This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
Chapter 1. Get Started

If you have one of ESP32 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-DevKitC V4 Getting Started Guide**

This guide shows how to start using the ESP32-DevKitC V4 development board.

**What You Need**

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview** ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-DA
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROVER-E
  - ESP32-WROVER-IE
- male or female pin headers.

For details please refer to ESP Product Selector.

**Functional Description** The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

<table>
<thead>

**Fig. 1: ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered**

access to the SPI flash memory / SPI RAM.

---

**Note:** The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

---

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

---

**Header Block** The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, as shown in *ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered*. The numbering and names are the same as in the *ESP32-DevKitC V4 schematics* (PDF).

### Pin Layout

**Note on C15** The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows the location of C15 highlighted in yellow.
Chapter 1. Get Started

Fig. 2: ESP32-DevKitC Pin Layout (click to enlarge)

Fig. 3: Location of C15 (yellow) on ESP32-DevKitC V4 board
**Start Application Development** Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options.

What You Need

- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-E module
- LCD screen
- microSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

*Espressif Systems*
Allocation of ESP32 Pins  Some pins or terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data/Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1  The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<tr>
<td>2</td>
</tr>
</tbody>
</table>

Note:  Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 or R23 and re-soldering them to positions R12 or R24.
### Chapter 1. Get Started

#### SPI Flash / JP2

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLK / GPIO6</td>
<td>TRST_N</td>
</tr>
<tr>
<td>SD0 / GPIO7</td>
<td>TMS</td>
</tr>
<tr>
<td>SD1 / GPIO8</td>
<td>TDO</td>
</tr>
<tr>
<td>SD2 / GPIO9</td>
<td>TDI</td>
</tr>
<tr>
<td>SD3 / GPIO10</td>
<td>TCK</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

**Start Application Development** Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the **Power Switch** to ON, and the **5V Power On LED** should light up.

**Now to Development** Please proceed to **Get Started**, where Section **Installation** will quickly help you set up the development environment and then flash an example project onto your board.

A Board Support Package can be found in **IDF Component Registry**.
The application examples that use some hardware specific to your ESP-WROVER-KIT can be found below.

- On-board LCD example: peripherals/spi_master/lcd
- SD card slot example: storage/sd_card
- Camera connector example: https://github.com/espressif/esp32-camera

ESP-WROVER-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
### Key Component Description

<table>

</tr>
</tbody>
</table>
Allocation of ESP32 Pins  Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1  The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<th>ESP32 Pin</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.
**SPI Flash / JP13**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>

</tr>
<tr>
<td>6 CMD / GPIO11</td>
<td></td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

Start Application Development  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the Power Switch to ON, the 5V Power On LED should light up.

Now to Development  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 12: ESP-WROVER-KIT block diagram

Fig. 13: ESP-WROVER-KIT board layout - front
Fig. 14: ESP-WROVER-KIT board layout - back
### Key Component | Description
--- | ---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

**ESP32 Module** | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.

**CTS/RTS** | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

**UART** | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

**SPI** | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.

**JTAG** | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

**FT2232** | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.

**EN** | Reset button.

**Boot** | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

**USB** | USB interface. Power supply for the board as well as the communication interface between a computer and the board.

**Power Select** | Power supply selector interface. The board can be powered either via USB or via the 5 V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.

**Power Key** | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.

**5V Input** | The 5 V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).

**LDO** | NCP1117(1 A), 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1 A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.

**Camera** | Camera interface, a standard OV7670 camera module.

**RGB** | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).

**I/O** | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.

**microSD Card** | microSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the microSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.

**LCD** | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.
<table>

ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4/V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check *ESP32 Hardware Reference*.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

What You Need

- *ESP32-PICO-KIT mini development board*
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*. 
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. There are two versions of ESP32-PICO-KIT boards, respectively with male headers and female headers. In this guide, the male header version is taken as an example.
2. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details, see module’s datasheet in Related Documents.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

![ESP32-PICO-KIT block diagram](image-url)
**Functional Description** The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-PICO-D4</td>
<td>Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.</td>
</tr>
<tr>
<td>LDO</td>
<td>5V-to-3.3V Low dropout voltage regulator (LDO).</td>
</tr>
<tr>
<td>USB-UART bridge</td>

</tr>
</tbody>
</table>

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
Pin Descriptions  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see ESP32-PICO-KIT board layout (with female headers). The pin numbering and header names are the same as in the schematic given in Related Documents.

3.3V power supply

5V power supply

Espressif Systems

Release v5.0-dev-4379-g36f49f361c
Chapter 1. Get Started

Note:

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input, b) output.
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development  Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions  The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-PICO-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-PICO-D4</td>
<td>Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT V3 board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.</td>
</tr>
<tr>

ESP32-Ethernet-Kit V1.2 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

![ESP32-Ethernet-Kit V1.2 Overview](image)

Fig. 20: ESP32-Ethernet-Kit V1.2 Overview (click to enlarge)

What You Need

- ESP32-Ethernet-Kit V1.2 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.
Chapter 1. Get Started

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

Fig. 21: ESP32-Ethernet-Kit V1.2 (click to enlarge)

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

**Functionality Overview**  The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

**Functional Description**  The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)**  The table below provides description starting from the picture’s top right corner and going clockwise.
Chapter 1. Get Started

<td>Two LEDs to show the status of UART transmission.</td>
</tr>
<tr>
<td>FT2232H</td>
<td>The FT2232H chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232H also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232H chip enhances user-friendliness in terms of application development and debugging. See ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.</td>
</tr>
<tr>
<td>USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the board.</td>
</tr>
<tr>
<td>Power Switch</td>
<td>Power On/Off Switch. Toggling the switch to 5V0 position powers the board on, toggling to GND position powers the board off.</td>
</tr>
<tr>
<td>5V Input</td>
<td>The 5 V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board, either from USB or 5 V Input.</td>
</tr>
<tr>
<td>DC/DC Converter</td>
<td>Provided DC 5 V to 3.3 V conversion, output current up to 2 A.</td>
</tr>
<tr>
<td>Board B Connectors</td>
<td>A pair male and female header pins for mounting the PoE board (B)</td>
</tr>
<tr>
<td>IP101GRI (PHY)</td>
<td>The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GRI chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3/802.3u standard of 10/100 Mbps.</td>
</tr>
<tr>
<td>RJ45 Port</td>
<td>Ethernet network data transmission port.</td>
</tr>
<tr>
<td>Magnetics Module</td>
<td>The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.</td>
</tr>
<tr>
<td>Link/Activity LEDs</td>
<td>Two LEDs (green and red) that respectively indicate the “Link” and “Activity” statuses of the PHY.</td>
</tr>
<tr>
<td>BOOT Button</td>
<td>Download button. Holding down BOOT and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
<tr>
<td>GPIO Header 1</td>
<td>This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see GPIO Header 1.</td>
</tr>
</tbody>
</table>

**Note:** Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users don’t need to do any operation with BOOT button or EN button.

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:
- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an
Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Ethemet board](image)

</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**RMII Clock Selection** The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

**RMII Clock Sourced Externally by PHY** By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GR PHY's 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).
Fig. 25: RMII Clock from IP101GRI PHY
Fig. 26: RMII Clock from ESP Internal APLL
Chapter 1. Get Started

**RMI Clock Sourced Internally from ESP32’s APLL**  Another option is to source the RMI Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMI clock.

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>

<td>MDIO</td>
</tr>
<tr>
<td>PHY Reset</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

**Note:**  The allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix. REF_CLK can only be selected from GPIO0, GPIO16 or GPIO17 and it cannot be changed through GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RE-
Chapter 1. Get Started

SET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

1. Set the **Function Switch** on the Ethernet board (A) to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development**  Proceed to Get Started, where Section **Installation** will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**  After setting up the development environment and testing the board, you can configure and flash the `ethernet/basic` example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on ESP32-Ethernet-Kit V1.2 (click to enlarge).

**Summary of Changes from ESP32-Ethernet-Kit V1.1**

- Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
- Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
- Replace ESP32-WROOM-B with ESP32-WROOM-E.

**Chapter 1. Get Started**

**ESP32-Ethernet-Kit V1.0 Getting Started Guide**

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**

ESP32-Ethernet-Kit is an ESP32-based development board produced by *Espressif*.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface.
without a separate JTAG debugger.

**Functionality Overview**  The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

![ESP32-Ethernet-Kit block diagram](image)

Fig. 28: ESP32-Ethernet-Kit block diagram (click to enlarge)

**Functional Description**  The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)**  The table below provides description starting from the picture’s top right corner and going clockwise.
### Key Component | Description
--- | ---
ESP32-WROVER-B | This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
GPIO Header 2 | Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see **GPIO Header 2**.
Flow Control | A jumper header with access to the board signals. For details, see **Flow Control**.
Function Switch | A DIP switch used to configure the functionality of selected GPIOs of ESP32. For details, see **Function Switch**.
Tx/Rx LEDs | Two LEDs to show the status of UART transmission.
GPIO Header 3 | Provides access to some GPIOs of ESP32 that can be used depending on the position of the **Function Switch**.
FT2232H | The FT2232H chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232H also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232H chip enhances user-friendliness in terms of application development and debugging. See **ESP32-Ethernet-Kit V1.0 Ethernet board (A) schematic**.
USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power On/Off Switch | Power On/Off Switch. Toggling toward the **Boot** button powers the board on, toggling away from **Boot** powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).

---

**Fig. 29: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)**
Chapter 1. Get Started

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under **Functionality Overview**.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE Board (B) layout](image)

<tr>
<td>4</td>
<td>GPIO35</td>
</tr>
<tr>
<td>5</td>
<td>GPIO36</td>
</tr>
<tr>
<td>6</td>
<td>GPIO39</td>
</tr>
</tbody>
</table>

**GPIO Header 2**  This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see *IP101GRI (PHY) Interface*. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>

Note:

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

Start Application Development  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development

Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

To use the older GNU Make compilation system, please refer to Installation section.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example

After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on ESP32-Ethernet-Kit V1.0 board.

ESP32-Ethernet-Kit V1.1 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

<td>Ethernet network data transmission port.</td>
</tr>
<tr>
<td>Magnetics Module</td>
<td>The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejecting high-frequency signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.</td>
</tr>
</tbody>
</table>
PoE Board (B)  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE Board Layout](image)

</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

### Setup Options

This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APPLL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.
RMII Clock Sourced Externally by PHY  
By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

RMII Clock Sourced Internally from ESP32’s APLL  
Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

GPIO Allocation  
This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Fig. 36: RMI Clock from ESP Internal APLL
IP101GRI (PHY) Interface  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RMII Interface</strong></td>
<td></td>
</tr>
<tr>

</tbody>
</table>

Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also RMII Clock Sourced Externally by PHY. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

Start Application Development   Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development**  Proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**  After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.1*.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**ESP32-DevKitS(-R)**

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif. ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
Chapter 1. Get Started

ESP32-DevKitS ESP32-DevKitS-R

The document consists of the following major sections:

- **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.
- **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section *How to Flash a Board* provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

**Overview**  ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

- **ESP32-DevKitS**:
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R**:
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

For information about above modules, please refer to [ESP32 Series Modules](#).

**How to Flash a Board** Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Hardware Setup** Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:
- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

**Software Setup**

**Preferred Method** The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

**Alternative Method** As an alternative, Windows users can flash binaries using the Flash Download Tool. Just download it, unzip it, and follow the instructions inside the doc folder.

**Note:**
1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

**Board Dimensions**

**Contents and Packaging**
Chapter 1. Get Started

Fig. 39: ESP32-DevKitS board dimensions - back

Fig. 40: ESP32-DevKitS-R board dimensions - back
Retail orders  If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  A block diagram below shows the components of ESP32-DevKitS(-R) and their interconnections.

![Block Diagram](https://www.espressif.com/residential-media-center/)

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

**ESP32-PICO-KIT-1**

**Overview**  ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-V3 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:
Chapter 1. Get Started

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

**Note:** ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started:** Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
- **Contents and Packaging:** Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference:** Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
- **Hardware Revision Details:** Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
- **Related Documents:** Gives links to related documentation.

**Getting Started** This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

**Description of Components** The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>

Submit Document Feedback
Fig. 42: ESP32-PICO-KIT-1 Overview (click to enlarge)
Chapter 1. Get Started

Fig. 43: ESP32-PICO-KIT-1 board layout - front (click to enlarge)

Start Application Development  Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

Required Hardware

- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS

Software Setup  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment.

Contents and Packaging

Retail Orders  If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins
Warning: The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

#### Note:

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Chapter 1. Get Started

ESP32-PICO-DevKitM-2

Overview

ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-MINI-02(02U) module with complete Wi-Fi and Bluetooth functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02(02U) are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

• **Getting Started**: Provides an overview of the ESP32-PICO-DevKitM-2 and software setup instructions to get started.

• **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.

• **Hardware Reference**: Provides more detailed information about the ESP32-PICO-DevKitM-2’s hardware.

• **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions (if any) of the ESP32-PICO-DevKitM-2.

• **Related Documents**: Gives links to related documentation.

**Getting Started**

This section describes how to get started with the ESP32-PICO-DevKitM-2. It begins with a few introductory sections about the ESP32-PICO-DevKitM-2, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-DevKitM-2.
Fig. 46: ESP32-PICO-DevKitM-2 Overview (click to enlarge)
Description of Components  The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-DevKitM-2 board. We take the board with a ESP32-PICO-MINI-02 module as an example in the following sections.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-PICO-MINI-02</td>
<td>Standard ESP32-PICO-MINI-02 module soldered to the ESP32-PICO-DevKitM-2 board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the module. Users can also select the board with ESP32-PICO-MINI-02U soldered.</td>
</tr>
<tr>
<td>LDO</td>
<td>V-to-3.3V Low dropout voltage regulator (LDO).</td>
</tr>
<tr>
<td>USB-to-UART bridge</td>
<td>CP2102N, single-chip USB-UART bridge that offers up to 3 Mbps transfers rates.</td>
</tr>
<tr>
<td>Micro-B USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the board.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board. For details, see the schematic in Related Documents.</td>
</tr>
<tr>
<td>I/O Connector</td>
<td>All the pins on ESP32-PICO-MINI-02 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section Pin Descriptions.</td>
</tr>
<tr>
<td>BOOT Button</td>
<td>Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
</tbody>
</table>

Start Application Development  Before powering up your ESP32-PICO-DevKitM-2, please make sure that the board is in good condition with no obvious signs of damage.

Required Hardware
- 1 x ESP32-PICO-DevKitM-2
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS
Chapter 1. Get Started

**Software Setup**  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment.

**Contents and Packaging**

**Retail Orders**  If you order one or several samples of the board, each ESP32-PICO-DevKitM-2 development board comes in an individual package.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram**  The block diagram below shows the main components of ESP32-PICO-DevKitM-2 and their interconnections.

![ESP32-PICO-DevKitM-2 Block Diagram](Fig.48: ESP32-PICO-DevKitM-2 Block Diagram (click to enlarge))

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:**  The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

Espressif Systems

Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
Chapter 1. Get Started

Note:

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-DevKitM-2’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

ESP32-DevKitM-1

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-1(1U)-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.
The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  
This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.

**Overview**  
This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

**Contents and Packaging**

**Retail orders**  
If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

**Wholesale Orders**  
If you order in bulk, the boards come in large cardboard boxes.

**Description of Components**  
The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.
Chapter 1. Get Started

Fig. 50: ESP32-DevKitM-1 - front

<table>

</tr>
<tr>
<td>I/O Connector</td>
<td>All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. Users can program ESP32 chip to enable multiple functions.</td>
</tr>
</tbody>
</table>

**Start Application Development**  Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.
Attention: ESP32-DevKitM-1 is a board with a single core module, please enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing your applications.

Hardware Reference

Block Diagram  A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

![Block Diagram of ESP32-DevKitM-1](image)

Fig. 51: ESP32-DevKitM-1

Power Source Select  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

Warning:

- The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.

Pin Descriptions  The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

### 1.2.2 Software

To start using ESP-IDF on **ESP32**, install the following software:
• **Toolchain** to compile code for ESP32
• **Build tools** - CMake and Ninja to build a full **Application** for ESP32
• **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**

1.3 **Installation**

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 **IDE**

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

• **Eclipse Plugin**
• **VSCode Extension**

1.3.2 **Manual Installation**

For the manual procedure, please select according to your operating system.
Standard Setup of Toolchain for Windows

**Introduction**  ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

**ESP-IDF Tools Installer**  The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

What is the use case for Online and Offline Installer  Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory \%userprofile\%.espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

**Components of the installation**  The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is \%userprofile%\Desktop\esp-idf where \%userprofile% is your home directory.
Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

![Setup - ESP-IDF Tools 2.9](image)

Fig. 52: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt  For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs export.bat script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

First Steps on ESP-IDF  Now since all requirements are met, the next topic will guide you on how to start your first project.

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

Note: There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device  Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32 for full details.

Note: Keep the port name handy as you will need it in the next steps.

Configure Your Project  Navigate to your hello_world directory, set ESP32 as the target, and run the project configuration utility menuconfig.

Windows

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with idf.py set-target esp32. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”, since this example runs with default configuration.

Attention: If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MINI-1(1U) module, please enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing examples.
Chapter 1. Get Started

![Project configuration - Home window](image)

**Fig. 56: Project configuration - Home window**

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See **Additional Tips** for more information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.../.../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.
Chapter 1. Get Started

Flash onto the Device  Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:

```bash
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see `idf.py`.

Note: The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

Encountered Issues While Flashing?  If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

Normal Operation  When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB-
--0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin-
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting........_
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz

Hard resetting via RTS pin...
Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out Eclipse Plugin, VSCode Extension.

Monitor the Output To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB... external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].
Chapter 1. Get Started

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26 MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

idf.py -p PORT flash monitor

See also:
- IDF Monitor for handy shortcuts and more details on using IDF monitor.
- idf.py for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

Important: Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

Additional Tips

Permission issues /dev/ttyUSB0  With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Python compatibility  ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Start with Board Support Package  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via IDF Component Manager, so they can be found in IDF Component Registry.

Here’s an example of how to add ESP-WROVER-KIT BSP to your project:
idf.py add-dependency esp_wrover_kit

More examples of BSP usage can be found in BSP examples folder.

Related Documents For advanced users who want to customize the install process:
- Updating ESP- IDF tools on Windows
- Establish Serial Connection with ESP32
- Eclipse Plugin
- VSCode Extension
- IDF Monitor

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

Add ESP-IDF tools to PATH using an export script ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%/esp/esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.ps1:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.

Connect ESP32 to PC Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:
Chapter 1. Get Started

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

![Device Manager](image)

Fig. 57: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

**Check port on Linux and macOS** To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*
```

**macOS**

```
ls /dev/cu.*
```

**Note:** macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed. See Section *Connect ESP32 to PC* for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly
Fig. 58: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer ...” where the developer name is Silicon Labs or FTDI.

**Adding user to dialout on Linux**  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection**  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32.

**Windows and Linux**  In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screenshot of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 59: Setting Serial Communication in PuTTY on Windows
Fig. 60: Setting Serial Communication in PuTTY on Linux
Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32, see Example Output.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in *Check port on Linux and macOS*, run:

  ```bash
  ls /dev/cu.*
  ```

  You should see similar output:

  ```bash
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
  ```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

  ```bash
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32, see Example Output. To exit the `screen` session type Ctrl-A + \. 

  **Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00

entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the `esptool documentation` for more details.
Chapter 1. Get Started

If you got here from Step 5. First Steps on ESP-IDF when installing s/w for ESP32 development, then you can continue with Step 5. First Steps on ESP-IDF.

IDF Monitor

IDF Monitor is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running idf.py monitor.

Keyboard Shortcuts   For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+J</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>Interrupt running application</td>
<td>Pauses IDF Monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.
IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses `addr2line_` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.
Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : ...

0x400d071d: main_task at /home/gus/esp/32/idf/components.esp32./cpu_start.c:254
```
To decode each address, IDF Monitor runs the following command in the background:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

**Target Reset on Connection**  By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf_monitor.py --no-reset`).

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

**Launching GDB with GDBStub**  GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board’s Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex
                        --interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering**  IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the `logging library`. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.
Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples of Filtering Rules:

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means matching everything.
- ":N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To avoid this, use *:E or a higher verbosity level.
- Rules "tag1:V"="tag1:v", "tag1:V", "tag1::*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.
- tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_ →1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I" is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `\`PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows
Chapter 1. Get Started

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when `idf.py` exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When `gdb` is run, it might stall for a short time before it begins communicating with the GDBStub.

Standard Toolchain Setup for Linux and macOS

Installation Step by Step  This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment  These are the steps for setting up the ESP-IDF for your ESP32.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the tools**
- **Step 4. Set up the environment variables**
- **Step 5. First Steps on ESP-IDF**

Step 1. Install Prerequisites  In order to use ESP-IDF with the ESP32, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

For Linux Users  To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:
  ```bash
  sudo apt-get install git wget flex bison gperf python3 python3-venv cmake
  --ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```
  ```bash
  ```
- CentOS 7 & 8:
  ```bash
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake
  --ninja-build ccache dfu-util libusbx
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:
  ```bash
  sudo pacman --needed gcc git make flex bison gperf python cmake ninja
  --ccache dfu-util libusb
  ```

Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run `tools/idf_tools.py install cmake` to install a suitable version if your OS versions doesn’t have one.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```bash
    ```
**Chapter 1. Get Started**

```bash
sudo port install cmake ninja dfu-util
```

– Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

• It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via `brew install ccache` or `sudo port install ccache` on MacPorts.

**Note:** If an error like this is shown during any step:

```bash
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Installing Python 3** Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```bash
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```bash
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

• Installing with HomeBrew can be done as follows:

```bash
brew install python3
```

• If you have MacPorts, you can run:

```bash
sudo port install python38
```

---

**Step 2. Get ESP-IDF** To build applications for the ESP32, you need the software libraries provided by Espresif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult **ESP-IDF Versions** for information about which ESP-IDF version to use in a given situation.

---

**Step 3. Set up the tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32.

```bash
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell

Espressif Systems 111 Release v5.0-dev-4379-g36f49f361c
The above commands install tools for ESP32 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```bash
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```bash
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish all
```

### Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running install.sh:

```bash
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

### Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

### Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```bash
./$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):
Chapter 1. Get Started

Note the space between the leading dot and the path!
If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

```
alias get_idf='.$$HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF**

Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

**Start a Project**

Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device**

Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32](#) for full details.

**Note:** Keep the port name handy as you will need it in the next steps.
Chapter 1. Get Started

**Configure Your Project**  Navigate to your `hello_world` directory, set ESP32 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See *Select the Target Chip: set-target* for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello_word”, since this example runs with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MIN1-1(1U) module, please enable single core mode (*CONFIG_FREERTOS_UNICORE*) in `menuconfig` before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See *Additional Tips* for more information.

**Build the Project**  Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.
Chapter 1. Get Started

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device** Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see *idf.py*.

**Note:** The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

**Encountered Issues While Flashing?** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).
For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP- IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).

- For other types of hardware, try pulling GPIO0 down.

**Normal Operation**  
When flashing, you will see the output log similar to the following:

```
... 
esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --  
  after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB -  
  0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin -  
  0x10000 hello_world.bin 
esptool.py v3.0-dev 
Serial port /dev/ttyUSB0 
Connecting............_ 
Chip is ESP32DWDQ6 (revision 0) 
Features: WiFi, BT, Dual Core, Coding Scheme None 
Crystal is 40MHz

Leaving... 
Hard resetting via RTS pin... 
Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running \textit{idf.py}, check out Eclipse Plugin, VSCode Extension.

**Monitor the Output**  
To check if “hello_world” is indeed running, type \textit{idf.py -p PORT monitor} (Do not forget to replace PORT with your serial port name).

This command launches the \textit{IDF Monitor} application:

```
$ idf.py -p <PORT> monitor 
Running idf_monitor in directory [...]/esp/hello_world/build
```

(continues on next page)
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"

--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---

ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)

Hello world!

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26 MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- IDF Monitor for handy shortcuts and more details on using IDF monitor.
- idf.py for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

Important: Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.
Chapter 1. Get Started

Additional Tips

**Permission issues /dev/ttyUSB0**  With some Linux distributions, you may get the *Failed to open port /dev/ttyUSB0* error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

**Python compatibility**  ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as *pyenv*.

**Start with Board Support Package**  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via *IDF Component Manager*, so they can be found in *IDF Component Registry*.

Here’s an example of how to add ESP-WROVER-KIT BSP to your project:

```bash
idf.py add-dependency esp_wrover_kit
```

More examples of BSP usage can be found in *BSP examples folder*.

**Tip: Updating ESP-IDF**  It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see *ESP-IDF Versions*.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in *Step 2. Get ESP-IDF*.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at *Step 3. Set up the tools*.

Once the new tools are installed, update the environment using the Export script. See instructions at *Step 4. Set up the environment variables*.

Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the build system guide.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with esp_err_t type. See Error Handling section for more information about error handling approaches. Error Code Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:
Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack. The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

**Default initializers**

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.
This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API. It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

### 2.1.5 API Stability

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system renaming mechanism ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](https://www.espressif.com/en/support/documentation/configuration-structures) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- **Private APIs.**
- **Components in example projects.**
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
• Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
• Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
• Location of Kconfig options in menuconfig.
• Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO port

Asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

• ASIO component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ASIO documentation (English)

2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component freemodbus has been moved from ESP-IDF since version v5.0 to a separate repository:

• ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

• protocols/modbus/serial/mb_slave
• protocols/modbus/serial/mb_master
• protocols/modbus/tcp/mb_tcp_slave
• protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.
Chapter 2. API Reference

Protocol References

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of [MQTT](mqtt.org) protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedTLS, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tls, default port 8883
- protocols/mqtt/ssl_ds: MQTT over tls using digital signature peripheral for authentication, default port 8883.
- protocols/mqtt/ssl_mutual_auth: MQTT over tls using certificates for authentication, default port 8883.
- protocols/mqtt/ssl_psk: MQTT over tls using pre-shared keys for authentication, default port 8883.
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- broker - Allow to set address and security verification.
- credentials - Client credentials for authentication.
- session - Configuration for MQTT session aspects.
- network - Networking related configuration.
- task - Allow to configure FreeRTOS task.
- buffer - Buffer size for input and output.

In the following session the most common aspects are detailed.

Broker

Address  Broker address can be set by usage of `broker.address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in websocket connections.

The `uri` field is used in the following format `scheme://hostname:port/path`. - Currently support `mqtt`, `mqtts`, `ws`, `wss` schemes - MQTT over TCP samples:

- `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
Chapter 2. API Reference

- `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password

- MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io:8883` MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884` MQTT over SSL, port 8884

- MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`

- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`

- Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, \n    client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

**Verification** For secure connections TLS is used, and to guarantee Broker’s identity the `brokerverification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER the equivalent `_len` field must be set, otherwise a NULL terminated string in PEM format should be provided to `certificate` field.

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null | openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .broker = {
    .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
  },
};
```

To details on other fields check the Reference API and *TLS Server verification*.

**Client Credentials** All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI.
- `client_id`: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It’s possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- Using a password by setting `authentication.password`.
- Mutual authentication with TLS by setting `authentication.certificate` and `authentication.key`, both can be provided in PEM or DER format.
- Using secure element available in ESP32-WROOM-32SE, setting `authentication.use_secure_element`.
- Using Digital Signature Peripheral available in some Espressif devices, setting `authentication.ds_data`. 
Session  For MQTT session related configurations section fields should be used.

Last Will and Testament  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t.

- **topic**: pointer to the LWT message topic
- **msg**: pointer to the LWT message
- **msg_len**: length of the LWT message, required if msg is not null-terminated
- **qos**: quality of service for the LWT message
- **retain**: specifies the retain flag of the LWT message

Change settings in Project Configuration Menu  The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates MQTT client handle based on the configuration.

Submit Document Feedback
**Chapter 2. API Reference**

**Parameters**
- `config` - MQTT configuration structure

**Returns**
- `mqtt_client_handle` if successfully created, NULL on error

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets MQTT connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Parameters**
- `client` - MQTT client handle
- `uri` -

**Returns**
- ESP_FAIL if URI parse error, ESP_OK on success

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```

Starts MQTT client with already created client handle.

**Parameters**
- `client` - MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

**Parameters**
- `client` - MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

**Parameters**
- `client` - MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

```c
esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
```

Stops MQTT client tasks.

**Notes:**
- Cannot be called from the MQTT event handler

```c
int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
```

Subscribe the client to defined topic with defined qos.

**Notes:**
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Parameters**
- `client` - MQTT client handle
- `topic` -
- `qos` -// TODO describe parameters

**Returns**
- message_id of the subscribe message on success -1 on failure

```c
int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)
```

Unsubscribe the client from defined topic.

**Notes:**
- Client must be connected to send unsubscribe message
• It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**
- `client` - MQTT client handle
- `topic` -

**Returns** message_id of the subscribe message on success -1 on failure

```c
int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
```

Client to send a publish message to the broker.

Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**
- `client` - MQTT client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag

**Returns** message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

```c
int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)
```

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

**Parameters**
- `client` - MQTT client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag
- `store` - if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message_id if queued successfully, -1 otherwise

```c
esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)
```

Destroys the client handle.

Notes:
- Cannot be called from the MQTT event handler

**Parameters**
- `client` - MQTT client handle

**Returns** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization
Chapter 2. API Reference

```c
esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
```

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

**Parameters**
- `client` - MQTT client handle
- `config` - MQTT configuration structure

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

```c
esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Registers MQTT event.

**Parameters**
- `client` - MQTT client handle
- `event` - event type
- `event_handler` - handler callback
- `event_handler_arg` - handlers context

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

```c
int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)
```

Get outbox size.

**Parameters** `client` - MQTT client handle

**Returns** outbox size 0 on wrong initialization

**Structures**

```c
struct esp_mqtt_error_codes
```

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

- `error_type` - related member variables
- `note` - MQTT_ERROR_TYPE_TCP_TRANSPORT
- `esp_tls_last_stack_err` - esp_stack err
- `esp_tls_cert_verify_flags` - sock_errno
- `esp_tls_cert_verify_flags` - Error reported from tcp_transport/esp-tls
- `MQTT_ERROR_TYPE_CONNECTION_REFUSED` - connect_return_code
- `Internal` - error reported from MQTT broker on connection

**Public Members**

```c
esp_err_t esp_tls_last_esp_err
```

last esp_err code reported from esp-tls component

```c
int esp_tls_stack_err
```

tls specific error code reported from underlying tls stack

```c
int esp_tls_cert_verify_flags
```

tls flags reported from underlying tls stack during certificate verification

Submit Document Feedback
**esp_mqtt_error_type_t** error_type
   error type referring to the source of the error

**esp_mqtt_connect_return_code_t** connect_return_code
   connection refused error code reported from MQTT* broker on connection

int **esp_transport_sock_errno**
   errno from the underlying socket

struct **esp_mqtt_event_t**
   MQTT event configuration structure

**Public Members**

**esp_mqtt_event_id_t** event_id
   MQTT event type

**esp_mqtt_client_handle_t** client
   MQTT client handle for this event

char * **data**
   Data associated with this event

int **data_len**
   Length of the data for this event

int **total_data_len**
   Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**
   Actual offset for the data associated with this event

char * **topic**
   Topic associated with this event

int **topic_len**
   Length of the topic for this event associated with this event

int **msg_id**
   MQTT message id of message

int **session_present**
   MQTT session_present flag for connection event

**esp_mqtt_error_codes_t** * **error_handle**
   esp-mqtt error handle including esp-tls errors as well as internal MQTT errors
bool retain
    Retained flag of the message associated with this event

int qos
    QoS of the messages associated with this event

bool dup
    dup flag of the message associated with this event

*esp_mqtt_protocol_ver_t* protocol_ver
    MQTT protocol version used for connection, defaults to value from menuconfig

struct *esp_mqtt_client_config_t*

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

**Public Members**

struct *esp_mqtt_client_config_t::broker_t* broker
    Broker address and security verification

struct *esp_mqtt_client_config_t::credentials_t* credentials
    User credentials for broker

struct *esp_mqtt_client_config_t::session_t* session
    MQTT session configuration.

struct *esp_mqtt_client_config_t::network_t* network
    Network configuration

struct *esp_mqtt_client_config_t::task_t* task
    FreeRTOS task configuration.

struct *esp_mqtt_client_config_t::buffer_t* buffer
    Buffer size configuration.

struct broker_t
    Broker related configuration

**Public Members**

struct *esp_mqtt_client_config_t::broker_t::address_t* address
    Broker address configuration
struct `esp_mqtt_client_config_t::broker_t::verification_t` **verification**

Security verification of the broker

struct `address_t`

Broker address

- uri have precedence over other fields
- If uri isn’t set at least hostname, transport and port should.

### Public Members

const char * `uri`

Complete MQTT broker URI

const char * `hostname`

Hostname, to set ipv4 pass it as string)

`esp_mqtt_transport_t` **transport**

Selects transport

const char * `path`

Path in the URI

`uint32_t` **port**

MQTT server port

struct `verification_t`

Broker identity verification

If fields are not set broker’s identity isn’t verified. it’s recommended to set the options in this struct for security reasons.

### Public Members

bool `use_global_ca_store`

Use a global ca_store, look esp-tls documentation for details.

`esp_err_t` (*`crt_bundle_attach`)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char * `certificate`

Certificate data, default is NULL, not required to verify the server.

`size_t` **certificate_len**

Length of the buffer pointed to by certificate.
const struct psk_key_hint *psk_hint_key

Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool skip_cert_common_name_check

Skip any validation of server certificate CN field, this reduces the security of TLS and makes MQTT clients susceptible to MITM attacks

const char **alpn_protos

NULL-terminated list of supported application protocols to be used for ALPN

struct buffer_t

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int size

size of MQTT send/receive buffer

int out_size

size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t

Client related credentials for authentication.

Public Members

const char *username

MQTT username

const char *client_id

Set MQTT client identifier. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool set_null_client_id

Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_t authentication

Client authentication

struct authentication_t

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.
**Public Members**

```c
const char *password

MQTT password
```

```c
const char *certificate

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with key.
```

```c
size_t certificate_len

Length of the buffer pointed to by certificate.
```

```c
const char *key

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also certificate has to be provided.
```

```c
size_t key_len

Length of the buffer pointed to by key.
```

```c
const char *key_password

Client key decryption password, not PEM nor DER, if provided key_password_len must be correctly set.
```

```c
int key_password_len

Length of the password pointed to by key_password
```

```c
bool use_secure_element

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection
```

```c
void *ds_data

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.
```

```c
struct network_t

Network related configuration
```

**Public Members**

```c
int reconnect_timeout_ms

Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)
```

```c
int timeout_ms

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).
```

```c
int refresh_connection_after_ms

Refresh connection after this value (in milliseconds)
```
bool **disable_auto_reconnect**  
Client will reconnect to server (when errors/disconnect). Set **disable_auto_reconnect**=true to disable

struct **session_t**  
MQTT Session related configuration

**Public Members**

struct **esp_mqtt_client_config_t::session_t::last_will_t last_will**  
Last will configuration

bool **disable_clean_session**  
MQTT clean session, default clean_session is true

int **keepalive**  
MQTT keepalive, default is 120 seconds

bool **disable_keepalive**  
Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

**esp_mqtt_protocol_ver_t protocol_ver**  
MQTT protocol version used for connection.

int **message_retransmit_timeout**  
timeout for retransmitting of failed packet

struct **last_will_t**  
Last Will and Testament message configuration.

**Public Members**

const char * **topic**  
LWT (Last Will and Testament) message topic

const char * **msg**  
LWT message, may be NULL terminated

int **msg_len**  
LWT message length, if msg isn’t NULL terminated must have the correct length

int **qos**  
LWT message QoS

int **retain**  
LWT retained message flag
struct task_t
   Client task configuration

   Public Members

int priority
   MQTT task priority

int stack_size
   MQTT task stack size

Macros

MQTT_ERROR_TYPE_ESP_TLS
   MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
   MQTT event types.
   User event handler receives context data in esp_mqtt_event_t structure with
   • client - MQTT client handle
   • various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
   MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
   MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
   MQTT protocol version used for connection

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
   MQTT error code structure to be passed as a contextual information into ERROR event
   Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)
   Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
</table>
| MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_error, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from
chapter 2. api reference

tcp_transport/esp-tls | | mqtt_error_type_connection_refused | connect_return_code | Internal error reported from MQTT broker on connection |

typedef struct esp_mqtt_event_t esp_mqtt_event_t
MQTT event configuration structure

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t
MQTT client configuration structure

• Default values can be set via menuconfig
• All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

enumerations
enum esp_mqtt_event_id_t
MQTT event types.
User event handler receives context data in esp_mqtt_event_t structure with

• client - MQTT client handle
• various other data depending on event type

Values:

everifier MQTT_EVENT_ANY

everifier MQTT_EVENT_ERROR
on error event, additional context: connection return code, error handle from esp_tls (if supported)

everifier MQTT_EVENT_CONNECTED
connected event, additional context: session_present flag

everifier MQTT_EVENT_DISCONNECTED
disconnected event

everifier MQTT_EVENT_SUBSCRIBED
subscribed event, additional context:
• msg_id message id
• data pointer to the received data
• data_len length of the data for this event

everifier MQTT_EVENT_UNSUBSCRIBED
unsubscribed event
### Chapter 2. API Reference

**enumerator** `MQTT_EVENT_PUBLISHED`

published event, additional context: `msg_id`

**enumerator** `MQTT_EVENT_DATA`

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- topic_len length of the topic
- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**enumerator** `MQTT_EVENT_BEFORE_CONNECT`

The event occurs before connecting

**enumerator** `MQTT_EVENT_DELETED`

Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

**enum** `esp_mqtt_connect_return_code_t`

MQTT connection error codes propagated via `ERROR` event

**Values:**

**enumerator** `MQTT_CONNECTION_ACCEPTED`

Connection accepted

**enumerator** `MQTT_CONNECTION_REFUSE_PROTOCOL`

MQTT connection refused reason: Wrong protocol

**enumerator** `MQTT_CONNECTION_REFUSE_ID_REJECTED`

MQTT connection refused reason: ID rejected

**enumerator** `MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE`

MQTT connection refused reason: Server unavailable

**enumerator** `MQTT_CONNECTION_REFUSE_BAD_USERNAME`

MQTT connection refused reason: Wrong user

**enumerator** `MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED`

MQTT connection refused reason: Wrong username or password
enum esp_mqtt_error_type_t

MQTT connection error codes propagated via ERROR event

Values:

enumerator MQTT_ERROR_TYPE_NONE
enumerator MQTT_ERROR_TYPE_TCP_TRANSPORT
enumerator MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t

Values:

enumerator MQTT_TRANSPORT_UNKNOWN
enumerator MQTT_TRANSPORT_OVER_TCP
    MQTT over TCP, using scheme: MQTT
enumerator MQTT_TRANSPORT_OVER_SSL
    MQTT over SSL, using scheme: MQTTS
enumerator MQTT_TRANSPORT_OVER_WS
    MQTT over Websocket, using scheme:: ws
enumerator MQTT_TRANSPORT_OVER_WSS
    MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t

MQTT protocol version used for connection

Values:

enumerator MQTT_PROTOCOL_UNDEFINED
enumerator MQTT_PROTOCOL_V_3_1
enumerator MQTT_PROTOCOL_V_3_1_1
enumerator MQTT_PROTOCOL_V_5

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
Chapter 2. API Reference

- esp_tls_init(): for initializing the TLS connection handle.
- esp_tls_conn_new_sync(): for opening a new blocking TLS connection.
- esp_tls_conn_new_async(): for opening a new non-blocking TLS connection.
- esp_tls_conn_read(): for reading from the connection.
- esp_tls_conn_write(): for writing into the connection.
- esp_tls_conn_destroy(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the esp_tls_cfg_t structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- cacert_buf and cacert_bytes: The CA certificate can be provided in a buffer to the esp_tls_cfg_t structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in esp_tls_cfg_t structure must be set.
  - cacert.buf - pointer to the buffer which contains the CA cert.
  - cacert_bytes - size of the CA certificate in bytes.
- use_global_ca_store: The global_ca_store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set use_global_ca_store = true in their respective esp_tls_cfg_t structure. See API Reference section below on information regarding different API used for initializing and setting up the global_ca_store.
- crt_bundle_attach: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle
- psk_hint_key: To use pre-shared keys for server verification, CONFIG_ESP_TLS_PSK_VERIFICATION should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the esp_tls_cfg_t structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- skip server verification: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling CONFIG_ESP_TLS_INSECURE and CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the esp_tls_cfg_t structure. WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.
Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.:
   
   (First change directory (cd) to your project directory)
   mkdir components
   cd components
   git clone https://github.com/espressif/esp-wolfssl.git

2) Add wolfssl as an extra component in your project.
   • Download wolfssl with:
     
     git clone https://github.com/espressif/esp-wolfssl.git
   
   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedtls as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.
To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add `esp-cryptoauthlib` in your project, for details please refer `esp-cryptoauthlib with ESP_IDF`
2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```

3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit `ATECC608A chip type`

4) Enable use of ATECC608A in ESP-TLS by providing following config option in `esp_tls_cfg_t`

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

### API Reference

#### Header File

- `components/esp-tls/esp_tls.h`

#### Functions

- `esp_tls_t *esp_tls_init (void)`
  
  Create TLS connection.
  
  This function allocates and initializes esp-tls structure handle.
  
  **Returns**
  
  Tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

- `esp_tls_t *esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)`
  
  Create a new blocking TLS/SSL connection with a given “HTTP” url.
  
  **Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

  **Parameters**

  - `url` [-in] url of host.
  - `cfg` [-in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.

  **Returns**

  Pointer to esp_tls_t, or NULL if connection couldn’t be opened.

- `int esp_tls_conn_new_sync(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)`
  
  Create a new blocking TLS/SSL connection.
  
  This function establishes a TLS/SSL connection with the specified host in blocking manner.

  **Parameters**

  - `hostname` [-in] Hostname of the host.
Chapter 2. API Reference

- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

**Returns**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```
int esp_tls_conn_http_new_sync (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_sync() API. However, this API accepts host’s url.

**Parameters**
- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- **tls** – [in] Pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Parameters**
- **hostname** – [in] Hostname of the host.
- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. **non_block** member of this structure should be set to be true.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```
int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_async() API. However, this API accepts host’s url.

**Parameters**
- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```
ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.
Chapter 2. API Reference

**Parameters**

- `tls` [in] pointer to esp-tls as esp-tls handle.
- `data` [in] Buffer from which data will be written.
- `datalen` [in] Length of data buffer.

**Returns**

- `>=0` if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- `<0` if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE` if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

```c
ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer `data`.

**Parameters**

- `tls` [in] pointer to esp-tls as esp-tls handle.
- `data` [in] Buffer to hold read data.
- `datalen` [in] Length of data buffer.

**Returns**

- `>0` if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- `0` if read operation was not successful. The underlying connection was closed.
- `<0` if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

```c
int esp_tls_conn_destroy(esp_tls_t *tls)
```

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

**Parameters**

- `tls` [in] pointer to esp-tls as esp-tls handle.

**Returns**

- 0 on success
- `-1` if socket error or an invalid argument

```c
ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
```

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

**Parameters**

- `tls` [in] pointer to esp-tls as esp-tls handle.

**Returns**

- `-1` in case of invalid arg
- bytes available in the application data record read buffer

```c
esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
```

Returns the connection socket file descriptor from esp_tls session.

**Parameters**

- `tls` [in] handle to esp_tls context
- `sockfd` [out] int pointer to sockfd value.

**Returns**

- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

```c
void *esp_tls_get_ssl_context(esp_tls_t *tls)
```

Returns the ssl context.

**Parameters**

- `tls` [in] handle to esp_tls context

**Returns**

- ssl_ctx pointer to ssl context of underlying TLS layer on success
- NULL in case of error
**esp_err_t esp_tls_init_global_ca_store (void)**

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Returns**

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occured when allocating the mbedtls resources.

**esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)**

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Parameters**

- **cacert_pem_buf** - [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** - [in] Length of the buffer.

**Returns**

- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

**void esp_tls_free_global_ca_store (void)**

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

**esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)**

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- **h** - [in] esp-tls error handle.
- **esp_tls_code** - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- **esp_tls_flags** - [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**esp_err_t esp_tls_get_and_clear_error_type (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)**

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

**Parameters**

- **h** - [in] esp-tls error handle.
- **err_type** - [in] specific error type
- **error_code** - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**

- ESP_ERR_INVALID_STATE if invalid parameters
**Chapter 2. API Reference**

- ESP_OK if a valid error returned and was cleared

```c
esp_err_t esp_tls_get_error_handle (esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
```

Returns the ESP-TLS error_handle.

**Parameters**
- `tls` [in] handle to esp_tls context
- `error_handle` [out] pointer to the error handle.

**Returns**
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

```c
mbedtls_x509_crt *esp_tls_get_global_ca_store (void)
```

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

**Returns**
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

```c
esp_err_t esp_tls_plain_tcp_connect (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg,
                                   esp_tls_error_handle_t error_handle, int *sockfd)
```

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**
- `host` [in] Hostname of the host.
- `hostlen` [in] Length of hostname.
- `port` [in] Port number of the host.
- `cfg` [in] ESP-TLS configuration as esp_tls_cfg_t.
- `error_handle` [out] ESP-TLS error handle holding potential errors occurred during connection
- `sockfd` [out] Socket descriptor if successfully connected on TCP layer

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid output parameters
- ESP-TLS based error codes on failure

**Structures**

```c
struct psk_key_hint
```

ESP-TLS preshared key and hint structure.

**Public Members**

```c
const uint8_t *key
```

key in PSK authentication mode in binary format

```c
const size_t key_size
```

length of the key

```c
const char *hint
```

hint in PSK authentication mode in string format
struct **tls_keep_alive_cfg
    esp-tls client session ticket ctx
    Keep alive parameters structure

Public Members

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time (second)

int keep_alive_interval
    Keep-alive interval time (second)

int keep_alive_count
    Keep-alive packet retry send count

struct esp_tls_cfg
    ESP-TLS configuration parameters.

---

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys,
  which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated
  (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be
  only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward
  compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was
  supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

---

Public Members

const char **alpn_protos
    Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
    should be negotiated. The format is length followed by protocol name. For the most common cases the
    following is ok: const char **alpn_protos = { “h2”, NULL };  
        • where ‘h2’ is the protocol name

const unsigned char *cacert_buf
    Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-
    support. This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
    CA certificate buffer legacy name
unsigned int \texttt{cacert\_bytes}  
\hspace*{5pt} Size of Certificate Authority certificate pointed to by \texttt{cacert\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{cacert\_pem\_bytes}  
\hspace*{5pt} Size of Certificate Authority certificate legacy name

const unsigned char* \texttt{clientcert\_buf}  
\hspace*{5pt} Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char* \texttt{clientcert\_pem\_buf}  
\hspace*{5pt} Client certificate legacy name

unsigned int \texttt{clientcert\_bytes}  
\hspace*{5pt} Size of client certificate pointed to by \texttt{clientcert\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientcert\_pem\_bytes}  
\hspace*{5pt} Size of client certificate legacy name

const unsigned char* \texttt{clientkey\_buf}  
\hspace*{5pt} Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char* \texttt{clientkey\_pem\_buf}  
\hspace*{5pt} Client key legacy name

unsigned int \texttt{clientkey\_bytes}  
\hspace*{5pt} Size of client key pointed to by \texttt{clientkey\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientkey\_pem\_bytes}  
\hspace*{5pt} Size of client key legacy name

const unsigned char* \texttt{clientkey\_password}  
\hspace*{5pt} Client key decryption password string

unsigned int \texttt{clientkey\_password\_len}  
\hspace*{5pt} String length of the password pointed to by \texttt{clientkey\_password}

bool \texttt{non\_block}  
\hspace*{5pt} Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool \texttt{use\_secure\_element}  
\hspace*{5pt} Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int \texttt{timeout\_ms}  
\hspace*{5pt} Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX
bool **use_global_ca_store**
Use a global ca_store for all the connections in which this bool is set.

cost char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t **keep_alive_cfg**
Enable TCP keep-alive timeout for SSL connection

cost psk_hint_key_t **psk_hint_key**
Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (**crt_bundle_attach**)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool **is_plain_tcp**
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

**Type Definitions**

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx
Keep alive parameters structure

typedef struct esp_cfg esp_tls_cfg_t
ESP-TLS configuration parameters.

---

Note: Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls 

Enumertations

enum esp_tls_conn_state

ESP-TLS Connection State.

Values:

enumerator ESP_TLS_INIT
enumerator ESP_TLS_CONNECTING
enumerator ESP_TLS_HANDSHAKE
enumerator ESP_TLS_FAIL
enumerator ESP_TLS_DONE

enum esp_tls_role

Values:

enumerator ESP_TLS_CLIENT
enumerator ESP_TLS_SERVER

Header File

Structures

struct esp_tls_last_error

Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t last_error

error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error
int esp_tls_error_code
    esp_tls error code from last esp_tls failed api

int esp_tls_flags
    last certification verification flags

Macros

ESP_ERR_ESP_TLS_BASE
    Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
    Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
    Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
    Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
    Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
    failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
    new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK
    mbedtls parse certificates was partly successful

ESP_TLS_ERR_SSL_WANT_READ
Definition of errors reported from IO API (potentially non-blocking) in case of error:

• esp_tls_conn_read()
• esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT

Type Definitions
typedef struct esp_tls_last_error *esp_tls_error_handle_t
typedef struct esp_tls_last_error esp_tls_last_error_t
Error structure containing relevant errors in case tls error occurred.

Enumerations
enum esp_tls_error_type_t
Definition of different types/sources of error codes reported from different components

Values:

enumerator ESP_TLS_ERR_TYPE_UNKNOWN
enumerator ESP_TLS_ERR_TYPE_SYSTEM
System error &8212; errno
enumerator ESP_TLS_ERR_TYPE_MBEDTLS
Error code from mbedTLS library
enumerator ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS
Certificate flags defined in mbedTLS
enumerator ESP_TLS_ERR_TYPE_ESP
ESP-IDF error type &8212; esp_err_t
enumerator ESP_TLS_ERR_TYPE_WOLFSSL
Error code from wolfSSL library
enumerator ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS
Certificate flags defined in wolfSSL
enumerator ESP_TLS_ERR_TYPE_MAX
Last err type &8212; invalid entry
2.2.5 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- **esp_http_client_init()**: Creates an esp_http_client_config_t instance i.e. a HTTP client handle based on the given esp_http_client_config_t configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- **esp_http_client_perform()**: Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in esp_http_client_config_t).
- **esp_http_client_cleanup()**: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

Basic HTTP request

Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the Connection: close header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the url configuration starting with https scheme or transport_type set to HTTP_TRANSPORT_OVER_SSL. HTTPS support can be configured via CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS (enabled by default).

Note: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the cert_pem member in esp_http_client_config_t configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the crt_bundle_attach member of the esp_http_client_config_t configuration.

Check out the example functions https_with_url and https_with_hostname_path in the application example. (Implementation details of the above note are found here)
HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type` = `HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type` = `HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the `401 Unauthorized` header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI
  ```c
  esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

- Authentication with username and password entry
  ```c
  esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

API Reference

Header File
• components/esp_http_client/include/esp_http_client.h

Functions

`esp_http_client_handle_t esp_http_client_init (const esp_http_client_config_t *config)`

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters** config – [in] The configurations, see `http_client_config_t`

**Returns**

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform (esp_http_client_handle_t client)`

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**betweentheinvokestopsetoptionsforthe

**Following `esp_http_client_perform`**.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

**Parameters** client – The `esp_http_client` handle

**Returns**

- ESP_OK on successful
- ESP_FAIL on error

`esp_err_t esp_http_client_set_url (esp_http_client_handle_t client, const char *url)`

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**

- url – [in] The url

**Returns**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)`

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- data – [in] post data pointer
- len – [in] post length
Returns

- ESP_OK
- ESP_FAIL

int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)

Get current post field information.

Parameters

- **client** -in] The client
- **data** -[out] Point to post data pointer

Returns Size of post data

**esp_err_t** esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

Parameters

- **client** -[in] The esp_http_client handle
- **key** -[in] The header key
- **value** -[in] The header value

Returns

- ESP_OK
- ESP_FAIL

**esp_err_t** esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- **client** -[in] The esp_http_client handle
- **key** -[in] The header key
- **value** -[out] The header value

Returns

- ESP_OK
- ESP_FAIL

**esp_err_t** esp_http_client_get_username(esp_http_client_handle_t client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- **client** -[in] The esp_http_client handle
- **value** -[out] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t** esp_http_client_set_username(esp_http_client_handle_t client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Parameters

- **client** -[in] The esp_http_client handle
- **username** -[in] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t** esp_http_client_get_password(esp_http_client_handle_t client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.
Chapter 2. API Reference

**Parameters**
- **client** [in] The esp_http_client handle
- **value** [out] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_password (esp_http_client_handle_t client, const char *password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**
- **client** [in] The esp_http_client handle
- **password** [in] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_auth_type (esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)`

Set http request auth_type.

**Parameters**
- **client** [in] The esp_http_client handle
- **auth_type** [in] The esp_http_client auth type

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

`int esp_http_client_get_errno (esp_http_client_handle_t client)`

Get HTTP client session errno.

**Parameters**
- **client** [in] The esp_http_client handle

**Returns**
- (-1) if invalid argument
- errno

`esp_err_t esp_http_client_set_method (esp_http_client_handle_t client, esp_http_client_method_t method)`

Set http request method.

**Parameters**
- **client** [in] The esp_http_client handle
- **method** [in] The method

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_timeout_ms (esp_http_client_handle_t client, int timeout_ms)`

Set http request timeout.

**Parameters**
- **client** [in] The esp_http_client handle
- **timeout_ms** [in] The timeout value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char *key)`

Delete http request header.

**Parameters**
- **client** [in] The esp_http_client handle
• key –[in] The key

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)

This function will be open the connection, write all header strings and return.

Parameters
• client –[in] The esp_http_client handle
• write_len –[in] HTTP Content length need to write to the server

Returns
• ESP_OK
• ESP_FAIL

int esp_http_client_write (esp_http_client_handle_t client, const char* buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

Parameters
• client –[in] The esp_http_client handle
• buffer – The buffer
• len –[in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

Returns
• (-1) if any errors
• Length of data written

int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

Parameters client –[in] The esp_http_client handle

Returns
• (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
• (-1: ESP_FAIL) if any errors
• (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
• Download data length defined by content-length header

bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)

Check response data is chunked.

Parameters client –[in] The esp_http_client handle

Returns true or false

int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)

Read data from http stream.

Note: (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

Parameters
• client –[in] The esp_http_client handle
• buffer – The buffer
• len –[in] The length

Returns
• (-1) if any errors
• Length of data was read

int esp_http_client_get_status_code (esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform
Parameters `client` [in] The esp_http_client handle

Returns Status code

```c
int64_t esp_http_client_get_content_length(esp_http_client_handle_t client)
```

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

Parameters `client` [in] The esp_http_client handle

Returns

- (-1) Chunked transfer
- Content-Length value as bytes

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)
```

Close http connection, still kept all http request resources.

