESP_ERROR_CHECK to handle errors from various APIs. This is not the best practice for applications, and is done to make example code more concise.
Example:

```c
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.8.12 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using `CONFIG_COMPILER_CXX_EXCEPTIONS` option.

Enabling exception handling normally increases application binary size by a few KB. Additionally it may be necessary to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` variable.

If an exception is thrown, but there is no `catch` block, the program will be terminated by `abort` function, and backtrace will be printed. See Fatal Errors for more information about backtraces.

See `cxx/exceptions` for an example of C++ exception handling.

### 4.9 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation, sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely communicate with one another.
Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is dependent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the ESP-BLE-MESH Architecture for information about the implementation of ESP-BLE-MESH architecture and ESP-BLE-MESH API Reference for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer here for the certification details of ESP-BLE-MESH.

Note: If you are looking for Wi-Fi based implementation of mesh for ESP32, please check another product by Espressif called ESP-WIF-MESH. For more information and documentation see ESP-WIFI-MESH.

4.9.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF Get Started documentation.

What You Need

Hardware:

• Three ESP32 boards, see options.
• USB cables to connect the boards.
• Computer configured with ESP-IDF.
• Mobile phone or tablet running Android or iOS.

Software:

• Example application bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server code to load to the ESP32 boards.
• Mobile App: nRF Mesh for Android or iOS. Optionally you can use some other Apps:
  – EspBleMesh Android App
  – Silicon Labs Android or iOS App

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

Step 1. Check Hardware  Both ESP32-DevKitC and ESP-WROVER-KIT development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: idf.py menuconfig > Example Configuration > Board selection for ESP-BLE-MESH

Note: If you plan to use ESP32-DevKitC, connect a RGB LED to GPIO pins 25, 26 and 27.

Step 2. Configure Software  Enter the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example directory, run idf.py menuconfig to select your board and then run idf.py build to compile the example.
Step 3. Upload Application to Nodes   After the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example is compiled successfully, users can run `idf.py flash` to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn **GREEN**.

Fig. 7: ESP-BLE-MESH Devices Power On

Step 4. Provision Nodes   In this section, we will use the **nRF Mesh Android** App to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

4.1 Scanner   The Scanner is App’s functionality to search for unprovisioned devices in range. Open the App, press **Scanner** at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

4.2 Identify   Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the **IDENTIFY** interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

**Note:** The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the **IDENTIFY** interface button, no signs can be seen from the device except from the log on the serial monitor.

After the **IDENTIFY** interface button is pressed, users can see the **PROVISION** interface button.

4.3 Provision   Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:
Fig. 8: nRF Mesh - Scanner

Fig. 9: nRF Mesh - IDENTIFY - PROVISION
1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing **OK**, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

![Fig. 10: nRF Mesh - Configuration Complete](image)

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing **OK**, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press **CONNECT** on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing **CONNECT**, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

### 4.4 Configuration

When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.
Fig. 11: nRF Mesh - Initial Configuration Failed

Fig. 12: nRF Mesh - Reconnect - Initial Configuration
Fig. 13: nRF Mesh - Reconnect - Three Nodes

Fig. 14: nRF Mesh - Model Bind AppKey
Chapter 4. API Guides

**Note:** No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

**Step 5. Operate Network**  After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

![Generic On Off Server](image)

**Fig. 15: nRF Mesh - Generic OnOff Control**

The following screenshot shows different board with different color on.

**Note:** For nRF Mesh iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

### 4.9.2 ESP-BLE-MESH Examples

- **ESP-BLE-MESH Node OnOff Server** - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see [example code](#).
- **ESP-BLE-MESH Node OnOff Client** - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see [example code](#).
- **ESP-BLE-MESH Provisioner** - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see [example code](#).
ESP-BLE-MESH Fast Provisioning - Client and Server - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see example client code and example server code.

ESP-BLE-MESH and Wi-Fi Coexistence - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32. Simply put, users can use the Wi-Fi while operating Bluetooth, see example code.

ESP-BLE-MESH Console - an example that implements BLE Mesh basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see example node code.

ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

- ESP-BLE-MESH Architecture Overview
  - Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
- ESP-BLE-MESH Architecture Implementation
  - Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
- ESP-BLE-MESH Auxiliary Routines
  - Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

1. ESP-BLE-MESH Architecture Overview

Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth certification.