Parameters `client` [in] The esp_http_client handle

Returns

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)
```

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

Parameters `client` [in] The esp_http_client handle

Returns

- ESP_OK
- ESP_FAIL

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)
```

Get transport type.

Parameters `client` [in] The esp_http_client handle

Returns

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)
```

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Parameters `client` [in] The esp_http_client handle

Returns

- ESP_OK
- ESP_FAIL

```c
void esp_http_client_add_auth(esp_http_client_handle_t client)
```

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

```c
bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)
```

Checks if entire data in the response has been read without any error.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.
Chapter 2. API Reference

### Parameters

**client** - [in] The esp_http_client handle

**Returns**

- true
- false

### int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)

Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

#### Parameters

- **client** - [in] The esp_http_client handle
- **buffer** - The buffer
- **len** - [in] The buffer length

#### Returns

- Length of data was read

### esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to esp_http_client_read_response in situations where the content of the response may be ignored.

#### Parameters

- **client** - [in] The esp_http_client handle
- **len** - Length of data discarded

#### Returns

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

### esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)

Get URL from client.

#### Parameters

- **client** - [in] The esp_http_client handle
- **url** - [inout] The buffer to store URL
- **len** - [in] The buffer length

#### Returns

- ESP_OK
- ESP_FAIL

### esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)

Get Chunk-Length from client.

#### Parameters

- **client** - [in] The esp_http_client handle
- **len** - [out] Variable to store length

#### Returns

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

### Structures

**struct esp_http_client_event**

HTTP Client events data.

### Public Members
`esp_http_client_event_id_t` **event_id**

event_id, to know the cause of the event

`esp_http_client_handle_t` **client**

esp_http_client_handle_t context

void *`data`

data of the event

int `data_len`

data length of data

void *`user_data`

user_data context, from `esp_http_client_config_t` user_data

char *`header_key`

For `HTTP_EVENT_ON_HEADER` event_id, it’s store current http header key

char *`header_value`

For `HTTP_EVENT_ON_HEADER` event_id, it’s store current http header value

struct `esp_http_client_config_t`

HTTP configuration.

**Public Members**

const char *`url`

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *`host`

Domain or IP as string

int `port`

Port to connect, default depend on `esp_http_client_transport_t` (80 or 443)

const char *`username`

Using for Http authentication

const char *`password`

Using for Http authentication

`esp_http_client_auth_type_t` **auth_type**

Http authentication type, see `esp_http_client_auth_type_t`

const char *`path`

HTTP Path, if not set, default is /
const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password

const char *user_agent
    The User Agent string to send with HTTP requests

exp_http_client_method_t method
    HTTP Method

int timeout_ms
    Network timeout in milliseconds

bool disable_auto_redirect
    Disable HTTP automatic redirects

int max_redirection_count
    Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
    Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
    HTTP Event Handle
**esp_http_client_transport_t**

- **transport_type**
  HTTP transport type, see `esp_http_client_transport_t`

- **buffer_size**
  HTTP receive buffer size

- **buffer_size_tx**
  HTTP transmit buffer size

- **user_data**
  HTTP user_data context

- **is_async**
  Set asynchronous mode, only supported with HTTPS for now

- **use_global_ca_store**
  Use a global ca_store for all the connections in which this bool is set.

- **skip_cert_common_name_check**
  Skip any validation of server certificate CN field

**esp_err_t (**crt_bundle_attach**)(void *conf)**

- Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

- **keep_alive_enable**
  Enable keep-alive timeout

- **keep_alive_idle**
  Keep-alive idle time. Default is 5 (second)

- **keep_alive_interval**
  Keep-alive interval time. Default is 5 (second)

- **keep_alive_count**
  Keep-alive packet retry send count. Default is 3 counts

- **if_name**
  The name of interface for data to go through. Use the default interface without setting

### Macros

- **DEFAULT_HTTP_BUF_SIZE**

- **ESP_ERR_HTTP_BASE**
  Starting number of HTTP error codes

- **ESP_ERR_HTTP_MAX_REDIRECT**
  The error exceeds the number of HTTP redirects
Chapter 2. API Reference

**ESP_ERR_HTTP_CONNECT**
Error open the HTTP connection

**ESP_ERR_HTTP_WRITE_DATA**
Error write HTTP data

**ESP_ERR_HTTP_FETCH_HEADER**
Error read HTTP header from server

**ESP_ERR_HTTP_INVALID_TRANSPORT**
There are no transport support for the input scheme

**ESP_ERR_HTTP_CONNECTING**
HTTP connection hasn’t been established yet

**ESP_ERR_HTTP_EAGAIN**
Mapping of errno EAGAIN to esp_err_t

**ESP_ERR_HTTP_CONNECTION_CLOSED**
Read FIN from peer and the connection closed

**Type Definitions**

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

**Enumerations**

enum esp_http_client_event_id_t
HTTP Client events id.

*Values:*

enumerator HTTP_EVENT_ERROR
This event occurs when there are any errors during execution

enumerator HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

enumerator HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

enumerator HTTP_EVENT_HEADER_SENT
This header has been kept for backward compatability and will be deprecated in future versions esp-idf
enumerator **HTTP_EVENT_ON_HEADER**
Occurs when receiving each header sent from the server

denumerator **HTTP_EVENT_ON_DATA**
Occurs when receiving data from the server, possibly multiple portions of the packet

denumerator **HTTP_EVENT_ON_FINISH**
Occurs when finish a HTTP session

denumerator **HTTP_EVENT_DISCONNECTED**
The connection has been disconnected

denumerator **HTTP_EVENT_REDIRECT**
Intercepting HTTP redirects to handle them manually

**enum esp_http_client_transport_t**
HTTP Client transport.

*Values:*

enumerator **HTTP_TRANSPORT_UNKNOWN**
Unknown

denumerator **HTTP_TRANSPORT_OVER_TCP**
Transport over tcp

denumerator **HTTP_TRANSPORT_OVER_SSL**
Transport over ssl

**enum esp_http_client_method_t**
HTTP method.

*Values:*

enumerator **HTTP_METHOD_GET**
HTTP GET Method

denumerator **HTTP_METHOD_POST**
HTTP POST Method

denumerator **HTTP_METHOD_PUT**
HTTP PUT Method

denumerator **HTTP_METHOD_PATCH**
HTTP PATCH Method

denumerator **HTTP_METHOD_DELETE**
HTTP DELETE Method

denumerator **HTTP_METHOD_HEAD**
HTTP HEAD Method
enumerator HTTP_METHOD_NOTIFY
    HTTP NOTIFY Method

enumerator HTTP_METHOD_SUBSCRIBE
    HTTP SUBSCRIBE Method

enumerator HTTP_METHOD_UNSUBSCRIBE
    HTTP UNSUBSCRIBE Method

enumerator HTTP_METHOD_OPTIONS
    HTTP OPTIONS Method

enumerator HTTP_METHOD_COPY
    HTTP COPY Method

enumerator HTTP_METHOD_MOVE
    HTTP MOVE Method

enumerator HTTP_METHOD_LOCK
    HTTP LOCK Method

enumerator HTTP_METHOD_UNLOCK
    HTTP UNLOCK Method

enumerator HTTP_METHOD_PROPFIND
    HTTP PROPFIND Method

enumerator HTTP_METHOD_PROPPATCH
    HTTP PROPPATCH Method

enumerator HTTP_METHOD_MKCOL
    HTTP MKCOL Method

enumerator HTTP_METHOD_MAX

data esp_http_client_auth_type_t
    HTTP Authentication type.

Values:

enumerator HTTP_AUTH_TYPE_NONE
    No authentication

enumerator HTTP_AUTH_TYPE_BASIC
    HTTP Basic authentication

enumerator HTTP_AUTH_TYPE_DIGEST
    HTTP Digest authentication
enum HttpStatus_Code
    Enum for the HTTP status codes.

    Values:

    enumerator HttpStatus_Ok
    enumerator HttpStatus_MultipleChoices
    enumerator HttpStatus_MovedPermanently
    enumerator HttpStatus_Found
    enumerator HttpStatus_SeeOther
    enumerator HttpStatus_TemporaryRedirect
    enumerator HttpStatus_PermanentRedirect
    enumerator HttpStatus_BADRequest
    enumerator HttpStatusUnauthorized
    enumerator HttpStatus_Forgidden
    enumerator HttpStatus_NotFound
    enumerator HttpStatus_InternalError

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                 * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0x84, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    }
}
```

(continues on next page)
Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_ →start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_ →end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_ →start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_ →end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOL_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};
```

(continues on next page)
You may set security for transport in ESP local control using following options:

1. **PROTOCOL_SEC2**: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. **PROTOCOL_SEC1**: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. **PROTOCOL_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTOCOL_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t` in this context.

**Note**: The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocomm security version section in Protocol Communication for more details.

### Creating a property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g. enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or byte stream). For fixed length property value data-types, like int, float, etc., setting the `size` field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
estp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
estp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_property_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    (continues on next page)
```
for (uint32_t i = 0; i < props_count; i++) {
    ESP_LOGI(TAG, "Reading %s", props[i].name);
    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;
        /* Use static variable for saving the value.
        * This is essential because the value has to be
        * valid even after this function returns.
        * Alternative is to use dynamic allocation
        * and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                       prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

For complete example see protocols/esp_local_ctrl

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. get_prop_count: This should simply return the total number of properties supported by the service
2. get_prop_values: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. set_prop_values: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client
Chapter 2. API Reference

should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
```
Function for obtaining BLE transport mode.

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
```
Function for obtaining HTTPD transport mode.

```c
esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
```
Start local control service.

**Parameters**

- config – [in] Pointer to configuration structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Failure

```c
esp_err_t esp_local_ctrl_stop (void)
```
Stop local control service.

```c
esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
```
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`.

**Parameters**

- prop – [in] Property description structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Failure

```c
esp_err_t esp_local_ctrl_remove_property (const char *name)
```
Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters**

- name – [in] Name of the property to remove

**Returns**

- ESP_OK : Success
• ESP_ERR_NOT_FOUND : Failure

```c
const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
```

Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known.

**Parameters**
- `name` - [in] Name of the property to find

**Returns**
- Pointer to property
- NULL if not found

```c
esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Parameters**
- `ep_name` - [in] Name of the endpoint
- `handler` - [in] Endpoint handler function
- `user_ctx` - [in] User data

**Returns**
- ESP_OK : Success
- ESP_FAIL : Failure

### Unions

`.union esp_local_ctrl_transport_config_t`

```c
#include <esp_local_ctrl.h>
```

Transport mode (BLE/HTTPD) configuration.

### Public Members

#### `esp_local_ctrl_transport_config_ble_t *ble`

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

#### `esp_local_ctrl_transport_config_httpd_t *httpd`

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

### Structures

#### `struct esp_local_ctrl_prop`

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.
**Public Members**

```cpp
char *name
Unique name of property
```

```cpp
uint32_t type
Type of property. This may be set to application defined enums
```

```cpp
size_t size
Size of the property value, which:

• if zero, the property can have values of variable size
• if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property
```

```cpp
uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant
```

```cpp
void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.
```

```cpp
void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.
```

```cpp
struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.
```

**Public Members**

```cpp
void *data
Pointer to memory holding property value
```

```cpp
size_t size
Size of property value
```

```cpp
void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.
```

```cpp
struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.
```
**Public Members**

`esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t *props[], esp_local_ctrl_prop_val_t *prop_values[], void *usr_ctx)`

Handler function to be implemented for retrieving current values of properties.

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set.

- **Param props_count [in]** Total elements in the props array
- **Param props [in]** Array of properties, the current values for which have been requested by the client
- **Param prop_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- **Param usr_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
  - ESP_OK : Success
  - ESP_ERR_INVALID_ARG : InvalidArgument
  - ESP_ERR_INVALID_STATE : InvalidProto
  - All other error codes : InternalError

`esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t *props[], const esp_local_ctrl_prop_val_t *prop_values[], void *usr_ctx)`

Handler function to be implemented for changing values of properties.

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

- **Param props_count [in]** Total elements in the props array
- **Param props [in]** Array of properties, the values for which the client requests to change
- **Param prop_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument
- **Param usr_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
  - ESP_OK : Success
  - ESP_ERR_INVALID_ARG : InvalidArgument
  - ESP_ERR_INVALID_STATE : InvalidProto
  - All other error codes : InternalError

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.
struct esp_local_ctrl_proto_sec_cfg

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t version

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

void *custom_handle

Custom security handle if security is set custom via proto_sec above This handle must follow protocomm_security_t signature

const void *pop

Proof of possession to be used for local control. Could be NULL.

const void *sec_params

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type esp_local_ctrl_security1_params_t for protocomm security 1 and esp_local_ctrl_security2_params_t for protocomm security 2 respectively. Could be NULL.

struct esp_local_ctrl_config

Configuration structure to pass to esp_local_ctrl_start()

Public Members

const esp_local_ctrl_transport_t *transport

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t transport_config

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t proto_sec

Security version and POP

esp_local_ctrl_handlers_t handlers

Register handlers for responding to get/set requests on properties

size_t max_properties

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD
Chapter 2. API Reference

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

    Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE/HTTPD) over which the service will be provided.

    This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.

    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.

    This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.

    typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t
    typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

    typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs

    typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()

Enumerations

typedef enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.

    Values:

    enumerator PROTOCOM_SEC0
2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave

This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif chips

The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32</th>

</tbody>
</table>

* Not including the interrupt registers

ESP SDIO Slave Initialization

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of SDIO Simplified Specification). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000
   CMD5 arg = 0x001f8000 (according to the response above, poll until ready)
   **Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFFF00.
   Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
Chapter 2. API Reference

5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)
   
   **Example:** Arg of R6 after CMD3 is 0x0001xxxx.
   
   Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)

**ESP SDIO Slave Protocol**  The ESP SDIO Slave protocol is based on the SDIO Specification’s I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example peripherals/sdio.

The **ESP Serial Slave Link** component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

### Slave register table

**32-bit**

- 0x044 (TOKEN_RXDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

**8-bit**  Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave, auto clear.

**FIFO (sending and receiving)**  0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[
\text{requested length} = 0x1F800 - \text{address}
\]
The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the requested length, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

**Note:** The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

**Interrupts**

SDIO interrupts are “level sensitive”. For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO**

To write to the slave’s receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the requested length should not exceed the length calculated at Step 2, and the FIFO address is related to requested length.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

**Sending FIFO**

To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. **Update the read length.**

**Warning:** The driver for ESP32 hasn’t been developed yet.

**Introduction**  
In the half-duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave  
  This phase determines the rest phases of the transactions. See *Supported Commands*.

- **Address:** 8-bit, master to slave, optional  
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy:** 8-bit, floating, optional  
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data:** variable length, the direction is also determined by the command.  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes**  
In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>

<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

**QPI Mode**  
The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>

<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Mask</th>

<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.

4. The master sends CMD8 to the slave

5. The slave loads another 4092 bytes of data onto the RDDMA

6. The master can start new reading transactions after it sends the CMD8

Terminology

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: A virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: A handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc. The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: The slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: A counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: A counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   - The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): The slave can receive data from the master in units of receiving buffers.
   - The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See **SDIO Slave Capabilities of Espressif chips** and **SPI Slave Capabilities of Espressif chips** for more details.

Initialization of ESP Serial Slave Link

**ESP SDIO Slave**  The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `doc:` Document of SDMMC driver `<api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essi_init()` to do initialization of the SDIO part.
5. Call `essi_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**  
**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**To host Interrupts (optional)**

1. Call `essi_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essi_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essi_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essi_get_intr()` to know which events are active, and call `essi_clear_intr()` to clear them.

**From host Interrupts**

1. Call `essi_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essi_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essi_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essi_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essi_get_packet()` to receive data from the slave.

**Reset counters (Optional)**  
Call `essi_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.  
`peripherals/sdio`.  
Please refer to the specific example README.md for details.
API Reference

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

**`essl_init`** *(essl_handle_t handle, uint32_t wait_ms)*

Initialize the slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer init.

**`essl_wait_for_ready`** *(essl_handle_t handle, uint32_t wait_ms)*

Wait for interrupt of an ESSL slave device.

**Parameters**
- **handle** – Handle of a ESSL device.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**`essl_get_tx_buffer_num`** *(essl_handle_t handle, uint32_t *out tx num, uint32_t wait_ms)*

Get buffer num for the host to send data to the slave. The buffers are size of buffer_size.

**Parameters**
- **handle** – Handle of a ESSL device.
- **out tx num** – Output of buffer num that host can send data to ESSL slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

**`essl_get_rx_data_size`** *(essl_handle_t handle, uint32_t *out rx size, uint32_t wait_ms)*

Get the size, in bytes, of the data that the ESSL slave is ready to send

**Parameters**
- **handle** – Handle of an ESSL device.
- **out rx size** – Output of data size to read from slave, in bytes
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

**`essl_reset_cnt`** *(essl_handle_t handle)*

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Parameters**
- **handle** – Handle of an ESSL device.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.
**esp_err_t essl_send_packet** (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

**Parameters**
- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode.
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_get_packet** (essl_handle_t handle, void **out_data**, size_t size, size_t **out_length**, uint32_t wait_ms)

Get a packet from ESSL slave.

**Parameters**
- handle: Handle of an ESSL device.
- out_data: [out] Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- out_length: [out] Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode.
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_write_reg** (essl_handle_t handle, uint8_t addr, uint8_t *value, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**
- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see essl_spi.h
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- One of the error codes from SDMMC/SPI host controller

**esp_err_t essl_read_reg** (essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.
Parameters
- **handle** - Handle of an eSSL device.
- **add** - Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`.
- **value_o** - Output value read from the register.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

Parameters
- **handle** - Handle of an ESSL device.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters
- **handle** - Handle of an ESSL device.
- **intr_mask** - Mask of interrupt bits to clear.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

Parameters
- **handle** - Handle of an ESSL device.
- **intr_raw** - Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** - Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters
- **handle** - Handle of an ESSL device.
- **ena_mask** - Mask of the interrupt bits to enable.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t*ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

**Parameters**

- **handle** - Handle of an ESSL device.
- **ena_mask_o** - Output of interrupt bit enable mask.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK Success
- One of the error codes from SDMMC host controller

**esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**

- **handle** - Handle of an ESSL device.
- **intr_mask** - Mask of interrupt bits to send to slave.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

**Parameters**

- **out_handle** - Output of the handle.
- **config** - Configuration for the ESSL SDIO device.

**Returns**

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)**

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** - Handle of the ESSL SDIO device to deinit.

**Returns**

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

**Structures**

struct essl_sdio_config_t

Configuration for the ESSL SDIO device.
Public Members

sdmmc_card_t *card

The initialized sdmmc card pointer of the slave.

int recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)

Initialize the ESSL SPI device function list and get its handle.

Parameters

• out_handle [out] Output of the handle
• init_config Configuration for the ESSL SPI device

Returns

• ESP_OK: On success
• ESP_ERR_NO_MEM: Memory exhausted
• ESP_ERR_INVALID_STATE: SPI driver is not initialized
• ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t essl_spi_deinit_dev (essl_handle_t handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters handle Handle of the ESSL SPI device

Returns

• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Parameters

• arg – Context of the component. (Member arg from essl_handle_t)
• addr – Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
• out_value [out] Read buffer for the shared registers.
• wait_ms – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• or other return value from :cpp:func:spl_device_transmit.

esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.
Parameters
- `arg` – Context of the component. (Member `arg` from `essl_handle_t`)
- `out_data` – [out] Output data address
- `size` – The size of the output data.
- `wait_ms` – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires `size` bytes of data but Slave did not load enough bytes.

```c
esp_err_t essl_spi_write_reg( void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms )
```

Write to the shared registers.

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

Parameters
- `arg` – Context of the component. (Member `arg` from `essl_handle_t`)
- `addr` – Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- `value` – Buffer for data to send, should be align to 4.
- `out_value` – [out] Not supported, should be set to NULL.
- `wait_ms` – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note2.
- or other return value from `cpp:func:spi_device_transmit`.

```c
esp_err_t essl_spi_send_packet( void *arg, const void *data, size_t size, uint32_t wait_ms )
```

Send a packet to Slave.

Parameters
- `arg` – Context of the component. (Member `arg` from `essl_handle_t`)
- `data` – Address of the data to send
- `size` – Size of the data to send.
- `wait_ms` – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer
void essl_spi_reset_cnt (void *arg)
Reset the counter in Master context.

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized.

**Parameters**
- **arg** - Context of the component. (Member arg from essl_handle_t)

```c
esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```
Read the shared buffer from the slave in ISR way.

**Note:** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note:** *out_data* should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the *len* is shorter than a word.

**Parameters**
- **spi** - SPI device handle representing the slave
- **out_data** - [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** - Address of the slave shared buffer
- **len** - Length to read
- **flags** - SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: on success
- or other return value from cfunc:spi_device_transmit.

```c
esp_err_t essl_spi_rdbuf_polling (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```
Read the shared buffer from the slave in polling way.

**Note:** *out_data* should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the *len* is shorter than a word.

**Parameters**
- **spi** - SPI device handle representing the slave
- **out_data** - [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** - Address of the slave shared buffer
- **len** - Length to read
- **flags** - SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: on success
- or other return value from cfunc:spi_device_transmit.

```c
esp_err_t essl_spi_wrbuf (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```
Write the shared buffer of the slave in ISR way.
Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- `spi` – SPI device handle representing the slave
- `data` – Buffer for data to send, strongly suggested to be in the DRAM
- `addr` – Address of the slave shared buffer,
- `len` – Length to write
- `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func::spi_device_transmit`.

```c
esp_err_t essl_spi_wrbuf_polling (spi_device_handle_t spi, const uint8_t* data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- `spi` – SPI device handle representing the slave
- `data` – Buffer for data to send, strongly suggested to be in the DRAM
- `addr` – Address of the slave shared buffer,
- `len` – Length to write
- `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func::spi_device_polling_transmit`.

```c
esp_err_t essl_spi_rddma (spi_device_handle_t spi, uint8_t* out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several `cpp:func::essl_spi_rddma_seg` and one `cpp:func::essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Parameters
- `spi` – SPI device handle representing the slave
- `out_data` – Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- `len` – Total length of data to receive.
- `seg_len` – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func::spi_device_transmit`.
**esp_err_t** `essl_spi_rddma_seg` *(spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)*

Read one data segment from the slave through its DMA.

**Note:** To read long buffer, call `cpp:func:essl_spi_rddma` instead.

**Parameters**
- **spi** - SPI device handle representing the slave
- **out_data** - [out] Buffer to hold the received data. Strongly suggested to be in the DRAM and aligned to 4
- **seg_len** - Length of this segment
- **flags** - `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_rddma_done` *(spi_device_handle_t spi, uint32_t flags)*

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even if there are data unsent, and maybe prepare the next buffer to send.

**Note:** This is required only when the slave is working in segment mode.

**Parameters**
- **spi** - SPI device handle representing the slave
- **flags** - `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_wrdma` *(spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)*

Send long buffer in segments to the slave through its DMA.

**Note:** This function combines several `cpp:func:essl_spi_wrdma_seg` and one `cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- **spi** - SPI device handle representing the slave
- **data** - Buffer for data to send. Strongly suggested to be in the DRAM
- **len** - Total length of data to send.
- **seg_len** - Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent).
- **flags** - `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_wrdma_seg` *(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)*

Send one data segment to the slave through its DMA.

**Note:** To send long buffer, call `cpp:func:essl_spi_wrdma` instead.
### Parameters

- **spi** – SPI device handle representing the slave
- **data** – Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** – Length of this segment
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Returns

- **ESP_OK**: success
- or other return value from `cpp:func::spi_device_transmit`

```c
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

### Structures

struct **essl_spi_config_t**

Configuration of ESSL SPI device.

#### Public Members

```c
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```c
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```c
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.2.8 ESP x509 Certificate Bundle

#### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.
Chapter 2. API Reference

**Note:** The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the `gen_crt_bundle.py` python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jul 19 03:12:06 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

### Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

### Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#).

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, `cmn_crtAuthorities.csv`, from [this list](#) provided by Mozilla.
Chapter 2. API Reference

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in Generating the List of Root Certificates.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

`esp_err_t esp_crt_bundle_attach (void *conf)`

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

Parameters `conf` [in] The config struct for the SSL connection.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

`void esp_crt_bundle_detach (mbedtls_ssl_config *conf)`

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters `conf` [in] The config struct for the SSL connection.

`esp_err_t esp_crt_bundle_set (const uint8_t *x509_bundle, size_t bundle_size)`

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

2.2.9 HTTP Server
Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are
detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon
  the specified configuration and outputs a handle to the server instance. The server has both, a listening socket
  (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin
  fashion in the server task loop. The task priority and stack size are configurable during server instance creation
  by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending
  on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response
  packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated mem-
  ory/resources. This is a blocking function that first signals a halt to the server task and then waits for the
  task to terminate. While stopping, the task will close all open connections, remove registered URI handlers
  and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type
  httpd_uri_t structure which has members including
  
  ```
  uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.
  ```

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
  /* Send a simple response */
  const char resp[] = "URI GET Response";
  httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
  return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
  /* Destination buffer for content of HTTP POST request.
   * httpd_req_recv() accepts char* only, but content could
   * as well be any binary data (needs type casting).
   * In case of string data, null termination will be absent, and
   * content length would give length of string */
  char content[100];

  /* Truncate if content length larger than the buffer */
  size_t recv_size = MIN(req->content_len, sizeof(content));

  int ret = httpd_req_recv(req, content, recv_size);
  if (ret <= 0) { /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
      /* In case of timeout one can choose to retry calling
       * httpd_req_recv(), but to keep it simple, here we
       * respond with an HTTP 408 (Request Timeout) error */
      httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
     * ensure that the underlying socket is closed */
    return ESP_FAIL;
  }

  /* Send a simple response */
```

(continues on next page)
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all while maintaining context-specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.
Persistent Connections Example

```c
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx)
    {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx_func = free_ctx_func; /* Function to free context data */
    }
    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ................
    ................
    return ESP_OK;
}
```

Check the example under protocols/http_server/persistent_sockets.

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

- `esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`
  Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t* req)
{
    //Recv, Process and Send
    ....
    ....
    ....
    //Fail condition
}
```

(continues on next page)
if {...} {
    // Return fail to close session //
    return ESP_FAIL;
}

// On success
return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

**Parameters**
- **handle** -in] handle to HTTPD server instance
- **uri_handler** - [in] pointer to handler that needs to be registered

**Returns**
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

`esp_err_t httpd_unregister_uri_handler (httpd_handle_t handle, const char *uri, httpd_method_t method)`

Unregister a URI handler.

**Parameters**
- **handle** -in] handle to HTTPD server instance
- **uri** -in] URI string
- **method** -in] HTTP method

**Returns**
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_NOT_FOUND: Handler with specified URI and method not found

`esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)`

Unregister all URI handlers with the specified uri string.

**Parameters**
- **handle** -in] handle to HTTPD server instance
- **uri** -in] uri string specifying all handlers that need to be deregistered

**Returns**
- ESP_OK: On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_NOT_FOUND: No handler registered with specified uri string
**esp_err_t** `httpd_sess_set_recv_override` *(httpd_handle_t* `hd`, int `sockfd`, `httpd_recv_func_t` `recv_func`)*

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- *hd* - [in] HTTPD instance handle
- *sockfd* - [in] Session socket FD
- *recv_func* - [in] The receive function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**esp_err_t** `httpd_sess_set_send_override` *(httpd_handle_t* `hd`, int `sockfd`, `httpd_send_func_t` `send_func`)*

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- *hd* - [in] HTTPD instance handle
- *sockfd* - [in] Session socket FD
- *send_func* - [in] The send function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**esp_err_t** `httpd_sess_set_pending_override` *(httpd_handle_t* `hd`, int `sockfd`, `httpd_pending_func_t` `pending_func`)*

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- *hd* - [in] HTTPD instance handle
- *sockfd* - [in] Session socket FD
- *pending_func* - [in] The receive function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null arguments

int httpd_req_to_sockfd (httpd_req_t *r)
Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctxt(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

Note: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

Parameters  
- [in] The request whose socket descriptor should be found

Returns
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)
API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

Parameters
- [in] The request being responded to
- buf – [in] Pointer to a buffer that the data will be read into
- buf_len – [in] Length of the buffer

Returns
- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)
Search for a field in request headers and return the string length of it’s value.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
There are two functions provided in this example:

1. `esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char* field, char* val, size_t val_size)`

   - **Purpose:** Get the value string of a field from the request headers.
   - **Parameters:**
     - `r` - The request being responded to
     - `field` - The header field to be searched in the request
     - `val` - Pointer to the buffer into which the value will be copied if the field is found
     - `val_size` - Size of the user buffer
   - **Returns:**
     - ESP_OK: Field found in the request header and value string copied
     - ESP_ERR_NOT_FOUND: Key not found
     - ESP_ERR_INVALID_ARG: Null arguments
     - ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
     - ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

2. `size_t httpd_req_get_url_query_len(httpd_req_t *r)`

   - **Purpose:** Get Query string length from the request URL.
   - **Parameters:**
     - `r` - The request being responded to
   - **Returns:**
     - Length: Query is found in the request URL
     - Zero: Query not found / Null arguments / Invalid request

3. `esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)`

   - **Purpose:** Get Query string from the request URL.
   - **Parameters:**
     - `r` - The request being responded to
   - **Returns:**
     - Length: Query is found in the request URL
     - Zero: Query not found / Null arguments / Invalid request

**Note:**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t* request` pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length.

**Parameters:**
- `r` - The request being responded to
- `field` - The field to be searched in the header
- `val` - Pointer to the buffer into which the value will be copied if the field is found
- `val_size` - Size of the user buffer

**Returns:**
- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

**Note:**
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (e.g., Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t* request` pointer is valid.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string.

**Parameters**

- `r` - [in] The request being responded to
- `buf` - [out] Pointer to the buffer into which the query string will be copied (if found)
- `buf_len` - [in] Length of output buffer

**Returns**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

```c
esp_err_t httpd_query_key_value(const char* qry, const char* key, char* val, size_t val_size)
```

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

**Note:**

- The components of URL query string (keys and values) are not URL decoded. The user must check for `Content-Type` field in the request headers and then depending upon the specified encoding (URL-encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

**Parameters**

- `qry` - [in] Pointer to query string
- `key` - [in] The key to be searched in the query string
- `val` - [out] Pointer to the buffer into which the value will be copied if the key is found
- `val_size` - [in] Size of the user buffer

**Returns**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

```c
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char* cookie_name, char* val, size_t *val_size)
```

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

**Parameters**

- `req` - [in] Pointer to the HTTP request
- `cookie_name` - [in] The cookie name to be searched in the request
- `val` - [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- `val_size` - [inout] Pointer to size of the user buffer

**Note:** This variable will contain cookie length if `ESP_OK` is returned and required buffer length in case `ESP_ERR_HTTPD_RESULT_TRUNC` is returned.

**Returns**

- `ESP_OK` : Key is found in the cookie string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated
- `ESP_ERR_NO_MEM` : Memory allocation failure
bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with ‘?’ to make the previous character optional (typically a slash), ‘*’ for a wildcard match, and ‘?*’ to make the previous character optional, and if present, allow anything to follow.

Example:
• * matches everything
• /foo/? matches /foo and /foo/
• /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
• /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters ‘?’ and ‘*’ anywhere else in the template will be taken literally.

Parameters
• uri_template [in] URI template (pattern)
• uri_to_match [in] URI to be matched
• match_upto [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
• r [in] The request being responded to
• buf [in] Buffer from where the content is to be fetched
• buf_len [in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.
Chapter 2. API Reference

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers
httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• When you are finished sending all your chunks, you must call this function with buf_len as 0.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters

• r [in] The request being responded to
• buf [in] Pointer to a buffer that stores the data
• buf_len [in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns

• ESP_OK: On successfully sending the response packet chunk
• ESP_ERR_INVALID_ARG: Null request pointer
• ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

• r [in] The request being responded to
• str [in] String to be sent as response body

Returns

• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null request pointer
• ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

• r [in] The request being responded to
• str [in] String to be sent as response body (NULL to finish response packet)

Returns

• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null request pointer
• ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Esperr_t httpd_resp_set_status(httpd_req_t *r, const char *status)

API to set the HTTP status code.
This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Parameters
- `r` - [in] The request being responded to
- `status` - [in] The HTTP status code of this response

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

`esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)`

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

Parameters
- `r` - [in] The request being responded to
- `type` - [in] The Content Type of the response

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

`esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)`

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

Parameters
- `r` - [in] The request being responded to
- `field` - [in] The field name of the HTTP header
Chapter 2. API Reference

- **value** – [in] The value of this HTTP header

**Returns**
- ESP_OK: On successfully appending new header
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

`esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need to be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Parameters**
- `req` – [in] Pointer to the HTTP request for which the response needs to be sent
- `error` – [in] Error type to send
- `msg` – [in] Error message string (pass NULL for default message)

**Returns**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_404 (httpd_req_t *r)`

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need to be copied into separate buffers if they are required later.

**Parameters**
- `r` – [in] The request being responded to

**Returns**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_408 (httpd_req_t *r)`

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
- \( r \) - [in] The request being responded to

Returns
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline esp_err_t httpd_resp_send_500 (httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
- \( r \) - [in] The request being responded to

Returns
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()
**Chapter 2. API Reference**

- HTTPD_SOCKET_ERR_INVALID: Invalid arguments
- HTTPD_SOCKET_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCKET_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Parameters**
- `hd` - [in] server instance
- `sockfd` - [in] session socket file descriptor
- `buf` - [in] buffer with bytes to send
- `buf_len` - [in] data size
- `flags` - [in] flags for the send() function

**Returns**
- Bytes: The number of bytes sent successfully
- HTTPD_SOCKET_ERR_INVALID: Invalid arguments
- HTTPD_SOCKET_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCKET_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_recv (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Parameters**
- `hd` - [in] server instance
- `sockfd` - [in] session socket file descriptor
- `buf` - [in] buffer with bytes to send
- `buf_len` - [in] data size
- `flags` - [in] flags for the send() function

**Returns**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCKET_ERR_INVALID: Invalid arguments
- HTTPD_SOCKET_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCKET_ERR_FAIL: Unrecoverable error while calling socket recv()

```c
esp_err_t httpd_register_err_handler (httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

**Parameters**
Chapter 2. API Reference

- **handle** - [in] HTTP server handle
- **error** - [in] Error type
- **handler_fn** - [in] User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**

- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

**Example usage:**

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Parameters**

- **config** - [in] Configuration for new instance of the server
- **handle** - [out] Handle to newly created instance of the server. NULL on error

**Returns**

- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

```c
esp_err_t httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

**Example usage:**

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```
Chapter 2. API Reference

Parameters

- handle [in] Handle to server returned by httpd_start

Returns

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is null

**esp_err_t** httpd_queue_work (httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution.

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Parameters

- handle [in] Handle to server returned by httpd_start
- work [in] Pointer to the function to be executed in the HTTPD’s context
- arg [in] Pointer to the arguments that should be passed to this function

Returns

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

**void** httpd_sess_get_ctx (httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Parameters

- handle [in] Handle to server returned by httpd_start
- sockfd [in] The socket descriptor for which the context should be extracted.

Returns

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

**void** httpd_sess_set_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

Parameters

- handle [in] Handle to server returned by httpd_start
- sockfd [in] The socket descriptor for which the context should be extracted.
- ctx [in] Context object to assign to the session
- free_fn [in] Function that should be called to free the context

**void** httpd_sess_get_transport_ctx (httpd_handle_t handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:

httpd_sess_get_ctx()
Chapter 2. API Reference

- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

```c
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void* ctx, httpd_free_ctx_fn_t free_fn)
```

Set session ‘transport’ context by socket descriptor.

**See also:**
httpd_sess_set_ctx()

**Parameters**
- `handle` [in] Handle to server returned by httpd_start
- `sockfd` [in] The socket descriptor for which the context should be extracted.
- `ctx` [in] Transport context object to assign to the session
- `free_fn` [in] Function that should be called to free the transport context

```c
void* httpd_get_global_user_ctx(httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

**Parameters**
- `handle` [in] Handle to server returned by httpd_start

**Returns**
- global user context

```c
void* httpd_get_global_transport_ctx(httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

**Parameters**
- `handle` [in] Handle to server returned by httpd_start

**Returns**
- global transport context

```c
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```

Trigger an httpd session close externally.

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.
Parameters

- `handle` [in] Handle to server returned by `httpd_start`
- `sockfd` [in] The socket descriptor of the session for which LRU counter is to be updated

Returns

- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

```c
esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t*fds, int*client_fds)
```

Returns list of current socket descriptors of active sessions.

Note: Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config` structure.

---

Parameters

- `handle` [in] Handle to server returned by `httpd_start`
- `fds` [inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`
- `client_fds` [out] Array of client fds

Returns

- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

```c
struct httpd_config
```

HTTP Server Configuration Structure.

Note: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

Public Members

```c
unsigned task_priority
```

Priority of FreeRTOS task which runs the server

```c
size_t stack_size
```

The maximum stack size allowed for the server task

```c
BaseType_t core_id
```

The core the HTTP server task will run on

```c
uint16_t server_port
```

TCP Port number for receiving and transmitting HTTP traffic

```c
uint16_t ctrl_port
```

UDP Port number for asynchronously exchanging control signals between various components of the server
Chapter 2. API Reference

```c
uint16_t max_open_sockets
    Max number of sockets/clients connected at any time

uint16_t max_uri_handlers
    Maximum allowed uri handlers

uint16_t max_resp_headers
    Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
    Number of backlog connections

bool lru_purge_enable
    Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
    Timeout for recv function (in seconds)

uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.
    This field can be used to store arbitrary user data within the server context. The value can be retrieved
    using the server handle, available e.g. in the httpd_req_t struct.
    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
    If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.
    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
    will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

httpd_open_func_t open_fn
    Custom session opening callback.
    Called on a new session socket just after accept(), but before reading any data.
    This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
    session overrides.
    If a context needs to be maintained between these functions, store it in the session using
    httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()
    Returning a value other than ESP_OK will immediately close the new socket.
```
Chapter 2. API Reference

`httpd_close_func_t close_fn`

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

`httpd_uri_match_func_t uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

```c
struct httpd_req
```

HTTP Request Data Structure.

**Public Members**

`httpd_handle_t handle`

Handle to server instance

`int method`

The type of HTTP request, -1 if unsupported method

`const char uri[HTTPD_MAX_URI_LEN + 1]`

The URI of this request (1 byte extra for null termination)

`size_t content_len`

Length of the request body

`void *aux`

Internally used members

`void *user_ctx`

User context pointer passed during URI registration.

`void *sess_ctx`

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.
By default, this is NULL. URI Handlers can set this to any meaningful value.
If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

### free_ctx
- **httpd_free_ctx_fn_t**
  - Pointer to free context hook
  - Function to free session context
  - If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.
  - If you wish to use a custom function for freeing the session context, please specify that here.

### ignore_sess_ctx_changes
- **bool**
  - Flag indicating if Session Context changes should be ignored
  - By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

### httpd_uri
- **Structure for URI handler.**

  **Public Members**

  - **const char *uri**
    - The URI to handle
  
  - **httpd_method_t** method
    - Method supported by the URI
  
  - **esp_err_t (**handler**(httpd_req_t **r)**
    - Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

  - **void **user_ctx**
    - Pointer to user context data which will be available to handler

### Macros

- **HTTPD_MAX_REQ_HDR_LEN**
- **HTTPD_MAX_URI_LEN**
- **HTTPD.Socket.ERR_FAIL**
- **HTTPD.Socket.ERR_INVALID**
- **HTTPD.Socket.ERR_TIMEOUT**
HTTPD_200
HTTP Response 200

HTTPD_204
HTTP Response 204

HTTPD_207
HTTP Response 207

HTTPD_400
HTTP Response 400

HTTPD_404
HTTP Response 404

HTTPD_408
HTTP Response 408

HTTPD_500
HTTP Response 500

HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML

HTTPD_TYPE_OCTET
HTTP Content type octet-stream

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

**ESP_ERR_HTTPD_RESP_SEND**

Error occurred while sending response packet

**ESP_ERR_HTTPD_ALLOC_MEM**

Failed to dynamically allocate memory for resource

**ESP_ERR_HTTPD_TASK**

Failed to launch server task/thread

**HTTPD_RESP_USE_StrLen**

Type Definitions

typedef struct httpd_req httpd_req_t

HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t

Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level send function.

**Note:** User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

<table>
<thead>
<tr>
<th>Param hd</th>
<th>[in] server instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Param sockfd</td>
<td>[in] session socket file descriptor</td>
</tr>
<tr>
<td>Param buf</td>
<td>[in] buffer with bytes to send</td>
</tr>
<tr>
<td>Param buf_len</td>
<td>[in] data size</td>
</tr>
<tr>
<td>Param flags</td>
<td>[in] flags for the send() function</td>
</tr>
</tbody>
</table>

Return

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**httpd_recv_func_t**

Prototype for HTTPDs low-level recv function.

**Note:** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

<table>
<thead>
<tr>
<th>Param hd</th>
<th>[in] server instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Param sockfd</td>
<td>[in] session socket file descriptor</td>
</tr>
<tr>
<td>Param buf</td>
<td>[in] buffer with bytes to send</td>
</tr>
<tr>
<td>Param buf_len</td>
<td>[in] data size</td>
</tr>
<tr>
<td>Param flags</td>
<td>[in] flags for the send() function</td>
</tr>
</tbody>
</table>

Return
• Bytes: The number of bytes received successfully
• 0: Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_codes, which will be handled accordingly in the server task.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor

Return
• Bytes: The number of bytes waiting to be received
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:
• If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_respsend_err() must be invoked inside this function if user wishes to generate HTTP error responses.
• When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
• The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Param req [in] HTTP request for which the error needs to be handled
Param error [in] Error type

Return
• ESP_OK: error handled successful
• ESP_FAIL: failure indicates that the underlying socket needs to be closed

typedef void *httpd_handle_t
HTTP Server Instance Handle. Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
    Prototype for freeing context data (if any)
    Param ctx [in] object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
    Function prototype for opening a session.
    Called immediately after the socket was opened to set up the send/recv functions and other parameters of the
    socket.
    Param hd [in] server instance
    Param sockfd [in] session socket file descriptor
    Return
        • ESP_OK : On success
        • Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
    Function prototype for closing a session.

    Note: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated
    sessions. Ensure proper handling of return codes.

    Param hd [in] server instance
    Param sockfd [in] session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
    Function prototype for URI matching.
    Param reference_uri [in] URI/template with respect to which the other URI is matched
    Param uri_to_match [in] URI/template being matched to the reference URI/template
    Param match_upto [in] For specifying the actual length of uri_to_match up to which the
    matching algorithm is to be applied (The maximum value is strlen(uri_to_match),
    independent of the length of reference_uri)
    Return true on match

typedef struct httpd_config httpd_config_t
    HTTP Server Configuration Structure.

    Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify
    only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)
    Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.
    Param arg [in] The arguments for this work function

Enumerations

enum httpd_err_code_t
    Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.
    Values:
2.2.10 HTTPS Server

Overview

This component is built on top of HTTP Server. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for HTTP Server applies also to a server you create this way.

Used APIs

The following APIs of HTTP Server should not be used with HTTPS Server, as they are used internally to handle secure sessions and to maintain internal state:

• “send”, “receive” and “pending” callback registration functions - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
• “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
Chapter 2. API Reference

- `httpd_get_global_transport_ctx()` - returns the shared SSL context
- `httpd_config::global_transport_ctx`
- `httpd_config::global_transport_ctx_free_fn`
- `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- `components/esp_https_server/include/esp_https_server.h`

Functions

`esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters

- `config` - [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- `handle` - [out] - storage for the server handle, must be a valid pointer

Returns

- success

`esp_err_t httpd_ssl_stop(httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

Parameters

- `handle` - [in]

Returns

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

```
struct esp_https_server_user_cb_arg
```

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.
Chapter 2. API Reference

Public Members

`httpd_ssl_user_cb_state_t` **user_cb_state**
State of user callback

`esp_tls_t *tls`
ESP-TLS connection handle

`struct httpd_ssl_config`
HTTPS server config struct
Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

`httpd_config_t` **httpd**
Underlying HTTPD server config
Parameters like task stack size and priority can be adjusted here.

`const uint8_t *servercert`
Server certificate

`size_t servercert_len`
Server certificate byte length

`const uint8_t *cacert_pem`
CA certificate ((CA used to sign clients, or client cert itself)

`size_t cacert_len`
CA certificate byte length

`const uint8_t *prvtkey_pem`
Private key

`size_t prvtkey_len`
Private key byte length

`httpd_ssl_transport_mode_t` **transport_mode**
Transport Mode (default secure)

`uint16_t port_secure`
Port used when transport mode is secure (default 443)

`uint16_t port_insecure`
Port used when transport mode is insecure (default 80)

`bool session_tickets`
Enable tls session tickets
Chapter 2. API Reference

bool use_secure_element
   Enable secure element for server session

esp_https_server_user_cb *user_cb
   User callback for esp_https_server

Macros
HTTPD_SSL_CONFIG_DEFAULT ()
   Default config struct init

   (http_server default config had to be copied for customization)

Notes:
   • port is set when starting the server, according to ‘transport_mode’
   • one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
   • SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
   • Stack size may need adjustments depending on the user application

Type Definitions
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
   Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
   Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

   Param user_cb Callback data struct
typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations
enum httpd_ssl_transport_mode_t
   Values:

   enumerator HTTPD_SSL_TRANSPORT_SECURE

   enumerator HTTPD_SSL_TRANSPORT_INSECURE

enum httpd_ssl_user_cb_state_t
   Indicates the state at which the user callback is executed, i.e at session creation or session close.
   Values:

   enumerator HTTPD_SSL_USER_CB_SESS_CREATE

   enumerator HTTPD_SSL_USER_CB_SESS_CLOSE
Chapter 2. API Reference

2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\r\n", recv_len,
            inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
            seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
            sizeof(transmitted));
    // (continues on next page)
```
void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;  // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;  // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo";  // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File
• components/lwip/include/apps/ping/ping_sock.h

**Functions**

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t *config`, const `esp_ping_callbacks_t *cbs`, `esp_ping_handle_t *hdl_out`)

Create a ping session.

**Parameters**
- `config` – ping configuration
- `cbs` – a bunch of callback functions invoked by internal ping task
- `hdl_out` – handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (esp_ping_handle_t `hdl`)

Delete a ping session.

**Parameters**
- `hdl` – handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

`esp_err_t esp_ping_start` (esp_ping_handle_t `hdl`)

Start the ping session.

**Parameters**
- `hdl` – handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

`esp_err_t esp_ping_stop` (esp_ping_handle_t `hdl`)

Stop the ping session.

**Parameters**
- `hdl` – handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

`esp_err_t esp_ping_get_profile` (esp_ping_handle_t `hdl`, esp_ping_profile_t `profile`, void *`data`, uint32_t `size`)

Get runtime profile of ping session.

**Parameters**
- `hdl` – handle of ping session
- `profile` – type of profile
- `data` – profile data
- `size` – profile data size

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Structures**

`struct esp_ping_callbacks_t`

Type of “ping” callback functions.
Chapter 2. API Reference

Public Members

void *cb_args
arguments for callback functions

void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of “ping” configuration.

Public Members

uint32_t count
A “ping” session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

int tos
Type of Service, a field specified in the IP header

int ttl
Time to Live, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX
**Macros**

`ESP_PING_DEFAULT_CONFIG()`

Default ping configuration.

`ESP_PING_COUNT_INFINITE`

Set ping count to zero will ping target infinitely

**Type Definitions**

```c
typedef void *esp_ping_handle_t
```

Type of "ping" session handle.

**Enumerations**

```c
enum esp_ping_profile_t
```

Profile of ping session.

*Values:*

- `ESP_PING_PROF_SEQNO` — Sequence number of a ping procedure
- `ESP_PING_PROF_TOS` — Type of service of a ping procedure
- `ESP_PING_PROF_TTL` — Time to live of a ping procedure
- `ESP_PING_PROF_REQUEST` — Number of request packets sent out
- `ESP_PING_PROF_REPLY` — Number of reply packets received
- `ESP_PING_PROF_IPADDR` — IP address of replied target
- `ESP_PING_PROF_SIZE` — Size of received packet
- `ESP_PING_PROF_TIMEGAP` — Elapsed time between request and reply packet
- `ESP_PING_PROF_DURATION` — Elapsed time of the whole ping session

**2.2.12 mDNS Service**

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component *mDNS* has been moved from ESP-IDF since version v5.0 to a separate repository:
2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

Note: ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Note: Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the old Mbed TLS site.

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF here.

Note: Please refer the ESP-IDF Migration Guide to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at https://github.com/espressif/esp-wolfSSL with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options does for more information on this and comparison of Mbed TLS and wolfSSL.
Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE.Bundle`: Support for trusted root certificate bundle (more about this: ESP.x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage  The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed Test</th>
<th>Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL</td>
<td><code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic</td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code></td>
<td>22013 B</td>
</tr>
<tr>
<td>TX/RX Buffer</td>
<td><code>CON FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code></td>
<td>CON FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size  Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in Minimizing Binary Size docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.
2.3 Bluetooth API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h

Structures

struct esp_bt_uuid_t

- UUID type.

Public Members

- uint16_t len
  - UUID length, 16bit, 32bit or 128bit

- uint16_t uuid16
  - 16bit UUID

- uint32_t uuid32
  - 32bit UUID

- uint8_t uuid128[ESP_UUID_LEN_128]
  - 128bit UUID

- union esp_bt_uuid_t::[anonymous] uuid
  - UUID

Macros

ESP_BLUEDROID_STATUS_CHECK (status)

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF

- Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN

- Minimum advertising interval for undirected and low duty cycle directed advertising
Chapter 2.  API Reference

**ESP_BLE_PRIM_ADV_INT_MAX**

Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP_BLE_CONN_INT_MIN**

relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

**ESP_BLE_CONN_INT_MAX**

relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

**ESP_BLE_CONN_LATENCY_MAX**

relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

**ESP_BLE_CONN_SUP_TOUT_MIN**

relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

**ESP_BLE_CONN_SUP_TOUT_MAX**

relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

**ESP_BLE_CONN_PARAM_UNDEF**

**ESP_BLE_SCAN_PARAM_UNDEF**

**ESP_BLE_IS_VALID_PARAM** \((x, \text{min}, \text{max})\)

Check the param is valid or not.

**ESP_UUID_LEN_16**

**ESP_UUID_LEN_32**

**ESP_UUID_LEN_128**

**ESP_BD_ADDR_LEN**

Bluetooth address length.

**ESP_BLE_ENC_KEY_MASK**

Used to exchange the encryption key in the init key & response key.

**ESP_BLE_ID_KEY_MASK**

Used to exchange the IRK key in the init key & response key.

**ESP_BLE_CSR_KEY_MASK**

Used to exchange the CSRK key in the init key & response key.

**ESP_BLE_LINK_KEY_MASK**

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP_APP_ID_MIN**

Minimum of the application id.
ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

**Type Definitions**

typedef uint8_t esp_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BT_OCTET8_LEN]

Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

**Enumerations**

enum esp_bt_status_t

Status Return Value.

*Values:*

enumerator ESP_BT_STATUS_SUCCESS

enumerator ESP_BT_STATUS_FAIL

BT MAIN API

API Reference

Header File
    • components/bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

esp_bluedroid_status_t esp_bluedroid_get_status (void)
    Get bluetooth stack status.
    
    Returns  Bluetooth stack status

esp_err_t esp_bluedroid_enable (void)
    Enable bluetooth, must after esp_bluedroid_init().
    
    Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_disable (void)
    Disable bluetooth, must prior to esp_bluedroid_deinit().
    
    Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_init (void)
    Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.
    
    Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_deinit (void)
    Deinit and free the resource for bluetooth, must be after every bluetooth stuff.
    
    Returns
    • ESP_OK : Succeed
    • Other : Failed

Enumerations

enum esp_bluedroid_status_t
    Bluetooth stack status type, to indicate whether the bluetooth stack is ready.
    
    Values:
Chapter 2. API Reference

enumerator ESP_BLUEDROID_STATUS_UNINITIALIZED
    Bluetooth not initialized

enumerator ESP_BLUEDROID_STATUS_INITIALIZED
    Bluetooth initialized but not enabled

enumerator ESP_BLUEDROID_STATUS_ENABLED
    Bluetooth initialized and enabled

BT DEVICE APIs

Overview  Bluetooth device reference APIs.

API Reference

Header File
• components/bt/host/bluedroid/api/include/api/esp_bt_device.h

Functions
const uint8_t* esp_bt_dev_get_address ( void )
    Get bluetooth device address. Must use after “esp_bluedroid_enable”.
Returns  bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name ( const char* name )
    Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.
Parameters  name [in] : devicename to be set
Returns
• ESP_OK : Succeed
• ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
• ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
• ESP_FAIL : others

2.3.2 BT LE

GAP API

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:
• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough
• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough
API Reference

Header File

- components/blueteeth/api/include/api/esp_ble_api.h

Functions

`esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)`

This function is called to occur gap event, such as scan result.

Parameters

- `callback` - [in] callback function

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)`

This function is called to override the BTA default ADV parameters.

Parameters

- `adv_data` - [in] Pointer to User defined ADV data structure. This memory space cannot be freed until callback of config_adv_data is received.

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)`

This function is called to set scan parameters.

Parameters

- `scan_params` - [in] Pointer to User defined scan_params data structure. This memory space cannot be freed until callback of set_scan_params

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_start_scanning(uint32_t duration)`

This procedure keep the device scanning the peer device which advertising on the air.

Parameters

- `duration` - [in] Keeping the scanning time, the unit is second.

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_stop_scanning(void)`

This function call to stop the device scanning the peer device which advertising on the air.

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)`

This function is called to start advertising.

Parameters

- `adv_params` - [in] pointer to User defined adv_params data structure.

Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_stop_advertising(void)`

This function is called to stop advertising.

Returns

- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)**

Update connection parameters, can only be used when connection is up.

**Parameters**

- `params` – [in] - connection update parameters

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)**

This function is to set maximum LE data packet size.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)**

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Parameters**

- `rand_addr` – [in] - the random address which should be setting

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clear_rand_addr (void)**

This function clears the random address for the application.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)**

Enable/disable privacy on the local device.

**Parameters**

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)**

Set local gap appearance icon

**Parameters**

- `icon` – [in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to [https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf](https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf)

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble wl addr_type_t wl addr_type)**

Add or remove device from white list.

**Parameters**

- `add_remove` – [in] - the value is true if added the ble device to the white list, and false remove to the white list.
- `remote_bda` – [in] - the remote device address add/remove from the white list.
- `wl_addr_type` – [in] - whitelist address type

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clear_whitelist (void)**

Clear all white list.
Returns

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_get_whitelist_size(uint16_t *length)`

Get the whitelist size in the controller.

**Parameters**
- `length` - [out] the white list length.

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)`

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Parameters**

- `bd_addr` - [in] BD address of the peripheral
- `min_conn_int` - [in] minimum preferred connection interval
- `max_conn_int` - [in] maximum preferred connection interval
- `slave_latency` - [in] preferred slave latency
- `supervision_tout` - [in] preferred supervision timeout

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_set_device_name(const char *name)`

Set device name to the local device.

**Parameters**

- `name` - [in] - device name.

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)`

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

**Parameters**

- `local_used_addr` - [in] - current local used ble address (six bytes)
- `addr_type` - [in] - ble address type

**Returns**

- ESP_OK : success
- other : failed

`uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)`

This function is called to get ADV data for a specific type.

**Parameters**

- `adv_data` - [in] - pointer of ADV data which to be resolved
- `type` - [in] - finding ADV data type
- `length` - [out] - return the length of ADV data not including type

**Returns**

pointer of ADV data

`esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)`

This function is called to set raw advertising data. User need to fill ADV data by self.

**Parameters**

- `raw_data` - [in] : raw advertising data
- `raw_data_len` - [in] : raw advertising data length , less than 31 bytes

**Returns**

- ESP_OK : success
**Chapter 2. API Reference**

- other : failed

**esp_err_t esp_ble_gap_config_scan_rsp_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

**Parameters**
- raw_data : [in] raw scan response data
- raw_data_len : [in] raw scan response data length, less than 31 bytes

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_read_rssi** (esp_bd_addr_t remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Parameters**
- remote_addr : [in] The remote connection device address.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device** (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)

This function is called to add a device info into the duplicate scan exceptionallist.

**Parameters**
- type : [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- device_info : [in] the device information.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device** (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)

This function is called to remove a device info from the duplicate scan exceptionallist.

**Parameters**
- type : [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- device_info : [in] the device information.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list** (esp_duplicate_scan_exceptional_list_type_t list_type)

This function is called to clean the duplicate scan exceptionallist. This API will delete all device information in the duplicate scan exceptionallist.

**Parameters**
- list_type : [in] duplicate scan exceptionallist type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_set_security_param** *(esp_ble_sm_param_t param_type, void *value, uint8_t len)*

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary to do as following:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

**Parameters**

- **param_type** - [in]: the type of the param which to be set
- **value** - [in]: the param value
- **len** - [in]: the length of the param value

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_securityrsp** *(esp_bd_addr_t bd_addr, bool accept)*

Grant security request access.

**Parameters**

- **bd_addr** - [in]: BD address of the peer
- **accept** - [in]: accept the security request or not

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_set_encryption** *(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)*

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Parameters**

- **bd_addr** - [in]: the address of the peer device need to encryption
- **sec_act** - [in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Parameters**

- **bd_addr** - [in]: BD address of the peer
- **accept** - [in]: passkey entry successful or declined.
- **passkey** - [in]: passkey value, must be a 6 digit number, can be lead by 0.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**
• **bd_addr** -[in] : BD address of the peer device
• **accept** -[in] : numbers to compare are the same or different.

**Returns** - ESP_OK : success  
• other : failed

```c
esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)
```

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters**  
bd_addr -[in] : BD address of the peer device

**Returns** - ESP_OK : success  
• other : failed

```c
int esp_ble_get_bond_device_num(void)
```

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns** - >= 0 : bonded devices number.  
• ESP_FAIL : failed

```c
esp_err_t esp_ble_get_bond_device_list(int*dev_num, esp_ble_bond_dev_t*dev_list)
```

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**  
• **dev_num** -[inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().  
• **dev_list** -[out] an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**Returns** - ESP_OK : success  
• other : failed

```c
esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t*TK, uint8_t len)
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Parameters**  
• **bd_addr** -[in] BD address of the peer device.  
• **TK** -[in] TK value, the TK value shall be a 128-bit random number  
• **len** -[in] length of tk, should always be 128-bit

**Returns** - ESP_OK : success  
• other : failed

```c
esp_err_t esp_ble_gap_disconnect(esp_bd_addr_t remote_device)
```

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Parameters**  
remote_device -[in] : BD address of the peer device

**Returns** - ESP_OK : success  
• other : failed

```c
esp_err_t esp_ble_get_current_conn_params(esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
```

This function is called to read the connection parameters information of the device.

**Parameters**  
• **bd_addr** -[in] BD address of the peer device.  
• **conn_params** -[out] the connection parameters information

**Returns** - ESP_OK : success  
• other : failed
**esp_err_t** esp_gap_ble_set_channels(esp_gap_ble_channels channels)

BLE set channels.

**Parameters**

channels — [in]: The n-th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**esp_err_t** esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)

This function is called to authorize a link after Authentication(MITM protection)

**Parameters**

- bd_addr — [in]: BD address of the peer device.
- authorize — [out]: Authorized the link or not.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t** esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Parameters**

bd_addr — [in]: BD address of the peer device

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t** esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Parameters**

- tx_phy_mask — [in]: indicates the transmitter PHYs that the Host prefers the Controller to use
- rx_phy_mask — [in]: indicates the receiver PHYs that the Host prefers the Controller to use

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t** esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_gap_phy_t tx_phy_mask, esp_gap_phy_t rx_phy_mask, esp_gap_prefer_phy_options_t phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Parameters**

- bd_addr — [in]: remote address
- all_phys_mask — [in]: a bit field that allows the Host to specify
- tx_phy_mask — [in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- rx_phy_mask — [in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- phy_options — [in]: a bit field that allows the Host to specify options for PHYs

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t** esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.
**Chapter 2. API Reference**

### Parameters

- **instance** - [in]: Used to identify an advertising set
- **rand_addr** - [in]: Random Device Address

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)
```

This function is used by the Host to set the advertising parameters.

### Parameters

- **instance** - [in]: identifies the advertising set whose parameters are being configured.
- **params** - [in]: advertising parameters

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)
```

This function is used to set the data used in advertising PDUs that have a data field.

### Parameters

- **instance** - [in]: identifies the advertising set whose data are being configured
- **length** - [in]: data length
- **data** - [in]: data information

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)
```

This function is used to provide scan response data used in scanning response PDUs.

### Parameters

- **instance** - [in]: identifies the advertising set whose response data are being configured.
- **length** - [in]: responsedata length
- **scan_rsp_data** - [in]: response data information

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)
```

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

### Parameters

- **num_adv** - [in]: Number of advertising sets to enable or disable
- **ext_adv** - [in]: adv parameters

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t *ext_adv_inst)
```

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

### Parameters

- **num_adv** - [in]: Number of advertising sets to enable or disable
- **ext_adv_inst** - [in]: ext adv instance

### Returns

- **ESP_OK**: success
- **other**: failed

```c
esp_err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)
```

This function is used to remove an advertising set from the Controller.

### Parameters

- **instance** - [in]: Used to identify an advertising set
Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_ext_adv_set_clear (void)
```

This function is used to remove all existing advertising sets from the Controller.

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_set_params (uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)
```

This function is used by the Host to set the parameters for periodic advertising.

Parameters
• instance - [in] : identifies the advertising set whose periodic advertising parameters are being configured.
• params - [in] : periodic adv parameters

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_config_periodic_adv_data_raw (uint8_t instance, uint16_t length, const uint8_t *data)
```

This function is used to set the data used in periodic advertising PDUs.

Parameters
• instance - [in] : identifies the advertising set whose periodic advertising parameters are being configured.
• length - [in] : the length of periodic data
• data - [in] : periodic data information

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_start (uint8_t instance)
```

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Parameters instance - [in] : Used to identify an advertising set

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_stop (uint8_t instance)
```

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Parameters instance - [in] : Used to identify an advertising set

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_set_ext_scan_params (const esp_ble_ext_scan_params_t *params)
```

This function is used to set the extended scan parameters to be used on the advertising channels.

Parameters params - [in] : scan parameters

Returns - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_start_ext_scan (uint32_t duration, uint16_t period)
```

This function is used to enable scanning.

Parameters
• duration - [in] : Scan duration
• period - [in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

Returns - ESP_OK : success
• other : failed
esp_err_t esp_ble_gap_stop_ext_scan (void)

This function is used to disable scanning.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_create_sync (const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Parameters params - [in] : sync parameters
Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Parameters sync_handle - [in] : identify the periodic advertiser
Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Parameters
- addr_type - [in] : address type
- addr - [in] : Device Address
- sid - [in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising
Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Parameters
- addr_type - [in] : address type
- addr - [in] : Device Address
- sid - [in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising
Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_periodic_adv_clear_dev (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Returns
- ESP_OK : success
- other : failed
This function is used to set aux connection parameters.

**Parameters**
- **addr** [in]: device address
- **phy_mask** [in]: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** [in]: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** [in]: Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** [in]: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns**
- ESP_OK: success
- other: failed

**Unions**

union **esp_ble_key_value_t**

#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate perf default phy set status
struct **ble_set_perf_phy_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate perf phy set status

struct **ble_set_rand_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate set static rand address operation success status

struct **ble_update_conn_params_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate update connection parameters success status

```c
esp_bd_addr_t bda
```

Bluetooth device address

```c
uint16_t min_int
```

Min connection interval

```c
uint16_t max_int
```

Max connection interval

```c
uint16_t latency
```

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

```c
uint16_t conn_int
```

Current connection interval

```c
uint16_t timeout
```

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct **ble_update_duplicate_exceptional_list_cmpl_evt_param**

```c

```
Chapter 2. API Reference

Public Members

```c
esp_bt_status_t status
```
Indicate update duplicate scan exceptional list operation success status

```c
uint8_t subcode
```
Define in esp_bt_duplicate_exceptional_subcode_type_t

```c
uint16_t length
```
The length of device_info

```c
esp_duplicate_info_t device_info
```
device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

Public Members

```c
esp_bt_status_t status
```
Indicate the add or remove whitelist operation success status

```c
esp_ble_wl_operation_t wl_operation
```
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

```c
struct esp_ble_adv_params_t
```
Advertising parameters.

Public Members

```c
uint16_t adv_int_min
```
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

```c
uint16_t adv_int_max
```
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

```c
esp_ble_adv_type_t adv_type
```
Advertising type

```c
esp_ble_addr_type_t own_addr_type
```
Owner bluetooth device address type
**Chapter 2. API Reference**

**esp_bd_addr_t** `peer_addr`
Peer device bluetooth device address

**esp_ble_addr_type_t** `peer_addr_type`
Peer device bluetooth device address type, only support public address type and random address type

**esp_ble_adv_channel_t** `channel_map`
Advertising channel map

**esp_ble_adv_filter_t** `adv_filter_policy`
Advertising filter policy

**struct esp_ble_adv_data_t**
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

`bool set_scan_rsp`
Set this advertising data as scan response or not

`bool include_name`
Advertising data include device name or not

`bool include_txpower`
Advertising data include TX power

`int min_interval`
Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

`int max_interval`
Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

`int appearance`
External appearance of device

`uint16_t manufacturer_len`
Manufacturer data length

`uint8_t* p_manufacturer_data`
Manufacturer data point

`uint16_t service_data_len`
Service data length
Chapter 2. API Reference

`uint8_t *p_service_data`  
Service data point

`uint16_t service_uuid_len`  
Service uuid length

`uint8_t *p_service_uuid`  
Service uuid array point

`uint8_t flag`  
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

```c
struct esp_ble_scan_params_t

Ble scan parameters.
```

**Public Members**

```c
    esp_ble_scan_type_t scan_type

    Scan type
```

```c
    esp_ble_addr_type_t own_addr_type

    Owner address type
```

```c
    esp_ble_scan_filter_t scan_filter_policy

    Scan filter policy
```

```c
    uint16_t scan_interval

    Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds
```

```c
    uint16_t scan_window

    Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec
```

```c
    esp_ble_scan_duplicate_t scan_duplicate

    The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received
```

```c
struct esp_gap_conn_params_t

connection parameters information
```

**Public Members**

```c
    uint16_t interval

    connection interval
```
uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
Connection update parameters.

Public Members

esp_bd_addr_t bda
Bluetooth device address

uint16_t min_int
Min connection interval

uint16_t max_int
Max connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
BLE pkt date length keys.

Public Members

uint16_t rx_len
pkt rx data length value

uint16_t tx_len
pkt tx data length value

struct esp_ble_penc_keys_t
BLE encryption keys.

Public Members

esp_bt_octet16_tltk
The long term key
**esp_bt_octet8_t** `rand`
The random number

`uint16_t` `ediv`
The ediv value

`uint8_t` `sec_level`
The security level of the security link

`uint8_t` `key_size`
The key size(7~16) of the security link

**struct esp_ble_pcsrk_keys_t**
BLE CSRK keys.

**Public Members**

`uint32_t` `counter`
The counter

**esp_bt_octet16_t** `csrk`
The csrk key

`uint8_t` `sec_level`
The security level

**struct esp_ble_pid_keys_t**
BLE pid keys.

**Public Members**

**esp_bt_octet16_t** `irk`
The irk value

**esp_ble_addr_type_t** `addr_type`
The address type

**esp_bd_addr_t** `static_addr`
The static address

**struct esp_ble_lenc_keys_t**
BLE Encryption reproduction keys.

**Public Members**
esp_bt_octet16_t ltk
The long term key

uint16_t div
The div value

uint8_t key_size
The key size of the security link

uint8_t sec_level
The security level of the security link

struct esp_ble_lcsrk_keys
BLE SRK keys.

Public Members

uint32_t counter
The counter value

uint16_t div
The div value

uint8_t sec_level
The security level of the security link

esp_bt_octet16_t csrk
The csrk key value

struct esp_ble_sec_key_notif_t
Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t bd_addr
peer address

uint32_t passkey
the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
Structure of the security request.

Public Members
Chapter 2. API Reference

```c
const esp_bd_addr_t bd_addr
    peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value
```

**Public Members**

```c
const esp_ble_key_mask_t key_mask
    the key mask to indicate which key is present

const esp_ble_penc_keys_t penc_key
    received peer encryption key

const esp_ble_pcsrk_keys_t pcsrk_key
    received peer device SRK

const esp_ble_pid_keys_t pid_key
    peer device ID key
```

```c
struct esp_ble_bond_dev_t
    struct type of the bond device value
```

**Public Members**

```c
const esp_bd_addr_t bd_addr
    peer address

const esp_ble_bond_key_info_t bond_key
    the bond key information
```

```c
union esp_ble_key_t
    union type of the security key value
```

**Public Members**

```c
const esp_bd_addr_t bd_addr
    peer address

const esp_ble_key_type_t key_type
    key type of the security link

const esp_ble_key_value_t p_key_value
    the pointer to the key value
```

```c
struct esp_ble_local_id_keys_t
    structure type of the ble local id keys value
```
Public Members

```c
esp_bt_octet16_t ir
    the 16 bits of the ir value
```

```c
esp_bt_octet16_t irk
    the 16 bits of the ir key value
```

```c
esp_bt_octet16_t dhk
    the 16 bits of the dh key value
```

```c
struct esp_ble_auth_cmpl_t
    Structure associated with ESP_AUTH_CMPL_EVT.
```

Public Members

```c
esp_bd_addr_t bd_addr
    BD address peer device.
```

```c
bool key_present
    Valid link key value in key element
```

```c
esp_link_key key
    Link key associated with peer device.
```

```c
uint8_t key_type
    The type of Link Key
```

```c
bool success
    TRUE of authentication succeeded, FALSE if failed.
```

```c
uint8_t fail_reason
    The HCI reason/error code for when success=FALSE
```

```c
esp_ble_addr_type_t addr_type
    Peer device address type
```

```c
esp_bt_dev_type_t dev_type
    Device type
```

```c
esp_ble_auth_req_t auth_mode
    authentication mode
```

```c
struct esp_ble_gap_ext_adv_params_t
    ext adv parameters
```
Public Members

`esp_ble_ext_adv_type_mask_t type`
- ext adv type

`uint32_t interval_min`
- ext adv minimum interval

`uint32_t interval_max`
- ext adv maximum interval

        ext scan uncoded config parameters
```

```c
esp_ble_ext_scan_cfg_t coded_cfg
        ext scan coded config parameters
```

```
struct esp_ble_gap_conn_params_t
        create extend connection parameters
```

Public Members

```c
uint16_t scan_interval
        init scan interval
```

```c
uint16_t scan_window
        init scan window
```

```c
uint16_t interval_min
        minimum interval
```
**API Reference**

```
uint16_t interval_max
    maximum interval

uint16_t latency
    ext scan type

uint16_t supervision_timeout
    connection supervision timeout

uint16_t min_ce_len
    minimum ce length

uint16_t max_ce_len
    maximum ce length

struct esp_ble_gap_ext_adv_t
    extend adv enable parameters

**Public Members**

uint8_t instance
    advertising handle

int duration
    advertising duration

int max_events
    maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
    periodic adv parameters

**Public Members**

uint16_t interval_min
    periodic advertising minimum interval

uint16_t interval_max
    periodic advertising maximum interval

uint8_t properties
    periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
    periodic adv sync parameters
```
Public Members

```c
esp_ble_gap_sync_t filter_policy
    periodic advertising sync filter policy
```

```c
uint8_t sid
    periodic advertising sid
```

```c
esp_ble_addr_type_t addr_type
    periodic advertising address type
```

```c
esp_bd_addr_t addr
    periodic advertising address
```

```c
uint16_t skip
    the maximum number of periodic advertising events that can be skipped
```

```c
uint16_t sync_timeout
    synchronization timeout
```

```c
struct esp_ble_gap_ext_adv_report_t
    extend adv report parameters
```

Public Members

typedef uint8_t esp_ble_gap_adv_type_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t

GAP BLE callback event type.

Values:

enumerator ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT
When advertising data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
When scan response data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
When scan parameters set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RESULT_EVT
When one scan result ready, the event comes each time

enumerator ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes
enumerator `ESP_GAP_BLE_ADV_START_COMPLETE_EVT`
When start advertising complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_START_COMPLETE_EVT`
When start scan complete, the event comes

enumerator `ESP_GAP_BLE_AUTH_CMPL_EVT`

enumerator `ESP_GAP_BLE_KEY_EVT`

enumerator `ESP_GAP_BLE_SEC_REQ_EVT`

enumerator `ESP_GAP_BLE_PASSKEY_NOTIF_EVT`

enumerator `ESP_GAP_BLE_PASSKEY_REQ_EVT`

enumerator `ESP_GAP_BLE_OOB_REQ_EVT`

enumerator `ESP_GAP_BLE_LOCAL_IR_EVT`

enumerator `ESP_GAP_BLE_LOCAL_ER_EVT`

enumerator `ESP_GAP_BLE_NC_REQ_EVT`

enumerator `ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT`
When stop adv complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT`
When stop scan complete, the event comes

enumerator `ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT`
When set the static rand address complete, the event comes

enumerator `ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT`
When update connection parameters complete, the event comes

enumerator `ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT`
When set pkt length complete, the event comes

enumerator `ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT`
When Enable/disable privacy on the local device complete, the event comes

enumerator `ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT`
When remove the bond device complete, the event comes

enumerator `ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT`
When clear the bond device clear complete, the event comes
enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**
   When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**
   When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**
   When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**
   When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**
   When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**

enumerator ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE
enumerator ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE
enumerator ESP_BLE_AD_TYPE_MANUFACTURER_SPECIFIC_TYPE

enum esp_ble_adv_type_t
    Advertising mode.
    
    Values:

    enumerator ADV_TYPE_IND

    enumerator ADV_TYPE_DIRECT_IND_HIGH

    enumerator ADV_TYPE_SCAN_IND

    enumerator ADV_TYPE_NONCONN_IND

    enumerator ADV_TYPE_DIRECT_IND_LOW

enum esp_ble_adv_channel_t
    Advertising channel mask.
    
    Values:

    enumerator ADV_CHNL_37

    enumerator ADV_CHNL_38

    enumerator ADV_CHNL_39
enumerator **ADV_CHNL_ALL**

**enum esp_ble_adv_filter_t**
*Values:*

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY**
Allow both scan and connection requests from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY**
Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST**
Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST**
Allow scan and connection requests from White List devices only.

**enum esp_ble_sec_act_t**
*Values:*

enumerator **ESP_BLE_SEC_ENCRYPT**

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

**enum esp_ble_sm_param_t**
*Values:*

enumerator **ESP_BLE_SM_PASSKEY**

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

enumerator **ESP_BLE_SM_IOCAP_MODE**

enumerator **ESP_BLE_SM_SET_INIT_KEY**

enumerator **ESP_BLE_SM_SET_RSP_KEY**

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**
enum **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

enumerator **ESP_BLE_SM_OOB_SUPPORT**

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all:

i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only:

i. advertisement packets from devices where the advertiser’s address is in the White list.

ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all:

i. undirected advertisement packets, and

ii. directed advertising packets where the initiator address is a resolvable private address, and

iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all:

i. advertisement packets from devices where the advertiser’s address is in the White list, and

ii. directed advertising packets where the initiator address is a resolvable private address, and

iii. directed advertising packets addressed to this device.

enum **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:
enumerator BLE_SCAN_DUPLICATE_DISABLE
the Link Layer should generate advertising reports to the host for each packet received

enumerator BLE_SCAN_DUPLICATE_ENABLE
the Link Layer should filter out duplicate advertising reports to the Host

enumerator BLE_SCAN_DUPLICATE_MAX
0x02 – 0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.
Values:

enumerator ESP_GAP_SEARCH_INQ_RES_EVT
Inquiry result for a peer device.

enumerator ESP_GAP_SEARCH_INQ_CMPL_EVT
Inquiry complete.

enumerator ESP_GAP_SEARCH_DISC_RES_EVT
Discovery result for a peer device.

enumerator ESP_GAP_SEARCH_DISC_BLE_RES_EVT
Discovery result for BLE GATT based service on a peer device.

enumerator ESP_GAP_SEARCH_DISC_CMPL_EVT
Discovery complete.

enumerator ESP_GAP_SEARCH_DI_DISC_CMPL_EVT
Discovery complete.

enumerator ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT
Search cancelled

enumerator ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.
Values:

enumerator ESP_BLE_EVT_CONN_ADV
Connectable undirected advertising (ADV_IND)

enumerator ESP_BLE_EVT_CONN_DIR_ADV
Connectable directed advertising (ADV_DIRECT_IND)
Chapter 2. API Reference

enumerator **ESP_BLE_EVT_DISC_ADV**
Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

*Values:*

enumerator **ESP_BLE_WHITELIST_REMOVE**
remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**
add address to whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

*Values:*

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
Remove device info from duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

*Values:*

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | … |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | … |
enum esp_duplicate_scan_exceptional_list_type_t

Values:

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST
duplicate scan exceptional addr list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST
duplicate scan exceptional mesh link ID list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST
duplicate scan exceptional mesh beacon type list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST
duplicate scan exceptional mesh adv with provisioning service uuid

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST
duplicate scan exceptional mesh adv with provisioning service uuid

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST
duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t attr_value

Gatt attribute structure

uint16_t handle

Gatt attribute handle

Structures

struct esp_gatt_id_t

Gatt id, include uuid and instance id.
Public Members

`esp_bt_uuid_t uuid`
UUID

`uint8_t inst_id`
Instance id

`struct esp_gatt_srvc_id_t`
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

`esp_gatt_id_t id`
Gatt id, include uuid and instance

`bool is_primary`
This service is primary or not

`struct esp_attr_desc_t`
Attribute description (used to create database)

Public Members

`uint16_t uuid_length`
UUID length

`uint8_t* uuid_p`
UUID value

`uint16_t perm`
Attribute permission

`uint16_t max_length`
Maximum length of the element

`uint16_t length`
Current length of the element

`uint8_t* value`
Element value array

`struct esp_attr_control_t`
attribute auto response flag
Public Members

```c
uint8_t auto_rsp
```
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

```c
struct esp_gatts_attr_db_t
```
attribute type added to the gatt server database

Public Members

```c
esp_attr_control_t attr_control
```
The attribute control type

```c
esp_attr_desc_t att_desc
```
The attribute type

```c
struct esp_attr_value_t
```
set the attribute value type

Public Members

```c
uint16_t attr_max_len
```
attribute max value length

```c
uint16_t attr_len
```
attribute current value length

```c
uint8_t* attr_value
```
the pointer to attribute value

```c
struct esp_gatts_incl_svc_desc_t
```
Gatt include service entry element.

Public Members

```c
uint16_t start_hdl
```
Gatt start handle value of included service

```c
uint16_t end_hdl
```
Gatt end handle value of included service

```c
uint16_t uuid
```
Gatt attribute value UUID of included service

```c
struct esp_gatts_incl128_svc_desc_t
```
Gatt include 128 bit service entry element.
Chapter 2. API Reference

Public Members

uint16_t **start_hdl**
Gatt start handle value of included 128 bit service

uint16_t **end_hdl**
Gatt end handle value of included 128 bit service

struct **esp_gatt_value_t**
Gatt attribute value.

Public Members

uint8_t **value**[ESP_GATT_MAX_ATTR_LEN]
Gatt attribute value

uint16_t **handle**
Gatt attribute handle

uint16_t **offset**
Gatt attribute value offset

uint16_t **len**
Gatt attribute value length

uint8_t **auth_req**
Gatt authentication request

struct **esp_gatt_conn_params_t**
Connection parameters information.

Public Members

uint16_t **interval**
connection interval

uint16_t **latency**
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_gattc_multi_t**
read multiple attribute
Public Members

uint8_t **num_attr**

The number of the attribute

uint16_t **handles**[ESP_GATT_MAX_READ_MULTI_HANDLES]

The handles list

struct **esp_gattc_db_elem_t**

data base attribute element

Public Members

*esp_gatt_db_attr_type_t** **type**

The attribute type

uint16_t **attribute_handle**

The attribute handle, it’s valid for all of the type

uint16_t **start_handle**

The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t **end_handle**

The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

*esp_gatt_char_prop_t** **properties**

The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

*esp_bt_uuid_t** **uuid**

The attribute uuid, it’s valid for all of the type

struct **esp_gattc_service_elem_t**

service element

Public Members

bool **is_primary**

The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**

The start handle of the service

uint16_t **end_handle**

The end handle of the service
struct esp_gattc_char_elem_t
characteristic element

Public Members

uint16_t char_handle
The characteristic handle

esp_gatt_char_prop_t properties
The characteristic properties

esp_bt_uuid_t uuid
The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members

uint16_t handle
The characteristic descriptor handle

esp_bt_uuid_t uuid
The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
include service element

Public Members

uint16_t handle
The include service current attribute handle

uint16_t incl_srvc_s_handle
The start handle of the service which has been included

uint16_t incl_srvc_e_handle
The end handle of the service which has been included

esp_bt_uuid_t uuid
The include service uuid

ESP_GATT_CHAR_PROP_BIT_NOTIFY

ESP_GATT_CHAR_PROP_BIT_INDICATE

ESP_GATT_CHAR_PROP_BIT_AUTH

ESP_GATT_CHAR_PROP_BIT_EXT_PROP

ESP_GATT_MAX_ATTR_LEN
   GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE
   If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
   Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum esp_gatt_prep_write_type
   Attribute write data type from the client.
   Values:

   enumerator ESP_GATT_PREP_WRITE_CANCEL
      Prepare write cancel

   enumerator ESP_GATT_PREP_WRITE_EXEC
      Prepare write execute

enum esp_gatt_status_t
   GATT success code and error codes.
   Values:

   enumerator ESP_GATT_OK
enumerator ESP_GATT_INVALID_HANDLE
enumerator ESP_GATT_READ_NOT_PERMIT
enumerator ESP_GATT_WRITE_NOT_PERMIT
enumerator ESP_GATT_INVALID_PDU
enumerator ESP_GATT_INSUF_AUTHENTICATION
enumerator ESP_GATT_REQ_NOT_SUPPORTED
enumerator ESP_GATT_INVALID_OFFSET
enumerator ESP_GATT_INSUF_AUTHORIZATION
enumerator ESP_GATT_PREPARE_Q_FULL
enumerator ESP_GATT_NOT_FOUND
enumerator ESP_GATT_NOT_LONG
enumerator ESP_GATT_INSUF_KEY_SIZE
enumerator ESP_GATT_INVALID_ATTR_LEN
enumerator ESP_GATT_ERR_UNLIKELY
enumerator ESP_GATT_INSUF_ENCRYPTION
enumerator ESP_GATT_UNSUPPORT_GRP_TYPE
enumerator ESP_GATT_INSUF_RESOURCE
enumerator ESP_GATT_NO_RESOURCES
enumerator ESP_GATT_INTERNAL_ERROR
enumerator ESP_GATT_WRONG_STATE
enumerator ESP_GATT_DB_FULL
enumerator ESP_GATT_BUSY
enumerator ESP_GATT_ERROR
enumerator ESP_GATT_CMD_STARTED
enumerator ESP_GATT_ILLEGAL_PARAMETER
enumerator ESP_GATT_PENDING
enumerator ESP_GATT_AUTH_FAIL
enumerator ESP_GATT_MORE
enumerator ESP_GATT_INVALID_CFG
enumerator ESP_GATT_SERVICE_STARTED
enumerator ESP_GATT_ENCRYPTED_MITM
enumerator ESP_GATT_ENCRYPTED_NO_MITM
enumerator ESP_GATT_NOT_ENCRYPTED
enumerator ESP_GATT_CONGESTED
enumerator ESP_GATT_DUP_REG
enumerator ESP_GATT_ALREADY_OPEN
enumerator ESP_GATT_CANCEL
enumerator ESP_GATT_STACK_RSP
enumerator ESP_GATT_APP_RSP
enumerator ESP_GATT_UNKNOWN_ERROR
enumerator ESP_GATT_CCC_CFG_ERR
enumerator ESP_GATT_PRC_IN_PROGRESS
enumerator ESP_GATT_OUT_OF_RANGE

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.
    
    Values:
    
    enumerator ESP_GATT_CONN_UNKNOWN
        Gatt connection unknown
enumerator ESP_GATT_CONN_L2C_FAILURE
   General L2cap failure

denumerator ESP_GATT_CONN_TIMEOUT
   Connection timeout

enumerator ESP_GATT_CONN_TERMINATE_PEER_USER
   Connection terminate by peer user

enumerator ESP_GATT_CONN_TERMINATE_LOCAL_HOST
   Connection terminated by local host

enumerator ESP_GATT_CONN_FAIL_ESTABLISH
   Connection fail to establish

enumerator ESP_GATT_CONN_LMP_TIMEOUT
   Connection fail for LMP response tout

enumerator ESP_GATT_CONN_CONN_CANCEL
   L2CAP connection cancelled

enumerator ESP_GATT_CONN_NONE
   No connection to cancel

denum esp_gatt_auth_req_t
   Gatt authentication request type.

   Values:

denumerator ESP_GATT_AUTH_REQ_NONE

denumerator ESP_GATT_AUTH_REQ_NO_MITM

denumerator ESP_GATT_AUTH_REQ_MITM

denumerator ESP_GATT_AUTH_REQ_SIGNED_NO_MITM

denumerator ESP_GATT_AUTH_REQ_SIGNED_MITM

denum esp_service_source_t
   Values:

   enumerator ESP_GATT_SERVICE_FROM_REMOTE_DEVICE

   enumerator ESP_GATT_SERVICE_FROM_NVS_FLASH

   enumerator ESP_GATT_SERVICE_FROM_UNKNOWN
```c
enum esp_gatt_write_type_t
{
   Gatt write type.

    Values:

    enumerator ESP_GATT_WRITE_TYPE_NO_RSP
    Gatt write attribute need no response

    enumerator ESP_GATT_WRITE_TYPE_RSP
    Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
    the type of attribute element

    Values:

    enumerator ESP_GATT_DB_PRIMARY_SERVICE
    Gatte primary service attribute type in the cache

    enumerator ESP_GATT_DB_SECONDARY_SERVICE
    Gatte secondary service attribute type in the cache

    enumerator ESP_GATT_DB_CHARACTERISTIC
    Gatte characteristic attribute type in the cache

    enumerator ESP_GATT_DB_DESCRIPTOR
    Gatte characteristic descriptor attribute type in the cache

    enumerator ESP_GATT_DB_INCLUDED_SERVICE
    Gatte include service attribute type in the cache

    enumerator ESP_GATT_DB_ALL
    Gatte all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache
```

### GATT SERVER API

**Application Example**  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

**API Reference**
Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

**esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)**

This function is called to register application callbacks with BTA GATTTS module.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_app_register (uint16_t app_id)**

This function is called to register application identifier.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)**

unregister with GATT Server.

**Parameters**

- **gatts_if** - [in] GATT server access interface

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)**

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- **gatts_if** - [in] GATT server access interface
- **service_id** - [in] service ID.
- **num_handle** - [in] number of handle requested for this service.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)**

Create a service attribute tab.

**Parameters**

- **gatts_attr_db** - [in] the pointer to the service attr tab
- **gatts_if** - [in] GATT server access interface
- **max_nb_attr** - [in] the number of attribute to be added to the service database.
- **srvc_inst_id** - [in] the instance id of the service

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_add_included_service (uint16_t service_handle, uint16_t included_service_handle)**

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Parameters**

- **service_handle** - [in] service handle to which this included service is to be added.
• included_service_handle – [in] the service ID to be included.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid,
                                esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
                                esp_attr_value_t *char_val,
                                esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

Parameters
• service_handle – [in] service handle to which this included service is to be added.
• char_uuid – [in] : Characteristic UUID.
• perm – [in] : Characteristic value declaration attribute permission.
• property [in] : Characteristic Properties
• char_val [in] : Characteristic value
• control – [in] : attribute response control byte

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid,
                                        esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val,
                                        esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Parameters
• service_handle – [in] service handle to which this characteristic descriptor is to be added.
• perm – [in] descriptor access permission.
• descr_uuid – [in] descriptor UUID.
• char_descr_val – [in] : Characteristic descriptor value
• control – [in] : attribute response control byte

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_delete_service(uint16_t service_handle)
```

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Parameters service_handle – [in] service_handle to be deleted.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_start_service(uint16_t service_handle)
```

This function is called to start a service.

Parameters service_handle – [in] the service handle to be started.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_stop_service(uint16_t service_handle)
```

This function is called to stop a service.

Parameters service_handle – [in] - service to be topped.

Returns
• ESP_OK : success
• other : failed
esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Parameters
- **gatts_if** - [in] GATT server access interface
- **conn_id** - [in] - connection id to indicate.
- **attr_handle** - [in] - attribute handle to indicate.
- **value_len** - [in] - indicate value length.
- **value** - [in] value to indicate.
- **need_confirm** - [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)

This function is called to send a response to a request.

Parameters
- **gatts_if** - [in] GATT server access interface
- **trans_id** - [in] - transfer id
- **status** - [in] - response status
- **rsp** - [in] - response data.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Parameters
- **attr_handle** - [in] the attribute handle which to be set
- **length** - [in] the value length
- **value** - [in] the pointer to the attribute value

Returns
- ESP_OK : success
- other : failed

esp_gatt_status_t esp_ble_gatts_get_attr_value (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

Parameters
- **attr_handle** - [in] Attribute handle.
- **length** - [out] pointer to the attribute value length
- **value** - [out] Pointer to attribute value payload, the value cannot be modified by user

Returns
- ESP_GATT_OK : success
- other : failed

esp_err_t esp_ble_gatts_open (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

Parameters
- **gatts_if** - [in] GATT server access interface
- **remote_bda** - [in] remote device bluetooth device address.
- **is_direct** - [in] direct connection or background auto connection
Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`
Close a connection a remote device.

Parameters
• `gatts_if`  [in] GATT server access interface
• `conn_id` [in] connection ID to be closed.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`
Send service change indication.

Parameters
• `gatts_if`  [in] GATT server access interface
• `remote_bda` [in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Returns
• ESP_OK: success
• other: failed

Unions
union `esp_ble_gatts_cb_param_t`

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct `esp_ble_gatts_cb_param_t`::gatts_reg_evt_param `reg`
Gatt server callback param of ESP_GATTS_REG_EVT

struct `esp_ble_gatts_cb_param_t`::gatts_read_evt_param `read`
Gatt server callback param of ESP_GATTS_READ_EVT

struct `esp_ble_gatts_cb_param_t`::gatts_write_evt_param `write`
Gatt server callback param of ESP_GATTS_WRITE_EVT

struct `esp_ble_gatts_cb_param_t`::gatts_exec_write_evt_param `exec_write`
Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct `esp_ble_gatts_cb_param_t`::gatts_mtu_evt_param `mtu`
Gatt server callback param of ESP_GATTS_MTU_EVT

struct `esp_ble_gatts_cb_param_t`::gatts_conf_evt_param `conf`
Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct `esp_ble_gatts_cb_param_t`::gatts_create_evt_param `create`
Gatt server callback param of ESP_GATTS_CREATE_EVT
struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICECHANGE_EVT

struct gatts_add_attr_tab_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

Type Definitions
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
    GATT Server callback function type.

    Param event  : Event type
    Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile
    Param param  : Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
    GATT Server callback function events.

    Values:

    enumerator ESP_GATTS_REG_EVT
        When register application id, the event comes

    enumerator ESP_GATTS_READ_EVT
        When gatt client request read operation, the event comes

    enumerator ESP_GATTS_WRITE_EVT
        When gatt client request write operation, the event comes

    enumerator ESP_GATTS_EXEC_WRITE_EVT
        When gatt client request execute write, the event comes

    enumerator ESP_GATTS_MTU_EVT
        When set mtu complete, the event comes

    enumerator ESP_GATTS_CONF_EVT
        When receive confirm, the event comes
enumerator `ESP_GATTS_UNREG_EVT`
   When unregister application id, the event comes

enumerator `ESP_GATTS_CREATE_EVT`
   When create service complete, the event comes

enumerator `ESP_GATTS_ADD_INCL_SRVC_EVT`
   When add included service complete, the event comes

enumerator `ESP_GATTS_ADD_CHAR_EVT`
   When add characteristic complete, the event comes

enumerator `ESP_GATTS_ADD_CHAR_DESCR_EVT`
   When add descriptor complete, the event comes

enumerator `ESP_GATTS_DELETE_EVT`
   When delete service complete, the event comes

enumerator `ESP_GATTS_START_EVT`
   When start service complete, the event comes

enumerator `ESP_GATTS_STOP_EVT`
   When stop service complete, the event comes

enumerator `ESP_GATTS_CONNECT_EVT`
   When gatt client connect, the event comes

enumerator `ESP_GATTS_DISCONNECT_EVT`
   When gatt client disconnect, the event comes

enumerator `ESP_GATTS_OPEN_EVT`
   When connect to peer, the event comes

enumerator `ESP_GATTS_CANCEL_OPEN_EVT`
   When disconnect from peer, the event comes

enumerator `ESP_GATTS_CLOSE_EVT`
   When gatt server close, the event comes

enumerator `ESP_GATTS_LISTEN_EVT`
   When gatt listen to be connected the event comes

enumerator `ESP_GATTS_CONGEST_EVT`
   When congest happen, the event comes

enumerator `ESP_GATTS_RESPONSE_EVT`
   When gatt send response complete, the event comes
enumerator `ESP_GATTS_CREAT_ATTR_TAB_EVT`
When gatt create table complete, the event comes

enumerator `ESP_GATTS_SET_ATTR_VAL_EVT`
When gatt set attr value complete, the event comes

enumerator `ESP_GATTS_SEND_SERVICE_CHANGE_EVT`
When gatt send service change indication complete, the event comes

**GATT CLIENT API**

**Application Example** Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - `bluetooth/bluedroid/ble/gatt_client`
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - `bluetooth/bluedroid/ble/gattc_multi_connect`
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - `bluetooth/bluedroid/ble/ble_spp_client`

**API Reference**

**Header File**

- `components/bt/host/bluedroid/api/include/api/esp_gattc_api.h`

**Functions**

`esp_err_t esp_ble_gattc_register_callback` *(esp_gattc_cb_t callback)*
This function is called to register application callbacks with GATTC module.

Parameters **callback** [in]: pointer to the application callback function.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_app_register` *(uint16_t app_id)*
This function is called to register application callbacks with GATTC module.

Parameters **app_id** [in]: Application Identify (UUID), for different application

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_app_unregister` *(esp_gatt_if_t gattc_if)*
This function is called to unregister an application from GATTC module.

Parameters **gattc_if** [in] Gatt client access interface.

Returns

- ESP_OK: success
- other: failed
**esp_err_t esp_ble_gattc_open** *(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)*

Open a direct connection or add a background auto connection.

**Parameters**
- remote_bda - [in] remote device bluetooth device address.
- remote_addr_type - [in] remote device bluetooth device the address type.
- is_direct - [in] direct connection or background auto connection(by now, background auto connection is not supported).

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_aux_open** *(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)*

**esp_err_t esp_ble_gattc_close** *(esp_gatt_if_t gattc_if, uint16_t conn_id)*

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Parameters**
- conn_id - [in] connection ID to be closed.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_send_mtu_req** *(esp_gatt_if_t gattc_if, uint16_t conn_id)*

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Parameters**
- conn_id - [in] connection ID.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_search_service** *(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)*

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**Parameters**
- conn_id - [in] connection ID.
- filter_uuid - [in] a UUID of the service application is interested in. If Null, discover for all services.

**Returns**
- ESP_OK: success
- other: failed

**esp_gatt_status_t esp_ble_gattc_get_service** *(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)*

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
Chapter 2. API Reference

Parameters

- `conn_id` - [in] connection ID which identify the server.
- `svc_uuid` - [in] the pointer to the service uuid.
- `result` - [out] The pointer to the service which has been found in the gattc cache.
- `count` - [inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- `offset` - [in] Offset of the service position to get.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_char
    (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle,
     esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the characteristic with the given service in the gattc cache. Note: It just get characteristic from local cache, won’t get from remote devices.

Parameters

- `conn_id` - [in] connection ID which identify the server.
- `start_handle` - [in] the attribute start handle.
- `end_handle` - [in] the attribute end handle.
- `result` - [out] The pointer to the characteristic in the service.
- `count` - [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- `offset` - [in] Offset of the characteristic position to get.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_descr
    (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache. Note: It just get descriptor from local cache, won’t get from remote devices.

Parameters

- `conn_id` - [in] connection ID which identify the server.
- `char_handle` - [in] the given characteristic handle.
- `result` - [out] The pointer to the descriptor in the characteristic.
- `count` - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- `offset` - [in] Offset of the descriptor position to get.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid
    (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache. Note: It just get characteristic from local cache, won’t get from remote devices.

Parameters

- `conn_id` - [in] connection ID which identify the server.
• **start_handle** - [in] the attribute start handle
• **end_handle** - [in] the attribute end handle
• **char_uuid** - [in] the characteristic uuid
• **result** - [out] The pointer to the characteristic in the service.
• **count** - [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid,
    esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Parameters**

- **conn_id** - [in] connection ID which identify the server.
- **start_handle** - [in] the attribute start handle
- **end_handle** - [in] the attribute end handle
- **char_uuid** - [in] the characteristic uuid.
- **descr_uuid** - [in] the descriptor uuid.
- **result** - [out] The pointer to the descriptor in the given characteristic.
- **count** - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle,
    esp_bt_uuid_t descr_uuid,
    esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Parameters**

- **conn_id** - [in] connection ID which identify the server.
- **char_handle** - [in] the characteristic handle.
- **descr_uuid** - [in] the descriptor uuid.
- **result** - [out] The pointer to the descriptor in the given characteristic.
- **count** - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
    uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid,
    esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

**Parameters**
Chapter 2. API Reference

- `conn_id` - [in] connection ID which identify the server.
- `start_handle` - [in] the attribute start handle
- `end_handle` - [in] the attribute end handle
- `incl_uuid` - [in] the include service uuid
- `result` - [out] The pointer to the include service in the given service.
- `count` - [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          esp_gatt_db_attr_type_t type, uint16_t start_handle,
                                          uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**
- `conn_id` - [in] connection ID which identify the server.
- `type` - [in] the attribute type.
- `start_handle` - [in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored
- `end_handle` - [in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored
- `char_handle` - [in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
- `count` - [out] output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle,
                                          uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Parameters**
- `start_handle` - [in] the attribute start handle
- `end_handle` - [in] the attribute end handle
- `conn_id` - [in] connection ID which identify the server.
- `db` - [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- `count` - [in] number of elements in database.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                  esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Parameters**
- `conn_id` - [in]: connection ID.
- `handle` - [in]: characteritic handle to read.
• **auth_req** - [in]: authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```plaintext
esp_err_t esp_ble_gattc_read_by_type (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Parameters**
- **gattc_if** - [in]: Gatt client access interface.
- **conn_id** - [in]: connection ID.
- **start_handle** - [in]: the attribute start handle.
- **end_handle** - [in]: the attribute end handle
- **uuid** - [in]: The UUID of attribute which will be read.
- **auth_req** - [in]: authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```plaintext
esp_err_t esp_ble_gattc_read_multiple (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Parameters**
- **gattc_if** - [in]: Gatt client access interface.
- **conn_id** - [in]: connection ID.
- **read_multi** - [in]: pointer to the read multiple parameter.
- **auth_req** - [in]: authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```plaintext
esp_err_t esp_ble_gattc_read_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Parameters**
- **gattc_if** - [in]: Gatt client access interface.
- **conn_id** - [in]: connection ID.
- **handle** - [in]: descriptor handle to read.
- **auth_req** - [in]: authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```plaintext
esp_err_t esp_ble_gattc_write_char (esp_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t* value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Parameters**
- **gattc_if** - [in]: Gatt client access interface.
- **conn_id** - [in]: connection ID.
- **handle** - [in]: characteristic handle to write.
- **value_len** - [in]: length of the value to be written.
- **value** - [in]: the value to be written.
- **write_type** - [in]: the type of attribute write operation.
- **auth_req** - [in]: authentication request.

**Returns**
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_write_char_descr` (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)

This function is called to write characteristic descriptor value.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in]: connection ID.
• handle [in]: descriptor handle to write.
• value_len [in]: length of the value to be written.
• value [in]: the value to be written.
• write_type [in]: the type of attribute write operation.
• auth_req [in]: authentication request.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_prepare_write` (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)

This function is called to prepare write a characteristic value.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in]: connection ID.
• handle [in]: characteristic handle to prepare write.
• offset [in]: offset of the write value.
• value_len [in]: length of the value to be written.
• value [in]: the value to be written.
• auth_req [in]: authentication request.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_prepare_write_char_descr` (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)

This function is called to prepare write a characteristic descriptor value.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in]: connection ID.
• handle [in]: characteristic descriptor handle to prepare write.
• offset [in]: offset of the write value.
• value_len [in]: length of the value to be written.
• value [in]: the value to be written.
• auth_req [in]: authentication request.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_execute_write` (esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in]: connection ID.
Chapter 2. API Reference

- `is_execute` - [in] : execute or cancel.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_register_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to register for notification of a service.

Parameters

Returns
- ESP_OK: registration succeeds
- other: failed

`esp_err_t esp_ble_gattc_unregister_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to de-register for notification of a service.

Parameters

Returns
- ESP_OK: unregister succeeds
- other: failed

`esp_err_t esp_ble_gattc_cache_refresh (esp_bd_addr_t remote_bda)`

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Parameters `remote_bda` - [in] remote device BD address.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_cache_assoc (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)`

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

Parameters
- `src_addr` - [in] the source address which provide the attribute table.
- `assoc_addr` - [in] the associated device address which went to share the attribute table with the source address.
- `is_assoc` - [in] true add the associated device address, false remove the associated device address.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_cache_get_addr_list (esp_gatt_if_t gattc_if)`

Get the address list which has store the attribute table in the gattc cache. There will callback
Chapter 2. API Reference

ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Parameters**  

**Returns**  
• ESP_OK: success
• other: failed

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

**Parameters**  
remote_bda - [in] remote device BD address.

**Returns**  
• ESP_OK: success
• other: failed

**Unions**

```c
union esp_ble_gattc_cb_param_t
```

#include `<esp_gattc_api.h` Gatt client callback parameters union.

The Characteristic or descriptor handle
```

```c
uint16_t offset
The prepare write offset, this value is valid only when prepare write
```

Type Definitions

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

GATT Client callback function type.