ESP-BLE-MESH architecture includes five key parts:

- Mesh Protocol Stack
  - Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
  - Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
  - Mesh Models is responsible for the implementation of SIG-defined models.
- Network Management
  - Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
- Features
  - Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
- Mesh Bearer Layer
  - Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.
- Applications
  - Based on ESP-BLE-MESH protocol stack and Mesh Models.
  - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

1.1 Mesh Protocol Stack
Fig. 17: Figure 1.1 ESP-BLE-MESH Architecture Diagram
1.1.1 Mesh Networking  Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Layer</td>
<td>Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.</td>
</tr>
<tr>
<td>Upper Transport Layer</td>
<td>Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages”, including messages related to “friendship” and heartbeat messages.</td>
</tr>
<tr>
<td>Lower Transport Layer</td>
<td>Lower Transport Layer handles segmentation and reassembly of PDU.</td>
</tr>
<tr>
<td>Network Layer</td>
<td>Network Layer defines the address type and format of the network messages, and implements the relay function of the device.</td>
</tr>
</tbody>
</table>

1.1.2 Mesh Provisioning  Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>Provisioning PDUs from different layers are handled using provisioning protocol.</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT</td>
<td>These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.</td>
</tr>
</tbody>
</table>

1.1.3 Mesh Models  Mesh Models in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:
Table 3: Table 1.3 Mesh Models Architecture Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model Layer</td>
<td>Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.</td>
</tr>
<tr>
<td>Foundation Model</td>
<td>Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.</td>
</tr>
</tbody>
</table>

1.2 Mesh Network Management Network Management implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node’s IV Index.
- IV update procedure is used to update the nodes’ IV Index.
- Key refresh procedure is used to update the nodes’ NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node’s networking information.

1.3 Mesh Features Features includes the following options:

- Low Power feature is used to reduce node’s power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

1.4 Mesh Bearer Layer Bearers in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

Bearers can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

Table 4: Table 1.3 Mesh Bearers Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT Bearer</td>
<td>The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.</td>
</tr>
<tr>
<td>Advertising Bearer</td>
<td>When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.</td>
</tr>
</tbody>
</table>

1.5 Mesh Applications The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
  - Call the provisioning-related API for provisioning.
  - Call the model-related API to send messages.
  - Call the device-attributes-related API to get local information about the device.
- Application layer processes Event
  The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.
  - The events completed by calling API.
    - Such as nodes sending messages.
  - The events that the protocol stack actively reports to the application layer.
    - The Event that the protocol stack actively reports.
Chapter 4. API Guides

- The Event that Model actively reports.
  - The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between **API / Event** and ESP-BLE-MESH protocol stack

- **API used by user mainly calls functions provided by **Mesh Networking**, **Mesh Provisioning** and **Mesh Models**.
- The interaction between **API / Event** and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to **Network Layer**.

2. ESP-BLE-MESH Architecture Implementation  The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

- **Layer-based Approach**: With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.
- **Module-based Approach**: Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

2.1 Mesh Protocol Stack Implementation

2.1.1 Mesh Networking Implementation  The list of files and the functions implemented in each file in **Mesh Networking** are shown in Table 2.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>ESP-BLE-MESH Access Layer</td>
</tr>
<tr>
<td>transport.c</td>
<td>ESP-BLE-MESH Lower/Upper Transport Layer</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Network Layer</td>
</tr>
<tr>
<td>adv.c</td>
<td>A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers</td>
</tr>
</tbody>
</table>

2.1.2 Mesh Provisioning Implementation  The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>ESP-BLE-MESH Node provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>beacon.c</td>
<td>APIs used to handle ESP-BLE-MESH Beacons</td>
</tr>
</tbody>
</table>

Specific files that implement functions of Provisioner are shown in Table 2.3:
### Table 7: Table 2.3 Mesh Provisioning (Provisioner) File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>ESP-BLE-MESH Provisioner provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>ESP-BLE-MESH Provisioner networking related functionalities</td>
</tr>
</tbody>
</table>

#### 2.1.3 Mesh Models Implementation

Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

### Table 8: Table 2.4 Mesh Models File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg_cli.c</td>
<td>Send Configuration Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>cfg_srv.c</td>
<td>Receive Configuration Client messages and send proper response messages</td>
</tr>
<tr>
<td>health_cli.c</td>
<td>Send Health Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>health_srv.c</td>
<td>Receive Health Client messages and send proper response messages</td>
</tr>
<tr>
<td>client_common.c</td>
<td>ESP-BLE-MESH model related operations</td>
</tr>
<tr>
<td>generic_client.c</td>
<td>Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>lighting_client.c</td>
<td>Send ESP-BLE-MESH Lighting Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>sensor_client.c</td>
<td>Send ESP-BLE-MESH Sensor Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>time_scene_client.c</td>
<td>Send ESP-BLE-MESH Time Scene Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>generic_server.c</td>
<td>Receive ESP-BLE-MESH Generic Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>lighting_server.c</td>
<td>Receive ESP-BLE-MESH Lighting Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>sensor_server.c</td>
<td>Receive ESP-BLE-MESH Sensor Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>time_scene_server.c</td>
<td>Receive ESP-BLE-MESH Time Scene Client messages and send corresponding response messages</td>
</tr>
</tbody>
</table>

#### 2.2 Mesh Bearers Implementation

Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify `mesh_bearer_adapt.c` (example of NimBLE version).