Param event : Event type
**Param gattc_if** : GATT client access interface, normally different gattc_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
{
    GATT_CLIENT_CALLBACK_FUNCTION_EVENTS,

    ESP_GATTC_REG_EVT,  // When GATT client is registered, the event comes
    ESP_GATTC_UNREG_EVT,  // When GATT client is unregistered, the event comes
    ESP_GATTC_OPEN_EVT,  // When GATT virtual connection is set up, the event comes
    ESP_GATTC_READ_CHAR_EVT,  // When GATT characteristic is read, the event comes
    ESP_GATTC_WRITE_CHAR_EVT,  // When GATT characteristic write operation completes, the event comes
    ESP_GATTC_CLOSE_EVT,  // When GATT virtual connection is closed, the event comes
    ESP_GATTC_SEARCH_CMPL_EVT,  // When GATT service discovery is completed, the event comes
    ESP_GATTC_SEARCH_RES_EVT,  // When GATT service discovery result is got, the event comes
    ESP_GATTC_READ_DESCR_EVT,  // When GATT characteristic descriptor read completes, the event comes
    ESP_GATTC_WRITE_DESCR_EVT,  // When GATT characteristic descriptor write completes, the event comes
    ESP_GATTC_NOTIFY_EVT,  // When GATT notification or indication arrives, the event comes
    ESP_GATTC_PREP_WRITE_EVT,  // When GATT prepare-write operation completes, the event comes
    ESP_GATTC_EXEC_EVT,  // When write execution completes, the event comes

    ESP_GATTC_EVT_MAX
};
```
enumerator **ESP_GATTC_ACL_EVT**
   When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**
   When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHANGE_EVT**
   When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**
   When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**
   When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**
   When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**
   When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**
   When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**
   When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**
   When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**
   When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**
   When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**
   When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**
   When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**
   When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**
   When Batch scan parameters are set, the event comes
enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**  
When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**  
When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**  
When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**  
When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**  
When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**  
When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**  
When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**  
When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**  
When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**  
When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**  
When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**  
When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**  
When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**  
When the ble discover service complete, the event comes

**BLUFI API**

**Overview**  
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.
Application Example  Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

API Reference

Header File

- components/bt/common/api/include/api/esp_blufi_api.h

Functions

**esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)**

This function is called to receive blufi callback event.

Parameters

- callbacks - [in] callback functions

Returns

- ESP_OK - success, other - failed

**esp_err_t esp_blufi_profile_init (void)**

This function is called to initialize blufi_profile.

Returns

- ESP_OK - success, other - failed

**esp_err_t esp_blufi_profile_deinit (void)**

This function is called to de-initialize blufi_profile.

Returns

- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)**

This function is called to send wifi connection report.

Parameters

- opmode - wifi opmode
- sta_conn_state - station is already in connection or not
- softap_conn_num - softap connection number
- extra_info - extra information, such as sta_ssid, softap_ssid and etc.

Returns

- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)**

This function is called to send wifi list.

Parameters

- apCount - wifi list count
- list - wifi list

Returns

- ESP_OK - success, other - failed

**uint16_t esp_blufi_get_version (void)**

Get BLUFI profile version.

Returns

- Most 8bit significant is Great version, Least 8bit is Sub version

**esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)**

This function is called to send blufi error information.

Parameters

- state - error state

Returns

- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)**

This function is called to custom data.

Parameters

- data - custom data
- data_len - length of custom data
Chapter 2. API Reference

- **data**: custom data value
- **data_len**: the length of custom data

**Returns** ESP_OK - success, other - failed

**Unions**

union `esp_blufi_cb_param_t`

#include `<esp_blufi_api.h>` BLUFI callback parameters union.

**Public Members**

struct `esp_blufi_cb_param_t`:blufi_init_finish_evt_param `init_finish`

struct esp_blufi_ap_record_t
    Description of an WiFi AP.

Public Members

uint8_t ssid[33]
    SSID of AP

int8_t rssi
    signal strength of AP

struct esp_blufi_callbacks_t
    BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
    BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
    BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
    BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
    BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
    BLUFI check sum function (FCS)

Macros

ESP_BLUFI_BD_ADDR_LEN
    Bluetooth address length.

Type Definitions

typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]
    Bluetooth device address.
typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)

BLUFI event callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone
Param len : length of data from phone
Param output_data : data want to send to phone
Param output_len : length of data want to send to phone
Param need_free : output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : plain text and encrypted data, the encrypt function must support au-
tochthonous encrypt
Param crypt_len : length of plain text
Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : encrypted data and plain text, the encrypt function must support au-
tochthonous decrypt
Param crypt_len : length of encrypted text
Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param data : data need to checksum
Param len : length of data

enum `esp_blufi_init_state_t`
   BLUFI init status.
   
   Values:
   
   enumerator `ESP_BLUFI_INIT_OK`
   
   enumerator `ESP_BLUFI_INIT_FAILED`

enum `esp_blufi_deinit_state_t`
   BLUFI deinit status.
   
   Values:
   
   enumerator `ESP_BLUFI_DEINIT_OK`
   
   enumerator `ESP_BLUFI_DEINIT_FAILED`

enum `esp_blufi_error_state_t`
   Values:
   
   enumerator `ESP_BLUFI_SEQUENCE_ERROR`
   
   enumerator `ESP_BLUFI_CHECKSUM_ERROR`
   
   enumerator `ESP_BLUFI_DECRYPT_ERROR`
   
   enumerator `ESP_BLUFI_ENCRYPT_ERROR`
   
   enumerator `ESP_BLUFI_INIT_SECURITY_ERROR`
   
   enumerator `ESP_BLUFI_DH_MALLOC_ERROR`
   
   enumerator `ESP_BLUFI_DH_PARAM_ERROR`
   
   enumerator `ESP_BLUFI_READ_PARAM_ERROR`
   
   enumerator `ESP_BLUFI_MAKE_PUBLIC_ERROR`
2.3.3 CLASSIC BT

CLASSIC BLUETOOTH GAP API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

static inline uint32_t esp_bt_gap_get_cod_srvc (uint32_t cod)
get major service field of COD

Parameters
cod - [in] Class of Device

Returns major service bits

static inline uint32_t esp_bt_gap_get_cod_major_dev (uint32_t cod)
get major device field of COD

Parameters
cod - [in] Class of Device

Returns major device bits

static inline uint32_t esp_bt_gap_get_cod_minor_dev (uint32_t cod)
get minor service field of COD

Parameters
cod - [in] Class of Device

Returns minor service bits

static inline uint32_t esp_bt_gap_get_cod_format_type (uint32_t cod)
get format type of COD

Parameters
cod - [in] Class of Device

Returns format type

static inline bool esp_bt_gap_is_valid_cod (uint32_t cod)
decide the integrity of COD

Parameters
cod - [in] Class of Device

Returns
- true if cod is valid
- false otherwise

esp_err_t esp_bt_gap_register_callback (esp_bt_gap_cb_t callback)
register callback function. This function should be called after esp_bluedroid_enable() completes successfully

Returns
- ESP_OK: Succeed
- ESP_FAIL: others

esp_err_t esp_bt_gap_set_scan_mode (esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)
Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

Parameters
Chapter 2. API Reference

- **c_mode [in]**: one of the enums of esp_BT_connection_mode_t
- **d_mode [in]**: one of the enums of esp_BT_discovery_mode_t

**Returns**

- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_start_discovery(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)
```

This function starts Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.

**Parameters**

- **mode [in]** - Inquiry mode
- **inq_len [in]** - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process, – when this time expires, Inquiry will be halted.
- **num_rsps [in]** - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

**Returns**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_cancel_discovery()
```

Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.

**Returns**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_remote_services(esp_bd_addr_t remote_bda)
```

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCVS_EVT after service discovery ends.

**Returns**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_remote_service_record(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)
```

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends.

**Returns**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
uint8_t* esp_bt_gap_resolve_eir_data (uint8_t*eir, esp_bt_eir_type_t type, uint8_t*length)

This function is called to get EIR data for a specific type.

Parameters

- **eir** - [in] - pointer of raw eir data to be resolved
- **type** - [in] - specific EIR data type
- **length** - [out] - return the length of EIR data excluding fields of length and data type

Returns

- pointer of starting position of eir data excluding eir data type, NULL if not found

esp_err_t esp_bt_gap_config_eir_data (esp_bt_eir_data_t*eir_data)

This function is called to config EIR data.

Parameters

- **eir_data** - [in] - pointer of EIR data content

Returns

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

esp_err_t esp_bt_gap_set_cod (esp_bt_cod_t cod, esp_bt_cod_mode_t mode)

This function is called to set class of device. The structure esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

Parameters

- **cod** - [in] - class of device
- **mode** - [in] - setting mode

Returns

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

esp_err_t esp_bt_gap_get_cod (esp_bt_cod_t*cod)

This function is called to get class of device.

Parameters

- **cod** - [out] - class of device

Returns

- ESP_OK: Succeed
- ESP_FAIL: others

esp_err_t esp_bt_gap_read_rssi_delta (esp_bd_addr_t remote_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Parameters

- **remote_addr** - [in] - remote device address, corresponding to a certain connection handle

Returns

- ESP_OK: Succeed
- ESP_FAIL: others

esp_err_t esp_bt_gap_remove_bond_device (esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device.

Parameters

- **bd_addr** - [in] - BD address of the peer device

Returns

- ESP_OK: success
- ESP_FAIL: failed
int esp_bt_gap_get_bond_device_num (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Returns
- >= 0 : bonded devices number
- ESP_FAIL : failed

esp_err_t esp_bt_gap_get_bond_device_list (int *dev_num, esp_bd_addr_t *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Parameters
- dev_num -[inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- dev_list -[out] an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

Returns
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL : others

esp_err_t esp_bt_gap_set_pin (esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)

Set pin type and default pin code for legacy pairing.

Parameters
- pin_type -[in] Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- pin_code_len -[in] Length of pin_code
- pin_code -[in] Pin_code

Returns
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t esp_bt_gap_pin_reply (esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Parameters
- bd_addr -[in] BD address of the peer
- accept -[in] Pin_code reply successful or declined.
- pin_code_len -[in] Length of pin_code
- pin_code -[in] Pin_code

Returns
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t esp_bt_gap_set_security_param (esp_bt_sp_param_t param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Parameters
- param_type -[in] : the type of the param which is to be set
- value -[in] : the param value
- len -[in] : the length of the param value

Returns
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed
**esp_err_t esp_bt_gap_ssp_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** [in]: BD address of the peer
- **accept** [in]: passkey entry successful or declined.
- **passkey** [in]: passkey value, must be a 6 digit number, can be lead by 0.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**esp_err_t esp_bt_gap_ssp_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** [in]: BD address of the peer device
- **accept** [in]: numbers to compare are the same or different

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**esp_err_t esp_bt_gap_set_afh_channels** *(esp_bt_gap_afh_channels channels)*

Set the AFH channels.

**Parameters**
- **channels** [in]: The n th such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**esp_err_t esp_bt_gap_read_remote_name** *(esp_bd_addr_t remote_bda)*

Read the remote device name.

**Parameters**
- **remote_bda** [in]: The remote device’s address

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**esp_err_t esp_bt_gap_set_qos** *(esp_bd_addr_t remote_bda, uint32_t t_poll)*

Config Quality of service.

**Parameters**
- **remote_bda** [in]: The remote device’s address
- **t_poll** [in]: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Unions**

**union esp_bt_gap_cb_param_t**

#include <esp_gap_bt_api.h> GAP state callback parameters.

**Public Members**

struct esp_bt_gap_cb_param_t:disc_res_param disc_res

discovery result parameter struct
struct esp_bt_gap_cb_param_t::disc_state_changed_param disc_st_chg
discovery state changed parameter struct

struct esp_bt_gap_cb_param_t::rmt_srvcs_param rmt_srvcs
services of remote device parameter struct

struct esp_bt_gap_cb_param_t::rmt_svc_rec_param rmt_svc_rec
specific service record from remote device parameter struct

struct esp_bt_gap_cb_param_t::read_rssi_delta_param read_rssi_delta
read rssi parameter struct

struct esp_bt_gap_cb_param_t::config_eir_data_param config_eir_data
config EIR data

struct esp_bt_gap_cb_param_t::auth_cmpl_param auth_cmpl
authentication complete parameter struct

struct esp_bt_gap_cb_param_t::pin_req_param pin_req
pin request parameter struct

struct esp_bt_gap_cb_param_t::cfm_req_param cfm_req
confirm request parameter struct

struct esp_bt_gap_cb_param_t::key_notif_param key_notif
passkey notif parameter struct

struct esp_bt_gap_cb_param_t::key_req_param key_req
passkey request parameter struct

struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels
set AFH channel parameter struct

struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name
read Remote Name parameter struct

struct esp_bt_gap_cb_param_t::modechg_param modechg
mode change event parameter struct

struct esp_bt_gap_cb_param_t::bt_remove_bond_dev_cmpl_evt_param remove_bond_dev_cmpl
Event parameter of ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT

struct esp_bt_gap_cb_param_t::qos_cmpl_param qos_cmpl
QoS complete parameter struct

struct auth_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_AUTH_CMPL_EVT.
Public Members

```c
esp_bd_addr_t bda
remote bluetooth device address
```

```c
esp_bt_status_t stat
authentication complete status
```

esp_bt_status_t stat
config EIR status: ESP_BT_STATUS_SUCCESS: config success
ESP_BT_STATUS_EIR_TOO_LARGE: the EIR data is more than 240B. The EIR may not
contain the whole data. others: failed
```

```c
uint8_t eir_type_num
the number of EIR types in EIR type
```
esp_bt_eir_type_t eir_type[ESP_BT_EIR_TYPE_MAX_NUM]
EIR types in EIR type

struct disc_res_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_RES_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

int num_prop
number of properties got

esp_bt_gap_dev_prop_t *prop
properties discovered from the new device

struct disc_state_changed_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_STATE_CHANGED_EVT.

Public Members

esp_bt_gap_discovery_state_t state
discovery state

struct key_notif_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

uint32_t passkey
the numeric value for passkey entry.

struct key_req_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_REQ_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

struct mode_chg_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_MODE_CHG_EVT.
Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_pm_mode_t mode`
PM mode

struct `pin_req_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_PIN_REQ_EVT.

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

bool `min_16_digit`
TRUE if the pin returned must be at least 16 digits

struct `qos_cmpl_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_QOS_CMPL_EVT.

Public Members

`esp_bt_status_t stat`
QoS status

`esp_bd_addr_t bda`
remote bluetooth device address

uint32_t `t_poll`
poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms.

struct `read_rmt_name_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_REMOTE_NAME_EVT.

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_status_t stat`
read Remote Name status

uint8_t `rmt_name`[ESP_BT_GAP_MAX_BDNAME_LEN + 1]
Remote device name
struct read_rssi_delta_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

esp_bt_status_t stat
read rssi status

int8_t rssi_delta
rssi delta value range -128 ~ 127. The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP_BT_GAP_RSSI_LOW_THRLD to ESP_BT_GAP_RSSI_HIGH_THRLD

struct rmt_srvc_rec_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVC_REC_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

service search status

struct rmt_srvcs_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVCBS_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

esp_bt_status_t stat
service search status

int num_uuids
number of UUID in uuid_list

esp_bt_uuid_t *uuid_list
list of service UUIDs of remote device

struct set_afh_channels_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_SET_AFH_CHANNELS_EVT.
Public Members

`esp_bt_status_t` **stat**
set AFH channel status

Structures

struct **esp_bt_cod_t**
Class of device.

Public Members

`uint32_t` **reserved_2**
undefined

`uint32_t` **minor**
minor class

`uint32_t` **major**
major class

`uint32_t` **service**
service class

`uint32_t` **reserved_8**
undefined

struct **esp_BT_gap_dev_prop_t**
Bluetooth Device Property Descriptor.

Public Members

`esp_BT_gap_dev_prop_type_t` **type**
Device property type

`int` **len**
Device property value length

`void *` **val**
Device property value

struct **esp_BT_eir_data_t**
EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members
bool **fec_required**
FEC is required or not, true by default

bool **include_txpower**
EIR data include TX power, false by default

bool **include_uuid**
EIR data include UUID, false by default

**uint8_t flag**
EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

**uint16_t manufacturer_len**
Manufacturer data length, 0 by default

**uint8_t *p_manufacturer_data**
Manufacturer data point

**uint16_t url_len**
URL length, 0 by default

**uint8_t *p_url**
URL point

**Macros**

**ESP_BT_GAP_RSSI_HIGH_THRLD**
RSSI threshold.
High RSSI threshold

**ESP_BT_GAP_RSSI_LOW_THRLD**
Low RSSI threshold

**ESP_BT_GAP_AFH_CHANNELS_LEN**

**ESP_BT_GAP_MAX_BDNAME_LEN**
Maximum bytes of Bluetooth device name.

**ESP_BT_GAP_EIR_DATA_LEN**
Maximum size of EIR Significant part.

**ESP_BT_EIR_TYPE_FLAGS**
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

**ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID**
Incomplete list of 16-bit service UUIDs
Chapter 2. API Reference

- **ESP_BT_EIR_TYPE_CMPL_16BITS_UUID**
  Complete list of 16-bit service UUIDs

- **ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID**
  Incomplete list of 32-bit service UUIDs

- **ESP_BT_EIR_TYPE_CMPL_32BITS_UUID**
  Complete list of 32-bit service UUIDs

- **ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID**
  Incomplete list of 128-bit service UUIDs

- **ESP_BT_EIR_TYPE_CMPL_128BITS_UUID**
  Complete list of 128-bit service UUIDs

- **ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME**
  Shortened Local Name

- **ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME**
  Complete Local Name

- **ESP_BT_EIR_TYPE_TX_POWER_LEVEL**
  Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

- **ESP_BT_EIR_TYPE_URL**
  Uniform resource identifier

- **ESP_BT_EIR_TYPE_MANU_SPECIFIC**
  Manufacturer specific data

- **ESP_BT_EIR_TYPE_MAX_NUM**
  MAX number of EIR type

- **ESP_BT_EIR_FLAG_LIMIT_DISC**

- **ESP_BT_EIR_FLAG_GEN_DISC**

- **ESP_BT_EIR_FLAG_BREDR_NOT_SPT**

- **ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT**

- **ESP_BT_EIR_FLAG_DMT_HOST_SPT**

- **ESP_BT_EIR_MAX_LEN**

- **ESP_BT_PIN_CODE_LEN**
  Max pin code length
ESP_BT_IO_CAP_OUT
ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE

ESP_BT_PM_MD_ACTIVE
  Active mode
ESP_BT_PM_MD_HOLD
  Hold mode
ESP_BT_PM_MD_SNIFF
  Sniff mode
ESP_BT_PM_MD_PARK
  Park state

ESP_BT_COD_SRVC_BIT_MASK
  Bits of major service class field.
  Major service bit mask

ESP_BT_COD_SRVC_BIT_OFFSET
  Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
  Bits of major device class field.
  Major device bit mask

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
  Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
  Bits of minor device class field.
  Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
  Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
  Bits of format type.
  Format type bit mask

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
  Format type bit offset
Chapter 2. API Reference

**ESP_BT_COD_FORMAT_TYPE_1**
Class of device format type 1.

**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
Combination of the IO Capability

typedef uint8_t esp_bt_pm_mode_t

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

**Param event** : Event type
**Param param** : Pointer to callback parameter

**Enumerations**

enum esp_bt_cod_mode_t
class of device settings

**Values:**

- enumerator ESP_BT_SET_COD_MAJOR_MINOR
  overwrite major, minor class

- enumerator ESP_BT_SET_COD_SERVICE_CLASS
  set the bits in the input, the current bit will remain

- enumerator ESP_BT_CLR_COD_SERVICE_CLASS
  clear the bits in the input, others will remain

- enumerator ESP_BT_SET_COD_ALL
  overwrite major, minor, set the bits in service class

- enumerator ESP_BT_INIT_COD
  overwrite major, minor, and service class
enum `esp_bt_connection_mode_t`  
Discoverability and Connectability mode.  
\textit{Values:}  

- \texttt{ESP_BT_NON_CONNECTABLE}  
  Non-connectable  

- \texttt{ESP_BT_CONNECTABLE}  
  Connectable  

enum `esp_bt_discovery_mode_t`  
\textit{Values:}  

- \texttt{ESP_BT_NON_DISCOVERABLE}  
  Non-discoverable  

- \texttt{ESP_BT_LIMITED_DISCOVERABLE}  
  Limited Discoverable  

- \texttt{ESP_BT_GENERAL_DISCOVERABLE}  
  General Discoverable  

def `esp_bt_gap_dev_prop_type_t`  
Bluetooth Device Property type.  
\textit{Values:}  

- \texttt{ESP_BT_GAP_DEV_PROP_BDNAME}  
  Bluetooth device name, value type is \texttt{int8_t [ ]}  

- \texttt{ESP_BT_GAP_DEV_PROP_COD}  
  Class of Device, value type is \texttt{uint32_t}  

- \texttt{ESP_BT_GAP_DEV_PROP_RSSI}  
  Received Signal strength Indication, value type is \texttt{int8_t}, ranging from -128 to 127  

- \texttt{ESP_BT_GAP_DEV_PROP_EIR}  
  Extended Inquiry Response, value type is \texttt{uint8_t [ ]}  

def `esp_bt_cod_srvc_t`  
Major service class field of Class of Device, multiple bits can be set.  
\textit{Values:}  

- \texttt{ESP_BT_COD_SRVC_NONE}  
  None indicates an invalid value  

- \texttt{ESP_BT_COD_SRVC_LMTD_DISCOVER}  
  Limited Discoverable Mode
enumerator **ESP_BT_COD_SRVC_POSITIONING**  
Positioning (Location identification)

enumerator **ESP_BT_COD_SRVC_NETWORKING**  
Networking, e.g. LAN, Ad hoc

enumerator **ESP_BT_COD_SRVC_RENDERING**  
Rendering, e.g. Printing, Speakers

enumerator **ESP_BT_COD_SRVC_CAPTUREING**  
Capturing, e.g. Scanner, Microphone

enumerator **ESP_BT_COD_SRVC_OBJ_TRANSFER**  
Object Transfer, e.g. v-Inbox, v-Folder

enumerator **ESP_BT_COD_SRVC_AUDIO**  
Audio, e.g. Speaker, Microphone, Headset service

enumerator **ESP_BT_COD_SRVC_TELEPHONY**  
Telephony, e.g. Cordless telephony, Modem, Headset service

enumerator **ESP_BT_COD_SRVC_INFORMATION**  
Information, e.g., WEB-server, WAP-server

enum **esp_bt_pin_type_t**  
Values:

enumerator **ESP_BT_PIN_TYPE_VARIABLE**  
Refer to BTM_PIN_TYPE_VARIABLE

enumerator **ESP_BT_PIN_TYPE_FIXED**  
Refer to BTM_PIN_TYPE_FIXED

enum **esp_bt_sp_param_t**  
Values:

enumerator **ESP_BT_SP_IOCAP_MODE**  
Set IO mode

enum **esp_bt_cod_major_dev_t**  
Major device class field of Class of Device.  
Values:

enumerator **ESP_BT_COD_MAJOR_DEV_MISC**  
Miscellaneous

enumerator **ESP_BT_COD_MAJOR_DEV_COMPUTER**  
Computer
Chapter 2. API Reference

enumerator ESP_BT_COD_MAJOR_DEV_PHONE
   Phone (cellular, cordless, pay phone, modem

enumerator ESP_BT_COD_MAJOR_DEV_LAN_NAP
   LAN, Network Access Point

enumerator ESP_BT_COD_MAJOR_DEV_AV
   Audio/Video (headset, speaker, stereo, video display, VCR

enumerator ESP_BT_COD_MAJOR_DEV_PERIPHERAL
   Peripheral (mouse, joystick, keyboard)

enumerator ESP_BT_COD_MAJOR_DEV_IMAGING
   Imaging (printer, scanner, camera, display

enumerator ESP_BT_COD_MAJOR_DEV_WEARABLE
   Wearable

enumerator ESP_BT_COD_MAJOR_DEV_TOY
   Toy

enumerator ESP_BT_COD_MAJOR_DEV_HEALTH
   Health

enumerator ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED
   Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
   Bluetooth Device Discovery state
   Values:

   enumerator ESP_BT_GAP_DISCOVERY_STOPPED
      Device discovery stopped

   enumerator ESP_BT_GAP_DISCOVERY_STARTED
      Device discovery started

enum esp_bt_gap_cb_event_t
   BT GAP callback events.
   Values:

   enumerator ESP_BT_GAP_DISC_RES_EVT
      Device discovery result event

   enumerator ESP_BT_GAP_DISC_STATE_CHANGED_EVT
      Discovery state changed event
Chapter 2 API Reference

enumerator `ESP_BT_GAP_RMT_SRVCS_EVT`
   Get remote services event

enumerator `ESP_BT_GAP_RMT_SRVC_REC_EVT`
   Get remote service record event

enumerator `ESP_BT_GAP_AUTH_CMPL_EVT`
   Authentication complete event

enumerator `ESP_BT_GAP_PIN_REQ_EVT`
   Legacy Pairing Pin code request

enumerator `ESP_BT_GAP_CFM_REQ_EVT`
   Security Simple Pairing User Confirmation request.

enumerator `ESP_BT_GAP_KEY_NOTIF_EVT`
   Security Simple Pairing Passkey Notification

enumerator `ESP_BT_GAP_KEY_REQ_EVT`
   Security Simple Pairing Passkey request

enumerator `ESP_BT_GAP_READ_RSSI_DELTA_EVT`
   Read rssi event

enumerator `ESP_BT_GAP_CONFIG_EIR_DATA_EVT`
   Config EIR data event

enumerator `ESP_BT_GAP_SET_AFH_CHANNELS_EVT`
   Set AFH channels event

enumerator `ESP_BT_GAP_READ_REMOTE_NAME_EVT`
   Read Remote Name event

enumerator `ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT`
   remove bond device complete event

enumerator `ESP_BT_GAP_QOS_CMPL_EVT`
   QOS complete event

enumerator `ESP_BT_GAP_EVT_MAX`

enum `esp_bt_inq_mode_t`
   Inquiry Mode
   
   Values:
enumerator **ESP_BT_INQ_MODE_GENERAL_INQUIRY**
General inquiry mode

enumerator **ESP_BT_INQ_MODE_LIMITED_INQUIRY**
Limited inquiry mode

**Bluetooth A2DP API**

**Application Example**
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

**Functions**

```c
esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)
```

Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

**Parameters**

- `callback` - [in] A2DP event callback function

**Returns**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)
```

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

**Parameters**

- `callback` - [in] A2DP sink data callback function

**Returns**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
esp_err_t esp_a2d_sink_init (void)
```

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

**Returns**

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_a2d_sink_deinit (void)
```

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.
Returns

- ESP_OK: if the deinitialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`

Connect to remote bluetooth A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Parameters `remote_bda` - [in] remote bluetooth device address

Returns

- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Parameters `remote_bda` - [in] remote bluetooth device address

Returns

- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_set_delay_value (uint16_t delay_value)`

Set delay reporting value. The delay value of sink is caused by buffering (including protocol stack and application layer), decoding and rendering. The default delay value is 120ms, if the set value is less than 120ms, the setting will fail. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Parameters `delay_value` - [in] reporting value is in 1/10 millisecond

Returns

- ESP_OK: delay value is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_get_delay_value (void)`

Get delay reporting value. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Returns

- ESP_OK: if the request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`

Media control commands. This API can be used for both A2DP sink and source and must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Parameters `ctrl` - [in] control commands for A2DP data channel

Returns

- ESP_OK: control command is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_init (void)`

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

Returns

- ESP_OK: if the initialization request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_source_deinit (void)
```

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Returns**

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)
```

Register A2DP source data input function. For now, the input shoule be PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Parameters**

`callback` – [in] A2DP source data callback function

**Returns**

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

```
esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)
```

Connect to remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

**Parameters**

`remote_bda` – [in] remote bluetooth device address

**Returns**

• ESP_OK: connect request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)
```

Disconnect from the remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

**Parameters**

`remote_bda` – [in] remote bluetooth device address

**Returns**

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Unions**

union esp_a2d_cb_param_t

`#include <esp_a2dp_api.h>` A2DP state callback parameters.

**Public Members**

```
struct esp_a2d_cb_param_t:
    a2d_conn_stat_param conn_stat
```

Type Definitions

typedef uint8_t  esp_a2d_mct_t

typedef uint16_t esp_a2d_psc_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
  A2DP profile callback function type.
  Param event : Event type
  Param param : Pointer to callback parameter

typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t *buf,uint32_t len)
  A2DP sink data callback function.
  Param buf [in] : pointer to the data received from A2DP source device and is PCM format de-
  coded from SBC decoder; buf references to a static memory block and can be overwritten by
  upcoming data
  Param len [in] : size(in bytes) in buf
typedef int32_t(*esp_a2d_source_data_cb_t)(uint8_t*buf, int32_t len)
A2DP source data read callback function.

Param buf [in]: buffer to be filled with PCM data stream from higher layer
Param len [in]: size (in bytes) of data block to be copied to buf. -1 is an indication to user that
data buffer shall be flushed
Return size of bytes read successfully, if the argument len is -1, this value is ignored.

Enumerations
enum esp_a2d_connection_state_t
Bluetooth A2DP connection states.
Values:

enumerator ESP_A2D_CONNECTION_STATE_DISCONNECTED
connection released

enumerator ESP_A2D_CONNECTION_STATE_CONNECTING
connecting remote device

enumerator ESP_A2D_CONNECTION_STATE_CONNECTED
connection established

enumerator ESP_A2D_CONNECTION_STATE_DISCONNECTING
disconnecting remote device

enum esp_a2d_disc_rsn_t
Bluetooth A2DP disconnection reason.
Values:

enumerator ESP_A2D_DISC_RSN_NORMAL
Finished disconnection that is initiated by local or remote device

enumerator ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t
Bluetooth A2DP datapath states.
Values:

enumerator ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND
audio stream datapath suspended by remote device

enumerator ESP_A2D_AUDIO_STATE_STOPPED
audio stream datapath stopped

enumerator ESP_A2D_AUDIO_STATE_STARTED
audio stream datapath started
enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.

Values:

enumerator ESP_A2D_MEDIA_CTRL_ACK_SUCCESS
media control command is acknowledged with success

enumerator ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

enumerator ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.

Values:

enumerator ESP_A2D_MEDIA_CTRL_NONE
Not for application use, use inside stack only.

enumerator ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

enumerator ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

enumerator ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

enumerator ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.

Values:

enumerator ESP_A2D_DEINIT_SUCCESS
A2DP profile deinit successful event

enumerator ESP_A2D_INIT_SUCCESS
A2DP profile deinit successful event

enum esp_a2d_set_delay_value_state_t
Bluetooth A2DP set delay report value states.

Values:

enumerator ESP_A2D_SET_SUCCESS
A2DP profile set delay report value successful
enumerator ESP_A2D_SET_INVALID_PARAMS
A2DP profile set delay report value is invalid parameter

denum esp_a2d_cb_event_t
A2DP callback events.

Values:

denumerator ESP_A2D_CONNECTION_STATE_EVT
collection state changed event

denumerator ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

denumerator ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

denumerator ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

denumerator ESP_A2D_PROF_STATE_EVT
indicate a2dp init&deinit complete

denumerator ESP_A2D_SNK_PSC_CFG_EVT
protocol service capabilities configured, only used for A2DP SINK

denumerator ESP_A2D_SNK_SET_DELAY_VALUE_EVT
indicate a2dp sink set delay report value complete, only used for A2DP SINK

denumerator ESP_A2D_SNK_GET_DELAY_VALUE_EVT
indicate a2dp sink get delay report value complete, only used for A2DP SINK

denumerator ESP_A2D_REPORT_SNK_DELAY_VALUE_EVT
report delay value, only used for A2DP SRC

BT AVRCP APIs

Overview Bluetooth AVRCP reference APIs.

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_avrc_api.h

Functions

esp_err_t esp_avrc_ct_register_callback (esp_avrc_ct cb callback)

Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.
Parameters \textbf{callback} \texttt{[in]} AVRCP controller callback function

Returns
\begin{itemize}
  \item ESP\_OK: success
  \item ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
  \item ESP\_FAIL: others
\end{itemize}

\texttt{esp\_err\_t esp\_avrc\_ct\_init} (void)

Initialize the bluetooth AVRCP controller module. This function should be called after \texttt{esp\_bluedroid\_enable()} completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Returns
\begin{itemize}
  \item ESP\_OK: success
  \item ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
  \item ESP\_FAIL: others
\end{itemize}

\texttt{esp\_err\_t esp\_avrc\_ct\_deinit} (void)

De-initialize AVRCP controller module. This function should be called after after \texttt{esp\_bluedroid\_enable()} completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Returns
\begin{itemize}
  \item ESP\_OK: success
  \item ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
  \item ESP\_FAIL: others
\end{itemize}

\texttt{esp\_err\_t esp\_avrc\_ct\_send\_set\_player\_value\_cmd} (uint8\_t tl, uint8\_t attr\_id, uint8\_t value\_id)

Send player application settings command to AVRCP target. This function should be called after \texttt{ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT} is received and AVRCP connection is established.

Parameters
\begin{itemize}
  \item tl \texttt{[in]}: transaction label, 0 to 15, consecutive commands should use different values
  \item attr\_id \texttt{[in]}: player application setting attribute IDs from one of \texttt{esp\_avrc\_ps\_attr\_ids\_t}
  \item value\_id \texttt{[in]}: attribute value defined for the specific player application setting attribute
\end{itemize}

Returns
\begin{itemize}
  \item ESP\_OK: success
  \item ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
  \item ESP\_FAIL: others
\end{itemize}

\texttt{esp\_err\_t esp\_avrc\_ct\_send\_get\_rn\_capabilities\_cmd} (uint8\_t tl)

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event\_ids. This function should be called after \texttt{ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT} is received and AVRCP connection is established.

Parameters
\begin{itemize}
  \item tl \texttt{[in]}: transaction label, 0 to 15, consecutive commands should use different values
\end{itemize}

Returns
\begin{itemize}
  \item ESP\_OK: success
  \item ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
  \item ESP\_FAIL: others
\end{itemize}

\texttt{esp\_err\_t esp\_avrc\_ct\_send\_register\_notification\_cmd} (uint8\_t tl, uint8\_t event\_id, uint32\_t event\_parameter)

Send register notification command to AVRCP target. This function should be called after \texttt{ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT} is received and AVRCP connection is established.

Parameters
\begin{itemize}
  \item tl \texttt{[in]}: transaction label, 0 to 15, consecutive commands should use different values.
  \item event\_id \texttt{[in]}: id of events, e.g. ESP\_AVRC\_RN\_PLAY\_STATUS\_CHANGE, ESP\_AVRC\_RN\_TRACK\_CHANGE, etc.
\end{itemize}
• **event_parameter**  *[in]*  : playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd** (uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl**  *[in]*  : transaction label, 0 to 15, consecutive commands should use different values
- **volume**  *[in]*  : volume, 0 to 0x7f, means 0% to 100%

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_metadata_cmd** (uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl**  *[in]*  : transaction label, 0 to 15, consecutive commands should use different values.
- **attr_mask**  *[in]*  : mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_passsthrough_cmd** (uint8_t tl, uint8_t key_code, uint8_t key_state)

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl**  *[in]*  : transaction label, 0 to 15, consecutive commands should use different values.
- **key_code**  *[in]*  : passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- **key_state**  *[in]*  : passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_tg_register_callback** (esp_avrc_tg_cb_t callback)

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

**Parameters**
- **callback**  *[in]*  : AVRCP target callback function

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
**ESP_FAIL:** others

`esp_err_t esp_avrc_tg_init (void)`

Initialize the Bluetooth AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_tg_deinit (void)`

Deinitialize AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)`

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. For filter type `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type `ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS`, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using `esp_avrc_tg_set_psth_cmd_filter()`.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not enabled or AVRC TG is not initialized
- `ESP_ERR_INVALID_ARG`: if filter type is invalid or `cmd_set` is NULL
- `ESP_FAIL`: otherwise

`esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)`

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`.

If filter type is `ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS`, the passthrough commands which are set “1” as given in `cmd_set` will generate `ESP_AVRC_CT_PASSTHROUGH_RSP_EVT` callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using `esp_avrc_tg_get_psth_cmd_filter()` with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if Bluetooth stack is not enabled
- `ESP_ERR_INVALID_ARG`: if filter type is invalid or `cmd_set` is NULL
- `ESP_ERR_NOT_SUPPORTED`: if `filter` type is `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, or `cmd_set` includes commands that are not allowed

`bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)`
Operate on the type `esp_avrc_psth_bit_mask_t` with regard to a specific PASSTHROUGH command.

**Parameters**
- `op` [in] operation requested on the bit mask field
- `psth` [in] pointer to passthrough command bit mask structure
- `cmd` [in] passthrough command code

**Returns**
For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise false. For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

```c
esp_err_t esp_avrc_psth_bit_mask_operation(esp_avrc_psth_bit_mask_t *psth, uint32_t cmd, uint32_t op);
```

### esp_avrc_tg_get_rn_evt_cap
Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

For capability type `ESP_AVRC_RN_CAP_ALLOWED_EVT`, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type `ESP_AVRC_RN_CAP_SUPPORTED_EVT`, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled or AVRCTG is not initialized
- `ESP_ERR_INVALID_ARG`: if cap is invalid or `evt_set` is NULL
- `ESP_FAIL`: otherwise

```c
esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set);
```

### esp_avrc_tg_set_rn_evt_cap
Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled
- `ESP_ERR_INVALID_ARG`: if `evt_set` is NULL

```c
esp_err_t esp_avrc_tg_set_rn_evt_cap(esp_avrc_rn_evt_cap_mask_t *evt_set);
```

### esp_avrc_rn_evt_bit_mask_operation
Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

**Parameters**
- `op` [in] operation requested on the bit mask field
- `events` [in] pointer to event notification capability bit mask structure
- `event_id` [in] notification event code

**Returns**
For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise false.

```c
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_rn_evt_ids_t event_ids, esp_avrc_bit_mask_t *events, esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *event_id);
```

### esp_avrc_tg_send_rn_rsp
Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

**Parameters**
- `rsp` [in] RegisterNotification Response
- `param` [in] parameter for RegisterNotification Response
- `event_ids` [in] notification event codes

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled
- `ESP_ERR_INVALID_ARG`: if `param` is NULL

```c
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_ids, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param);
```
Parameters

- **event_id** – [in] notification event ID that remote AVRCP CT registers
- **rsp** – [in] notification response code
- **param** – [in] parameters included in the specific notification

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

Unions

union **esp_avrc_rn_param_t**

```
#include <esp_avrc_api.h> AVRCP notification parameters.
```

Public Members

```
uint8_t volume
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127
```

```
esp_avrc_playback_stat_t playback
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE
```

```
uint8_t elem_id[8]
response data for ESP_AVRC_RN_TRACK_CHANGE
```

```
uint32_t play_pos
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond
```

```
esp_avrc_batt_stat_t batt
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE
```

union **esp_avrc_ct_cb_param_t**

```
#include <esp_avrc_api.h> AVRC controller callback parameters.
```

Public Members

```
struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
AVRC connection status
```

```
struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
passthrough command response
```

```
struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
metadata attributes response
```

```
struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
notifications
```
struct esp_avrc_ct_cb_param_t::avrc_rmt_feats_param rmt_feats
    AVRC features discovered from remote SDP server

struct esp_avrc_ct_cb_param_t::avrc_get_rn_caps_rsp_param get_rn_caps_rsp
    get supported event capabilities response from AVRCP target

struct esp_avrc_ct_cb_param_t::avrc_set_volume_rsp_param set_volume_rsp
    set absolute volume response event

struct avrc_ct_change_notify_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.

Public Members

    uint8_t event_id
        id of AVRC event notification

    esp_avrc_rn_param_t event_parameter
        event notification parameter

struct avrc_ct_conn_stat_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.

Public Members

    bool connected
        whether AVRC connection is set up

    esp_bd_addr_t remote_bda
        remote bluetooth device address

struct avrc_ct_get_rn_caps_rsp_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.

Public Members

    uint8_t cap_count
        number of items provided in event or company_id according to cap_id used

    esp_avrc_rn_evt_cap_mask_t evt_set
        supported event_ids represented in bit-mask

struct avrc_ct_meta_rsp_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
Public Members

```c
uint8_t attr_id
    id of metadata attribute
```

```c
uint8_t* attr_text
    attribute itself
```

```c
int attr_length
    attribute character length
```

```c
struct avrc_ct_psth_rsp_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

Public Members

```c
uint8_t tl
    transaction label, 0 to 15
```

```c
uint8_t key_code
    passthrough command code
```

```c
uint8_t key_state
    0 for PRESSED, 1 for RELEASED
```

```c
struct avrc_ct_rmt_feats_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

Public Members

```c
uint32_t feat_mask
    AVRC feature mask of remote device
```

```c
uint16_t tg_feat_flag
    feature flag of remote device as TG
```

```c
esp_bd_addr_t remote_bda
    remote bluetooth device address
```

```c
struct avrc_ct_set_volume_rsp_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.
```

Public Members

```c
uint8_t volume
    the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%
```
union esp_avrc_tg_cb_param_t
#include <esp_avrc_api.h> AVRC target callback parameters.

Public Members

struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
AVRC connection status

struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
AVRC features discovered through SDP

struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
passthrough command

struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
set absolute volume command targeted on audio sink

struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
register notification

struct esp_avrc_tg_cb_param_t::avrc_tg_set_app_value_param set_app_value
set player application value

struct avrc_tg_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.

Public Members

bool connected
whether AVRC connection is set up

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_tg_psth_cmd_param
#include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.

Public Members

uint8_t key_code
passthrough command code

uint8_t key_state
0 for PRESSED, 1 for RELEASED

struct avrc_tg_reg_ntf_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.
Public Members

- uint8_t `event_id`
  - Event id of AVRC RegisterNotification

- uint32_t `event_parameter`
  - Event notification parameter

```
struct avrc tg_rmt_feats_param

#include <esp_avrc_api.h> ESP_AVRC_TG_REMOTE_FEATURES_EVT.
```

Public Members

- uint32_t `feat_mask`
  - AVRC feature mask of remote device

- uint16_t `ct_feat_flag`
  - Feature flag of remote device as CT

```
esp_bd_addr_t `remote_bda`
```
- Remote Bluetooth device address

```
struct avrc tg_set_abs_vol_param

#include <esp_avrc_api.h> ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.
```

Public Members

- uint8_t `volume`
  - Volume ranges from 0 to 127

```
struct avrc tg_set_app_value_param

#include <esp_avrc_api.h> ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT.
```

Public Members

- uint8_t `num_val`
  - Attribute num

```
esp avrc set app_value_param_t *p vals
```
- Point to the id and value of player application attribute

Structures

```
struct esp avrc psth_bit_mask_t
```
- AVRC passthrough command bit mask.
Chapter 2. API Reference

Public Members

uint16_t bits[8]
    bit mask representation of PASSTHROUGH commands

struct esp_avrc_rn_evt_cap_mask_t
    AVRC target notification event capability bit mask.

Public Members

uint16_t bits
    bit mask representation of PASSTHROUGH commands

struct esp_avrc_set_app_value_param_t
    AVRCP set app value parameters.

Public Members

uint8_t attr_id
    player application attribute id

uint8_t attr_val
    player application attribute value

Macros

ESP_AVRC_TRANS_LABEL_MAX
    max transaction label

Type Definitions

typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
    AVRCP controller callback function type.
        Param event : Event type
        Param param : Pointer to callback parameter union

typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
    AVRCP target callback function type.
        Param event : Event type
        Param param : Pointer to callback parameter union

Enumerations

enum esp_avrc_features_t
    AVRC feature bit mask.
        Values:
enumerator **ESP_AVRC_FEAT_RCTG**
remote control target

enumerator **ESP_AVRC_FEAT_RCCT**
remote control controller

enumerator **ESP_AVRC_FEAT_VENDOR**
remote control vendor dependent commands

enumerator **ESP_AVRC_FEAT_BROWSE**
use browsing channel

enumerator **ESP_AVRC_FEAT_META_DATA**
remote control metadata transfer command/response

enumerator **ESP_AVRC_FEAT_ADV_CTRL**
remote control advanced control command/response

**enum esp_avrc_feature_flag_t**
AVRC supported features flag retrieved in SDP record.

*Values:*

enumerator **ESP_AVRC_FEAT_FLAG_CAT1**
category 1

enumerator **ESP_AVRC_FEAT_FLAG_CAT2**
category 2

enumerator **ESP_AVRC_FEAT_FLAG_CAT3**
category 3

enumerator **ESP_AVRC_FEAT_FLAG_CAT4**
category 4

enumerator **ESP_AVRC_FEAT_FLAG_BROWSING**
browsing

enumerator **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE_PROP**
Cover Art GetImageProperties

enumerator **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE**
Cover Art GetImage

enumerator **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_LINKED_THUMBNAIL**
Cover Art GetLinkedThumbnail

**enum esp_avrc_pt_cmd_t**
AVRC passthrough command code.

enum **esp_avrc_psth_filter_t**
AVRC passthrough command filter.

**Values:**

denumerator **ESP_AVRC_PSTH_FILTER_ALLOWED_CMD**
all of the PASSTHROUGH commands that can possibly be used, immutable

denumerator **ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD**
PASSTHROUGH commands selectively supported according to the current configuration

denumerator **ESP_AVRC_PSTH_FILTER_SUPPORT_MAX**

enum **esp_avrc_bit_mask_op_t**

**Values:**

denumerator **ESP_AVRC_BIT_MASK_OP_TEST**
operation code to test a specific bit

denumerator **ESP_AVRC_BIT_MASK_OP_SET**
operation code to set a specific bit
enumerator **ESP_AVRC_BIT_MASK_OP_CLEAR**
   operation code to clear a specific bit

**enum esp_avrc_pt_cmd_state_t**
AVRC passthrough command state.
*Values:*

enumerator **ESP_AVRC_PT_CMD_STATE_PRESSED**
key pressed

denumerator **ESP_AVRC_PT_CMD_STATE_RELEASED**
key released

**enum esp_avrc_ct_cb_event_t**
AVRC Controller callback events.
*Values:*

denumerator **ESP_AVRC_CT_CONNECTION_STATE_EVT**
connection state changed event

denumerator **ESP_AVRC_CT_PASSTHROUGH_RSP_EVT**
passthrough response event

denumerator **ESP_AVRC_CT_METADATA_RSP_EVT**
metadata response event

denumerator **ESP_AVRC_CT_PLAY_STATUS_RSP_EVT**
play status response event

denumerator **ESP_AVRC_CT_CHANGE_NOTIFY_EVT**
notification event

denumerator **ESP_AVRC_CT_REMOTE_FEATURES_EVT**
feature of remote device indication event

denumerator **ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT**
supported notification events capability of peer device

denumerator **ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT**
set absolute volume response event

**enum esp_avrc_tg_cb_event_t**
AVRC Target callback events.
*Values:*

denumerator **ESP_AVRC_TG_CONNECTION_STATE_EVT**
connection state changed event
enumerator `ESP_AVRC_TG_REMOTE_FEATURES_EVT`
feature of remote device indication event

enumerator `ESP_AVRC_TG_PASSTHROUGH_CMD_EVT`
passthrough command event

enumerator `ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT`
set absolute volume command from remote device

enumerator `ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT`
register notification event

enumerator `ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT`
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum `esp_avrc_md_attr_mask_t`
AVRC metadata attribute mask.

Values:

enumerator `ESP_AVRC_MD_ATTR_TITLE`
title of the playing track

enumerator `ESP_AVRC_MD_ATTR_ARTIST`
track artist

enumerator `ESP_AVRC_MD_ATTR_ALBUM`
album name

enumerator `ESP_AVRC_MD_ATTR_TRACK_NUM`
track position on the album

enumerator `ESP_AVRC_MD_ATTR_NUM_TRACKS`
number of tracks on the album

enumerator `ESP_AVRC_MD_ATTR_GENRE`
track genre

enumerator `ESP_AVRC_MD_ATTR_PLAYING_TIME`
total album playing time in milliseconds

enum `esp_avrc_rn_event_ids_t`
AVRC event notification ids.

Values:

enumerator `ESP_AVRC_RN_PLAY_STATUS_CHANGE`
track status change, eg. from playing to paused
enumerator **ESP_AVRC_RN_TRACK_CHANGE**
    new track is loaded

enumerator **ESP_AVRC_RN_TRACK_REACHED_END**
    current track reached end

enumerator **ESP_AVRC_RN_TRACK_REACHED_START**
    current track reached start position

enumerator **ESP_AVRC_RN_PLAY_POS_CHANGED**
    track playing position changed

enumerator **ESP_AVRC_RN_BATTERY_STATUS_CHANGE**
    battery status changed

enumerator **ESP_AVRC_RN_SYSTEM_STATUS_CHANGE**
    system status changed

enumerator **ESP_AVRC_RN_APP_SETTING_CHANGE**
    application settings changed

enumerator **ESP_AVRC_RN_NOW_PLAYING_CHANGE**
    now playing content changed

enumerator **ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE**
    available players changed

enumerator **ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE**
    the addressed player changed

enumerator **ESP_AVRC_RN_UIDS_CHANGE**
    UIDs changed

enumerator **ESP_AVRC_RN_VOLUMECHANGE**
    volume changed locally on TG

enumerator **ESP_AVRC_RN_MAX_EVT**

enum **esp_avrc_rn_evt_cap_t**
    AVRC target notification event notification capability.

    **Values:**

    enumerator **ESP_AVRC_RN_CAP_ALLOWED_EVT**
        all of the notification events that can possibly be supported, immutable

    enumerator **ESP_AVRC_RN_CAP_SUPPORTED_EVT**
        notification events selectively supported according to the current configuration
enumerator **ESP_AVRC_RN_CAP_MAX**

**enum esp_avrc_rn_rsp_t**
AVRC notification response type.
**Values:**

enumerator **ESP_AVRC_RN_RSP_INTERIM**
initial response to RegisterNotification, should be sent \( T_{\text{mtp}}(1000\text{ms}) \) from receiving the command

enumerator **ESP_AVRC_RN_RSP_CHANGED**
final response to RegisterNotification command

**enum esp_avrc_ps_attr_ids_t**
AVRC player setting ids.
**Values:**

enumerator **ESP_AVRC_PS_EQUALIZER**
equalizer, on or off

enumerator **ESP_AVRC_PS_REPEAT_MODE**
repeat mode

enumerator **ESP_AVRC_PS_SHUFFLE_MODE**
shuffle mode

enumerator **ESP_AVRC_PS_SCAN_MODE**
scan mode on or off

enumerator **ESP_AVRC_PS_MAX_ATTR**

**enum esp_avrc_ps_eq_value_ids_t**
AVRC equalizer modes.
**Values:**

enumerator **ESP_AVRC_PS_EQUALIZER_OFF**
equalizer OFF

enumerator **ESP_AVRC_PS_EQUALIZER_ON**
equalizer ON

**enum esp_avrc_ps_rpt_value_ids_t**
AVRC repeat modes.
**Values:**

enumerator **ESP_AVRC_PS_REPEAT_OFF**
repeat mode off
enumerator `ESP_AVRC_PS_REPEAT_SINGLE`
  single track repeat

enumerator `ESP_AVRC_PS_REPEAT_GROUP`
  group repeat

enum `esp_avrc_ps_shf_value_ids_t`
  AVRC shuffle modes.
  Values:

enumerator `ESP_AVRC_PS_SHUFFLE_OFF`

enumerator `ESP_AVRC_PS_SHUFFLE_ALL`

enumerator `ESP_AVRC_PS_SHUFFLE_GROUP`

enum `esp_avrc_ps_scn_value_ids_t`
  AVRC scan modes.
  Values:

enumerator `ESP_AVRC_PS_SCAN_OFF`
  scan off

enumerator `ESP_AVRC_PS_SCAN_ALL`
  all tracks scan

enumerator `ESP_AVRC_PS_SCAN_GROUP`
  group scan

enum `esp_avrc_rsp_t`
  AVCTP response codes.
  Values:

enumerator `ESP_AVRC_RSP_NOT_IMPL`
  not implemented

enumerator `ESP_AVRC_RSP_ACCEPT`
  accept

enumerator `ESP_AVRC_RSP_REJECT`
  reject

enumerator `ESP_AVRC_RSP_IN_TRANS`
  in transition

enumerator `ESP_AVRC_RSP_IMPL_STBL`
  implemented/stable
enumerator ESP_AVRC_RSP_CHANGED
   changed

enumerator ESP_AVRC_RSP_INTERIM
   interim

enum esp_avrc_batt_stat_t
AVRCP battery status.
Values:

enumerator ESP_AVRC_BATT_NORMAL
   normal state

enumerator ESP_AVRC_BATT_WARNING
   unable to operate soon

enumerator ESP_AVRC_BATT_CRITICAL
   cannot operate any more

enumerator ESP_AVRC_BATT_EXTERNAL
   plugged to external power supply

enumerator ESP_AVRC_BATT_FULL_CHARGE
   when completely charged from external power supply

enum esp_avrc_playback_stat_t
AVRCP current status of playback.
Values:

enumerator ESP_AVRC_PLAYBACK_STOPPED
   stopped

enumerator ESP_AVRC_PLAYBACK_PLAYING
   playing

enumerator ESP_AVRC_PLAYBACK_PAUSED
   paused

enumerator ESP_AVRC_PLAYBACK_FWD_SEEK
   forward seek

enumerator ESP_AVRC_PLAYBACK_REV_SEEK
   reverse seek

enumerator ESP_AVRC_PLAYBACK_ERROR
   error
Chapter 2. API Reference

SPP API

Application Example Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and recive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File
- components/bluetooth/bluedroid/api/include/api/esp_spp_api.h

Functions

```
esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)
```
This function is called to init callbacks with SPP module.

Parameters
- `callback` - [in] pointer to the init callback function.

Returns
- ESP_OK: success
- other: failed

```
esp_err_t esp_spp_init (esp_spp_mode_t mode)
```
This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Parameters
- `mode` - [in] Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

Returns
- ESP_OK: success
- other: failed

```
esp_err_t esp_spp_deinit (void)
```
This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

Returns
- ESP_OK: success
- other: failed

```
esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)
```
This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters
- `bd_addr` - [in] Remote device bluetooth device address.

Returns
- ESP_OK: success
- other: failed

```
esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)
```
This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().
Parameters

- **role** - [in] Master or slave.
- **remote_scn** - [in] Remote device Bluetooth device SCN.
- **peer_bd_addr** - [in] Remote device Bluetooth device address.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_disconnect (uint32_t handle)
```

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters

- **handle** - [in] The connection handle.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)
```

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters

- **role** - [in] Master or slave.
- **local_scn** - [in] The specific channel you want to get. If channel is 0, means get any channel.
- **name** - [in] Server’s name.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_stop_srv (void)
```

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_stop_srv_scn (uint8_t scn)
```

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters

- **scn** - [in] Server channel number.

Returns

- ESP_OK: success
- other: failed
**esp_err_t esp_spp_write** (uint32_t handle, int len, uint8_t *p_data)

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

**Parameters**
- handle [in] The connection handle.
- len [in] The length of the data written.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_spp_vfs_register** (void)

This function is used to register VFS. For now, SPP only supports write, read and close.

**Returns**
- ESP_OK: success
- other: failed

**Unions**

union esp_spp_cb_param_t

```c
#include <esp_spp_api.h> SPP callback parameters union.
```

**Public Members**

```c
struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
SPP callback param of ESP_SPP_SRV_STOP_EVT
```
struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
    SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
    SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
    SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
    SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
    #include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

    **Public Members**

    esp_spp_status_t status
        status

    uint32_t handle
        The connection handle

    uint8_t sec_id
        security ID used by this server

    bool use_co
        TRUE to use co_rfc_data

struct spp_close_evt_param
    #include <esp_spp_api.h> ESP_SPP_CLOSE_EVT.

`uint32_t handle`
The connection handle
int `len`

The length of the data written.

bool `cong`

Congestion status

**Macros**

**ESP_SPP_SEC_NONE**

No security. relate to BTA_SEC_NONE in bta/bta_api.h

**ESP_SPP_SEC_AUTHORIZE**

Authorization required (only needed for out going connection) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

**ESP_SPP_SEC_AUTHENTICATE**

Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

**ESP_SPP_SEC_ENCRYPT**

Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

**ESP_SPP_SEC_MODE4_LEVEL4**

Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

**ESP_SPP_SEC_MITM**

Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

**ESP_SPP_SEC_IN_16_DIGITS**

Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

**ESP_SPP_MAX_MTU**

SPP max MTU

**ESP_SPP_MAX_SCN**

SPP max SCN

**Type Definitions**

typedef uint16_t `esp_spp_sec_t`

typedef void (*`esp_spp_cb_t`)(`esp_spp_cb_event_t` event, `esp_spp_cb_param_t` *param)

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Param event** Event type

**Param param** Point to callback parameter, currently is union type

**Enumerations**
enum **esp_spp_status_t**

  * Values:

    - enumerator **ESP_SPP_SUCCESS**
      Successful operation.
    - enumerator **ESP_SPP_FAILURE**
      Generic failure.
    - enumerator **ESP_SPP_BUSY**
      Temporarily cannot handle this request.
    - enumerator **ESP_SPP_NO_DATA**
      No data
    - enumerator **ESP_SPP_NO_RESOURCE**
      No more resource
    - enumerator **ESP_SPP_NEED_INIT**
      SPP module shall init first
    - enumerator **ESP_SPP_NEED_DEINIT**
      SPP module shall deinit first
    - enumerator **ESP_SPP_NO_CONNECTION**
      Connection may have been closed
    - enumerator **ESP_SPP_NO_SERVER**
      No SPP server

enum **esp_spp_role_t**

  * Values:

    - enumerator **ESP_SPP_ROLE_MASTER**
      Role: master
    - enumerator **ESP_SPP_ROLE_SLAVE**
      Role: slave

enum **esp_spp_mode_t**

  * Values:

    - enumerator **ESP_SPP_MODE_CB**
      When data is coming, a callback will come with data
    - enumerator **ESP_SPP_MODE_VFS**
      Use VFS to write/read data
enum esp_spp_cb_event_t
    SPP callback function events.

Values:

enumerator ESP_SPP_INIT_EVT
    When SPP is initialized, the event comes

enumerator ESP_SPP_UNINIT_EVT
    When SPP is deinitialized, the event comes

enumerator ESP_SPP_DISCOVERY_COMP_EVT
    When SDP discovery complete, the event comes

enumerator ESP_SPP_OPEN_EVT
    When SPP Client connection open, the event comes

enumerator ESP_SPP_CLOSE_EVT
    When SPP connection closed, the event comes

enumerator ESP_SPP_START_EVT
    When SPP server started, the event comes

enumerator ESP_SPP_CL_INIT_EVT
    When SPP client initiated a connection, the event comes

enumerator ESP_SPP_DATA_IND_EVT
    When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_CONG_EVT
    When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_WRITE_EVT
    When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_SRV_OPEN_EVT
    When SPP Server connection open, the event comes

enumerator ESP_SPP_SRV_STOP_EVT
    When SPP server stopped, the event comes

HFP DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_hf_defs.h
Enumenations

enum esp_hf_in_band_ring_state_t
    in-band ring tone state
    Values:
    
    enumerator ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED
    
    enumerator ESP_HF_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_vr_state_t
    voice recognition state
    Values:
    
    enumerator ESP_HF_VR_STATE_DISABLED
        voice recognition disabled
    
    enumerator ESP_HF_VR_STATE_ENABLED
        voice recognition enabled

enum esp_hf_volume_control_target_t
    Bluetooth HFP audio volume control target.
    Values:
    
    enumerator ESP_HF_VOLUME_CONTROL_TARGET_SPK
        speaker
    
    enumerator ESP_HF_VOLUME_CONTROL_TARGET_MIC
        microphone

enum esp_hf_audio_state_t
    Bluetooth HFP audio connection status.
    Values:
    
    enumerator ESP_HF_AUDIO_STATE_DISCONNECTED
        audio connection released
    
    enumerator ESP_HF_AUDIO_STATE_CONNECTING
        audio connection has been initiated
    
    enumerator ESP_HF_AUDIO_STATE_CONNECTED
        audio connection is established
    
    enumerator ESP_HF_AUDIO_STATE_CONNECTED_MSBC
        mSBC audio connection is established

enum esp_hf_volume_type_t
    Values:
enumerator `ESP_HF_VOLUME_TYPE_SPK`

denumerator `ESP_HF_VOLUME_TYPE_MIC`

enum `esp_hf_network_state_t`
  +CIND network service availability status
  
  Values:

  enumerator `ESP_HF_NETWORK_STATE_NOT_AVAILABLE`

  enumerator `ESP_HF_NETWORK_STATE_AVAILABLE`

enum `esp_hf_service_type_t`
  +CIEV Service type
  
  Values:

  enumerator `ESP_HF_SERVICE_TYPE_HOME`

  enumerator `ESP_HF_SERVICE_TYPE_ROAMING`

enum `esp_hf_call_status_t`
  +CIND call status indicator values
  
  Values:

  enumerator `ESP_HF_CALL_STATUS_NO_CALLS`
  no call in progress

  enumerator `ESP_HF_CALL_STATUS_CALL_IN_PROGRESS`
  call is present (active or held)

enum `esp_hf_call_setup_status_t`
  +CIND call setup status indicator values
  
  Values:

  enumerator `ESP_HF_CALL_SETUP_STATUS_IDLE`
  no call setup in progress

  enumerator `ESP_HF_CALL_SETUP_STATUS_INCOMING`
  incoming call setup in progress

  enumerator `ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING`
  outgoing call setup in dialing state

  enumerator `ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING`
  outgoing call setup in alerting state
enum esp_hf_roaming_status_t

+ CIND roaming status indicator values

Values:

enumerator ESP_HF_ROAMING_STATUS_INACTIVE
roaming is not active

enumerator ESP_HF_ROAMING_STATUS_ACTIVE
a roaming is active

enum esp_hf_call_held_status_t

+ CIND call held indicator values

Values:

enumerator ESP_HF_CALL_HELD_STATUS_NONE
no calls held

enumerator ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE
both active and held call

enumerator ESP_HF_CALL_HELD_STATUS_HELD
call on hold, no active call

enum esp_hf_current_call_status_t

+ CLCC status of the call

Values:

enumerator ESP_HF_CURRENT_CALL_STATUS_ACTIVE
active

enumerator ESP_HF_CURRENT_CALL_STATUS_HELD
held

enumerator ESP_HF_CURRENT_CALL_STATUS_DIALING
dialing (outgoing calls only)

enumerator ESP_HF_CURRENT_CALL_STATUS_ALERTING
alerting (outgoing calls only)

enumerator ESP_HF_CURRENT_CALL_STATUS_INCOMING
incoming (incoming calls only)

enumerator ESP_HF_CURRENT_CALL_STATUS_WAITING
waiting (incoming calls only)

enumerator ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD
call held by response and hold
enum esp_hf_current_call_direction_t
+CLCC direction of the call

Values:

enumerator ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING outgoing

enumerator ESP_HF_CURRENT_CALL_DIRECTION_INCOMING incoming

enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag

Values:

enumerator ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE not a member of a multi-party call

enumerator ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI member of a multi-party call

enum esp_hf_current_call_mode_t
+CLCC call mode

Values:

enumerator ESP_HF_CURRENT_CALL_MODE_VOICE

enumerator ESP_HF_CURRENT_CALL_MODE_DATA

enumerator ESP_HF_CURRENT_CALL_MODE_FAX

enum esp_hf_call_addr_type_t
+CLCC address type

Values:

enumerator ESP_HF_CALL_ADDR_TYPE_UNKNOWN unknown address type

enumerator ESP_HF_CALL_ADDR_TYPEINTERNATIONAL international address

enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number

Values:

enumerator ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN unknown
enumerator `ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE`
voice service

enumerator `ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX`
fax service

enum `esp_hf_btrh_status_t`
+BTRH response and hold result code
Values:

enumerator `ESP_HF_BTRH_STATUS_HELD`
ingoing call is put on held in AG

enumerator `ESP_HF_BTRH_STATUS_ACCEPTED`
held incoming call is accepted in AG

enumerator `ESP_HF_BTRH_STATUS_REJECTED`
held incoming call is rejected in AG

enum `esp_hf_btrh_cmd_t`
AT+BTRH response and hold action code.
Values:

enumerator `ESP_HF_BTRH_CMD_HOLD`
put the incoming call on hold

enumerator `ESP_HF_BTRH_CMD_ACCEPT`
accept a held incoming call

enumerator `ESP_HF_BTRH_CMD_REJECT`
reject a held incoming call

enum `esp_hf_nrec_t`
Values:

enumerator `ESP_HF_NREC_STOP`

enumerator `ESP_HF_NREC_START`

enum `esp_hf_call_waiting_status_t`
+CCWA response status
Values:

enumerator `ESP_HF_CALL_WAITING_INACTIVE`

enumerator `ESP_HF_CALL_WAITING_ACTIVE`
enum `esp_hf_wbs_config_t`

Values:

- enumerator `ESP_HF_WBS_NONE`
- enumerator `ESP_HF_WBS_NO`
- enumerator `ESP_HF_WBS_YES`

enum `esp_hf_connection_state_t`

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

- enumerator `ESP_HF_CONNECTION_STATE_DISCONNECTED`
  RFCOMM data link channel released
- enumerator `ESP_HF_CONNECTION_STATE_CONNECTING`
  connecting remote device on the RFCOMM data link
- enumerator `ESP_HF_CONNECTION_STATE_CONNECTED`
  RFCOMM connection established
- enumerator `ESP_HF_CONNECTION_STATE_SLC_CONNECTED`
  service level connection established
- enumerator `ESP_HF_CONNECTION_STATE_DISCONNECTING`
  disconnecting with remote device on the RFCOMM data link

enum `esp_hf_chld_type_t`

AT+CHLD command values.

Values:

- enumerator `ESP_HF_CHLD_TYPE_REL`
  `<0>`, Terminate all held or set UDUB (“busy”) to a waiting call
- enumerator `ESP_HF_CHLD_TYPE_REL_ACC`
  `<1>`, Terminate all active calls and accepts a waiting/held call
- enumerator `ESP_HF_CHLD_TYPE_HOLD_ACC`
  `<2>`, Hold all active calls and accepts a waiting/held call
- enumerator `ESP_HF_CHLD_TYPE_MERGE`
  `<3>`, Add all held calls to a conference
- enumerator `ESP_HF_CHLD_TYPE_MERGE_DETACH`
  `<4>`, connect the two calls and disconnects the subscriber from both calls
enumerator **ESP_HF_CHLD_TYPE_REL_X**
<1x>, releases specified calls only

enumerator **ESP_HF_CHLD_TYPE_PRIV_X**
<2x>, request private consultation mode with specified call

enum **esp_hf_at_response_code_t**

Values:

enumerator **ESP_HF_AT_RESPONSE_CODE_OK**
acknowledges execution of a command line

enumerator **ESP_HF_AT_RESPONSE_CODE_ERR**
command not accepted

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_CARRIER**
connection terminated

enumerator **ESP_HF_AT_RESPONSE_CODE_BUSY**
busy signal detected

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_ANSWER**
connection completion timeout

enumerator **ESP_HF_AT_RESPONSE_CODE_DELAYED**
delayed

enumerator **ESP_HF_AT_RESPONSE_CODE_BLACKLISTED**
blacklisted

enumerator **ESP_HF_AT_RESPONSE_CODE_CME**
CME error

enum **esp_hf_at_response_t**

Values:

enumerator **ESP_HF_AT_RESPONSE_ERROR**

enumerator **ESP_HF_AT_RESPONSE_OK**

enum **esp_hf_cme_err_t**

Extended Audio Gateway Error Result Code Response.

Values:

enumerator **ESP_HF_CME_AG_FAILURE**
ag failure
enumerator ESP_HF_CME_NO_CONNECTION_TO_PHONE
    no connection to phone

enumerator ESP_HF_CME_OPERATION_NOT_ALLOWED
    operation not allowed

enumerator ESP_HF_CME_OPERATION_NOT_SUPPORTED
    operation not supported

enumerator ESP_HF_CME_PH_SIM_PIN_REQUIRED
    PH-SIM PIN Required

enumerator ESP_HF_CME_SIM_NOT_INSERTED
    SIM not inserted

enumerator ESP_HF_CME_SIM_PIN_REQUIRED
    SIM PIN required

enumerator ESP_HF_CME_SIM_PUK_REQUIRED
    SIM PUK required

enumerator ESP_HF_CME_SIM_FAILURE
    SIM failure

enumerator ESP_HF_CME_SIM_BUSY
    SIM busy

enumerator ESP_HF_CME_INCORRECT_PASSWORD
    incorrect password

enumerator ESP_HF_CME_SIM_PIN2_REQUIRED
    SIM PIN2 required

enumerator ESP_HF_CME_SIM_PUK2_REQUIRED
    SIM PUK2 required

enumerator ESP_HF_CME_MEMORY_FULL
    memory full

enumerator ESP_HF_CME_INVALID_INDEX
    invalid index

enumerator ESP_HF_CME_MEMORY_FAILURE
    memory failure

enumerator ESP_HF_CME_TEXT_STRING_TOO_LONG
    test string too long
enumerator ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING
invalid characters in text string

enumerator ESP_HF_CME_DIAL_STRING_TOO_LONG
dial string too long

enumerator ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING
invalid characters in dial string

enumerator ESP_HF_CME_NO_NETWORK_SERVICE
no network service

enumerator ESP_HF_CME_NETWORK_TIMEOUT
network timeout

enumerator ESP_HF_CME_NETWORK_NOT_ALLOWED
network not allowed & #8212; emergency calls only

HFP CLIENT API

API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h

Functions

esp_err_t esp_hf_client_register_callback (esp_hf_client_cb_t callback)
Register application callback function to HFP client module. This function should be called only after
esp_bluedroid_enable() completes successfully.

Parameters callback — [in] HFP client event callback function

Returns
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t esp_hf_client_init (void)
Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

Returns
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_deinit (void)
De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Returns
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
Chapter 2. API Reference

`esp_err_t esp_hf_client_connect(esp_bd_addr_t remote_bda)`

Establish a Service Level Connection to remote Bluetooth HFP audio gateway (AG) device. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

**Parameters**
- `remote_bda` - [in] remote Bluetooth device address

**Returns**
- ESP_OK: Connection request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_disconnect(esp_bd_addr_t remote_bda)`

Disconnect from the remote HFP audio gateway. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

**Parameters**
- `remote_bda` - [in] remote Bluetooth device address

**Returns**
- ESP_OK: Disconnect request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_connect_audio(esp_bd_addr_t remote_bda)`

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
- `remote_bda` - [in] remote Bluetooth device address

**Returns**
- ESP_OK: Disconnect request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)`

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
- `remote_bda` - [in] remote Bluetooth device address

**Returns**
- ESP_OK: Disconnect request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_start_voice_recognition(void)`

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: Disconnect request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_stop_voice_recognition(void)`

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: Disconnect request is sent to lower layer
- ESP_INVALID_STATE: Bluetooth stack is not yet enabled
- ESP_FAIL: Others

`esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)`

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
• **type**  [in] volume control target, speaker or microphone  
• **volume**  [in] gain of the speaker of microphone, ranges 0 to 15

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_dial (const char *number)
```

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- **number**  [in] number string of the call. If NULL, the last number is called (aka re-dial)

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_dial_memory (int location)
```

Place a call with number specified by location(speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- **location**  [in] location of the number in the memory

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_chld_cmd (esp_hf_chld_type_t chld, int idx)
```

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- **chld**  [in] AT+CHLD call hold and multiparty handling AT command.  
- **idx**  [in] used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)
```

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- **btrh**  [in] response and hold action to send

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_answer_call (void)
```

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**

• ESP_OK: disconnect request is sent to lower layer  
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_reject_call (void)
```

Reject an incoming call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.
Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_calls(void)`

Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_operator_name(void)`

Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_retrieve_subscriber_info(void)`

Get subscriber information number from AG (send AT+CNUM command). As a precondition to use this API, Service Level Connection shall exist with AG.

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_dtmf(char code)`

Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters

- `code` - [in] DTMF code, single ASCII character in the set 0-9, #, *, A-D

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_xapl(char* information, uint32_t features)`

Send command to enable Vendor specific feature to indicate battery level and docker status. This is Apple-specific commands, but used by most devices, including Android and Windows.

Parameters

- `information` - [in] XAPL vendorID-productID-version, such as "0505-1995-0610"
- `features` - [in] A base-10 representation of a bit field, such as ESP_HF_CLIENT_XAPL_FEAT_BATTERY_REPORT

Returns

- ESP_OK: Feature enable request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_iphoneaccev(uint32_t bat_level, bool docked)`

Send Battery level and docker status. Enable this feature using XAPL command first. This is Apple-specific commands, but used by most device, including Android and Windows.

Parameters
Chapter 2. API Reference

- **bat_level** – [in] Battery Level: value between 0 and 9
- **docked** – [in] Dock State: false = undocked, true = docked

**Returns**
- ESP_OK: battery level is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_request_last_voice_tag_number (void)
```

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_nrec (void)
```

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
```

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Parameters**
- **recv** – [in] HFP client incoming data callback function
- **send** – [in] HFP client outgoing data callback function

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
void esp_hf_client_outgoing_data_ready (void)
```

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

```c
void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)
```

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- **src_sps** – [in] original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- **bits** – [in] number of bits per pcm sample (16)
- **channels** – [in] number of channels (i.e. mono(1), stereo(2)…)

```c
void esp_hf_client_pcm_resample_deinit (void)
```

Deinitialize the down sampling converter.

```c
int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)
```

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- **src** – [in] pointer to the buffer where the original sampling PCM are stored
**Chapter 2. API Reference**

- **in_bytes** [in] length of the input PCM sample buffer in byte
- **dst** [in] pointer to the buffer which is to be used to store the converted PCM samples

**Returns** number of samples converted

**Unions**

union *esp_hf_client_cb_param_t*

```c
#include <esp_hf_client_api.h>
```

HFP client callback parameters.

**Public Members**

```c
struct esp_hf_client_cb_param_t::hf_client_conn_stat_param conn_stat
```

HF callback param of ESP_HF_CLIENT_CONNECTION_STATE_EVT

```c
struct esp_hf_client_cb_param_t::hf_client_audio_stat_param audio_stat
```

HF callback param of ESP_HF_CLIENT_AUDIO_STATE_EVT

```c

Chapter 2. API Reference

Public Members

int value
battery charge value, ranges from 0 to 5

struct hf_client_binp_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BINP_EVT.

Public Members

const char *number
phone number corresponding to the last voice tag in the HF

struct hf_client_bsirparam
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BSIR_EVT.

Public Members

esp_hf_client_in_band_ring_state_t state
setting state of in-band ring tone

struct hf_client_btrh_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BTRH_EVT.

Public Members

esp_hf_btrh_status_t status
call hold and response status result code

struct hf_client_bvra_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BVRA_EVT.

Public Members

esp_hf_vr_state_t value
voice recognition state

struct hf_client_call_held_ind_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_HELD_EVT.

Public Members

esp_hf_call_held_status_t status
bluetooth proprietary call hold status indicator
struct hf_client_call_ind_param

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

Param buf [in] : pointer to incoming data (payload of HCI synchronous data packet), the buffer
is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
finished.

Param len [in] : size (in bytes) in buf

typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio
connection is set up and the application layer has prepared data to send, the lower layer will call this function
to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not
enough, return value 0 is supposed.

Param buf [in] : pointer to incoming data (payload of HCI synchronous data packet), the buffer
is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
finished.

Param len [in] : size (in bytes) in buf

Return length of data successfully read

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
HFP client callback function type.

Param event : Event type

Param param : Pointer to callback parameter

Enumerations

enum esp_hf_client_connection_state_t
Bluetooth HFP RFCOMM connection and service level connection status.

Values:

enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED
RFCOMM data link channel released

enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED
RFCOMM connection established

enumerator ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED
service level connection established

enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM dat link

enum esp_hf_client_audio_state_t
Bluetooth HFP audio connection status.

Values:
enumerator **ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED**
  audio connection released

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTING**
  audio connection has been initiated

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED**
  audio connection is established

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC**
  mSBC audio connection is established

enum **esp hf client in band ring state t**
  in-band ring tone state
  
  *Values:*

  enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED**
  
  enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED**

enum **esp hf client cb event t**
  HF CLIENT callback events.
  
  *Values:*

  enumerator **ESP_HF_CLIENT_CONNECTION_STATE_EVT**
  connection state changed event

  enumerator **ESP_HF_CLIENT_AUDIO_STATE_EVT**
  audio connection state change event

  enumerator **ESP_HF_CLIENT_BVRA_EVT**
  voice recognition state change event

  enumerator **ESP_HF_CLIENT_CIND_CALL_EVT**
  call indication

  enumerator **ESP_HF_CLIENT_CIND_CALL_SETUP_EVT**
  call setup indication

  enumerator **ESP_HF_CLIENT_CIND_CALL_HELD_EVT**
  call held indication

  enumerator **ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT**
  network service availability indication

  enumerator **ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT**
  signal strength indication
enumerator ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
   roaming status indication

enumerator ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
   battery level indication

enumerator ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
   current operator information

enumerator ESP_HF_CLIENT_BTRH_EVT
   call response and hold event

enumerator ESP_HF_CLIENT_CLIP_EVT
   Calling Line Identification notification

enumerator ESP_HF_CLIENT_CCWA_EVT
   call waiting notification

enumerator ESP_HF_CLIENT_CLCC_EVT
   list of current calls notification

enumerator ESP_HF_CLIENT_VOLUME_CONTROL_EVT
   audio volume control command from AG, provided by +VGM or +VGS message

enumerator ESP_HF_CLIENT_AT_RESPONSE_EVT
   AT command response event

enumerator ESP_HF_CLIENT_CNUM_EVT
   subscriber information response from AG

enumerator ESP_HF_CLIENT_BSIR_EVT
   setting of in-band ring tone

enumerator ESP_HF_CLIENT_BINP_EVT
   requested number of last voice tag from AG

enumerator ESP_HF_CLIENT_RING_IND_EVT
   ring indication event

HFP AG API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h
Functions

*esp_err_t esp_hf_ag_register_callback (esp_hf_cb_t callback)*

Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Parameters callback – [in] HFP AG event callback function

Returns

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

*esp_err_t esp_hf_ag_init (void)*

Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_deinit (void)*

De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_slc_connect (esp_bd_addr_t remote_bda)*

To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

Parameters remote_bda – [in] remote bluetooth HFP client device address

Returns

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_slc_disconnect (esp_bd_addr_t remote_bda)*

Disconnect from the remote HFP client. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

Parameters remote_bda – [in] remote bluetooth device address

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_audio_connect (esp_bd_addr_t remote_bda)*

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters remote_bda – [in] remote bluetooth device address

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_audio_disconnect (esp_bd_addr_t remote_bda)*

Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters remote_bda – [in] remote bluetooth device address
Chapter 2. API Reference

Returns

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_ag_vra_control (esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)

Response of Volume Recognition Command (AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

• remote_bda - [in] the device address of voice recognition initiator
• value - [in] 0 - voice recognition disabled, 1 - voice recognition enabled

Returns

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_ag_volume_control (esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

• remote_bda - [in] remote bluetooth device address
• type - [in] volume control target, speaker or microphone
• volume - [in] gain of the speaker of microphone, ranges 0 to 15

Returns

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_ag_unknown_at_send (esp_bd_addr_t remote_addr, char* unat)

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

• remote_addr - [in] remote bluetooth device address
• unat - [in] User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

Returns

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_ag_cmee_send (esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

• remote_bda - [in] remote bluetooth device address
• response_code - [in] AT command response code
• error_code - [in] CME error code

Returns

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_ag_devices_status_indchange (esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)
Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- remote_addr - [in] remote bluetooth device address
- call_state - [in] call state
- call_setup_state - [in] call setup state
- ntk_state - [in] network service state
- signal - [in] signal strength from 0 to 5

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cind_response (esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state,
                                     esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state,
                                     int signal, esp_hf_roaming_status_t roam, int batt_lev,
                                     esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- remote_addr - [in] remote bluetooth device address
- call_state - [in] call state
- call_setup_state - [in] call setup state
- ntk_state - [in] network service state
- signal - [in] signal strength from 0 to 5
- roam - [in] roam state
- batt_lev - [in] battery level from 0 to 5
- call_held_status - [in] call held status

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cops_response (esp_bd_addr_t remote_addr, char *name)
```

Response for AT+COPS command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- remote_addr - [in] remote bluetooth device address
- name - [in] current operator name

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_clcc_response (esp_bd_addr_t remote_addr, int index,
                                    esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state,
                                    esp_hf_current_call_mode_t mode,
                                    esp_hf_current_call_mpty_type_t mpty, char *number,
                                    esp_hf_call_addr_type_t type)
```

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- remote_addr - [in] remote bluetooth device address
- index - [in] the index of current call
- dir - [in] call direction (incoming/outgoing)
- current_call_state - [in] current call state
- **mode** [in] current call mode (voice/data/fax)
- **mpty** [in] single or multi type
- **number** [in] current call number
- **type** [in] international type or unknown

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cnum_response(esp_bd_addr_t remote_addr, char*number,
                   esp_hf_subscriber_service_type_t type)
```

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** [in] remote bluetooth device address
- **number** [in] registration number
- **type** [in] service type (unknown/voice/fax)

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag BSIR(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)
```

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** [in] remote bluetooth device address
- **state** [in] in-band ring tone state

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_answer_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                         esp_hf_call_status_t call_state,
                         esp_hf_call_setup_status_t call_setup_state, char *number,
                         esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** [in] remote bluetooth device address
- **num_active** [in] the number of active call
- **num_held** [in] the number of held call
- **call_state** [in] call state
- **call_setup_state** [in] call setup state
- **number** [in] number of the incoming call
- **call_addr_type** [in] call address type

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_reject_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                         esp_hf_call_status_t call_state,
                         esp_hf_call_setup_status_t call_setup_state, char *number,
                         esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.
Parameters

- `remote_addr` [in] remote bluetooth device address
- `num_active` [in] the number of active call
- `num_held` [in] the number of held call
- `call_state` [in] call state
- `call_setup_state` [in] call setup state
- `number` [in] number of the incoming call
- `call_addr_type` [in] call address type

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_out_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                              esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                              char *number, esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- `remote_addr` [in] remote bluetooth device address
- `num_active` [in] the number of active call
- `num_held` [in] the number of held call
- `call_state` [in] call state
- `call_setup_state` [in] call setup state
- `number` [in] number of the outgoing call
- `call_addr_type` [in] call address type

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_end_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                              esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                              char *number, esp_hf_call_addr_type_t call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- `remote_addr` [in] remote bluetooth device address
- `num_active` [in] the number of active call
- `num_held` [in] the number of held call
- `call_state` [in] call state
- `call_setup_state` [in] call setup state
- `number` [in] number of the call
- `call_addr_type` [in] call address type

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_register_data_callback (esp_hf_incoming_data_cb_t recv,
                                          esp_hf_outgoing_data_cb_t send)
```

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

Parameters

- `recv` [in] HFP client incoming data callback function
- `send` [in] HFP client outgoing data callback function

Returns

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
void esp_hf_ag_outgoing_data_ready (void)

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled.
As a precondition to use this API, Service Level Connection shall exist with HFP client.
After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data

**Type Definitions**

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)

AG incoming data callback function, the callback is useful in case of Voice Over HCI.

- **Param buf** [in]: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len** [in]: size(in bytes) in buf

typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

- **Param buf** [in]: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len** [in]: size(in bytes) in buf
- **Return** length of data successfully read
typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)

HF AG callback function type.

**Param event** : Event type
**Param param** : Pointer to callback parameter

### Enumerations

enum esp_hf_cb_event_t

HF callback events.

**Values:**

- enumerator ESP_HF_CONNECTION_STATE_EVT
  - Connection state changed event
- enumerator ESP_HF_AUDIO_STATE_EVT
  - Audio connection state change event
- enumerator ESP_HF_BVRA_RESPONSE_EVT
  - Voice recognition state change event
- enumerator ESP_HF_VOLUME_CONTROL_EVT
  - Audio volume control command from HF Client, provided by +VGM or +VGS message
- enumerator ESP_HF_UNAT_RESPONSE_EVT
  - Unknown AT cmd Response
- enumerator ESP_HF_IND_UPDATE_EVT
  - Indicator Update Event
- enumerator ESP_HF_CIND_RESPONSE_EVT
  - Call And Device Indicator Response
- enumerator ESP_HF_COPS_RESPONSE_EVT
  - Current operator information
- enumerator ESP_HF_CLCC_RESPONSE_EVT
  - List of current calls notification
- enumerator ESP_HF_CNUM_RESPONSE_EVT
  - Subscriber information response from HF Client
- enumerator ESP_HF_VTS_RESPONSE_EVT
  - Enable or not DTMF
- enumerator ESP_HF_NREC_RESPONSE_EVT
  - Enable or not NREC
- enumerator ESP_HF_ATA_RESPONSE_EVT
  - Answer an Incoming Call
enumerator ESP_HF_CHUP_RESPONSE_EVT
    Reject an Incoming Call

enumerator ESP_HF_DIAL_EVT
    Origin an outgoing call with specific number or the dial the last number

enumerator ESP_HF_WBS_RESPONSE_EVT
    Codec Status

enumerator ESP_HF_BCS_RESPONSE_EVT
    Final Codec Choice

Bluetooth HID Device API

Overview A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

Application Example Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - bluetooth/bluedroid/classic_bt.bt_hid_mouse_device

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_hidd_api.h

Functions

`esp_err_t esp_bt_hid_device_register_callback (esp_hd_cb_t callback)`
This function is called to init callbacks with HID device module.

Parameters callback – [in] pointer to the init callback function.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_bt_hid_device_init (void)`
This function initializes HIDD. This function should be called after esp_bluedroid_enable and esp_bluedroid_init success, and should be called after esp_bt_hid_device_register_callback. When the operation is complete the callback function will be called with ESP_HIDD_INIT_EVT.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_bt_hid_device_deinit (void)`
This function de-initializes HIDD interface. This function should be called after esp_bluedroid_enable() and esp_bluedroid_init() success, and should be called after esp_bt_hid_device_init(). When the operation is complete the callback function will be called with ESP_HIDD_DEINIT_EVT.

Returns - ESP_OK: success
**esp_err_t** esp_bt_hid_device_register_app (**esp_hidd_app_param_t** *app_param,**
**esp_hidd_qos_param_t** *in_qos,** esp_hidd_qos_param_t** *out_qos**)

Registers HIDD parameters with SDP and sets L2cap Quality of Service. This function should be called after
esp_bluedroid_enable and esp_bluedroid_init success, and must be done after esp_bt_hid_device_init. When
the operation is complete the callback function will be called with ESP_HIDD_REGISTER_APP_EVT.

**Parameters**
- **app_param** – [in] HIDD parameters
- **in_qos** – [in] incoming QoS parameters
- **out_qos** – [in] outgoing QoS parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** esp_bt_hid_device_unregister_app (**void**)

Removes HIDD parameters from SDP and resets L2cap Quality of Service. This function should be
called after esp_bluedroid_enable and esp_bluedroid_init success, and should be called after
esp_bt_hid_device_init. When the operation is complete the callback function will be called with
ESP_HIDD_UNREGISTER_APP_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** esp_bt_hid_device_connect (**esp_bd_addr_t** bd_addr**
**)

This function connects HIDD interface to connected Bluetooth device, if not done already. When the operation
is complete the callback function will be called with ESP_HIDD_OPEN_EVT.

**Parameters**
- **bd_addr** – [in] Remote host Bluetooth device address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** esp_bt_hid_device_disconnect (**void**)

This function disconnects HIDD interface. When the operation is complete the callback function will be called with
ESP_HIDD_CLOSE_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** esp_bt_hid_device_send_report (**esp_hidd_report_type_t** type,**
**uint8_t** *id,** uint16_t** len,**
**uint8_t** *data**)

Send HIDD report. When the operation is complete the callback function will be called with
ESP_HIDD_SEND_REPORT_EVT.

**Parameters**
- **type** – [in] type of report
- **id** – [in] report id as defined by descriptor
- **len** – [in] length of report
- **data** – [in] report data

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** esp_bt_hid_device_report_error (**esp_hidd_handshake_error_t** error**
**)

Sends HIDD handshake with error info for invalid set_report. When the operation is complete the callback
function will be called with ESP_HIDD_REPORT_ERR_EVT.

**Parameters**
- **error** – [in] type of error

**Returns**
- ESP_OK: success
- other: failed
esp_err_t esp_bt_hid_device_virtual_cable_unplug(void)

Unplug virtual cable of HIDD. When the operation is complete the callback function will be called with
ESP_HIDD_VC_UNPLUG_EVT.

Returns - ESP_OK: success
• other: failed

Unions

union esp_hidd_cb_param_t

#include <esp_hidd_api.h> HID device callback parameters union.

Public Members

struct esp_hidd_cb_param_t::hidd_init_evt_param init
HIDD callback param of ESP_HIDD_INIT_EVT

struct esp_hidd_cb_param_t::hidd_deinit_evt_param deinit
HIDD callback param of ESP_HIDD_DEINIT_EVT

struct esp_hidd_cb_param_t::hidd_register_app_evt_param register_app
HIDD callback param of ESP_HIDDREGISTER_APP_EVT

struct esp_hidd_cb_param_t::hidd_unregister_app_evt_param unregister_app
HIDD callback param of ESP_HIDDUNREGISTER_APP_EVT

struct esp_hidd_cb_param_t::hidd_open_evt_param open
HIDD callback param of ESP_HIDD_OPEN_EVT

struct esp_hidd_cb_param_t::hidd_close_evt_param close
HIDD callback param of ESP_HIDD_CLOSE_EVT

struct esp_hidd_cb_param_t::hidd_send_report_evt_param send_report
HIDD callback param of ESP_HIDD_SEND_REPORT_EVT

size in bytes of HID descriptor list
```

```c
struct esp_hidd_qos_param_t
HIDD Quality of Service parameters negotiated over L2CAP.
```

**Public Members**
uint8_t service_type
the level of service, 0 indicates no traffic

uint32_t token_rate
token rate in bytes per second, 0 indicates “don’t care”

uint32_t token_bucket_size
limit on the burstness of the application data

uint32_t peak_bandwidth
bytes per second, value 0 indicates “don’t care”

uint32_t access_latency
maximum acceptable delay in microseconds

uint32_t delay_variation
the difference in microseconds between the max and min delay

Macros

ESP_HID_CLASS_UNKNOWN
subclass of hid device
unknown HID device subclass

ESP_HID_CLASS_JOS
joystick

ESP_HID_CLASS_GPD
game pad

ESP_HID_CLASS_RMC
remote control

ESP_HID_CLASS_SED
sensing device

ESP_HID_CLASS_DGT
digitizer tablet

ESP_HID_CLASS_CDR
card reader

ESP_HID_CLASS_KBD
keyboard

ESP_HID_CLASS_MIC
pointing device

ESP_HID_CLASS_COM
combo keyboard/pointing
Type Definitions

typedef void (*esp_hd_cb_t)(esp_hidd_cb_event_t event, esp_hidd_cb_param_t *param)
          HID device callback function type.
          Param event  Event type
          Param param  Point to callback parameter, currently is union type

Enumerations

enum esp_hidd_handshake_error_t
          HIDD handshake result code.
          Values:

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_SUCCESS
                      successful

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_NOT_READY
                      not ready, device is too busy to accept data

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_REP_ID
                      invalid report ID

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNSUPPORTED_REQ
                      device does not support the request

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_PARAM
                      parameter value is out of range or inappropriate

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNKNOWN
                      device could not identify the error condition

          enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_FATAL
                      restart is essential to resume functionality

enum esp_hidd_report_type_t
          HIDD report types.
          Values:

          enumerator ESP_HIDD_REPORT_TYPE_OTHER
                      unknown report type

          enumerator ESP_HIDD_REPORT_TYPE_INPUT
                      input report

          enumerator ESP_HIDD_REPORT_TYPE_OUTPUT
                      output report

          enumerator ESP_HIDD_REPORT_TYPE_FEATURE
                      feature report
enumerator **ESP_HIDD_REPORT_TYPE_INTRDATA**
   special value for reports to be sent on interrupt channel, INPUT is assumed

enum **esp_hidd_connection_state_t**
   HIDD connection state.
   **Values:**

   enumerator **ESP_HIDD_CONN_STATE_CONNECTED**
      HID connection established

   enumerator **ESP_HIDD_CONN_STATE_CONNECTING**
      connection to remote Bluetooth device

   enumerator **ESP_HIDD_CONN_STATE_DISCONNECTED**
      connection released

   enumerator **ESP_HIDD_CONN_STATE_DISCONNECTING**
      disconnecting to remote Bluetooth device

   enumerator **ESP_HIDD_CONN_STATE_UNKNOWN**
      unknown connection state

enum **esp_hidd_protocol_mode_t**
   HID device protocol modes.
   **Values:**

   enumerator **ESP_HIDD_REPORT_MODE**
      Report Protocol Mode

   enumerator **ESP_HIDD_BOOT_MODE**
      Boot Protocol Mode

   enumerator **ESP_HIDD_UNSUPPORTED_MODE**
      unsupported

enum **esp_hidd_boot_report_id_t**
   HID Boot Protocol report IDs.
   **Values:**

   enumerator **ESP_HIDD_BOOT_REPORT_ID_KEYBOARD**
      report ID of Boot Protocol keyboard report

   enumerator **ESP_HIDD_BOOT_REPORT_ID_MOUSE**
      report ID of Boot Protocol mouse report

enum [anonymous]
   HID Boot Protocol report size including report ID.
   **Values:**
enumerator ESP_HIDD_BOOT_REPORT_SIZE_KEYBOARD
    report size of Boot Protocol keyboard report

enumerator ESP_HIDD_BOOT_REPORT_SIZE_MOUSE
    report size of Boot Protocol mouse report

data type esp_hidd_cb_event_t
    HID device callback function events.
    Values:

enumerator ESP_HIDD_INIT_EVT
    When HID device is initialized, the event comes

enumerator ESP_HIDD_DEINIT_EVT
    When HID device is deinitialized, the event comes

enumerator ESP_HIDD_REGISTER_APP_EVT
    When HID device application registered, the event comes

enumerator ESP_HIDD_UNREGISTER_APP_EVT
    When HID device application unregistered, the event comes

enumerator ESP_HIDD_OPEN_EVT
    When HID device connection to host opened, the event comes

enumerator ESP_HIDD_CLOSE_EVT
    When HID device connection to host closed, the event comes

enumerator ESP_HIDD_SEND_REPORT_EVT
    When HID device send report to lower layer, the event comes

enumerator ESP_HIDD_REPORT_ERR_EVT
    When HID device report handshaking error to lower layer, the event comes

enumerator ESP_HIDD_GET_REPORT_EVT
    When HID device receives GET REPORT request from host, the event comes

enumerator ESP_HIDD_SET_REPORT_EVT
    When HID device receives SET REPORT request from host, the event comes

enumerator ESP_HIDD_SET_PROTOCOL_EVT
    When HID device receives SET_PROTOCOL request from host, the event comes

enumerator ESP_HIDD_INTR_DATA_EVT
    When HID device receives DATA from host on interrupt, the event comes

enumerator ESP_HIDD_VC_UNPLUG_EVT
    When HID device initiates Virtual Cable Unplug, the event comes
enumerator ESP_HIDD_API_ERR_EVT
   When HID device has API error, the event comes

enum esp_hid_status_t
   Values:

   enumerator ESP_HIDD_SUCCESS

   enumerator ESP_HIDD_ERROR
   general ESP HD error

   enumerator ESP_HIDD_NO_RES
   out of system resources

   enumerator ESP_HIDD_BUSY
   Temporarily can not handle this request.

   enumerator ESP_HIDD_NO_DATA
   No data.

   enumerator ESP_HIDD_NEED_INIT
   HIDD module shall init first

   enumerator ESP_HIDD_NEED_DEINIT
   HIDD module shall deinit first

   enumerator ESP_HIDD_NEED_REG
   HIDD module shall register first

   enumerator ESP_HIDD_NEED_DEREG
   HIDD module shall deregister first

   enumerator ESP_HIDD_NO_CONNECTION
   connection may have been closed

Classic Bluetooth L2CAP API

Application Example   Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:
   • This is a BT_L2CAP demo. This demo can connect, send and receive L2CAP data bluetooth/bluedroid/classic_bt/bt_l2cap_client, bluetooth/bluedroid/classic_bt/bt_l2cap_server

Chapter 2. API Reference

Functions

esp_err_t esp_bt_l2cap_register_callback (esp_bt_l2cap_cb_t callback)
This function is called to init callbacks with L2CAP module.

Parameters
  callback - [in] pointer to the init callback function.

Returns
  • ESP_OK: success
  • other: failed

esp_err_t esp_bt_l2cap_init (void)
This function is called to init L2CAP module. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Returns
  • ESP_OK: success
  • other: failed

esp_err_t esp_bt_l2cap_deinit (void)
This function is called to uninit l2cap module. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_UNINIT_EVT. This function should be called after esp_bt_l2cap_init() completes successfully.

Returns
  • ESP_OK: success
  • other: failed

esp_err_t esp_bt_l2cap_connect (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t remote_psm, esp_bd_addr_t peer_bd_addr)
This function makes an L2CAP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_BT_L2CAP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters
  • cntl_flag - [in] Lower 16-bit security settings mask.
  • remote_psm - [in] Remote device bluetooth Profile PSM.
  • peer_bd_addr - [in] Remote device bluetooth device address.

Returns
  • ESP_OK: success
  • other: failed

esp_err_t esp_bt_l2cap_start_srv (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t local_psm)
This function create a L2CAP server and starts listening for an L2CAP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_BT_L2CAP_START_EVT. When the connection is established, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters
  • cntl_flag - [in] Lower 16-bit security settings mask.
  • local_psm - [in] Dynamic PSM.

Returns
  • ESP_OK: success
  • other: failed

esp_err_t esp_bt_l2cap_stop_all_srv (void)
This function stops all L2CAP servers. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of
ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_stop_srv (uint16_t local_psm)
```

This function stops a specific L2CAP server. The operation will close all active L2CAP connection first on the specific L2CAP server, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Parameters**
- `local_psm` [in] Dynamic PSM.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_register (void)
```

This function is used to register VFS. Only supports write, read and close. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_unregister (void)
```

This function is used to unregister VFS. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

**Unions**

```c
union esp_bt_l2cap_cb_param_t
```

#include <esp_l2cap_bt_api.h>

L2CAP callback parameters union.