### Table 9: Table 2.5 Mesh Bearers File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh_bearer_adapt.c</td>
<td>ESP-BLE-MESH Bearer Layer adapter. This file provides the interfaces used to receive and send ESP-BLE-MESH ADV &amp; GATT related packets.</td>
</tr>
</tbody>
</table>

**Note:** `mesh_bearer_adapt.c` is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

#### 2.3 Mesh Applications Implementation

We have provided a series of application examples for customer development, and users can develop products based on `ESP-BLE-MESH Examples`.

#### 3. Auxiliary Routine

Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through `CONFIG_BLE_MESH`.

Espressif Systems 1823

Release v5.0-dev-2563-g45c1d1cb2

Submit Document Feedback
3.1 Features

- Low Power
- Friend
- Relay
- Proxy Client/Server

3.2 Network Management

- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

3.3 Auxiliary Routine Implementation

When adopting the design of independent module, the two main factors should be considered:

- The module can not be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpn.c</td>
<td>ESP-BLE-MESH Low Power functionality</td>

ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:

1. Provisioner Development
2. Node Development
3. ESP-BLE-MESH and Wi-Fi Coexistence
4. Fast Provisioning
5. Log Help
6. Example Help
7. Others

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

1. Provisioner Development

Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.
1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.
- The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

- Client model that corresponds to server model of the node is required.
- NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
- The address owned by the node shall be known, which could be its unicast address or subscription address.

1.3 How can NetKey and AppKey be used?

- NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
- AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

- The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
- The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can’t be changed afterwards.

1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message?

The unicast address of Provisioner can be set only once during initialization and can’t be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address.

Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.

1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can’t be changed afterwards.
1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.

1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner set to unprovisioned device during provisioning. It can be set only once during initialization and can’t be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.

1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples?

There are four authentication methods, i.e. No OOB, Static OOB, Output OOB and Input OOB. In the provided examples, No OOB is used.

1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?

- Device UUID
- OOB Info
- URL Hash (optional)

1.12 Can such information be used for device identification?

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?

- Provisioner can get the Composition Data of nodes using the `Configuration Client Model` API `esp_ble_mesh_config_client_set_state()` with `comp_data_get` in the parameter `esp_ble_mesh_cfg_client_get_state_t` set properly.
- Users can refer to the following code to parse the Composition Data:

```
#include <stdio.h>
#include <string.h>
#include <stdint.h>

// test date: 0C001A0001000800000001050100000801000103103F002A00
// 0C00 1A00 0100 0800 0000 0105 0100 0000 0801 0001 0310 3F 002A 00

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
```

(continues on next page)
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000, ...
// 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model Identifier 0x002A

    if (ret == -1) {
        printf("decode_comp_data error");
    }
}

1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the Configuration Client Model API esp_ble_mesh_config_client_set_state().

- Add AppKey to nodes with app_key_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Add subscription address to the models of nodes with model_sub_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Set publication information to the models of nodes with model_pub_set in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.

1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_ERR_INVALID_ARG;
    }
```
return ESP_FAIL;
}

for (i = 0; i < comp->element_count; i++) {
    element = &comp->elements[i];
    model = esp_ble_mesh_find_sig_model(element, model_id);
    if (!model) {
        continue;
    }
    for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