**Public Members**

```c

**BT SDP APIs**

**Overview**  Bluetooth SDP reference APIs.

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_sdp_api.h
Functions

`esp_err_t esp_sdp_register_callback(esp_sdp_cb_t callback)`

This function is called to init callbacks with SDP module.

Parameters `callback` – [in] pointer to the init callback function.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_init(void)`

This function is called to init SDP module. When the operation is completed, the callback function will be called with ESP_SDP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_deinit(void)`

This function is called to de-initialize SDP module. The operation will remove all SDP records, then the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT, and the number of ESP_SDP_REMOVE_RECORD_COMP_EVT is equal to the number of SDP records. When the operation is completed, the callback function will be called with ESP_SDP_DEINIT_EVT. This function should be called after esp_sdp.init() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_search_record(esp_bd_addr_t bd_addr, esp_bt_uuid_t uuid)`

This function is called to perform service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SDP_SEARCH_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_create_record(esp_bluetooth_sdp_record_t *record)`

This function is called to create SDP records. When the operation is completed, the callback function will be called with ESP_SDP_CREATE_RECORD_COMP_EVT. This function must be called after esp_sdp.init() successful and before esp_sdp_deinit().

Parameters `record` – [in] The SDP record to create.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_remove_record(int record_handle)`

This function is called to remove a SDP record. When the operation is completed, the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Returns

- ESP_OK: success
- other: failed

2.3.4 Controller && VHCI

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

• This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising `-bluetooth/hci/controller_vhci_ble_adv`

API Reference

Header File

• `components/bt/include/esp32/include/esp_bt.h`

Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`
Set BLE TX power Connection Tx power should only be set after connection created.

Parameters

• `power_type` - The type of which tx power, could set Advertising/Connection/Default and etc
• **power_level** – Power level(index) corresponding to absolute value(dbm)

**Returns** ESP_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get (esp_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

**Parameters**

- **power_type** – The type of which tx power, could set Advertising/Connection/Default and etc

**Returns**

- >= 0 - Power level, < 0 - Invalid

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Parameters**

- **min_power_level** – The minimum power level
- **max_power_level** – The maximum power level

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)`

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Parameters**

- **min_power_level** – The minimum power level
- **max_power_level** – The maximum power level

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)`

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Parameters**

- **data_path** – SCO data path

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)`

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Parameters**

- **cfg** – Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_deinit (void)`

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)`

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Parameters**

- **mode** – the mode(BLE/BT/BTD) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

**Returns** ESP_OK - success, other - failed
**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_disable (void)`

Disable BT controller.

**Returns** ESP_OK - success, other - failed

`esp_bt_controller_status_t esp_bt_controller_get_status (void)`

Get BT controller is initialised/de-initialised/enabled/disabled.

**Returns** status value

bool `esp_vhci_host_check_send_available (void)`

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

**Returns** true for ready to send, false means cannot send packet

void `esp_vhci_host_send_packet (uint8_t *data, uint16_t len)`

`esp_vhci_host_send_packet` host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- `data` - the packet point
- `len` - the packet length

`esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)`

`esp_vhci_host_register_callback` register the vhci reference callback struct defined by vhci_host_callback structure.

**Parameters** callback - `esp_vhci_host_callback` type variable

**Returns** ESP_OK - success, ESP_FAIL - failed

`esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)`

`esp_bt_controller_mem_release` release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

`esp_bt_controller_mem_release` should be called only before `esp_bt_controller_init()` or after `esp_bt_controller_deinit()`.

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the Bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function.

**Parameters** mode --: the mode want to release memory

**Returns** ESP_OK - success, other - failed

`esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)`

`esp_bt_mem_release` release controller memory and BSS and data section of the BT/BLE host stack as per the mode
This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note: In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Parameters**
- **mode**: the mode whose memory is to be released

**Returns**
- ESP_OK - success, other - failed

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_scan_duplicate_list_flush (void)**

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached. The amount of device in the filter can be configured in menuconfig.

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Returns**
- ESP_OK : success
- other : failed

**void esp_wifi_bt_power_domain_on (void)**

bt Wi-Fi power domain power on

**void esp_wifi_bt_power_domain_off (void)**

bt Wi-Fi power domain power off

**Structures**

**struct esp_bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

    BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
    SCO data path, i.e. HCI or PCM module

bool auto_latency
    BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
    BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
    BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
    BLE low power crystal accuracy index

uint8_t pcm_role
    PCM role (master & slave)

uint8_t pcm_polar
    PCM polar trig (falling clk edge & rising clk edge)

bool hli
    Using high level interrupt or not

uint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do
```

Public Members
void (*notify_host_send_available)(void)
callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

**Macros**

`ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL`
`BT_CONTROLLER_INIT_CONFIG_DEFAULT()`

**Type Definitions**

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

**Enumerations**

enum `esp_bt_mode_t`

Bluetooth mode for controller enable/disable.

*Values:*

enumerator `ESP_BT_MODE_IDLE`

Bluetooth is not running

enumerator `ESP_BT_MODE_BLE`

Run BLE mode

enumerator `ESP_BT_MODE_CLASSIC_BT`

Run Classic BT mode

enumerator `ESP_BT_MODE_BTDM`

Run dual mode

enum [anonymous]

BLE sleep clock accuracy(SCA), values for ble_sca field in `esp_bt_controller_config_t`, currently only `ESP_BLE_SCA_500PPM` and `ESP_BLE_SCA_250PPM` are supported.

*Values:*

enumerator `ESP_BLE_SCA_500PPM`

BLE SCA at 500ppm

enumerator `ESP_BLE_SCA_250PPM`

BLE SCA at 250ppm

enumerator `ESP_BLE_SCA_150PPM`

BLE SCA at 150ppm
Chapter 2. API Reference

enumerator ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

enumerator ESP_BLE_SCA_75PPM
BLE SCA at 75ppm

enumerator ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

enumerator ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

enumerator ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enumerator ESP_BT_CONTROLLER_STATUS_IDLE

enumerator ESP_BT_CONTROLLER_STATUS_INITED

enumerator ESP_BT_CONTROLLER_STATUS_ENABLED

enumerator ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type. ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. When disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV: for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN: for scan. ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value. If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator ESP_BLE_PWR_TYPE_CONN_HDL0
For connection handle 0

enumerator ESP_BLE_PWR_TYPE_CONN_HDL1
For connection handle 1

enumerator ESP_BLE_PWR_TYPE_CONN_HDL2
For connection handle 2

enumerator ESP_BLE_PWR_TYPE_CONN_HDL3
For connection handle 3
enumerator ESP_BLE_PWR_TYPE_CONN_HDL4
    For connection handle 4

enumerator ESP_BLE_PWR_TYPE_CONN_HDL5
    For connection handle 5

enumerator ESP_BLE_PWR_TYPE_CONN_HDL6
    For connection handle 6

enumerator ESP_BLE_PWR_TYPE_CONN_HDL7
    For connection handle 7

enumerator ESP_BLE_PWR_TYPE_CONN_HDL8
    For connection handle 8

enumerator ESP_BLE_PWR_TYPE_ADV
    For advertising

enumerator ESP_BLE_PWR_TYPE_SCAN
    For scan

enumerator ESP_BLE_PWR_TYPE_DEFAULT
    For default, if not set other, it will use default value

enumerator ESP_BLE_PWR_TYPE_NUM
    TYPE numbers

enum esp_power_level_t
    Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).
    
    Values:
    
    enumerator ESP_PWR_LVL_N12
        Corresponding to -12dbm

    enumerator ESP_PWR_LVL_N9
        Corresponding to -9dbm

    enumerator ESP_PWR_LVL_N6
        Corresponding to -6dbm

    enumerator ESP_PWR_LVL_N3
        Corresponding to -3dbm

    enumerator ESP_PWR_LVL_N0
        Corresponding to 0dbm

    enumerator ESP_PWR_LVL_P3
        Corresponding to +3dbm
Chapter 2. API Reference

enumerator ESP_PWR_LVL_P6
   Corresponding to +6dbm

enumerator ESP_PWR_LVL_P9
   Corresponding to +9dbm

enumerator ESP_PWR_LVL_N14
   Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator ESP_PWR_LVL_N11
   Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator ESP_PWR_LVL_N8
   Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator ESP_PWR_LVL_N5
   Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator ESP_PWR_LVL_N2
   Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator ESP_PWR_LVL_P1
   Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator ESP_PWR_LVL_P4
   Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator ESP_PWR_LVL_P7
   Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t
   Bluetooth audio data transport path.
   Values:

   enumerator ESP_SCO_DATA_PATH_HCI
      data over HCI transport

   enumerator ESP_SCO_DATA_PATH_PCM
      data over PCM interface

2.3.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.
Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_meshProvCbParam_t

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

Public Members

struct esp_ble_mesh_provCbParam_t::ble_mesh_prov_register_comp_param prov_register_comp

Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT

struct esp_ble_mesh_provCbParam_t::ble_mesh_set_unprov_dev_name_comp_param

node_set_unprov_dev_name_comp

Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT

struct esp_ble_mesh_provCbParam_t::ble_mesh_prov_enable_comp_param

node_prov_enable_comp

Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param
   node_prov_disable_comp
   Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param
   node_prov_link_open
   Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param
   node_prov_link_close
   Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param
   node_prov_output_num
   Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param
   node_prov_output_str
   Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param
   node_prov_input
   Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_complete_evt_param
   node_prov_complete
   Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_reset_param
   node_prov_reset
   Event parameter of ESP_BLE_MESH_NODE_PROV_RESET_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_oob_pub_key_comp_param
   node_prov_set_oob_pub_key_comp
   Event parameter of ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_number_comp_param
   node_prov_input_num_comp
   Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_string_comp_param
   node_prov_input_str_comp
   Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_identity_enable_comp_param
   node_proxy_identity_enable_comp
   Event parameter of ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_enable_comp_param
   node_proxy_gatt_enable_comp
   Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_disable_comp_param
   node_proxy_gatt_disable_comp
   Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param
declare_node_add_local_net_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param
declare_node_add_app_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_comp_param
declare_node_bind_app_key_to_model_comp
    Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param
declare_provisioner_recv_unprov_adv_pkt
    Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param
declare_provisioner_prov_enable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param
declare_provisioner_prov_disable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param
declare_provisioner_prov_link_open
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_evt_param
declare_provisioner_prov_read_oob_pub_key
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

declare_provisioner_prov_complete
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param
declare_provisioner_add_unprov_dev_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param
provisioner_prov_dev_with_addr_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_dev_comp_param
provisioner_delete_dev_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_uuid_match_comp_param
provisioner_set_dev_uuid_match_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_prov_data_info_comp_param
provisioner_set_dev_prov_data_info_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_PROV_DATA_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param
provisioner_set_static_oob_val_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primary_elem_addr_comp_param
provisioner_set_primary_elem_addr_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
provisioner_prov_read_oob_pub_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
provisioner_prov_input_num_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
provisioner_prov_input_str_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
provisioner_set_node_name_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
provisioner_add_app_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
provisioner_update_app_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param
provisioner_bind_app_key_to_model_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param

provisioner_add_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param

provisioner_update_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param

provisioner_store_node_comp_data_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param

provisioner_delete_node_with_uuid_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param

provisioner_delete_node_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Chapter 2. API Reference

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_direct_erase_settings_comp
ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
Index of Provisioner settings

struct esp_ble_meshProv_cb_param_t::[anonymous]
provisioner_open_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
Provisioner settings user id
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_open_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_info_comp_param
set_fast_prov_info_comp
    Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_action_comp_param
set_fast_prov_action_comp
    Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_heartbeat_msg_recv_param
heartbeat_msg_recv
    Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param
lpn_enable_comp
    Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param
lpn_disable_comp
    Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param
lpn_poll_comp
    Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_establish_param
lpn_friendship_establish
    Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_terminate_param
lpn_friendship_terminate
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_establish_param
frnd_friendship_establish
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param
frnd_friendship_terminate
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_adv_pkt_param
proxy_client_recv_adv_pkt
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connected_param
proxy_client_connected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnected_param
proxy_client_disconnected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_filter_status_param
proxy_client_recv_filter_status
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connect_comp_param
proxy_client_connect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnect_comp_param
proxy_client_disconnect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_set_filter_type_comp_param
proxy_client_set_filter_type_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT

deinit_mesh_comp

Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

struct ble_mesh_deinit_mesh_comp_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.

Public Members

int err_code

Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr

Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

class [anonymous]

This enum value is the reason of friendship termination on the friend node side

Values:

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to
be established

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**
Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**
Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**
Friend feature disabled or corresponding NetKey is deleted

**Public Members**

```c
uint16_t lpn_addr
Low Power Node unicast address
```

```c
enum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

Proxy connection handle

struct ble_mesh_proxy_server_disconnected_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT.

Public Members

uint8_t conn_handle
Proxy connection handle

uint8_t reason
Proxy disconnect reason
struct **ble_mesh_set_fast_prov_action_comp_param**

```
#include <esp_ble_mesh_defs.h>  ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.
```

**Public Members**

- `uint8_t status_action`
  - Indicate the result of setting action of fast provisioning

struct **ble_mesh_set_fast_prov_info_comp_param**

```
#include <esp_ble_mesh_defs.h>  ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.
```

**Public Members**

- `uint8_t status_unicast`
  - Indicate the result of setting unicast address range of fast provisioning
- `uint8_t status_net_idx`
  - Indicate the result of setting NetKey Index of fast provisioning
- `uint8_t status_match`
  - Indicate the result of setting matching Device UUID of fast provisioning

struct **ble_mesh_set_oob_pub_key_comp_param**

```
#include <esp_ble_mesh_defs.h>  ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.
```

**Public Members**

- `int err_code`
  - Indicate the result of setting OOB Public Key

struct **ble_mesh_set_unprov_dev_name_comp_param**

```
#include <esp_ble_mesh_defs.h>  ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.
```

**Public Members**

- `int err_code`
  - Indicate the result of setting BLE Mesh device name

union **esp_ble_mesh_server_state_value_t**

```
#include <esp_ble_mesh_defs.h>  Server model state value union.
```

**Public Members**
`uint8_t onoff`  
The value of the Generic OnOff state  
The value of the Light LC Light OnOff state

`struct esp_ble_mesh_server_state_value_t::{anonymous} gen_onoff`  
The Generic OnOff state

`int16_t level`  
The value of the Generic Level state

`struct esp_ble_mesh_server_state_value_t::{anonymous} gen_level`  
The Generic Level state

`uint8_t onpowerup`  
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_server_state_value_t::{anonymous} gen_onpowerup`  
The Generic OnPowerUp state

`uint16_t power`  
The value of the Generic Power Actual state

`struct esp_ble_mesh_server_state_value_t::{anonymous} gen_power_actual`  
The Generic Power Actual state

`uint16_t lightness`  
The value of the Light Lightness Actual state  
The value of the Light Lightness Linear state  
The value of the Light CTL Lightness state  
The value of the Light HSL Lightness state  
The value of the Light xyL Lightness state

`struct esp_ble_mesh_server_state_value_t::{anonymous} light_lightness_actual`  
The Light Lightness Actual state

`struct esp_ble_mesh_server_state_value_t::{anonymous} light_lightness_linear`  
The Light Lightness Linear state

`struct esp_ble_mesh_server_state_value_t::{anonymous} light_ctl_lightness`  
The Light CTL Lightness state

`uint16_t temperature`  
The value of the Light CTL Temperature state

`int16_t delta_uv`  
The value of the Light CTL Delta UV state
struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
The Light CTL Temperature & Delta UV states

uint16_t hue
The value of the Light HSL Hue state

uint16_t saturation
The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
The Light xyl Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param client_recv_publish_msg
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param
model_publish_update
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param
server_model_update_state
Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode
Opcode of the previously sent message

esp_ble_mesh_model_t *model
Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode
Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the message

uint16_t length
Length of the received message

uint8_t *msg
Value of the received message

struct ble_mesh_model_operation_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
Public Members

uint32_t opcode
   Opcode of the received message

esp_ble_mesh_model_t *model
   Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
   Pointer to the context of the received message

uint16_t length
   Length of the received message

uint8_t *msg
   Value of the received message

struct ble_mesh_model_publish_comp_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
   Indicate the result of publishing a message

esp_ble_mesh_model_t *model
   Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
   Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
   Indicate the result of sending a message

uint32_t opcode
   Opcode of the message
Chapter 2. API Reference

```

    esp_ble_mesh_model_t *model
    Pointer to the model which sends the message

    esp_ble_mesh_msg_ctx_t *ctx
    Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

    int err_code
    Indicate the result of updating server model state

    esp_ble_mesh_model_t *model
    Pointer to the server model which state value is updated

    esp_ble_mesh_server_state_type_t type
    Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

    bool erase_flash
    Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

    uint16_t element_addr
    Element Address, assigned during provisioning.

    const uint16_t location
    Location Descriptor (GATT Bluetooth Namespace Descriptors)

    const uint8_t sig_model_count
    SIG Model count

    const uint8_t vnd_model_count
    Vendor Model count
```
`esp_ble_mesh_model_t *sig_models`  
SIG Models

`esp_ble_mesh_model_t *vnd_models`  
Vendor Models

`struct esp_ble_mesh_model_pub_t`  
Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the model to which the context belongs. Initialized by the stack.

`uint16_t publish_addr`  
Publish Address.

`uint16_t app_idx`  
Publish AppKey Index.

`uint16_t cred`  
Friendship Credentials Flag.

`uint16_t send_rel`  
Force reliable sending (segment acks)

`uint8_t ttl`  
Publish Time to Live.

`uint8_t retransmit`  
Retransmit Count & Interval Steps.

`uint8_t period`  
Publish Period.

`uint8_t period_div`  
Divisor for the Period.

`uint8_t fast_period`  
Use FastPeriodDivisor

`uint8_t count`  
Retransmissions left.

`uint32_t period_start`  
Start of the current period.
struct net_buf_simple *msg
        Publication buffer, containing the publication message.
        This will get correctly created when the publication context has been defined using the
        ESP_BLE_MESH_MODEL.Popup_DEFINE macro.
        ESP_BLE_MESH_MODEL.Popup_DEFINE(name, size);

est_ble_mesh.cb_t update
        Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
        Publish Period Timer. Initialized by the stack.

uint8_t dev_role
        Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
        Abstraction that describes a model operation context. This structure is associated with struct
        bt_mesh_model_op in mesh_access.h

Public Members

cost uint32_t opcode
        Message opcode

cost size_t min_len
        Message minimum length

est_ble_mesh.cb_t param_cb
        Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
        Abstraction that describes a model callback structure. This structure is associated with struct
        bt_mesh_model_cb in mesh_access.h.

Public Members

est_ble_mesh.cb_t init_cb
        Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
        Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in
        mesh_access.h

Public Members
const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h
Public Members

uint16_t net_idx
    NetKey Index of the subnet through which to send the message.

uint16_t app_idx
    AppKey Index for message encryption.

uint16_t addr
    Remote address.

uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl
    Received TTL value. Not used for sending.

uint8_t send_rel
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier
**uint16_t vid**  
16-bit vendor-assigned product version identifier

**size_t element_count**  
Element count

**esp_ble_mesh_elem_t *elements**  
A sequence of elements

**struct esp_ble_mesh_unprov_dev_add_t**  
Information of the device which is going to be added for provisioning.

**Public Members**

**esp_ble_mesh_bd_addr_t addr**  
Device address

**esp_ble_mesh_addr_type_t addr_type**  
Device address type

**uint8_t uuid[16]**  
Device UUID

**uint16_t oob_info**  
Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

**esp_ble_mesh_prov_bearer_t bearer**  
Provisioning Bearer

**struct esp_ble_mesh_device_delete_t**  
Information of the device which is going to be deleted.

**Public Members**

**esp_ble_mesh_bd_addr_t addr**  
Device address

**esp_ble_mesh_addr_type_t addr_type**  
Device address type

**uint8_t uuid[16]**  
Device UUID

**uint8_t flag**  
BIT0: device address; BIT1: device UUID
struct `esp_ble_mesh_prov_data_info_t`
   Information of the provisioner which is going to be updated.

   **Public Members**

   `uint16_t net_idx`
   NetKey Index

   `uint8_t flags`
   Flags

   `uint32_t iv_index`
   IV Index

   `uint8_t flag`
   BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct `esp_ble_mesh_node_t`
   Information of the provisioned node

   **Public Members**

   `esp_ble_mesh_bd_addr_t addr`
   Node device address

   `esp_ble_mesh_addr_type_t addr_type`
   Node device address type

   `uint8_t dev_uuid[16]`
   Device UUID

   `uint16_t oob_info`
   Node OOB information

   `uint16_t unicast_addr`
   Node unicast address

   `uint8_t element_num`
   Node element number

   `uint16_t net_idx`
   Node NetKey Index

   `uint8_t flags`
   Node key refresh flag and iv update flag
### Chapter 2. API Reference

```c
uint32_t iv_index
   Node IV Index

uint8_t dev_key[16]
   Node device key

c char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
   Node name

uint16_t comp_length
   Length of Composition Data

uint8_t *comp_data
   Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
   Minimum unicast address used for fast provisioning

uint16_t unicast_max
   Maximum unicast address used for fast provisioning

uint16_t net_idx
   Netkey index used for fast provisioning

uint8_t flags
   Flags used for fast provisioning

uint32_t iv_index
   IV Index used for fast provisioning

uint8_t offset
   Offset of the UUID to be compared

uint8_t match_len
   Length of the UUID to be compared

uint8_t match_val[16]
   Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
   Context of Provisoner heartbeat filter information to be set
```
Public Members

uint16_t hb_src
Heartbeat source address (unicast address)

uint16_t hb_dst
Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.
Public Members

`esp_ble_mesh_opcode_t opcode`  
Message opcode

`esp_ble_mesh_model_t *model`  
Pointer to the client model structure

`esp_ble_mesh_msg_ctx_t ctx`  
The context used to send message

`int32_t msg_timeout`  
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

`uint8_t msg_role`  
Role of the device - Node/Provisioner

`struct esp_ble_mesh_state_transition_t`  
Parameters of the server model state transition

Public Functions

`BLE_MESH_ATOMIC_DEFINE`(flag, `ESP_BLE_MESH_SERVER_FLAG_MAX`)  
Flag used to indicate if the transition timer has been started internally.

If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

`bool just_started`  
Indicate if the state transition has just started

`uint8_t trans_time`  
State transition time

`uint8_t remain_time`  
Remaining time of state transition

`uint8_t delay`  
Delay before starting state transition

`uint32_t quott`  
Duration of each divided transition step
Chapter 2. API Reference

uint32_t counter
   Number of steps which the transition duration is divided

uint32_t total_duration
   State transition total duration

int64_t start_timestamp
   Time when the state transition is started

struct k_delayed_work timer
   Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
   Parameters of the server model received last same set message.

Public Members

uint8_t tid
   Transaction number of the last message

uint16_t src
   Source address of the last message

uint16_t dst
   Destination address of the last message

int64_t timestamp
   Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
   Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp
   BLE Mesh Server Response Option.

   i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client
      Get messages need to be replied by the application;
   ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get
       messages will be replied by the server models;
   iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client
        Set messages need to be replied by the application;
   iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set
       messages will be replied by the server models;
   v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server
      Status messages need to be replied by the application;
   vi. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server
       Status messages will be replied by the server models; Response control for Client Get messages
Chapter 2. API Reference

```c
uint8_t set_auto_rsp
    Response control for Client Set messages

uint8_t status_auto_rsp
    Response control for Server Status messages
```

Macros

```c
ESP_BLE_MESH_SDU_MAX_LEN
    < The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT
    Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG
    The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN
    The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
    The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE
    Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX
    Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL
    Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT
    Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES
```

**ESP_BLE_MESH_ADDR_IS_RFU** (addr)

**ESP_BLE_MESH_INVALID_NODE_INDEX**

**ESP_BLE_MESH_TRANSMIT** (count, int_ms)

Encode transmission count & interval steps.

**Note:** For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

**Parameters**
- **count** - Number of retransmissions (first transmission is excluded).
- **int_ms** - Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_TRANSMIT_COUNT** (transmit)

Decode transmit count from a transmit value.

**Parameters**
- **transmit** - Encoded transmit count & interval value.

**Returns** Transmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_TRANSMIT_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Parameters**
- **transmit** - Encoded transmit count & interval value.

**Returns** Transmission interval in milliseconds.

**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)

Encode Publish Retransmit count & interval steps.

**Parameters**
- **count** - Number of retransmissions (first transmission is excluded).
- **int_ms** - Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

**Parameters**
- `transmit` - Encoded Publish Retransmit count & interval value.

**Returns** Retransmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Parameters**
- `transmit` - Encoded Publish Retransmit count & interval value.

**Returns** Transmission interval in milliseconds.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**
Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.
In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note:** This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- `_loc` - Location Descriptor.
- `_mods` – Array of SIG models.
- `_vnd_mods` – Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**
BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
• _name – Variable name given to the context.
• _msg_len – Length of the publication message.
• _role – Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
• _opcode – Message opcode.
• _min_len – Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_LIGHT_ONOFF_GET

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_LIGHT_ONOFF_SET

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_LIGHT_ONOFF_SET_UNACK

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_LIGHT_ONOFF_STATUS

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_PROPERTY_GET

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_PROPERTY_SET

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_PROPERTY_SET_UNACK

ESP_BLE_MESH_MODEL_OP_LIGHT_LC_PROPERTY_STATUS

ESP_BLE_MESH_MODEL_STATUS_SUCCESS

ESP_BLE_MESH_MODEL_STATUS_CANNOT_SET_RANGE_MIN

ESP_BLE_MESH_MODEL_STATUS_CANNOT_SET_RANGE_MAX

ESP_BLE_MESH_SERVER_RSP_BY_APP

Response need to be sent in the application

ESP_BLE_MESH_SERVER_AUTO_RSP

Response will be sent internally

Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]

Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]

Invalid Company ID

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64
typedef uint8_t BD_ADDR[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_addr_type_t
    BLE device address type.

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
    esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
    locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in
    the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
    esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
    locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in
    the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
    esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
    the opcodes used by the Config Model messages The following opcodes are used by the BLE Mesh Config
    Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t
    This typedef is only used to indicate the status code contained in some of the Configuration Server Model status
    message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
    esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
    locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in
    the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
    esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
    locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in
    the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
    esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
    the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health
    Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
    esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
    the opcodes used by functions esp_ble_mesh_generic_client_get_state &
    esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

    esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is
    only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state &
    esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

    esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is
    only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state &
    esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

    esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
    the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state.
    Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

    End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

    This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic
    Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t

    Values:

    enumerator ESP_BLE_MESH_TYPE_PROV_CB

    enumerator ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB

    enumerator ESP_BLE_MESH_TYPE_OUTPUT_STR_CB

    enumerator ESP_BLE_MESH_TYPE_INPUT_CB

    enumerator ESP_BLE_MESH_TYPE_LINK_OPEN_CB

    enumerator ESP_BLE_MESH_TYPE_LINK_CLOSE_CB

    enumerator ESP_BLE_MESH_TYPE_COMPLETE_CB

    enumerator ESP_BLE_MESH_TYPE_RESET_CB

enum esp_ble_mesh_oob_method_t

    Values:

    enumerator ESP_BLE_MESH_NO_OOB

    enumerator ESP_BLE_MESH_STATIC_OOB
enumerator ESP_BLE_MESH_OUTPUT_OOB

enumerator ESP_BLE_MESH_INPUT_OOB

enum esp_ble_mesh_output_action_t
   Values:

   enumerator ESP_BLE_MESH_NO_OUTPUT

   enumerator ESP_BLE_MESH_BLINK

   enumerator ESP_BLE_MESH_BEEP

   enumerator ESP_BLE_MESH_VIBRATE

   enumerator ESP_BLE_MESH_DISPLAY_NUMBER

   enumerator ESP_BLE_MESH_DISPLAY_STRING

enum esp_ble_mesh_input_action_t
   Values:

   enumerator ESP_BLE_MESH_NO_INPUT

   enumerator ESP_BLE_MESH_PUSH

   enumerator ESP_BLE_MESH_TWIST

   enumerator ESP_BLE_MESH_ENTER_NUMBER

   enumerator ESP_BLE_MESH_ENTER_STRING

enum esp_ble_mesh_prov_bearer_t
   Values:

   enumerator ESP_BLE_MESH_PROV_ADV

   enumerator ESP_BLE_MESH_PROV_GATT

enum esp_ble_mesh_prov_oob_info_t
   Values:

   enumerator ESP_BLE_MESH_PROV_OOB_OTHER

   enumerator ESP_BLE_MESH_PROV_OOB_URI
enumerator ESP_BLE_MESH_PROV_OOB_2D_CODE
enumerator ESP_BLE_MESH_PROV_OOB_BAR_CODE
enumerator ESP_BLE_MESH_PROV_OOB_NFC
enumerator ESP_BLE_MESH_PROV_OOB_NUMBER
enumerator ESP_BLE_MESH_PROV_OOB_STRING
enumerator ESP_BLE_MESH_PROV_OOB_ON_BOX
enumerator ESP_BLE_MESH_PROV_OOB_IN_BOX
enumerator ESP_BLE_MESH_PROV_OOB_ON_PAPER
enumerator ESP_BLE_MESH_PROV_OOB_IN_MANUAL
enumerator ESP_BLE_MESH_PROV_OOB_ON_DEV

enum esp_ble_mesh_dev_role_t
Values:
enumerator ROLE_NODE
enumerator ROLE_PROVISIONER
enumerator ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
Values:
enumerator FAST_PROV_ACT_NONE
enumerator FAST_PROV_ACT_ENTER
enumerator FAST_PROV_ACT_SUSPEND
enumerator FAST_PROV_ACT_EXIT
enumerator FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
Values:
enumerator PROXY_FILTER_WHITELIST
enum esp_ble_mesh_prov_cb_event_t

Values:

enumerator PROXY_FILTER_BLACKLIST

enumerator ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
   Initialize BLE Mesh provisioning capabilities and internal data information completion event

denumerator ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
   Set the unprovisioned device name completion event

denumerator ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
   Enable node provisioning functionality completion event

denumerator ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
   Disable node provisioning functionality completion event

denumerator ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
   Establish a BLE Mesh link event

denumerator ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
   Close a BLE Mesh link event

denumerator ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
   Generate Node input OOB public key event

denumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
   Generate Node Output Number event

denumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
   Generate Node Output String event

denumerator ESP_BLE_MESH_NODE_PROV_INPUT_EVT
   Event requiring the user to input a number or string

denumerator ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
   Provisioning done event

denumerator ESP_BLE_MESH_NODE_PROV_RESET_EVT
   Provisioning reset event

denumerator ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
   Node set oob public key completion event

denumerator ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
   Node input number completion event

denumerator ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
   Node input string completion event
enumerator `ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT`
  Enable BLE Mesh Proxy Identity advertising completion event

enumerator `ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT`
  Enable BLE Mesh GATT Proxy Service completion event

enumerator `ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT`
  Disable BLE Mesh GATT Proxy Service completion event

enumerator `ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT`
  Node add NetKey locally completion event

enumerator `ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT`
  Node add AppKey locally completion event

enumerator `ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT`
  Node bind AppKey to model locally completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT`
  Provisioner enable provisioning functionality completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT`
  Provisioner disable provisioning functionality completion event

enumerator `ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT`
  Provisioner receives unprovisioned device beacon event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT`
  Provisioner read unprovisioned device OOB public key event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT`
  Provisioner input value for provisioning procedure event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT`
  Provisioner output value for provisioning procedure event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT`
  Provisioner establish a BLE Mesh link event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT`
  Provisioner close a BLE Mesh link event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`
  Provisioner provisioning done event

enumerator `ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT`
  Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
enumerator `ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT`
Provisioner start to provision an unprovisioned device completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT`
Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT`
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT`
Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT`
Provisioner set static oob value used for provisioning completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT`
Provisioner set unicast address of primary element completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT`
Provisioner read unprovisioned device OOB public key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT`
Provisioner input number completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT`
Provisioner input string completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT`
Provisioner set node name completion event

enumerator `ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT`
Provisioner add local app key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT`
Provisioner update local app key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT`
Provisioner bind local model with local app key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT`
Provisioner add local network key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT`
Provisioner update local network key completion event

enumerator `ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT`
Provisioner store node composition data completion event
enumerator ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
    Provisioner delete node with uuid completion event

denumerator ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
    Provisioner delete node with unicast address completion event

denumerator ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
    Provisioner start to receive heartbeat message completion event

denumerator ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
    Provisioner set the heartbeat filter type completion event

denumerator ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
    Provisioner set the heartbeat filter information completion event

denumerator ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
    Provisioner receive heartbeat message event

denumerator ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT
    Provisioner directly erase settings completion event

denumerator ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
    Provisioner open settings with index completion event

denumerator ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
    Provisioner open settings with user id completion event

denumerator ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
    Provisioner close settings with index completion event

denumerator ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
    Provisioner close settings with user id completion event

denumerator ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
    Provisioner delete settings with index completion event

denumerator ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
    Provisioner delete settings with user id completion event

denumerator ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
    Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

denumerator ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
    Set fast provisioning action completion event

denumerator ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
    Receive Heartbeat message event
enumerator ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
  Enable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
  Disable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_POLL_COMP_EVT
  Low Power Node send Friend Poll completion event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
  Low Power Node establishes friendship event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
  Low Power Node terminates friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
  Friend Node establishes friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
  Friend Node terminates friendship event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
  Proxy Client receives Network ID advertising packet event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
  Proxy Client establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
  Proxy Client terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
  Proxy Client receives Proxy Filter Status event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
  Proxy Client connect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
  Proxy Client disconnect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
  Proxy Client set filter type completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
  Proxy Client add filter address completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
  Proxy Client remove filter address completion event
enumerator ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
    Proxy Server establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT
    Proxy Server terminates connection successfully event

enumerator ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model subscribes group address completion event

enumerator ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model unsubscribes group address completion event

enumerator ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
    De-initialize BLE Mesh stack completion event

enumerator ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
    BLE Mesh server models related definitions.
    This enum value is the flag of transition timer operation
    Values:

enumerator ESP_BLE_MESH_SERVER_TRANS_TIMER_START

enumerator ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
    This enum value is the type of server model states
    Values:

enumerator ESP_BLE_MESH_GENERIC_ONOFF_STATE

enumerator ESP_BLE_MESH_GENERIC_LEVEL_STATE

enumerator ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE

enumerator ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE

enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE

enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE

enumerator ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE

enumerator ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
Chapter 2. API Reference

enumerator ESP_BLE_MESH_LIGHT_HSL_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
enumerator ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
enumerator ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

enumerator ESP_BLE_MESH_MODEL_OPERATION_EVT
    User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
enumerator ESP_BLE_MESH_MODEL_SEND_COMP_EVT
    User-defined models send messages completion event
enumerator ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
    User-defined models publish messages completion event
enumerator ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
    User-defined client models receive publish messages event
enumerator ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
    Timeout event for the user-defined client models that failed to receive response from peer server models
enumerator ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
    When a model is configured to publish messages periodically, this event will occur during every publish period
enumerator ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
    Server models update state value completion event
enumerator ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
Chapter 2. API Reference

- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

```c
esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note:** After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

**Parameters**

- `prov` - [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- `comp` - [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**Returns**  ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_deinit (esp_ble_mesh_deinit_param_t *param)
```

De-initialize BLE Mesh module.

**Note:** This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Parameters** `param` - [in] Pointer to the structure of BLE Mesh deinit parameters.

**Returns**  ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

```c
int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

**Parameters** `model` - [in] Model instance pointer.

**Returns**  Publish period value on success, 0 or (negative) error code from errno.h on failure.

```c
uint16_t esp_ble_mesh_get_primary_element_address (void)
```

Get the address of the primary element.

**Returns**  Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.
uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Parameters
   • model  -[in] Pointer to the model.
   • group_addr -[in] Group address.

Returns Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

Parameters element_addr -[in] Element address.

Returns Pointer to the element on success, or NULL on failure.

uint8_t esp_ble_mesh_get_element_count (void)

Get the number of elements that have been registered.

Returns Number of elements.

esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Parameters
   • element  -[in] Element to which the model belongs.
   • company_id -[in] A 16-bit company identifier assigned by the Bluetooth SIG.
   • model_id -[in] A 16-bit vendor-assigned model identifier.

Returns Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

Parameters
   • element  -[in] Element to which the model belongs.
   • model_id -[in] SIG model identifier.

Returns Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)

Get the Composition data which has been registered.

Returns Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters
   • element_addr -[in] Unicast address of the element to which the model belongs.
Chapter 2. API Reference

• company_id [in] A 16-bit company identifier.
• group_addr [in] The group address to be subscribed.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_model_unsubscribe_group_addr(
    uint16_t element_addr,
    uint16_t company_id,
    uint16_t model_id,
    uint16_t group_addr
)
```

A local model of node or Provisioner unsubscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters
• element_addr [in] Unicast address of the element to which the model belongs.
• company_id [in] A 16-bit company identifier.
• group_addr [in] The subscribed group address.

Returns ESP_OK on success or error code otherwise.

```c
const uint8_t *esp_ble_mesh_node_get_local_net_key( uint16_t net_idx )
```

This function is called by Node to get the local NetKey.

Parameters net_idx [in] NetKey index.

Returns NetKey on success, or NULL on failure.

```c
const uint8_t *esp_ble_mesh_node_get_local_app_key( uint16_t app_idx )
```

This function is called by Node to get the local AppKey.

Returns AppKey on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_node_add_local_net_key( const uint8_t net_key[16], uint16_t net_idx )
```

This function is called by Node to add a local NetKey.

Note: This function can only be called after the device is provisioned.

Parameters
• net_key [in] NetKey to be added.
• net_idx [in] NetKey Index.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_add_local_app_key( const uint8_t app_key[16], uint16_t net_idx,
                                             uint16_t app_idx )
```

This function is called by Node to add a local AppKey.

Note: The net_idx must be an existing one. This function can only be called after the device is provisioned.

Parameters
• app_key [in] AppKey to be added.
• net_idx [in] NetKey Index.
• app_idx [in] AppKey Index.

Returns ESP_OK on success or error code otherwise.
### esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model

**(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)**

This function is called by Node to bind AppKey to model locally.

**Note:** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Parameters**
- **element_addr** - [in] Node local element address
- **company_id** - [in] Node local company id
- **model_id** - [in] Node local model id
- **app_idx** - [in] Node local appkey index

**Returns** ESP_OK on success or error code otherwise.

### Low Power Operation (Updating)

**Header File**
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

**Functions**

- **esp_err_t esp_ble_mesh_lpn_enable**(void)
  
  Enable BLE Mesh device LPN functionality.

  **Note:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

  **Returns** ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_lpn_disable**(bool force)
  
  Disable BLE Mesh device LPN functionality.

  **Parameters**
  - **force** - [in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

  **Returns** ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_lpn_poll**(void)
  
  LPN tries to poll messages from the Friend Node.

  **Note:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

  **Returns** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

**esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)**

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Parameters**

- callback [in] Pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)**

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note:** This API is only used to set the opcode of the message.

**Parameters**

- data [in] Pointer to the message data.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)**

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t) of the client model need to be initialized.

**Parameters**

- model [in] BLE Mesh Client model to which the message belongs.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)**

De-initialize the user-defined client model.

**Note:** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Parameters**

- model [in] Pointer of the Client model.

**Returns**

- ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_server_model_send_msg** *(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)*

Send server model messages (such as server model status messages).

**Parameters**
- **model** – [in] BLE Mesh Server Model to which the message belongs.
- **ctx** – [in] Message context, includes keys, TTL, etc.
- **length** – [in] Message length (exclude the message opcode).
- **data** – [in] Parameters of Access Payload (exclude the message opcode) to be sent.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_send_msg** *(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp, esp_ble_mesh_dev_role_t device_role)*

Send client model message (such as model get, set, etc).

**Parameters**
- **model** – [in] BLE Mesh Client Model to which the message belongs.
- **ctx** – [in] Message context, includes keys, TTL, etc.
- **length** – [in] Message length (exclude the message opcode).
- **data** – [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout** – [in] Time to get response to the message (in milliseconds).
- **need_rsp** – [in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device_role** – [in] Role of the device (Node/Provisioner) that sends the message.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_publish** *(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)*

Send a model publication message.

**Note:** Before calling this function, the user needs to ensure that the model publication message (`esp_ble_mesh_model_pub_t::msg`) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Parameters**
- **length** – [in] Message length (exclude the message opcode).
- **data** – [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** – [in] Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_server_model_update_state** *(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)*

Update a server model state value. If the model publication state is set properly (e.g., publish address is set to a valid address), it will publish corresponding status message.
Chapter 2. API Reference

Note: Currently this API is used to update bound state value, not for all server model states.

Parameters

- model -[in] Server model which is going to update the state.
- type -[in] Server model state type.
- value -[in] Server model state value.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_local_reset (void)
```
Reset the provisioning procedure of the local BLE Mesh node.

Note: All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char* name)
```
This function is called to set the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters

- index -[in] Index of the node in the node queue.
- name -[in] Name (end by ‘\0’) to be set for the node.

Returns ESP_OK on success or error code otherwise.

```
const char* esp_ble_mesh_provisioner_get_node_name (uint16_t index)
```
This function is called to get the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

```
uint16_t esp_ble_mesh_provisioner_get_node_index (const char* name)
```
This function is called to get the node (provisioned device) index.

Parameters name -[in] Name of the node (end by ‘\0’).

Returns Node index on success, or an invalid value (0xFFFF) on failure.

```
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t* data, uint16_t length)
```
This function is called to store the Composition Data of the node.

Parameters

- unicast_addr -[in] Element address of the node
- data -[in] Pointer of Composition Data
- length -[in] Length of Composition Data

Returns ESP_OK on success or error code otherwise.
The `esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])` function is called to get the provisioned node information with the node device uuid.

**Parameters**
- `uuid` – [in] Device UUID of the node
- **Returns** Pointer of the node info struct or NULL on failure.

The `esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)` function is called to get the provisioned node information with the node unicast address.

**Parameters**
- `unicast_addr` – [in] Unicast address of the node
- **Returns** Pointer of the node info struct or NULL on failure.

The `esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)` function is called to get the provisioned node information with the node name.

**Parameters**
- `name` – [in] Name of the node (end by '\0').
- **Returns** Pointer of the node info struct or NULL on failure.

The `uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)` function is called by Provisioner to get provisioned node count.

**Returns** Number of the provisioned nodes.

The `esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)` function is called by Provisioner to get the entry of the node table.

**Returns** Pointer to the start of the node table.

The `esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])` function is called to delete the provisioned node information with the node device uuid.

**Parameters**
- `uuid` – [in] Device UUID of the node
- **Returns** ESP_OK on success or error code otherwise.

The `esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)` function is called to delete the provisioned node information with the node unicast address.

**Parameters**
- `unicast_addr` – [in] Unicast address of the node
- **Returns** ESP_OK on success or error code otherwise.

The `esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)` function is called to add a local AppKey for Provisioner.

**Note:** If app_key is set to NULL, app_key will be generated internally. If net_idx is set to 0xFFFF, and the new app_idx will be reported via an event.

**Parameters**
- `app_key` – [in] The app key to be set for the local BLE Mesh stack.
• **app_idx** – [in] The app key index.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key (const uint8_t app_key[16],
                                                      uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

**Parameters**
- **app_key** – [in] Value of the AppKey.
- **net_idx** – [in] Corresponding NetKey Index.
- **app_idx** – [in] The AppKey Index

Returns ESP_OK on success or error code otherwise.

```c
const uint8_t * esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

**Parameters**
- **app_idx** – [in] Application key index.

Returns App key on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr,
                                                               uint16_t app_idx,
                                                               uint16_t model_id,
                                                               uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

**Note:** company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

**Parameters**
- **element_addr** – [in] Provisioner local element address
- **app_idx** – [in] Provisioner local appkey index
- **model_id** – [in] Provisioner local model id
- **company_id** – [in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

**Note:** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Parameters**
- **net_key** – [in] The network key to be added to the Provisioner local BLE Mesh stack.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16],
                                                       uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Parameters**
- **net_key** – [in] Value of the NetKey.
### Chapter 2. API Reference

  
  **Returns** ESP_OK on success or error code otherwise.

const uint8_t * esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

**Parameters**
- Returns Network key on success, or NULL on failure.

**esp_err_t** esp_ble_mesh_provisioner_recv_heartbeat (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note:** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Parameters**
- enable – [in] Enable or disable receiving heartbeat messages.
- Returns ESP_OK on success or error code otherwise.

**esp_err_t** esp_ble_mesh_provisioner_set_heartbeat_filter_type (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

**Note:** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   
a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Parameters**
- type – [in] Heartbeat filter type (acceptlist or rejectlist).
- Returns ESP_OK on success or error code otherwise.

**esp_err_t** esp_ble_mesh_provisioner_set_heartbeat_filter_info (uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
  - The filter entry with the same SRC or DST will be removed.

**Note:** 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   
   - If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Parameters**
- op – [in] Add or REMOVE
* info  [in]  Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

Returns  ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Returns  ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**  
index  [in]  Settings index.

Returns  ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**  
uid  [in]  Settings userid.

Returns  ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:**  
1. Before closing the nvs namespace, it must be open.
   
a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:  
   a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. 
   b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   
b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
   
c. The working process shall be as following:  
   a) Open settings A  
   b) Start to provision and control nodes  
   c) Close settings A  
   d) Open settings B  
   e) Start to provision and control other nodes  
   f) Close settings B  
   g) ...  ...

**Parameters**  

- index  [in]  Settings index.
- erase  [in]  Indicate if erasing mesh information.

Returns  ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid** (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ...

**Parameters**
- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** index –[in] Settings index.
**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** uid –[in] Settings user id.
**Returns** ESP_OK on success or error code otherwise.

const char* **esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

**Parameters** index –[in] Settings index.
**Returns** Setting user id on success or NULL on failure.

**uint8_t esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

**Parameters** uid –[in] Settings user id.
**Returns** Settings index.

**uint8_t esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

**Returns** Number of free settings user id.
const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

**Parameters**

**Returns** Application key on success, or NULL on failure.

### Type Definitions

typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

### ESP-BLE-MESH Node/Provisioner Provisioning

#### Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

#### Functions

**esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)**

Register BLE Mesh provisioning callback.

**Parameters** callback – [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**bool esp_ble_mesh_node_is_provisioned (void)**

Check if a device has been provisioned.

**Returns** TRUE if the device is provisioned, FALSE if the device is un provisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable specific provisioning bearers to get the device ready for provisioning.

**Note:** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Parameters** bearers – Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Parameters** bearers – Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
Chapter 2. API Reference

**Parameters**

- **pub_key_x** - [in] Unprovisioned device’s Public Key X
- **pub_key_y** - [in] Unprovisioned device’s Public Key Y
- **private_key** - [in] Unprovisioned device’s Private Key

**Returns**  
ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_input_number (uint32_t number)`  
Provide provisioning input OOB number.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**

- **number** - [in] Number input by device.

**Returns**  
ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_input_string (const char* string)`  
Provide provisioning input OOB string.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**

- **string** - [in] String input by device.

**Returns**  
ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_set_unprovisioned_device_name (const char* name)`  
Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Parameters**

- **name** - [in] Unprovisioned device name

**Returns**  
ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])`  
Provisioner inputs unprovisioned device’s oob public key.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Parameters**

- **link_idx** - [in] The provisioning link index
- **pub_key_x** - [in] Unprovisioned device’s Public Key X
- **pub_key_y** - [in] Unprovisioned device’s Public Key Y

**Returns**  
ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_input_string (const char* string, uint8_t link_idx)`  
Provide provisioning input OOB string.
This is intended to be called after the esp_ble_mesh_prov_t prov_.
   → input_num
callback has been called with ESP_BLE_MESH_ENTER_STRING as the_
   → action.

Parameters
• string [in] String input by Provisioner.
• link_idx [in] The provisioning link index.
Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)
Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_.
   → input_num
callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the_
   → action.

Parameters
• number [in] Number input by Provisioner.
• link_idx [in] The provisioning link index.
Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable one or more provisioning bearers.

Note: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

Parameters bearers [in] Bit-wise OR of provisioning bearers.
Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable one or more provisioning bearers.

Note: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

Parameters bearers [in] Bit-wise OR of provisioning bearers.
Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t*
   *add_dev, esp_ble_mesh_dev_add_flag_t flags)
Add unprovisioned device info to the unprov_dev queue.

Note: : 1. Currently address type only supports public address and static random address.
a. If device UUID and/or device address as well as address type already exist in the device queue, but the
   bearer is different from the existing one, add operation will also be successful and it will update the
   provision bearer supported by the device.
b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovi-
   sioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add
the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.

• In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

c. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.

• If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
• If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
• If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g., after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

• Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

Parameters

• add_dev –[in] Pointer to a struct containing the device information
• flags –[in] Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16], esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info, uint16_t unicast_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Note: 1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROVADV_PKT_EVT event.

b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

c. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

Parameters

• uuid –[in] Device UUID of the unprovisioned device
Chapter 2. API Reference

- **addr** - [in] Device address of the unprovisioned device
- **addr_type** - [in] Device address type of the unprovisioned device
- **bearer** - [in] Provisioning bearer going to be used by Provisioner
- **oob_info** - [in] OOB info of the unprovisioned device
- **unicast_addr** - [in] Unicast address going to be allocated for the unprovisioned device

**Returns** Zero on success or (negative) error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note:** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Parameters**
- **del_dev** - [in] Pointer to a struct containing the device information.

**Returns** ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t*match_val,uint8_t match_len,uint8_t offset,bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Parameters**
- **match_val** - [in] Value to be compared with the part of the device UUID.
- **match_len** - [in] Length of the compared match value.
- **offset** - [in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** - [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

**Returns** ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

**Parameters**
- **prov_data_info** - [in] Pointer to a struct containing net_idx or flags or iv_index.

**Returns** ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t*value,uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Parameters**
- **value** - [in] Pointer to the static oob value.
- **length** - [in] Length of the static oob value.
Chapter 2. API Reference

Returns ESP_OK on success or error code otherwise.

\texttt{esp_err_t esp\_ble\_mesh\_provisioner\_set\_primary\_elem\_addr(\text{uint16\_t addr})}

This function is called by Provisioner to set own Primary element address.

\textbf{Note:} This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov\_unicast\_addr value in the struct \texttt{esp\_ble\_mesh\_prov\_t} will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

\textbf{Parameters} \texttt{addr} - [in] Unicast address of the Primary element of Provisioner.

\textbf{Returns} ESP_OK on success or error code otherwise.

\texttt{esp\_err\_t esp\_ble\_mesh\_set\_fast\_prov\_info(esp\_ble\_fast\_prov\_info\_t *fast\_prov\_info)}

This function is called to set provisioning data information before starting fast provisioning.

\textbf{Parameters} \texttt{fast\_prov\_info} - [in] Pointer to a struct containing unicast address range, net_idx, etc.

\textbf{Returns} ESP_OK on success or error code otherwise.

\texttt{esp\_err\_t esp\_ble\_mesh\_set\_fast\_prov\_action(esp\_ble\_fast\_prov\_action\_t action)}

This function is called to start/suspend/exit fast provisioning.

\textbf{Parameters} \texttt{action} - [in] fast provisioning action (i.e. enter, suspend, exit).

\textbf{Returns} ESP_OK on success or error code otherwise.

\textbf{Type Definitions}

\texttt{typedef void (*esp\_ble\_mesh\_prov\_cb\_t)(esp\_ble\_mesh\_prov\_cb\_event\_t event, esp\_ble\_mesh\_prov\_cb\_param\_t *param)}

: event, event code of provisioning events; param, parameters of provisioning events

\texttt{typedef void (*esp\_ble\_mesh\_prov\_adv\_cb\_t)(const esp\_ble\_mesh\_bd\_addr\_t addr, const esp\_ble\_mesh\_addr\_type\_t addr\_type, const uint8\_t adv\_type, const uint8\_t *dev\_uuid, uint16\_t oob\_info, esp\_ble\_mesh\_prov\_bearer\_t bearer)}

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

\textbf{Report} on the unprovisioned device beacon and mesh provisioning service adv data to application.

\textbf{Param} \texttt{addr} [in] Pointer to the unprovisioned device address.

\textbf{Param} \texttt{addr\_type} [in] Unprovisioned device address type.

\textbf{Param} \texttt{adv\_type} [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).

\textbf{Param} \texttt{dev\_uuid} [in] Unprovisioned device UUID pointer.

\textbf{Param} \texttt{oob\_info} [in] OOB information of the unprovisioned device.

\textbf{Param} \texttt{bearer} [in] Adv packet received from PB-GATT or PB-ADV bearer.

\textbf{ESP-BLE-MESH GATT Proxy Server}

\textbf{Header File}

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h
Functions

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
```
Enable advertising with Node Identity.

Note: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable(void)
```
Enable BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable(void)
```
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(uint8_t conn_handle, esp_ble_mesh_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)
```
Proxy Client creates a connection with the Proxy Server.

Parameters
- `conn_handle` - [in] Proxy connection handle.
- `addr` - [in] Device address of the Proxy Server.
- `addr_type` - [in] Device address type (public or static random).
- `net_idx` - [in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
```
Proxy Client terminates a connection with the Proxy Server.

Parameters `conn_handle` - [in] Proxy connection handle.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)
```
Proxy Client sets the filter type of the Proxy Server.

Parameters
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `filter_type` - [in] whitelist or blacklist.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_addr_t addr, uint16_t addr_num)
```
Proxy Client adds address to the Proxy Server filter list.

Parameters
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `addr` - [in] Pointer to the filter address.
- `addr_num` - [in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.
**Chapter 2. API Reference**

```c
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```

Proxy Client removes address from the Proxy Server filter list.

**Parameters**
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `addr` - [in] Pointer to the filter address.
- `addr_num` - [in] Number of the filter address.

**Returns** ESP_OK on success or error code otherwise.

---

**ESP-BLE-MESH Models API Reference**

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

**Note:** Definitions related to Server Models are being updated, and will be released soon.

---

**Configuration Client/Server Models**

**Header File**
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h
Chapter 2. API Reference

Parameters

- **params** [in] Pointer to BLE Mesh common client parameters.
- **get_state** [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

Parameters

- **params** [in] Pointer to BLE Mesh common client parameters.
- **set_state** [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

Unions

The model publication status value

esp_ble_mesh_cfg_model_sub_status_cb_t model_sub_status
The model subscription status value

esp_ble_mesh_cfg_net_key_status_cb_t netkey_status
The netkey status value

esp_ble_mesh_cfg_app_key_status_cb_t appkey_status
The appkey status value

esp_ble_mesh_cfg_mod_app_status_cb_t model_app_status
The model app status value

esp_ble_mesh_cfg_friend_status_cb_t friend_status
The friend status value
```

**Public Members**

`esp_ble_mesh_cfg_server_state_change_t state_change`
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

**Structures**

struct `esp_ble_mesh_cfg_srv`
Configuration Server Model context

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to Configuration Server Model

`uint8_t net_transmit`
Network Transmit state

`uint8_t relay`
Relay Mode state
uint8_t relay_retransmit
   Relay Retransmit state

uint8_t beacon
   Secure Network Beacon state

uint8_t gatt_proxy
   GATT Proxy state

uint8_t friend_state
   Friend state

uint8_t default_ttl
   Default TTL

struct k_delayed_work timer
   Heartbeat Publication timer

uint16_t dst
   Destination address for Heartbeat messages

uint16_t count
   Number of Heartbeat messages to be sent
   Number of Heartbeat messages received

uint8_t period
   Period for sending Heartbeat messages

uint8_t ttl
   TTL to be used when sending Heartbeat messages

uint16_t feature
   Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
   NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
   Heartbeat Publication

int64_t expiry
   Timestamp when Heartbeat subscription period is expired

uint16_t src
   Source address for Heartbeat messages

uint8_t min_hops
   Minimum hops when receiving Heartbeat messages
uint8_t `max_hops`
   Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`
   Optional heartbeat subscription tracking function

struct `esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub`
   Heartbeat Subscription

struct `esp_ble_mesh_cfg_composition_data_get_t`
   Parameters of Config Composition Data Get.

**Public Members**

uint8_t `page`
   Page number of the Composition Data.

struct `esp_ble_mesh_cfg_model_pub_get_t`
   Parameters of Config Model Publication Get.

**Public Members**

uint16_t `element_addr`
   The element address

uint16_t `model_id`
   The model id

uint16_t `company_id`
   The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_sig_model_sub_get_t`
   Parameters of Config SIG Model Subscription Get.

**Public Members**

uint16_t `element_addr`
   The element address

uint16_t `model_id`
   The model id

struct `esp_ble_mesh_cfg_vnd_model_sub_get_t`
   Parameters of Config Vendor Model Subscription Get.
Public Members

\texttt{uint16_t element_addr}

The element address

\texttt{uint16_t model_id}

The model id

\texttt{uint16_t company_id}

The company id, if not a vendor model, shall set to 0xFFFF

\texttt{struct esp_ble_mesh_cfg_app_key_get_t}

Parameters of Config AppKey Get.

Public Members

\texttt{uint16_t net_idx}

The network key index

\texttt{struct esp_ble_mesh_cfg_node_identity_get_t}

Parameters of Config Node Identity Get.

Public Members

\texttt{uint16_t net_idx}

The network key index

\texttt{struct esp_ble_mesh_cfg_sig_model_app_get_t}

Parameters of Config SIG Model App Get.

Public Members

\texttt{uint16_t element_addr}

The element address

\texttt{uint16_t model_id}

The model id

\texttt{struct esp_ble_mesh_cfg_vnd_model_app_get_t}

Parameters of Config Vendor Model App Get.
# Chapter 2. API Reference

```c
uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_kr_phase_get_t
    Parameters of Config Key Refresh Phase Get.

    **Public Members**

    ```c
    uint16_t net_idx
        The network key index
    ```

```c
struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
    Parameters of Config Low Power Node PollTimeout Get.

    **Public Members**

    ```c
    uint16_t lpn_addr
        The unicast address of the Low Power node
    ```

```c
struct esp_ble_mesh_cfg_beacon_set_t
    Parameters of Config Beacon Set.

    **Public Members**

    ```c
    uint8_t beacon
        New Secure Network Beacon state
    ```

```c
struct esp_ble_mesh_cfg_default_ttl_set_t
    Parameters of Config Default TTL Set.

    **Public Members**

    ```c
    uint8_t ttl
        The default TTL state value
    ```

```c
struct esp_ble_mesh_cfg_friend_set_t
    Parameters of Config Friend Set.

    **Public Members**

    ```c
    uint8_t friend_state
        The friend state value
    ```
struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value

uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.
Chapter 2. API Reference

**Public Members**

`uint16_t element_addr`
- The element address

`uint16_t model_app_idx`
- Index of the app key to bind with the model

`uint16_t model_id`
- The model id

`uint16_t company_id`
- The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_pub_set_t

Parameters of Config Model Publication Set.
```

**Public Members**

`uint16_t element_addr`
- The element address

`uint16_t publish_addr`
- Value of the publish address

`uint16_t publish_app_idx`
- Index of the application key

`bool cred_flag`
- Value of the Friendship Credential Flag

`uint8_t publish_ttl`
- Default TTL value for the publishing messages

`uint8_t publish_period`
- Period for periodic status publishing

`uint8_t publish_retransmit`
- Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`
- The model id

`uint16_t company_id`
- The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_sub_add_t

Parameters of Config Model Subscription Add.
```
**Public Members**

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete.

**Public Members**

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be removed from the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_overwrite_t**

Parameters of Config Model Subscription Overwrite.

**Public Members**

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF
Chapter 2. API Reference

struct `esp_ble_mesh_cfg_model_sub_va_add_t`
Parameters of Config Model Subscription Virtual Address Add.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_va_delete_t`
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be removed from the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_va_overwrite_t`
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List
uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
    Parameters of Config Model Publication Virtual Address Set.

    **Public Members**

    uint16_t element_addr
        The element address

    uint8_t label_uuid[16]
        Value of the Label UUID publish address

    uint16_t publish_app_idx
        Index of the application key

    bool cred_flag
        Value of the Friendship Credential Flag

    uint8_t publish_ttl
        Default TTL value for the publishing messages

    uint8_t publish_period
        Period for periodic status publishing

    uint8_t publish_retransmit
        Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
    Parameters of Config Model Subscription Delete All.

    **Public Members**

    uint16_t element_addr
        The element address
uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
Parameters of Config NetKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint8_t **net_key[16]**
The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
Parameters of Config NetKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index

struct esp_ble_mesh_cfg_app_key_update_t
Parameters of Config AppKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint16_t **app_idx**
The app key index

uint8_t **app_key[16]**
The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
Parameters of Config AppKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index
uint16_t app_idx
   The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
   Parameters of Config Node Identity Set.

**Public Members**

uint16_t net_idx
   The network key index

uint8_t identity
   New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
   Parameters of Config Model App Unbind.

**Public Members**

uint16_t element_addr
   The element address

uint16_t model_app_idx
   Index of the app key to bind with the model

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
   Parameters of Config Key Refresh Phase Set.

**Public Members**

uint16_t net_idx
   The network key index

uint8_t transition
   New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t
   Parameters of Config Network Transmit Set.
Chapter 2. API Reference

**Public Members**

```
uint8_t net_transmit
    Network Transmit State
```

`struct esp_ble_meshCfgHeartbeatPubSet_t`
Parameters of Config Model Heartbeat Publication Set.

**Public Members**

```
uint16_t dst
    Destination address for Heartbeat messages

uint8_t count
    Number of Heartbeat messages to be sent

uint8_t period
    Period for sending Heartbeat messages

uint8_t ttl
    TTL to be used when sending Heartbeat messages

uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
    NetKey Index
```

`struct esp_ble_meshCfgHeartbeatSubSet_t`
Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

```
uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Period for receiving Heartbeat messages
```

`struct esp_ble_meshCfgBeaconStatusCb_t`
Parameter of Config Beacon Status
Public Members

`uint8_t beacon`
Secure Network Beacon state value

`struct esp_ble_mesh_cfg_comp_data_status_cb_t`
Parameters of Config Composition Data Status

Public Members

`uint8_t page`
Page number of the Composition Data

`struct net_buf_simple *composition_data`
Pointer to Composition Data for the identified page

`struct esp_ble_mesh_cfg_default_ttl_status_cb_t`
Parameter of Config Default TTL Status

Public Members

`uint8_t default_ttl`
Default TTL state value

`struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t`
Parameter of Config GATT Proxy Status

Public Members

`uint8_t gatt_proxy`
GATT Proxy state value

`struct esp_ble_mesh_cfg_relay_status_cb_t`
Parameters of Config Relay Status

Public Members

`uint8_t relay`
Relay state value

`uint8_t retransmit`
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

`struct esp_ble_mesh_cfg_model_pub_status_cb_t`
Parameters of Config Model Publication Status
## Public Members

**uint8_t status**
Status Code for the request message

**uint16_t element_addr**
Address of the element

**uint16_t publish_addr**
Value of the publish address

**uint16_t app_idx**
Index of the application key

**bool cred_flag**
Value of the Friendship Credential Flag

**uint8_t ttl**
Default TTL value for the outgoing messages

**uint8_t period**
Period for periodic status publishing

**uint8_t transmit**
Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16_t company_id**
Company ID

**uint16_t model_id**
Model ID

### Parameters of Config Model Subscription Status

**struct esp_ble_mesh_cfg_model_sub_status_cb_t**

- **Public Members**

  **uint8_t status**
  Status Code for the request message

  **uint16_t element_addr**
  Address of the element

  **uint16_t sub_addr**
  Value of the address

  **uint16_t company_id**
  Company ID
Chapter 2. API Reference

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID
uint16_t \texttt{model\_id}

Model ID

\textbf{Public Members}

\begin{itemize}
  \item uint8_t \texttt{friend\_state}
    \hspace{1em} Friend state value
  \item struct \texttt{esp\_ble\_mesh\_cfg\_friend\_status\_cb\_t}
    \hspace{1em} Parameter of Config Friend Status
\end{itemize}

\begin{itemize}
  \item uint16_t \texttt{dst}
    \hspace{1em} Destination address for Heartbeat messages
  \item uint8_t \texttt{count}
    \hspace{1em} Number of Heartbeat messages remaining to be sent
  \item uint8_t \texttt{period}
    \hspace{1em} Period for sending Heartbeat messages
  \item uint8_t \texttt{ttl}
    \hspace{1em} TTL to be used when sending Heartbeat messages
  \item uint16_t \texttt{features}
    \hspace{1em} Features that trigger Heartbeat messages when changed
  \item uint16_t \texttt{net\_idx}
    \hspace{1em} Index of the NetKey
\end{itemize}

\textbf{Public Members}

\begin{itemize}
  \item uint8_t \texttt{status}
    \hspace{1em} Status Code for the request message
\end{itemize}
uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Remaining Period for processing Heartbeat messages

uint8_t count
    Number of Heartbeat messages received

uint8_t min_hops
    Minimum hops when receiving Heartbeat messages

uint8_t max_hops
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
    Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count
    Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
    Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID
struct net_buf_simple *sub_addr
A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
Parameter of Config NetKey List

**Public Members**

struct net_buf_simple *net_idx
A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
Parameters of Config AppKey List

**Public Members**

uint8_t status
Status Code for the request message

uint16_t net_idx
NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t
Parameters of Config Node Identity Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t identity
Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
Parameters of Config SIG/Vendor Model App List

**Public Members**

uint8_t status
Status Code for the request message
uint16_t element_addr
Address of the element

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct net_buf_simple *app_idx
All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
Parameters of Config Key Refresh Phase Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t phase
Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

int32_t poll_timeout
The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters

Public Members

int error_code
Appropriate error code
The client common parameters

The config status message callback values

Configuration Server model related context.

**Public Members**

```c
uint16_t element_addr
    Element Address
```

```c
uint16_t pub_addr
    Publish Address
```

```c
uint16_t app_idx
    AppKey Index
```

```c
bool cred_flag
    Friendship Credential Flag
```

```c
uint8_t pub_ttl
    Publish TTL
```

```c
uint8_t pub_period
    Publish Period
```

```c
uint8_t pub_retransmit
    Publish Retransmit
```

```c
uint16_t company_id
    Company ID
```

```c
uint16_t model_id
    Model ID
```

Parameters of Config Model Subscription Add

**Public Members**

```c
uint16_t element_addr
    Element Address
```
uint16_t sub_addr
   Subscription Address

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
   Parameters of Config Model Subscription Delete

   Public Members

   uint16_t element_addr
      Element Address

   uint16_t sub_addr
      Subscription Address

   uint16_t company_id
      Company ID

   uint16_t model_id
      Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
   Parameters of Config NetKey Add

   Public Members

      AppKey Index

   uint16_t company_id
      Company ID

   uint16_t model_id
      Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
   Parameters of Config Key Refresh Phase Set

   Public Members

   uint16_t net_idx
      NetKey Index
uint8_t **kr_phase**
New Key Refresh Phase Transition

```c
struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to the server model structure
```

```c
esp_ble_mesh_msg_ctx_t ctx
Context of the received message
```

```c
esp_ble_mesh_cfg_server_cb_value_t value
Value of the received configuration messages
```

**Macros**

```c
ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
Define a new Config Server Model.
```

**Note:** The Config Server Model can only be included by a Primary Element.

**Parameters**

- `srv_data` - Pointer to a unique Config Server Model user_data.

**Returns** New Config Server Model instance.

```c
ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
Define a new Config Client Model.
```

**Note:** The Config Client Model can only be included by a Primary Element.

**Parameters**

- `cli_data` - Pointer to a unique struct `esp_ble_mesh_client_t`.

**Returns** New Config Client Model instance.

**Type Definitions**

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context
```

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
  esp_ble_mesh_cfg_client_cb_param_t *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

- `Param event` Event type
- `Param param` Pointer to callback parameter
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

**Param event** Event type
**Param param** Pointer to callback parameter

### Enumerations

**enum esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

*Values:*

enumerator ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

**enum esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

*Values:*

enumerator ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_CFG_SERVER_EVT_MAX

### Health Client/Server Models

#### Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

#### Functions

**esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)**

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

*Parameters callback* –*[in]* Pointer to the callback function.
*Returns* ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)**

Register BLE Mesh Health Server Model callback.

*Parameters callback* –*[in]* Pointer to the callback function.
*Returns* ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_health_client_get_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)*

This function is called to get the Health Server states using the Health Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

**Parameters**

- `get_state` – [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_client_set_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)*

This function is called to set the Health Server states using the Health Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

**Parameters**

- `set_state` – [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_server_fault_update** *(esp_ble_mesh_elem_t *element)*

This function is called by the Health Server Model to update the context of its Health Current status.

**Parameters**

**Returns** ESP_OK on success or error code otherwise.

**Unions**

**union esp_ble_mesh_health_client_get_state_t**

#include `<esp_ble_mesh_health_model_api.h>`

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

**Public Members**

**esp_ble_mesh_health_fault_get_t fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

**union esp_ble_mesh_health_client_set_state_t**

#include `<esp_ble_mesh_health_model_api.h>`

Public Members

`esp_ble_mesh_health_attention_set_t attention_set`
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

`esp_ble_mesh_health_period_set_t period_set`
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

`esp_ble_mesh_health_fault_test_t fault_test`
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

`esp_ble_mesh_health_fault_clear_t fault_clear`
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union `esp_ble_mesh_health_client_common_cb_param_t`
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

`esp_ble_mesh_health_current_status_cb_t current_status`
The health current status value

`esp_ble_mesh_health_fault_status_cb_t fault_status`
The health fault status value

`esp_ble_mesh_health_period_status_cb_t period_status`
The health period status value

`esp_ble_mesh_health_attention_status_cb_t attention_status`
The health attention status value

union `esp_ble_mesh_health_server_cb_param_t`
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.

Public Members

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

### Structures

**struct esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback

#### Public Members

**esp_ble_mesh_cb_t** `fault_clear`

Clear health registered faults. Initialized by the stack.

**esp_ble_mesh_cb_t** `fault_test`

Run a specific health test. Initialized by the stack.

**esp_ble_mesh_cb_t** `attention_on`

Health attention on callback. Initialized by the stack.

**esp_ble_mesh_cb_t** `attention_off`

Health attention off callback. Initialized by the stack.

**struct esp_ble_mesh_health_test_t**

ESP BLE Mesh Health Server test Context

#### Public Members

`uint8_t id_count`

Number of Health self-test ID

`const uint8_t *test_ids`

Array of Health self-test IDs

`uint16_t company_id`

Company ID used to identify the Health Fault state

`uint8_t prev_test_id`

Current test ID of the health fault test

`uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`

Array of current faults

`uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`

Array of registered faults
struct esp_ble_mesh_health_srv_t
    ESP BLE Mesh Health Server Model Context

Public Members

    esp_ble_mesh_model_t *model
        Pointer to Health Server Model

    esp_ble_mesh_health_srv_cb_t health_cb
        Health callback struct

struct k_delayed_work attention_timer
    Attention Timer state

bool attention_timer_start
    Attention Timer start flag

    esp_ble_mesh_health_test_t health_test
        Health Server fault test

struct esp_ble_mesh_health_fault_get_t
    Parameter of Health Fault Get

Public Members

    uint16_t company_id
        Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
    Parameter of Health Attention Set

Public Members

    uint8_t attention
        Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
    Parameter of Health Period Set

Public Members

    uint8_t fast_period_divisor
        Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
    Parameter of Health Fault Test
Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

uint8_t test_id
ID of a specific test to be performed

struct esp_ble_mesh_health_fault_clear_t
Parameter of Health Fault Clear

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
Parameters of Health Current Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
Parameters of Health Fault Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status
Chapter 2. API Reference

Public Members

```c
uint8_t fast_period_divisor
```
Divider for the Publish Period

```c
struct esp_ble_mesh_health_attention_status_cb_t
```
Parameter of Health Attention Status

Public Members

```c
uint8_t attention
```
Value of the Attention Timer state

```c
struct esp_ble_mesh_health_client_cb_param_t
```
Health Client Model callback parameters

Public Members

```c
int error_code
```
Appropriate error code

```c
esp_ble_mesh_client_common_param_t *params
```
The client common parameters.

```c
esp_ble_mesh_health_client_common_cb_param_t status_cb
```
The health message status callback values

```c
struct esp_ble_mesh_health_fault_update_comp_cb_t
```
Parameter of publishing Health Current Status completion event

Public Members

```c
int error_code
```
The result of publishing Health Current Status

```c
esp_ble_mesh_elem_t *element
```
Pointer to the element which contains the Health Server Model

```c
struct esp_ble_mesh_health_fault_clear_cb_t
```
Parameters of Health Fault Clear event

Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the Health Server Model

\begin{verbatim}
// Chapter 2. API Reference

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
    Parameters of Health Fault Test event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

    uint8_t test_id
        ID of a specific test to be performed

    uint16_t company_id
        Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
    Parameter of Health Attention On event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

    uint8_t time
        Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
    Parameter of Health Attention Off event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
    Define a new Health Server Model.

\end{verbatim}

\textbf{Note:} The Health Server Model can only be included by a Primary Element.

\begin{itemize}
    \item \textbf{srv} – Pointer to the unique struct \texttt{esp_ble_mesh_health_srv_t}.
    \item \textbf{pub} – Pointer to the unique struct \texttt{esp_ble_mesh_model_pub_t}.
\end{itemize}

\textbf{Returns} New Health Server Model instance.
**Chapter 2. API Reference**

**ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)**
Define a new Health Client Model.

*Note:* This API needs to be called for each element on which the application needs to have a Health Client Model.

**Parameters**
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Health Client Model instance.

**ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)**
A helper to define a health publication context

**Parameters**
- `_name` - Name given to the publication context variable.
- `_max` - Maximum number of faults the element can have.
- `_role` - Role of the device which contains the model.

**ESP_BLE_MESH_HEALTH_STANDARD_TEST**
SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP_BLE_MESH_NO_FAULT**
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,
esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

  Param event  Event type
  Param param  Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,
esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

  Param event  Event type
  Param param  Pointer to callback parameter
Enumerations

enum esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

enumerator ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t

This enum value is the event of Health Server Model

Values:

enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)

Register BLE Mesh Generic Client Model callback.

Parameters callback - [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_generic_client_get_state_t *get_state)
Chapter 2. API Reference

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

### Parameters
- `params` [in] Pointer to BLE Mesh common client parameters.
- `get_state` [in] Pointer to generic get message value. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

### Parameters
- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer to generic set message value. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Parameters**
- `callback` [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

### Unions

```c
union esp_ble_mesh_generic_client_get_state_t

Chapter 2. API Reference

**Structures**

`struct esp_ble_mesh_gen_onoff_set_t`
Bluetooth Mesh Generic Client Model Get and Set parameters structure.
Parameters of Generic OnOff Set.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint8_t onoff`
  Target value of Generic OnOff state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_level_set_t`
Parameters of Generic Level Set.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `int16_t level`
  Target value of Generic Level state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_delta_set_t`
Parameters of Generic Delta Set.
Public Members

bool op_en
   Indicate if optional parameters are included

int32_t level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
   Parameters of Generic Move Set.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set.
Chapter 2  API Reference

**Public Members**

```c
uint8_t onpowerup
```

The value of the Generic OnPowerUp state

```c
struct esp_ble_mesh_gen_power_level_set_t
```

Parameters of Generic Power Level Set.

**Public Members**

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint16_t power
```

Target value of Generic Power Actual state

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_gen_power_default_set_t
```

Parameter of Generic Power Default Set.

**Public Members**

```c
uint16_t power
```

The value of the Generic Power Default state

```c
struct esp_ble_mesh_gen_power_range_set_t
```

Parameters of Generic Power Range Set.

**Public Members**

```c
uint16_t range_min
```

Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```

Value of Range Max field of Generic Power Range state

```c
struct esp_ble_mesh_gen_loc_global_set_t
```

Parameters of Generic Location Global Set.
Public Members

```c
int32_t global_latitude
    Global Coordinates (Latitude)
```

```c
int32_t global_longitude
    Global Coordinates (Longitude)
```

```c
int16_t global_altitude
    Global Altitude
```

```c
struct esp_ble_mesh_gen_loc_local_set_t
    Parameters of Generic Location Local Set.
```

Public Members

```c
int16_t local_north
    Local Coordinates (North)
```

```c
int16_t local_east
    Local Coordinates (East)
```

```c
int16_t local_altitude
    Local Altitude
```

```c
uint8_t floor_number
    Floor Number
```

```c
uint16_t uncertainty
    Uncertainty
```

```c
struct esp_ble_mesh_gen_user_property_get_t
    Parameter of Generic User Property Get.
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic User Property
```

```c
struct esp_ble_mesh_gen_user_property_set_t
    Parameters of Generic User Property Set.
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic User Property
```
struct net_buf_simple *property_value
    Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
    Parameter of Generic Admin Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    struct esp_ble_mesh_gen_admin_property_set_t
        Parameters of Generic Admin Property Set.

        **Public Members**

        uint16_t property_id
            Property ID identifying a Generic Admin Property

        uint8_t user_access
            Enumeration indicating user access

        struct net_buf_simple *property_value
            Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
    Parameter of Generic Manufacturer Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
    Parameters of Generic Manufacturer Property Set.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

    uint8_t user_access
        Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
    Parameter of Generic Client Properties Get.
Chapter 2. API Reference

Public Members

uint16_t **property_id**
A starting Client Property ID present within an element

struct **esp_ble_mesh_gen_onoff_status_cb_t**
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

uint8_t **present_onoff**
Current value of Generic OnOff state

uint8_t **target_onoff**
Target value of Generic OnOff state (optional)

uint8_t **remain_time**
Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_level_status_cb_t**
Parameters of Generic Level Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

int16_t **present_level**
Current value of Generic Level state

int16_t **target_level**
Target value of the Generic Level state (optional)

uint8_t **remain_time**
Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_def_trans_time_status_cb_t**
Parameter of Generic Default Transition Time Status.
Chapter 2. API Reference

```
uint8_t trans_time  
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t  

Public Members

uint8_t onpowerup  
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t  
Parameters of Generic Power Level Status.

Public Members

bool op_en  
Indicate if optional parameters are included

uint16_t present_power  
Current value of Generic Power Actual state

uint16_t target_power  
Target value of Generic Power Actual state (optional)

uint8_t remain_time  
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t  
Parameter of Generic Power Last Status.

Public Members

uint16_t power  
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t  
Parameter of Generic Power Default Status.

Public Members

uint16_t power  
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t  
Parameters of Generic Power Range Status.
```
Public Members

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of Range Min field of Generic Power Range state

uint16_t range_max
   Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
   Parameters of Generic Battery Status.

Public Members

uint32_t battery_level
   Value of Generic Battery Level state

uint32_t time_to_discharge
   Value of Generic Battery Time to Discharge state

uint32_t time_to_charge
   Value of Generic Battery Time to Charge state

uint32_t flags
   Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
   Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
   Global Coordinates (Latitude)

int32_t global_longitude
   Global Coordinates (Longitude)

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
   Parameters of Generic Location Local Status.
Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)

int16_t local_altitude
   Local Altitude

uint8_t floor_number
   Floor Number

uint16_t uncertainty
   Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
   Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
   Parameters of Generic User Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic User Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
   Parameter of Generic Admin Properties Status.
Chapter 2. API Reference

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)
struct esp_ble_mesh_gen_client_properties_status_cb_t
    Parameter of Generic Client Properties Status.

    **Public Members**

    struct net_buf_simple *property_ids
        Buffer contains a sequence of N Client Property IDs

    struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

    **Public Members**

    int error_code
        Appropriate error code

    esp_ble_mesh_client_common_param_t *params
        The client common parameters.

    esp_ble_mesh_gen_client_status_cb_t status_cb
        The generic status message callback values

    struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

    **Public Members**

    uint8_t onoff
        The present value of the Generic OnOff state

    uint8_t target_onoff
        The target value of the Generic OnOff state

    struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

    **Public Members**

    esp_ble_mesh_model_t *model
        Pointer to the Generic OnOff Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

    esp_ble_mesh_gen_onoff_state_t state
        Parameters of the Generic OnOff state
Chapter 2. API Reference

**esp_ble_mesh_last_msg_info_t**
Parameters of the last received set message

**esp_ble_mesh_state_transition_t**
Parameters of state transition

**struct esp_ble_mesh_gen_level_state_t**
Parameters of Generic Level state

### Public Members

**int16_t level**
The present value of the Generic Level state

**int16_t target_level**
The target value of the Generic Level state

**int16_t last_level**
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

**int32_t last_delta**
The last delta change of the Generic Level state

**bool move_start**
Indicate if the transition of the Generic Level state has been started

**bool positive**
Indicate if the transition is positive or negative

**struct esp_ble_mesh_gen_level_srv_t**
User data of Generic Level Server Model

### Public Members

**esp_ble_mesh_model_t *model**
Pointer to the Generic Level Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_gen_level_state_t state**
Parameters of the Generic Level state

**esp_ble_mesh_last_msg_info_t last**
Parameters of the last received set message
Chapter 2. API Reference

`esp_ble_mesh_state_transition_t` `transition`
Parameters of state transition

`int32_t tt_delta_level`
Delta change value of level state transition

`struct esp_ble_mesh_gen_def_trans_time_state_t`
Parameter of Generic Default Transition Time state

**Public Members**

`uint8_t trans_time`
The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_def_trans_time_srv_t`
User data of Generic Default Transition Time Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Default Transition Time Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_def_trans_time_state_t state`
Parameters of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_state_t`
Parameter of Generic OnPowerUp state

**Public Members**

`uint8_t onpowerup`
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_onoff_srv_t`
User data of Generic Power OnOff Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power OnOff Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages
Chapter 2. API Reference

### esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state

```c
struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model
```

## Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_gen_power_level_state_t
Parameters of Generic Power Level state
```

## Public Members

```c
uint16_t power_actual
The present value of the Generic Power Actual state
```

```c
uint16_t target_power_actual
The target value of the Generic Power Actual state
```

```c
uint16_t power_last
The value of the Generic Power Last state
```

```c
uint16_t power_default
The value of the Generic Power Default state
```

```c
uint8_t status_code
The status code of setting Generic Power Range state
```

```c
uint16_t power_range_min
The minimum value of the Generic Power Range state
```

```c
uint16_t power_range_max
The maximum value of the Generic Power Range state
```

```c
struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model
```
Public Members

typedef esp_ble_mesh_model_t *model

Pointer to the Generic Power Level Server Model. Initialized internally.

typedef esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

typedef esp_ble_mesh_gen_power_level_state_t *state

Parameters of the Generic Power Level state

typedef esp_ble_mesh_last_msg_info_t last

Parameters of the last received set message

typedef esp_ble_mesh_state_transition_t transition

Parameters of state transition

int32_t tt_delta_level

Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t

User data of Generic Power Level Setup Server Model

Public Members

typedef esp_ble_mesh_model_t *model

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

typedef esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

typedef esp_ble_mesh_gen_power_level_state_t *state

Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t

Parameters of Generic Battery state

Public Members

uint32_t battery_level

The value of the Generic Battery Level state

uint32_t time_to_discharge

The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge

The value of the Generic Battery Time to Charge state
Chapter 2. API Reference

`uint32_t battery_flags`

The value of the Generic Battery Flags state

`struct esp_ble_mesh_gen_battery_srv_t`

User data of Generic Battery Server Model

**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to the Generic Battery Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_battery_state_t state`

Parameters of the Generic Battery state

`struct esp_ble_mesh_gen_location_state_t`

Parameters of Generic Location state

**Public Members**

`int32_t global_latitude`

The value of the Global Latitude field

`int32_t global_longitude`

The value of the Global Longitude field

`int16_t global_altitude`

The value of the Global Altitude field

`int16_t local_north`

The value of the Local North field

`int16_t local_east`

The value of the Local East field

`int16_t local_altitude`

The value of the Local Altitude field

`uint8_t floor_number`

The value of the Floor Number field

`uint16_t uncertainty`

The value of the Uncertainty field

`struct esp_ble_mesh_gen_location_srv_t`

User data of Generic Location Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
Parameters of the Generic Location state

`struct esp_ble_mesh_gen_location_setup_srv_t`
User data of Generic Location Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Location Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
Parameters of the Generic Location state

`struct esp_ble_mesh_generic_property_t`
Parameters of Generic Property states

Public Members

`uint16_t id`
The value of User/Admin/Manufacturer Property ID

`uint8_t user_access`
The value of User Access field

`uint8_t admin_access`
The value of Admin Access field

`uint8_t manu_access`
The value of Manufacturer Access field

`struct net_buf_simple *val`
The value of User/Admin/Manufacturer Property

`struct esp_ble_mesh_generic_user_prop_srv_t`
User data of Generic User Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic User Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic User Property state

struct `esp_ble_mesh_gen_admin_prop_srv_t`
User data of Generic Admin Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Admin Property state

struct `esp_ble_mesh_gen_manu_prop_srv_t`
User data of Generic Manufacturer Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state
Chapter 2. API Reference

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

uint8_t id_count
   Generic Client Property ID count

uint16_t *property_ids
   Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
   Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
   The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
   Parameter of Generic Level Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
   Parameter of Generic Delta Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
   Parameter of Generic Move Set state change event
Chapter 2. API Reference

Public Members

int16_t **level**
The value of Generic Level state

struct *esp_ble_mesh_state_change_gen_def_trans_time_set_t*
Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t **trans_time**
The value of Generic Default Transition Time state

struct *esp_ble_mesh_state_change_gen_onpowerup_set_t*
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t **onpowerup**
The value of Generic OnPowerUp state

struct *esp_ble_mesh_state_change_gen_power_level_set_t*
Parameter of Generic Power Level Set state change event

Public Members

uint16_t **power**
The value of Generic Power Actual state

struct *esp_ble_mesh_state_change_gen_power_default_set_t*
Parameter of Generic Power Default Set state change event

Public Members

uint16_t **power**
The value of Generic Power Default state

struct *esp_ble_mesh_state_change_gen_power_range_set_t*
Parameters of Generic Power Range Set state change event

Public Members

uint16_t **range_min**
The minimum value of Generic Power Range state
uint16_t range_max
   The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
  Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
   The Global Latitude value of Generic Location state

int32_t longitude
   The Global Longitude value of Generic Location state

int16_t altitude
   The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
  Parameters of Generic Location Local Set state change event

Public Members

int16_t north
   The Local North value of Generic Location state

int16_t east
   The Local East value of Generic Location state

int16_t altitude
   The Local Altitude value of Generic Location state

uint8_t floor_number
   The Floor Number value of Generic Location state

uint16_t uncertainty
   The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
  Parameters of Generic User Property Set state change event

Public Members

uint16_t id
   The property id of Generic User Property state
struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message
Chapter 2. API Reference

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

int16_t level
Target value of Generic Level state

uint8_t tid
Transaction ID
Chapter 2. API Reference

```c
uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
    Context of the received Generic Delta Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int32_t delta_level
    Delta change of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
    Context of the received Generic Move Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
    Context of the received Generic Default Transition Time Set message
```

Espressif Systems 652 Release v5.0-dev-4379-g36f49f361c
Submit Document Feedback
Chapter 2. API Reference

Public Members

uint8_t **trans_time**
The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
Context of the received Generic Power Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
Context of the received Generic Power Default Set message

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message
**Public Members**

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_server_recv_gen_loc_global_set_t`
Context of the received Generic Location Global Set message

**Public Members**

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

`struct esp_ble_mesh_server_recv_gen_loc_local_set_t`
Context of the received Generic Location Local Set message

**Public Members**

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

`struct esp_ble_mesh_server_recv_gen_user_property_set_t`
Context of the received Generic User Property Set message

**Public Members**

```c
uint16_t property_id
```
Property ID identifying a Generic User Property

```c
struct net_buf_simple *property_value
```
Raw value for the User Property

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
```
Context of the received Generic Admin Property Set message

**Public Members**

```c
uint16_t property_id
```
Property ID identifying a Generic Admin Property

```c
uint8_t user_access
```
Enumeration indicating user access

```c
struct net_buf_simple *property_value
```
Raw value for the Admin Property

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
```
Context of the received Generic Manufacturer Property Set message

**Public Members**

```c
uint16_t property_id
```
Property ID identifying a Generic Manufacturer Property

```c
uint8_t user_access
```
Enumeration indicating user access

```c
struct esp_ble_mesh_generic_server_cb_param_t
```
Generic Server Model callback parameters

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to Generic Server Models

```c
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received messages

```c
esp_ble_mesh_generic_server_cb_value_t value
```
Value of the received Generic Messages
Chapter 2. API Reference

**Macros**

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Default Transition Time Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Power Level Client Model instance.
Chapter 2. API Reference

Parameters
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Generic Power Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)
Define a new Generic Battery Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Parameters
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Generic Battery Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)
Define a new Generic Location Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Parameters
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)
Define a new Generic Property Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Parameters
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)
Generic Server Models related context.
Define a new Generic OnOff Server Model.

Note: 1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

Parameters
• srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data – Pointer to the unique struct esp_ble_mesh_gen_onoff_srv_t.

Returns New Generic OnOff Server Model instance.
**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note:** 1. The Generic Level Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**Returns** New Generic Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note:** 1. The Generic Default Transition Time Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**Returns** New Generic Default Transition Time Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note:** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
   b. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

**Returns** New Generic Power OnOff Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

   a. This model shall support model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note: 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_power_level_srv_t.

Returns New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

   a. This model shall support model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

Returns New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note: 1. The Generic Battery Server Model is a root model.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that is powered by a battery.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_battery_srv_t.

Returns New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)
Define a new Generic Location Server Model.

Note: 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that knows its location (global or local).

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_location_srv_t.

Returns New Generic Location Server Model instance.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note: 1. The Generic Location Setup Server model extends the Generic Location Server model.
   a. This model shall support model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_location_setup_srv_t.

Returns New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note: 1. The Generic User Property Server model is a root model.
   a. This model shall support model publication and model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_user_prop_srv_t.

Returns New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note: 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_admin_prop_srv_t.

Returns New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

Note: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_gen_manu_prop_srv_t.

Returns New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note: 1. The Generic Client Property Server model is a root model.
a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Returns** New Generic Client Property Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(
    esp_ble_mesh_generic_client_cb_event_t event,
    esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(
    esp_ble_mesh_generic_server_cb_event_t event,
    esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

- **Values:**
  - enumerator `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
  - enumerator `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
  - enumerator `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
  - enumerator `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`
  - enumerator `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

- **Values:**
  - enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
  - enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ`
  - enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`
enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_admin_prop_access_t**

This enum value is the access value of Generic Admin Property

*Values:*

enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

*Values:*

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

*Values:*

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

  i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.

  ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

**Sensor Client/Server Models**

**Header File**

Chapter 2. API Reference

Functions

**esp_err_t esp_ble_mesh_register_sensor_client_callback** *(esp_ble_mesh_sensor_client_cb_t callback)*

Register BLE Mesh Sensor Client Model callback.

**Parameters**

- **callback** *[in]* Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_sensor_client_get_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)*

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- **params** *[in]* Pointer to BLE Mesh common client parameters.
- **get_state** *[in]* Pointer to sensor get message value. Shall not be set to NULL.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_sensor_client_set_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)*

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble.mesh_defs.h

**Parameters**

- **params** *[in]* Pointer to BLE Mesh common client parameters.
- **set_state** *[in]* Pointer to sensor set message value. Shall not be set to NULL.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_sensor_server_callback** *(esp_ble_mesh_sensor_server_cb_t callback)*

Register BLE Mesh Sensor Server Model callback.

**Parameters**

- **callback** *[in]* Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
Parameters of Sensor Descriptor Get

Public Members

bool `op_en`
Indicate if optional parameters are included

uint16_t `property_id`
Property ID of a sensor (optional)

struct `esp_ble_mesh_sensor_cadence_get_t`
Parameter of Sensor Cadence Get

Public Members

uint16_t `property_id`
Property ID of a sensor

struct `esp_ble_mesh_sensor_cadence_set_t`
Parameters of Sensor Cadence Set
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
    Property ID for the sensor
```

```c
uint8_t fast_cadence_period_divisor
    Divisor for the publish period
```

```c
uint8_t status_trigger_type
    The unit and format of the Status Trigger Delta fields
```

```c
struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message
```

```c
struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message
```

```c
uint8_t status_min_interval
    Minimum interval between two consecutive Status messages
```

```c
struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range
```

```c
struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range
```

```c
struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get
```

Public Members

struct esp_ble_mesh_sensor_column_get_t
    Parameters of Sensor Column Get
```

Public Members

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
    Raw value identifying a column
```

```c
struct esp_ble_mesh_sensor_series_get_t
    Parameters of Sensor Series Get
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x1
    Raw value identifying a starting column (optional)
```
struct net_buf_simple *raw_value_x2  
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.  
Parameter of Sensor Descriptor Status

**Public Members**

struct net_buf_simple *descriptor  
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t  
Parameters of Sensor Cadence Status

**Public Members**

uint16_t property_id  
Property for the sensor

struct net_buf_simple *sensor_cadence_value  
Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t  
Parameters of Sensor Settings Status

**Public Members**

uint16_t sensor_property_id  
Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids  
A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t  
Parameters of Sensor Setting Status

**Public Members**

bool op_en  
Indicate if optional parameters are included

uint16_t sensor_property_id  
Property ID identifying a sensor
`uint16_t sensor_setting_property_id`
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`
Parameter of Sensor Status

**Public Members**

`struct net_buf_simple *marshalled_sensor_data`
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`
Parameters of Sensor Column Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`
Parameters of Sensor Series Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`
Sensor Client Model callback parameters

**Public Members**
int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance
The value of Sensor Positive Tolerance field

uint32_t negative_tolerance
The value of Sensor Negative Tolerance field

uint32_t sampling_function
The value of Sensor Sampling Function field

uint8_t measure_period
The value of Sensor Measurement Period field

uint8_t update_interval
The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state

Public Members

uint16_t property_id
The value of Sensor Setting Property ID field

uint8_t access
The value of Sensor Setting Access field

struct net_buf_simple *raw
The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state
Public Members

uint8_t **period_divisor**
The value of Fast Cadence Period Divisor field

uint8_t **trigger_type**
The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
Note: The parameter "size" in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the "size" precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up field

uint8_t **min_interval**
The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t **format**
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length**
The value of the Sensor Data length

struct net_buf_simple *raw_value
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members
struct net_buf_simple *raw_value_x
    The value of Sensor Raw Value X field

struct net_buf_simple *column_width
    The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
    The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
    Parameters of Sensor states

Public Members

uint16_t sensor_property_id
    The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
    Parameters of the Sensor Descriptor state

const uint8_t *setting_count
    Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
    Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t *cadence
    The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t sensor_data
    Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t series_column
    Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t
    User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
const uint8_t \texttt{state\_count}  
Sensor state count

\texttt{esp\_ble\_mesh\_sensor\_state\_t \*states}  
Parameters of the Sensor states

\textbf{Public Members}

\texttt{esp\_ble\_mesh\_model\_t \*model}  
Pointer to the Sensor Setup Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \*rsp\_ctrl}  
Response control of the server model received messages

const uint8_t \texttt{state\_count}  
Sensor state count

\texttt{esp\_ble\_mesh\_sensor\_state\_t \*states}  
Parameters of the Sensor states

\textbf{Public Members}

uint16_t \texttt{property\_id}  
The value of Sensor Property ID state

uint8_t \texttt{period\_divisor}  
The value of Fast Cadence Period Divisor state

uint8_t \texttt{trigger\_type}  
The value of Status Trigger Type state

struct net_buf_simple \texttt{*trigger\_delta\_down}  
The value of Status Trigger Delta Down state

struct net_buf_simple \texttt{*trigger\_delta\_up}  
The value of Status Trigger Delta Up state

uint8_t \texttt{min\_interval}  
The value of Status Min Interval state
struct net_buf_simple *fast_cadence_low
   The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
   The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
   Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
   The value of Sensor Property ID state

uint16_t setting_property_id
   The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
   The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
   Context of the received Sensor Descriptor Get message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
   Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
   Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
   Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
   Property ID of a sensor
struct esp_ble_mesh_server_recv_sensor_setting_get_t
Context of the received Sensor Setting Get message

**Public Members**

uint16_t property_id
Property ID of a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
Context of the received Sensor Get message

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
Context of the received Sensor Column Get message

**Public Members**

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)
struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

**Public Members**

uint16_t `property_id`
Property ID for the sensor

struct net_buf_simple *`cadence`
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

**Public Members**

uint16_t `property_id`
Property ID identifying a sensor

uint16_t `setting_property_id`
Setting ID identifying a setting within a sensor

struct net_buf_simple *`setting_raw`
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to Sensor Server Models

`esp_ble_mesh_msg_ctx_t *ctx`
Context of the received messages

`esp_ble_mesh_sensor_server_cb_value_t *value`
Value of the received Sensor Messages

**Macros**

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Sensor Client Model.
Parameters

- **cli_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns

New Sensor Client Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

Note: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

Parameters

- **srv_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** - Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

Returns

New Sensor Server Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

Note: 1. The Sensor Setup Server model extends the Sensor Server model.

   a. This model shall support model publication and model subscription.

Parameters

- **srv_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** - Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

Returns

New Sensor Setup Server Model instance.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**

Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**

Length of Sensor Property ID

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**

Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**

Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**

Not applicable Sensor Update Interval
Chapter 2. API Reference

**ESP BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID**
Invalid Sensor Setting Property ID

**ESP BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN**
Length of Sensor Setting Property ID

**ESP BLE_MESH_SENSOR_SETTING_ACCESS_LEN**
Length of Sensor Setting Access

**ESP BLE_MESH_SENSOR_SETTING_ACCESS_READ**
Sensor Setting Access - Read

**ESP BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type “uint16”

**ESP BLE_MESH_SENSOR_DATA_FORMAT_A**
Sensor Data Format A

**ESP BLE_MESH_SENSOR_DATA_FORMAT_B**
Sensor Data Format B

**ESP BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN**
MPID length of Sensor Data Format A

**ESP BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN**
MPID length of Sensor Data Format B

**ESP BLE_MESH_SENSOR_DATA_ZERO_LEN**
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)
Get format of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.

**Returns** Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.
- **_fmt** – Format of the sensor data.

**Returns** Length (zero-based) of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.
- **_fmt** – Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)
Generate a MPID value for sensor data with Format A.

**Note:** 1. The Format field is 0b0 and indicates that Format A is used.
   a. The Length field is a 1-based uint4 value (valid range 0x0~0xF, representing range of 1~16).
   b. The Property ID is an 11-bit bit field representing 11 LSB of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x800.

**Parameters**
- **_len** – Length of Sensor Raw value.
- **_id** – Sensor Property ID.

**Returns** 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)
Generate a MPID value for sensor data with Format B.

**Note:** 1. The Format field is 0b1 and indicates Format B is used.
a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
b. The Property ID is a 16-bit bit field representing a Property ID.
c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Parameters**

- `__len` – Length of Sensor Raw value.
- `__id` – Sensor Property ID.

**Returns** 3-octet MPID value for sensor data with Format B.

**Type Definitions**

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

- **Values:**
  - enumerator ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
  - enumerator ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
  - enumerator ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
  - enumerator ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
  - enumerator ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func

This enum value is value of Sensor Sampling Function

- **Values:**
  - enumerator ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
enumerator ESP_BLE_MESH_SAMPLE_FUNC_RMS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

enumerator ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

Parameters

  callback – [in] Pointer to the callback function.

Returns

  ESP_OK on success or error code otherwise.
Chapter 2. API Reference

`esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)`

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- **params** [-in] Pointer to BLE Mesh common client parameters.
- **get_state** [-in] Pointer to time scene get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state)`

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- **params** [-in] Pointer to BLE Mesh common client parameters.
- **set_state** [-in] Pointer to time scene set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)`

Register BLE Mesh Time and Scenes Server Model callback.

**Parameters**
- **callback** [-in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```
union esp_ble_mesh_time_scene_client_get_state_t
{
    #include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model get message union.
}
```

**Public Members**

```

**Structures**

```c
struct esp_ble_mesh_time_set_t
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
Parameters of Time Set
```

**Public Members**

```
uint8_t tai_seconds[5]
The current TAI time in seconds
```

```
uint8_t sub_second
The sub-second time in units of 1/256 second
```

```
uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps
```

```
uint16_t time_authority
0 = No Time Authority, 1 = Time Authority
```

```
uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds
```

```
uint8_t time_zone_offset
The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_zone_set_t
Parameters of Time Zone Set
```

**Public Members**

```
uint8_t time_zone_offset_new
Upcoming local time zone offset
```

```
uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_tai_utc_delta_set_t
Parameters of TAI-UTC Delta Set
```

**Public Members**

```
uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds
```
uint16_t padding
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Second time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set

    Public Members

    uint8_t time_role
        The Time Role for the element

struct esp_ble_mesh_scene_store_t
    Parameter of Scene Store

    Public Members

    uint16_t scene_number
        The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
    Parameters of Scene Recall

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t scene_number
        The number of scenes to be recalled

    uint8_t tid
        Transaction ID

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
    Parameter of Scene Delete
Chapter 2. API Reference

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Scheduled days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action
uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_status_cb_t
    Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t sub_second
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
    Current local time zone offset

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status
Public Members

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint16_t padding_1
Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t padding_2
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
Parameter of Time Role Status

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t status_code
Status code of the last operation

uint16_t current_scene
Scene Number of the current scene

uint16_t target_scene
Scene Number of the target scene (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status
Public Members

uint8_t **status_code**
Status code for the previous operation

uint16_t **current_scene**
Scene Number of the current scene

struct net_buf_simple **scenes**
A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status

Public Members

uint16_t **schedules**
Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t **index**
Enumerates (selects) a Schedule Register entry

uint64_t **year**
Scheduled year for the action

uint64_t **month**
Scheduled month for the action

uint64_t **day**
Scheduled day of the month for the action

uint64_t **hour**
Scheduled hour for the action

uint64_t **minute**
Scheduled minute for the action

uint64_t **second**
Scheduled second for the action

uint64_t **day_of_week**
Scheduled days of the week for the action
**uint64_t** `action`
Action to be performed at the scheduled time

**uint64_t** `trans_time`
Transition time for this action

**uint16_t** `scene_number`
Transition time for this action

**struct esp_ble_mesh_time_scene_client_cb_param_t**
Time Scene Client Model callback parameters

**Public Members**

**int** `error_code`
Appropriate error code

* `esp_ble_mesh_client_common_param_t *params`
The client common parameters.

* `esp_ble_mesh_time_scene_client_status_cb_t status_cb`
The scene status message callback values

**struct esp_ble_mesh_time_state_t**
Parameters of Time state

**Public Members**

**uint8_t** `tai_seconds[5]`
The value of the TAI Seconds state

**uint8_t** `subsecond`
The value of the Subsecond field

**uint8_t** `uncertainty`
The value of the Uncertainty field

**uint8_t** `time_zone_offset_curr`
The value of the Time Zone Offset Current field

**uint8_t** `time_zone_offset_new`
The value of the Time Zone Offset New state

**uint8_t** `tai_zone_change[5]`
The value of the TAI of Zone Chaneg field
Chapter 2. API Reference

```
uint16_t time_authority
    The value of the Time Authority bit

uint16_t tai_utc_delta_curr
    The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new
    The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
    The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t time
    Parameters of the Time state

uint8_t time_role
    The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_time_state_t *state
    Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
    User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_time_state_t *state
    Parameters of the Time state
```
struct esp_ble_mesh_scene_register_t

a. Scene Store is an operation of storing values of a present state of an element.
b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t scene_number

The value of the Scene Number

uint8_t scene_type

The value of the Scene Type

struct net_buf_simple *scene_value

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct esp_ble_mesh_scenes_state_t

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count

The Scenes state’s scene count

esp_ble_mesh_scene_register_t *scenes

Parameters of the Scenes state

uint16_t current_scene

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.
When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene

The Target scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code

The status code of the last scene operation

bool in_progress

Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

**Public Members**

* esp_ble_mesh_model_t *model
  Pointer to the Scene Server Model. Initialized internally.

* esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

* esp_ble_mesh_scenes_state_t *state
  Parameters of the Scenes state

* esp_ble_mesh_last_msg_info_t *last
  Parameters of the last received set message

* esp_ble_mesh_state_transition_t *transition
  Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model
Chapter 2. API Reference

Public Members

*esp_ble_mesh_model_t* model

Pointer to the Scene Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl

Response control of the server model received messages

*esp_ble_mesh_scenes_state_t* state

Parameters of the Scenes state

struct esp_ble_mesh_schedule_register_t

Parameters of Scheduler Register state

Public Members

bool in_use

Indicate if the registered schedule is in use

uint64_t year

The value of Scheduled year for the action

uint64_t month

The value of Scheduled month for the action

uint64_t day

The value of Scheduled day of the month for the action

uint64_t hour

The value of Scheduled hour for the action

uint64_t minute

The value of Scheduled minute for the action

uint64_t second

The value of Scheduled second for the action

uint64_t day_of_week

The value of Schedule days of the week for the action

uint64_t action

The value of Action to be performed at the scheduled time

uint64_t trans_time

The value of Transition time for this action

uint16_t scene_number

The value of Scene Number to be used for some actions
struct esp_ble_mesh_scheduler_state_t
   Parameters of Scheduler state

   Public Members

   const uint8_t schedule_count
      Scheduler count

   esp_ble_mesh_schedule_register_t *schedules
      Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t
   User data of Scheduler Server Model

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Scheduler Server Model. Initialized internally.

   esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
      Response control of the server model received messages

   esp_ble_mesh_scheduler_state_t *state
      Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
   User data of Scheduler Setup Server Model

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Scheduler Setup Server Model. Initialized internally.

   esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
      Response control of the server model received messages

   esp_ble_mesh_scheduler_state_t *state
      Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
   Parameters of Time Set state change event

   Public Members

   uint8_t tai_seconds[5]
      The current TAI time in seconds
Chapter 2. API Reference

```c
uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]

// TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_state_change_tai_utc_delta_set_t

// Parameters of TAI UTC Delta Set state change event
```

**Public Members**

```c
uint16_t tai_utc_delta_new

// Upcoming difference between TAI and UTC in seconds
```

```c
uint8_t tai_delta_change[5]

// TAI Seconds time of the upcoming TAI-UTC Delta change
```

**Public Members**

```c
uint8_t time_role

// The Time Role for the element
```

```c
struct esp_ble_mesh_state_change_time_role_set_t

// Parameter of Time Role Set state change event
```

**Public Members**

```c
uint16_t scene_number

// The number of scenes to be stored
```

```c
struct esp_ble_mesh_state_change_scene_store_t

// Parameter of Scene Store state change event
```

**Public Members**

```c
uint16_t scene_number

// The number of scenes to be recalled
```

```c
struct esp_ble_mesh_state_change_scene_recall_t

// Parameter of Scene Recall state change event
```

**Public Members**

```c
uint16_t scene_number

// The number of scenes to be deleted
```
struct esp_ble_mesh_state_change_scheduler_act_set_t

Parameter of Scheduler Action Set state change event

**Public Members**

- `uint64_t index`
  Index of the Schedule Register entry to set

- `uint64_t year`
  Scheduled year for the action

- `uint64_t month`
  Scheduled month for the action

- `uint64_t day`
  Scheduled day of the month for the action

- `uint64_t hour`
  Scheduled hour for the action

- `uint64_t minute`
  Scheduled minute for the action

- `uint64_t second`
  Scheduled second for the action

- `uint64_t day_of_week`
  Schedule days of the week for the action

- `uint64_t action`
  Action to be performed at the scheduled time

- `uint64_t trans_time`
  Transition time for this action

- `uint16_t scene_number`
  Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t

Context of the received Scheduler Action Get message

**Public Members**

- `uint8_t index`
  Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t

Context of the received Time Set message
Public Members

uint8_t **tai_seconds[5]
The current TAI time in seconds

uint8_t **subsecond
The sub-second time in units of 1/256 second

uint8_t **uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
Context of the received Time Zone Set message

Public Members

uint8_t **time_zone_offset_new
Upcoming local time zone offset

uint8_t **tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message

Public Members

uint16_t **tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t **padding
Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
Context of the received Time Role Set message
Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
    Context of the received Scene Store message

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
    Context of the received Scene Recall message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t scene_number
    The number of scenes to be recalled

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
    Context of the received Scene Delete message

Public Members

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
    Context of the received Scheduler Action Set message
Public Members

uint64_t index
   Index of the Schedule Register entry to set

uint64_t year
   Scheduled year for the action

uint64_t month
   Scheduled month for the action

uint64_t day
   Scheduled day of the month for the action

uint64_t hour
   Scheduled hour for the action

uint64_t minute
   Scheduled minute for the action

uint64_t second
   Scheduled second for the action

uint64_t day_of_week
   Scheduled day of the week for the action

uint64_t action
   Action to be performed at the scheduled time

uint64_t trans_time
   Transition time for this action

uint16_t scene_number
   Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
   Context of the received Time Status message

Public Members

uint8_t tai_seconds[5]
   The current TAI time in seconds

uint8_t subsecond
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps
Chapter 2. API Reference

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t value
Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)
Define a new Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Time Client Model.

Parameters
  • cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)
Define a new Scene Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scene Client Model.

Parameters
  • cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Scene Client Model instance.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_SCHEDULER_CLI** (cli_pub, cli_data)

Define a new Scheduler Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Scheduler Client Model instance.

**ESP_BLE_MESH_MODEL_TIME_SRV** (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note:** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

**Returns** New Time Server Model instance.

**ESP_BLE_MESH_MODEL_TIME_SETUP_SRV** (srv_data)

Define a new Time Setup Server Model.

**Note:** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

   a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

   b. This model does not support subscribing nor publishing.

**Parameters**
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

**Returns** New Time Setup Server Model instance.

**ESP_BLE_MESH_MODEL_SCENE_SRV** (srv_pub, srv_data)

Define a new Scene Server Model.

**Note:** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. The model may be present only on the Primary element of a node.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

---

Submit Document Feedback
Returns New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_scene_setup_srv_t.

Returns New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_scheduler_srv_t.

Returns New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

Note: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_scheduler_setup_srv_t.

Returns New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change
Chapter 2. API Reference

**ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**
Every 15 seconds of the Scheduled minute
Chapter 2. API Reference

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC**
Every 20 seconds of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN**
Once of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF**
Scheduled Action - Turn Off

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON**
Scheduled Action - Turn On

**ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL**
Scheduled Action - Scene Recall

**ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION**
Scheduled Action - No Action

**ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE**
Scheduled Scene - No Scene

**ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX**
Maximum number of Scheduled entries

**ESP_BLE_MESH_TIME_NONE**
Time Role - None

**ESP_BLE_MESH_TIME_AUTHORITY**
Time Role - Mesh Time Authority

**ESP_BLE_MESH_TIME_RELAY**
Time Role - Mesh Time Relay

**ESP_BLE_MESH_TIME_CLINET**
Time Role - Mesh Time Client

**ESP_BLE_MESH_SCENE_SUCCESS**
Scene operation - Success

**ESP_BLE_MESH_SCENE_REG_FULL**
Scene operation - Scene Register Full

**ESP_BLE_MESH_SCENE_NOT_FOUND**
Scene operation - Scene Not Found

**Type Definitions**
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
Chapter 2. API Reference

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when TIme Status message is received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)
```

Register BLE Mesh Light Client Model callback.

**Parameters**

- callback

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params,
                                          esp_ble_mesh_light_client_get_state_t *get_state)
```

Get the value of Light Server Model states using the Light Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- params

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_light_client_set_state_t *set_state)
```

Set the value of Light Server Model states using the Light Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- params

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)
```

Register BLE Mesh Lighting Server Model callback.

**Parameters**

- callback

**Returns**

ESP_OK on success or error code otherwise.

uint16_t present_lightness
```
Current value of light lightness actual state

```c
uint16_t target_lightness
```
Target value of light lightness actual state (optional)

```c
uint8_t remain_time
```
Time to complete state transition (C.1)

```c
struct esp_ble_mesh_light_lightness_linear_status_cb_t
```
Parameters of Light Lightness Linear Status

**Public Members**

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t present_lightness
```
Current value of light lightness linear state
uint16_t \texttt{target\_lightness}

Target value of light lightness linear state (optional)

uint8_t \texttt{remain\_time}

Time to complete state transition (C.1)

\begin{verbatim}
struct esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t
\end{verbatim}

Parameter of Light Lightness Last Status

**Public Members**

uint16_t \texttt{lightness}

The value of the Light Lightness Last state

\begin{verbatim}
struct esp\_ble\_mesh\_light\_lightness\_default\_status\_cb\_t
\end{verbatim}

Parameter of Light Lightness Default Status

**Public Members**

uint16_t \texttt{lightness}

The value of the Light Lightness default State

\begin{verbatim}
struct esp\_ble\_mesh\_light\_lightness\_range\_status\_cb\_t
\end{verbatim}

Parameters of Light Lightness Range Status

**Public Members**

uint8_t \texttt{status\_code}

Status Code for the request message

uint16_t \texttt{range\_min}

Value of range min field of light lightness range state

uint16_t \texttt{range\_max}

Value of range max field of light lightness range state

\begin{verbatim}
struct esp\_ble\_mesh\_light\_ctl\_status\_cb\_t
\end{verbatim}

Parameters of Light CTL Status

**Public Members**

bool \texttt{op\_en}

Indicate if optional parameters are included

uint16_t \texttt{present\_ctl\_lightness}

Current value of light ctl lightness state
`uint16_t present_ctl_temperature`
Current value of light ctl temperature state

`uint16_t target_ctl_lightness`
Target value of light ctl lightness state (optional)

`uint16_t target_ctl_temperature`
Target value of light ctl temperature state (C.1)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_ctl_temperature_status_cb_t`
Parameters of Light CTL Temperature Status

**Public Members**

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_ctl_temperature`
Current value of light ctl temperature state

`uint16_t present_ctl_delta_uv`
Current value of light ctl delta UV state

`uint16_t target_ctl_temperature`
Target value of light ctl temperature state (optional)

`uint16_t target_ctl_delta_uv`
Target value of light ctl delta UV state (C.1)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t`
Parameters of Light CTL Temperature Range Status

**Public Members**

`uint8_t status_code`
Status code for the request message

`uint16_t range_min`
Value of temperature range min field of light ctl temperature range state
.uint16_t range_max
  Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
  Parameters of Light CTL Default Status

  Public Members

.uint16_t lightness
  Value of light lightness default state

.uint16_t temperature
  Value of light temperature default state

.int16_t delta_uv
  Value of light delta UV default state

struct esp_ble_mesh_light_hsl_status_cb_t
  Parameters of Light HSL Status

  Public Members

  Current value of light hsl lightness state

.uint16_t hsl_hue
  Current value of light hsl hue state

.uint16_t hsl_saturation
  Current value of light hsl saturation state

.uint8_t remain_time
  Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
  Parameters of Light HSL Target Status

  Public Members

.bool op_en
  Indicate if optional parameters are included
Chapter 2. API Reference

`uint16_t hsl_lightness_target`
Target value of light hsl lightness state

`uint16_t hsl_hue_target`
Target value of light hsl hue state

`uint16_t hsl_saturation_target`
Target value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

```c
struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status
```

**Public Members**

bool `op_en`
Indicate if optional parameters are included

`uint16_t present_hue`
Current value of light hsl hue state

`uint16_t target_hue`
Target value of light hsl hue state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

```c
struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status
```

**Public Members**

bool `op_en`
Indicate if optional parameters are included

`uint16_t present_saturation`
Current value of light hsl saturation state

`uint16_t target_saturation`
Target value of light hsl saturation state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

```c
struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status
```
Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t hue`
Value of light hue default state

`uint16_t saturation`
Value of light saturation default state

`struct esp_ble_mesh_light_hsl_range_status_cb_t`
Parameters of Light HSL Range Status

Public Members

`uint8_t status_code`
Status code for the request message

`uint16_t hue_range_min`
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`
Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`
Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`
Value of saturation range max field of light hsl saturation range state

`struct esp_ble_mesh_light_xyl_status_cb_t`
Parameters of Light xyL Status

Public Members

`bool op_en`
Indicate whether optional parameters included

`uint16_t xyl_lightness`
The present value of the Light xyL Lightness state

`uint16_t xyl_x`
The present value of the Light xyL x state

`uint16_t xyl_y`
The present value of the Light xyL y state
struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

Public Members

uint8_t status_code
Status Code for the requesting message
uint16_t \textit{xyl\_x\_range\_min}

The value of the \textit{xyl\_x\_Range\_Min} field of the Light \textit{xyl\_x\_Range} state

uint16_t \textit{xyl\_x\_range\_max}

The value of the \textit{xyl\_x\_Range\_Max} field of the Light \textit{xyl\_x\_Range} state

uint16_t \textit{xyl\_y\_range\_min}

The value of the \textit{xyl\_y\_Range\_Min} field of the Light \textit{xyl\_y\_Range} state

uint16_t \textit{xyl\_y\_range\_max}

The value of the \textit{xyl\_y\_Range\_Max} field of the Light \textit{xyl\_y\_Range} state

\textbf{struct} \textit{esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t}

Parameter of Light LC Mode Status

\textbf{Public Members}

uint8_t \textit{mode}

The present value of the Light LC Mode state

\textbf{struct} \textit{esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t}

Parameter of Light LC OM Status

\textbf{Public Members}

uint8_t \textit{mode}

The present value of the Light LC Occupancy Mode state

\textbf{struct} \textit{esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t}

Parameters of Light LC Light OnOff Status

\textbf{Public Members}

bool \textit{op\_en}

Indicate whether optional parameters included

uint8_t \textit{present\_light\_onoff}

The present value of the Light LC Light OnOff state

uint8_t \textit{target\_light\_onoff}

The target value of the Light LC Light OnOff state (Optional)

uint8_t \textit{remain\_time}

Time to complete state transition (C.1)

\textbf{struct} \textit{esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t}

Parameters of Light LC Property Status
Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_light_client_cb_param_t`
Lighting Client Model callback parameters

Public Members

`int error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_light_client_status_cb_t status_cb`
The light status message callback values

Public Members

`uint16_t lightness_linear`
The present value of Light Lightness Linear state

`uint16_t target_lightness_linear`
The target value of Light Lightness Linear state

`uint16_t lightness_actual`
The present value of Light Lightness Actual state

`uint16_t target_lightness_actual`
The target value of Light Lightness Actual state

`uint16_t lightness_last`
The value of Light Lightness Last state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint8_t status_code`
The status code of setting Light Lightness Range state
uint16_t lightness_range_min
The minimum value of Light Lightness Range state

uint16_t lightness_range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
**esp_ble_mesh_light_lightness_state_t** *state*

Parameters of the Light Lightness state

**struct esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

**Public Members**

```c
uint16_t lightness
    The present value of Light CTL Lightness state

uint16_t target_lightness
    The target value of Light CTL Lightness state

uint16_t temperature
    The present value of Light CTL Temperature state

uint16_t target_temperature
    The target value of Light CTL Temperature state

int16_t delta_uv
    The present value of Light CTL Delta UV state

int16_t target_delta_uv
    The target value of Light CTL Delta UV state

uint8_t status_code
    The statue code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t temperature_default
    The value of Light CTL Temperature Default state

int16_t delta_uv_default
    The value of Light CTL Delta UV Default state
```

**struct esp_ble_mesh_light_ctl_srv_t**

User data of Light CTL Server Model
Chapter 2. API Reference

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_setup_srv_t`
User data of Light CTL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.
**esp_ble_mesh_server_rsp_ctrl_t**

`rsp_ctrl`

Response control of the server model received messages

**esp_ble_mesh_light_ctl_state_t**

`state`

Parameters of the Light CTL state

**esp_ble_mesh_last_msg_info_t**

`last`

Parameters of the last received set message

**esp_ble_mesh_state_transition_t**

`transition`

Parameters of state transition

**int32_t**

`tt_delta_temperature`

Delta change value of temperature state transition

**int32_t**

`tt_delta_delta_uv`

Delta change value of delta uv state transition

**struct esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

**Public Members**

**uint16_t**

`lightness`

The present value of Light HSL Lightness state

**uint16_t**

`target_lightness`

The target value of Light HSL Lightness state

**uint16_t**

`hue`

The present value of Light HSL Hue state

**uint16_t**

`target_hue`

The target value of Light HSL Hue state

**uint16_t**

`saturation`

The present value of Light HSL Saturation state

**uint16_t**

`target_saturation`

The target value of Light HSL Saturation state

**uint16_t**

`lightness_default`

The value of Light Lightness Default state

**uint16_t**

`hue_default`

The value of Light HSL Hue Default state
Chapter 2. API Reference

uint16_t __attribute__((aligned(2))) saturation_default
    The value of Light HSL Saturation Default state

uint8_t __attribute__((aligned(1))) status_code
    The status code of setting Light HSL Hue & Saturation Range state

uint16_t __attribute__((aligned(2))) hue_range_min
    The minimum value of Light HSL Hue Range state

uint16_t __attribute__((aligned(2))) hue_range_max
    The maximum value of Light HSL Hue Range state

uint16_t __attribute__((aligned(2))) saturation_range_min
    The minimum value of Light HSL Saturation state

uint16_t __attribute__((aligned(2))) saturation_range_max
    The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
    User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
    Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

struct `esp_ble_mesh_light_hsl_state_t` Users data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

struct `esp_ble_mesh_light_hsl_sat_srv_t` Users data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state
### esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

### esp_ble_mesh_state_transition_t transition
Parameters of state transition

### int32_t tt_delta_saturation
Delta change value of saturation state transition

### struct esp_ble_mesh_light_xyl_state_t
Parameters of Light xyL state

#### Public Members

- **uint16_t lightness**
  The present value of Light xyL Lightness state

- **uint16_t target_lightness**
  The target value of Light xyL Lightness state

- **uint16_t x**
  The present value of Light xyL x state

- **uint16_t target_x**
  The target value of Light xyL x state

- **uint16_t y**
  The present value of Light xyL y state

- **uint16_t target_y**
  The target value of Light xyL y state

- **uint16_t lightness_default**
  The value of Light Lightness Default state

- **uint16_t x_default**
  The value of Light xyL x Default state

- **uint16_t y_default**
  The value of Light xyL y Default state

- **uint8_t status_code**
  The status code of setting Light xyL x & y Range state

- **uint16_t x_range_min**
  The minimum value of Light xyL x Range state

uint16_t x_range_max
    The maximum value of Light xyL x Range state

uint16_t y_range_min
    The minimum value of Light xyL y Range state

uint16_t y_range_max
    The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
    User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
    Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_x
    Delta change value of x state transition

int32_t tt_delta_y
    Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
    User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting xyL Setup Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyl state

struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states

Public Members

uint32_t mode
0b0 The controller is turned off.
• The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
• The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t occupancy_mode
The value of Light LC Occupancy Mode state

uint32_t light_onoff
The present value of Light LC Light OnOff state

uint32_t target_light_onoff
The target value of Light LC Light OnOff state

uint32_t occupancy
The value of Light LC Occupancy state

uint32_t ambient_luxlevel
The value of Light LC Ambient LuxLevel state

uint16_t linear_output
i. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
ii. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
iii. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members
uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC OccupancyDelay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
The value of transition time of Light LC Time Fade Standby Auto

The value of transition time of Light LC Time Fade Standby Manual

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

The value of Light LC state machine state

Timer of Light LC state machine

Parameters of Light Lightness controller

Parameters of Light LC state

Parameters of Light LC Property state

Parameters of Light LC state machine

User data of Light LC Server Model

Pointer to the Lighting LC Server Model. Initialized internally.

Response control of the server model received messages

Parameters of the Light controller

Parameters of the last received set message
**esp_ble_mesh_state_transition_t**

Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

**Public Members**

**esp_ble_mesh_model_t** *model

Pointer to the Lighting LC Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t** *rsp_ctrl

Response control of the server model received messages

**esp_ble_mesh_light_control_t** *lc

Parameters of the Light controller

**struct esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Actual state

**struct esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Linear state

**struct esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Default state

**struct esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event
Public Members

uint16_t range_min
   The minimum value of Light Lightness Range state

uint16_t range_max
   The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t
   Parameters of Light CTL state change event

Public Members

uint16_t lightness
   The value of Light CTL Lightness state

uint16_t temperature
   The value of Light CTL Temperature state

int16_t delta_uv
   The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
   Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
   The value of Light CTL Temperature state

int16_t delta_uv
   The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
   Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
   The minimum value of Light CTL Temperature Range state

uint16_t range_max
   The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
   Parameters of Light CTL Default state change event
Public Members

```c
uint16_t lightness
  The value of Light Lightness Default state

uint16_t temperature
  The value of Light CTL Temperature Default state

int16_t delta_uv
  The value of Light CTL Delta UV Default state
```

```c
struct esp_ble_mesh_state_change_light_hsl_set_t
  Parameters of Light HSL state change event

Public Members

```c
uint16_t lightness
  The value of Light HSL Lightness state

uint16_t hue
  The value of Light HSL Hue state

uint16_t saturation
  The value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_state_change_light_hsl_hue_set_t
  Parameter of Light HSL Hue state change event

Public Members

```c
uint16_t hue
  The value of Light HSL Hue state
```

```c
struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
  Parameter of Light HSL Saturation state change event

Public Members

```c
uint16_t saturation
  The value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_state_change_light_hsl_default_set_t
  Parameters of Light HSL Default state change event
```
Public Members

```c
uint16_t lightness
The value of Light HSL Lightness Default state
```

```c
uint16_t hue
The value of Light HSL Hue Default state
```

```c
uint16_t saturation
The value of Light HSL Saturation Default state
```

```c
struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event
```

Public Members

```c
uint16_t hue_range_min
The minimum hue value of Light HSL Range state
```

```c
uint16_t hue_range_max
The maximum hue value of Light HSL Range state
```

```c
uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state
```

```c
uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state
```

```c
struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyl state change event
```

Public Members

```c
uint16_t lightness
The value of Light xyl Lightness state
```

```c
uint16_t x
The value of Light xyl x state
```

```c
uint16_t y
The value of Light xyl y state
```

```c
struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyl Default state change event
```
Public Members

`uint16_t lightness`
The value of Light Lightness Default state

`uint16_t x`
The value of Light xyl x Default state

`uint16_t y`
The value of Light xyl y Default state

```c
struct esp_ble_mesh_state_change_light_xyl_range_set_t
```
Parameters of Light xyl Range state change event

Public Members

`uint16_t x_range_min`
The minimum value of Light xyl x Range state

`uint16_t x_range_max`
The maximum value of Light xyl x Range state

`uint16_t y_range_min`
The minimum value of Light xyl y Range state

`uint16_t y_range_max`
The maximum value of Light xyl y Range state

```c
struct esp_ble_mesh_state_change_light_lc_mode_set_t
```
Parameter of Light LC Mode state change event

Public Members

`uint8_t mode`
The value of Light LC Mode state

```c
struct esp_ble_mesh_state_change_light_lc_om_set_t
```
Parameter of Light LC Occupancy Mode state change event

Public Members

`uint8_t mode`
The value of Light LC Occupancy Mode state

```c
struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
```
Parameter of Light LC Light OnOff state change event
Chapter 2. API Reference

Public Members

`uint8_t onoff`
The value of Light LC Light OnOff state

`struct esp_ble_mesh_state_change_light_lc_property_set_t`
Parameters of Light LC Property state change event

Public Members

`uint16_t property_id`
The property id of Light LC Property state

`struct net_buf_simple *property_value`
The property value of Light LC Property state

`struct esp_ble_mesh_state_change_sensor_status_t`
Parameters of Sensor Status state change event

Public Members

`uint16_t property_id`
The value of Sensor Property ID

`uint8_t occupancy`
The value of Light LC Occupancy state

`uint32_t set_occupancy_to_1_delay`
The value of Light LC Set Occupancy to 1 Delay state

`uint32_t ambient_luxlevel`
The value of Light LC Ambient Luxlevel state

`union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state`
Parameters of Sensor Status related state

`struct esp_ble_mesh_server_recv_light_lc_property_get_t`
Context of the received Light LC Property Get message

Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct esp_ble_mesh_server_recv_light_lightness_set_t`
Context of the received Light Lightness Set message
Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t lightness
  Target value of light lightness actual state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
  Context of the received Light Lightness Linear Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t lightness
  Target value of light lightness linear state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
  Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
  The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
  Context of the received Light Lightness Range Set message
Public Members

```c
uint16_t range_min
    Value of range min field of light lightness range state
```

```c
uint16_t range_max
    Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_set_t
    Context of the received Light CTL Set message
```

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t lightness
    Target value of light ctl lightness state
```

  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
  Context of the received Light CTL Temperature Range Set message

  **Public Members**

  uint16_t range_min
    Value of temperature range min field of light ctl temperature range state

  uint16_t range_max
    Value of temperature range max field of light ctl temperature range state

```

```c
struct esp_ble_mesh_server_recv_light_ctl_default_set_t
  Context of the received Light CTL Default Set message

  **Public Members**

  uint16_t lightness
    Value of light lightness default state

  uint16_t temperature
    Value of light temperature default state

  int16_t delta_uv
    Value of light delta UV default state

```

```c
struct esp_ble_mesh_server_recv_light_hsl_set_t
  Context of the received Light HSL Set message

  **Public Members**

  bool op_en
    Indicate if optional parameters are included

  uint16_t lightness
    Target value of light hsl lightness state
```
uint16_t hue
    Target value of light hsl hue state

uint16_t saturation
    Target value of light hsl saturation state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
    Context of the received Light HSL Hue Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t hue
    Target value of light hsl hue state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
    Context of the received Light HSL Saturation Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t saturation
    Target value of light hsl hue state
uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
    Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
    Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
    Context of the received Light xyL Set message

Public Members
bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyL Lightness state

uint16_t x
The target value of the Light xyL x state

uint16_t y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyL x Default state

uint16_t y
The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

Public Members

uint16_t x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message
Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

```c
struct esp_ble_mesh_server_recv_sensor_status_t
```
Context of the received Sensor Status message

Public Members

```c
struct net_buf_simple *data
```
Value of sensor data state (optional)

`struct esp_ble_mesh_lighting_server_cb_param_t`
Lighting Server Model callback parameters

Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to Lighting Server Models

```c
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received messages

```c
esp_ble_mesh_lighting_server_cb_value_t value
```
Value of the received Lighting Messages

Macros

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)
```
Define a new Light Lightness Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Parameters**

- **cli_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** — Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**

New Light Lightness Client Model instance.

```c
ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)
```
Define a new Light CTL Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Parameters

• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)
Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters

• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)
Define a new Light xyL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters

• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light xyL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)
Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters

• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

Parameters

• srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data – Pointer to the unique struct esp_ble_mesh_light_lightness_srv_t.
Chapter 2. API Reference

Returns New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

Note: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
   a. This model shall support model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.

Returns New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)
Define a new Light CTL Server Model.

Note: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

Returns New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

Note: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

Parameters
   • srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.

Returns New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

Note: 1. The Light CTL Temperature Server model extends the Generic Level Server model.
   a. This model shall support model publication and model subscription.
Chapter 2. API Reference

Parameters
• **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

Returns New Light CTL Temperature Server Model instance.

```plaintext
ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)
Define a new Light HSL Server Model.
```

**Note:**
1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Parameters
• **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

Returns New Light HSL Server Model instance.

```plaintext
ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.
```

**Note:**
1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

Parameters
• **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

Returns New Light HSL Setup Server Model instance.

```plaintext
ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.
```

**Note:**
1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   a. This model shall support model publication and model subscription.

Parameters
• **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

Returns New Light HSL Hue Server Model instance.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

**Note:**  1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**Returns**  New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xyL Server Model.

**Note:**  1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**Returns**  New Light xyL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xyL Setup Server Model.

**Note:**  1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**Returns**  New Light xyL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)
Define a new Light LC Server Model.

**Note:**  1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.
Returns New Light LC Server Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)`

Define a new Light LC Setup Server Model.

**Note:** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   a. This model shall support model publication and model subscription.
   b. This model may be used to configure setup parameters for the Light LC Server model.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Returns** New Light LC Setup Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

**Lighting Client Model callback function type**

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

**Lighting Server Model callback function type**

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

- **Values:**
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT`
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT`
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT`
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

- **Values:**
  - enumerator `ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
enumerator `ESP_BLE_MESH_LC_OFF`

enumerator `ESP_BLE_MESH_LC_STANDBY`

enumerator `ESP_BLE_MESH_LC_FADE_ON`

enumerator `ESP_BLE_MESH_LC_RUN`

enumerator `ESP_BLE_MESH_LC_FADE`

enumerator `ESP_BLE_MESH_LC_PROLONG`

enumerator `ESP_BLE_MESH_LC_FADE_STANDBY_AUTO`

enumerator `ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL`

enum `esp_ble_mesh_lighting_server_cb_event_t`

This enum value is the event of Lighting Server Model

Values:

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT`

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT`

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT`

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT`

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX`

### 2.3.6 NimBLE-based host APIs

**Overview**

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features
of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

**Architecture**

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

**Threading Model**

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

**Programming Sequence**

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

**API Reference**

**Header File**

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`
**Functions**

*esp_err_t esp_nimble_hci_init (void)*

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Returns**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

*esp_err_t esp_nimble_hci_deinit (void)*

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note:** This function should be called after the NimBLE host is deinitialized.

**Returns**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**Macros**

BLE_HCI_UART_H4_NONE

BLE_HCI_UART_H4_CMD

BLE_HCI_UART_H4_ACL

BLE_HCI_UART_H4_SCO

BLE_HCI_UART_H4_EVT

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For use cases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only use cases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF)

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

**2.4 Error Codes Reference**

This section lists various error code constants defined in ESP-IDF.
For general information about error codes in ESP-IDF, see Error Handling.

ESP_FAIL (-1): Generic esp_err_t code indicating failure
ESP_OK (0): esp_err_t value indicating success (no error)
ESP_ERR_NO_MEM (0x101): Out of memory
ESP_ERR_INVALID_ARG (0x102): Invalid argument
ESP_ERR_INVALID_STATE (0x103): Invalid state
ESP_ERR_INVALID_SIZE (0x104): Invalid size
ESP_ERR_NOT_FOUND (0x105): Requested resource not found
ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported
ESP_ERR_TIMEOUT (0x107): Operation timed out
ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid
ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid
ESP_ERR_INVALID_VERSION (0x10a): Version was invalid
ESP_ERR_INVALID_MAC (0x10b): MAC address was invalid
ESP_ERR NOT_FINISHED (0x10c): There are items remained to retrieve
ESP_ERR_NVS_BASE (0x1100): Starting number of error codes
ESP_ERR_NVS_NOT_INITIALIZED (0x1101): The storage driver is not initialized
ESP_ERR_NVS_NOT_FOUND (0x1102): A requested entry couldn’t be found or namespace doesn’t exist yet
ESP_ERR_NVS_TYPE_MISMATCH (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
ESP_ERR_NVS_READ_ONLY (0x1104): Storage handle was opened as read only
ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105): There is not enough space in the underlying storage to save the value
ESP_ERR_NVS_INVALID_NAME (0x1106): Namespace name doesn’t satisfy constraints
ESP_ERR_NVS_INVALID_HANDLE (0x1107): Handle has been closed or is NULL
ESP_ERR_NVS_REMOVE_FAILED (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
ESP_ERR_NVS_KEY_TOO_LONG (0x1109): Key name is too long
ESP_ERR_NVS_PAGE_FULL (0x110a): Internal error; never returned by nvs API functions
ESP_ERR_NVS_INVALID_STATE (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.
ESP_ERR_NVS_INVALID_LENGTH (0x110c): String or blob length is not sufficient to store data
ESP_ERR_NVS_NO_FREE_PAGES (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.
ESP_ERR_NVS_VALUE_TOO_LONG (0x110e): Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation
ESP_ERR_NVS_PART_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table
ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code
ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111): XTS encryption failed while writing NVS entry
**ESP_ERR_NVS_XTS_DECRIPTION_FAILED (0x1112):** XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED (0x1113):** XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114):** XTS configuration not found

**ESP_ERR_NVS_ENCRYPTION_NOT_SUPPORTED (0x1115):** XTS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116):** NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117):** NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS (0x1118):** Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119):** NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE (0x1200):** Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG (0x1201):** Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202):** Load address is outside of RTC memory reserved for the ULP

**ESP_ERR_ULP_DUPLICATE_LABEL (0x1203):** More than one label with the same number was defined

**ESP_ERR_ULP_UNDEFINED_LABEL (0x1204):** Branch instructions references an undefined label

**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205):** Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE (0x1500):** Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT (0x1501):** Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502):** Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED (0x1503):** Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER (0x1504):** Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA.Rollback_FAILED (0x1505):** Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA.Rollback_INVALID_STATE (0x1506):** Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**ESP_ERR_EFUSE (0x1600):** Base error code for efuse api.

**ESP_OK_EFUSE_CNT (0x1601):** OK the required number of bits is set.

**ESP.ERR_EFUSE_CNT_IS_FULL (0x1602):** Error field is full.

**ESP.ERR.EFUSE.REPEATED_PROG (0x1603):** Error repeated programming of programmed bits is strictly forbidden.

**ESP.ERR_CODING (0x1604):** Error while a encoding operation.

**ESP.ERR_NOT_ENOUGH UNUSED_KEY_BLOCKS (0x1605):** Error not enough unused key blocks available

**ESP.ERR.DAMAGED_READING (0x1606):** Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out
ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)
ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer
2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview  ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7~</td>
<td></td>
</tr>
<tr>
<td>255 bytes</td>
<td>4 bytes</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value filed is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security  ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.
PMK is used to encrypt LMK with the AES-128 algorithm. Call \texttt{esp_now_set_pmk()} to set PMK. If PMK is not set, a default PMK will be used.

LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call \texttt{esp_now_init()} to initialize ESP-NOW and \texttt{esp_now_deinit()} to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When \texttt{esp_now_deinit()} is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call \texttt{esp_now_add_peer()} to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 16, the default is 6.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call \texttt{esp_now_send()} to send ESP-NOW data and \texttt{esp_now_register_send_cb()} to register sending callback function. It will return \texttt{ESP_NOW_SEND_SUCCESS} in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return \texttt{ESP_NOW_SEND_FAIL}. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call \texttt{esp_now_send()} to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call \texttt{esp_now_register_recv_cb()} to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call \texttt{esp_wifi_config_espnow_rate()} to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after \texttt{esp_wifi_start()}.

**Application Examples**
- Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.
Chapter 2. API Reference

Header File

- components/esp_wifi/include/esp_now.h

Functions

`esp_err_t esp_now_init (void)`
Initialize ESPNOW function.

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_INTERNAL: Internal error

`esp_err_t esp_now_deinit (void)`
De-initialize ESPNOW function.

Returns

- ESP_OK: succeed

`esp_err_t esp_now_get_version (uint32_t *version)`
Get the version of ESPNOW.

Parameters version - ESPNOW version

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_ARG: invalid argument

`esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)`
Register callback function of receiving ESPNOW data.

Parameters cb - callback function of receiving ESPNOW data

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

`esp_err_t esp_now_unregister_recv_cb (void)`
Unregister callback function of receiving ESPNOW data.

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

`esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)`
Register callback function of sending ESPNOW data.

Parameters cb - callback function of sending ESPNOW data

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

`esp_err_t esp_now_unregister_send_cb (void)`
Unregister callback function of sending ESPNOW data.

Returns

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

`esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)`
Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
**Chapter 2. API Reference**

**Attention** 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN

**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

**Parameters**

- **peer_addr** – peer MAC address
- **data** – data to send
- **len** – length of data

**Returns**

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error
- ESP_ERR_ESPNOW_NO_MEM: out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
- ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)
```

Add a peer to peer list.

**Parameters** peer – peer information

**Returns**

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_EXIST: peer has existed

```c
esp_err_t esp_now_del_peer (const uint8_t *peer_addr)
```

Delete a peer from peer list.

**Parameters** **peer_addr** – peer MAC address

**Returns**

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

```c
esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)
```

Modify a peer.

**Parameters** peer – peer information

**Returns**

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

```c
esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_start().

**Parameters**

- **ifx** – Interface to be configured.
- **rate** – Phy rate to be configured.

**Returns**

- ESP_OK: succeed
• others: failed

```c
esp_err_t esp_now_get_peer (const uint8_t *peer_addr, esp_now_peer_info_t *peer)
```

Get a peer whose MAC address matches `peer_addr` from peer list.

**Parameters**

- `peer_addr` – peer MAC address
- `peer` – peer information

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

```c
esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)
```

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- `from_head` – fetch from head of list or not
- `peer` – peer information

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

```c
bool esp_now_is_peer_exist (const uint8_t *peer_addr)
```

Peer exists or not.

**Parameters**

- `peer_addr` – peer MAC address

**Returns**

- `true`: peer exists
- `false`: peer not exists

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t *num)
```

Get the number of peers.

**Parameters**

- `num` – number of peers

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument

```c
esp_err_t esp_now_set_pmk (const uint8_t *pmk)
```

Set the primary master key.

**Attention**

1. primary master key is used to encrypt local master key

**Parameters**

- `pmk` – primary master key

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument

```c
esp_err_t esp_now_set_wake_window (uint16_t window)
```

Set wake window for esp_now to wake up in interval unit.
Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

Parameters window – Milliseconds would the chip keep waked each interval, from 0 to 65535.

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

Structures

struct esp_now_peer_info

ESPNOW peer information parameters.

Public Members

uint8_t peer_addr[ESP_NOW_ETH_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8_t channel

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt

ESPNOW data that this peer sends/receives is encrypted or not

void *priv

ESPNOW peer private data

struct esp_now_peer_num

Number of ESPNOW peers which exist currently.

Public Members

int total_num

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num

Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
Chapter 2. API Reference

Macros

**ESP_ERR_ESPNOW_BASE**
ESPNOW error number base.

**ESP_ERR_ESPNOW_NOT_INIT**
ESPNOW is not initialized.

**ESP_ERR_ESPNOW_ARG**
Invalid argument

**ESP_ERR_ESPNOW_NO_MEM**
Out of memory

**ESP_ERR_ESPNOW_FULL**
ESPNOW peer list is full

**ESP_ERR_ESPNOW_NOT_FOUND**
ESPNOW peer is not found

**ESP_ERR_ESPNOW_INTERNAL**
Internal error

**ESP_ERR_ESPNOW_EXIST**
ESPNOW peer has existed

**ESP_ERR_ESPNOW_IF**
Interface error

**ESP_NOW_ETH_ALEN**
Length of ESPNOW peer MAC address

**ESP_NOW_KEY_LEN**
Length of ESPNOW peer local master key

**ESP_NOW_MAX_TOTAL_PEER_NUM**
Maximum number of ESPNOW total peers

**ESP_NOW_MAX_ENCRYPT_PEER_NUM**
Maximum number of ESPNOW encrypted peers

**ESP_NOW_MAX_DATA_LEN**
Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
Chapter 2. API Reference

typedef void (*esp_now_recv_cb_t)(const uint8_t*mac_addr, const uint8_t*data, int data_len)

Callback function of receiving ESPNOW data.

- **Param mac_addr**: peer MAC address
- **Param data**: received data
- **Param data_len**: length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t*mac_addr, esp_now_send_status_t status)

Callback function of sending ESPNOW data.

- **Param mac_addr**: peer MAC address
- **Param status**: status of sending ESPNOW data (succeed or fail)

Enumerations

enum esp_now_send_status_t

Status of sending ESPNOW data.

**Values:**

- enumerator **ESP_NOW_SEND_SUCCESS**: Send ESPNOW data successfully
- enumerator **ESP_NOW_SEND_FAIL**: Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. **ESP-WIFI-MESH Programming Model**
2. **Writing an ESP-WIFI-MESH Application**
3. **Self Organized Networking**
4. **Application Examples**
5. **API Reference**

For documentation regarding the ESP-WIFI-MESH protocol, please see the **ESP-WIFI-MESH API Guide**. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

**Software Stack**  The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

**System Events**  An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The **mesh_event_id_t** defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register
a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect.scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`**. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately **obtain an IP address**. Doing so will allow other nodes to begin transmitting/receiving packets to/from
Chapter 2. API Reference

the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. Initialize Mesh
2. Configuring an ESP-WIFI-MESH Network
3. Start Mesh

Initialize Mesh The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
```

Configuring an ESP-WIFI-MESH Network ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
if((channel = CONFIG_MESH_CHANNEL);
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
```

(continues on next page)
Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self Organized Networking**  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in Building a Network)
- Selection of a preferred parent node (see **Parent Node Selection** in Building a Network)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

**Toggling Self Organized Networking**  Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking**  The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking**  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
Select Parent | Is Root Node | Effects |
--- | --- | --- |
N | N | • Nodes already connected to a parent node will remain connected.  
• Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
Y | | • A root node already connected to router will stay connected.  
• A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
Y | N | • Nodes without a parent node will automatically select a preferred parent and connect.  
• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
Y | | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API**  
There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using...
ESP-WIFI-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0);  //Don't select new parent
esp_mesh_connect();  //Manually reconnect to router
```

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

```c
esp_err_t esp_mesh_init(void)
```

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention  This API shall be called after Wi-Fi is started.

Returns

- ESP_OK
- ESP_FAIL

Submit Document Feedback
**esp_err_t** esp_mesh_deinit (void)

Mesh de-initialization.

- **Returns**
  - ESP_OK
  - ESP_FAIL

**esp_err_t** esp_mesh_start (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

- **Returns**
  - ESP_OK
  - ESP_FAIL
  - ESP_ERR_MESH_NOT_INIT
  - ESP_ERR_MESH_NOT_CONFIG
  - ESP_ERR_MESH_NO_MEMORY

**esp_err_t** esp_mesh_stop (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

- **Returns**
  - ESP_OK
  - ESP_FAIL

**esp_err_t** esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.
**Attention** This API is not reentrant.

**Parameters**

- **to** - [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.

- **data** - [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

- **flag** - [in] bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root ( “to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

- **opt** - [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

- **opt_count** - [in] option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```
Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Parameters**
- `time_ms` **[in]** blocking time of esp_mesh_send(), unit: ms

**Returns**
- ESP_OK

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**
- `from` **[out]** the address of the original source of the packet
- `data` **[out]** pointer to the received mesh packet
  - Field `proto` is the data protocol in use. Should follow it to parse the received data.
  - Field `tos` is the transmission `tos` (type of service) in use.
- `timeout_ms` **[in]** wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- `flag` **[out]** bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- `opt` **[out]** options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- `opt_count` **[in]** option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.
flag could be MESH_DATA_TODS.

**Attention** This API is only called by the root.

### Parameters
- **from** - [out] the address of the original source of the packet
- **to** - [out] the address contains remote IP address and port (IPv4:PORT)
- **data** - [out] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** - [in] wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** - [out] bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** - [out] options desired to receive
- **opt_count** - [in] option count desired to receive

### Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

### Parameters
- **config** - [in] pointer to mesh stack configuration

### Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

Get mesh stack configuration.
Parameters `config` –[out] pointer to mesh stack configuration

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_set_router` (const `mesh_router_t *router`)
Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Parameters `router` –[in] pointer to router configuration

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_get_router` (mesh_router_t *router)
Get router configuration.

Parameters `router` –[out] pointer to router configuration

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_set_id` (const `mesh_addr_t *id`)
Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

Parameters `id` –[in] pointer to mesh network ID

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

`esp_err_t esp_mesh_get_id` (mesh_addr_t *id)
Get mesh network ID.

Parameters `id` –[out] pointer to mesh network ID

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_set_type` (mesh_type_t `type`)
Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Parameters `type` –[in] device type

Returns
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
**mesh_type_t esp_mesh_get_type (void)**
Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** mesh type

**esp_err_t esp_mesh_set_max_layer (int max_layer)**
Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters**
- **max_layer** - [in] max layer value

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**int esp_mesh_get_max_layer (void)**
Get max layer value.

**Returns** max layer value

**esp_err_t esp_mesh_set_ap_password (const uint8_t *pwd, int len)**
Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**
- **pwd** - [in] pointer to the password
- **len** - [in] password length

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)**
Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters**
- **authmode** - [in] authentication mode

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**

Get mesh softAP authentication mode.

**Returns** authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** connections [in] the number of max connections

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**int esp_mesh_get_ap_connections (void)**

Get mesh max connection configuration.

**Returns** the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**

Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

**int esp_mesh_get_layer (void)**

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Parameters** bssid [out] pointer to parent BSSID

**Returns**
- ESP_OK
- ESP_FAIL

**bool esp_mesh_is_root (void)**

Return whether the device is the root node of the network.

**Returns** true/false

**esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)**

Enable/disable self-organized networking.
Chapter 2. API Reference

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Parameters**
- `enable` [in] enable or disable self-organized networking
- `select_parent` [in] Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

**Returns**
- ESP_OK
- ESP_FAIL

`bool esp_mesh_get_self_organized (void)`
Return whether enable self-organized networking or not.

**Returns** true/false

`esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)`
Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Parameters**
- `vote` [in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- `reason` [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

**Returns**
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

`esp_err_t esp_mesh_set_vote_percentage (float percentage)`
Set vote percentage threshold for approval of being a root (default:0.9)
• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters**
- **percentage** – [in] vote percentage threshold

**Returns**
- ESP_OK
- ESP_FAIL

```c
float esp_mesh_get_vote_percentage (void)
```
Get vote percentage threshold for approval of being a root.

**Returns**
- percentage threshold

```c
esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
```
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters**
- **seconds** – [in] the expired time

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_mesh_get_ap_assoc_expire (void)
```
Get mesh softAP associate expired time.

**Returns**
- seconds

```c
int esp_mesh_get_total_node_num (void)
```
Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns**
- total number of devices (including the root)

```c
int esp_mesh_get_routing_table_size (void)
```
Get the number of devices in this device’s sub-network (including self)

**Returns**
- the number of devices over this device’s sub-network (including self)

```c
esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
```
Get routing table of this device’s sub-network (including itself)

**Parameters**
- **mac** – [out] pointer to routing table
- **len** – [in] routing table size (in bytes)
- **size** – [out] pointer to the number of devices in routing table (including itself)

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_post_toDS_state (bool reachable)
```
Post the toDS state to the mesh stack.
**Attention**  This API is only for the root.

**Parameters**  reachable  -[in]  this state represents whether the root is able to access external IP network

**Returns**
- ESP_OK
- ESP_FAIL

```
esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
```

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters**  pending  -[out]  pointer to the TX pending

**Returns**
- ESP_OK
- ESP_FAIL

```
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
```

Return the number of packets available in the queue waiting to be received by applications.

**Parameters**  pending  -[out]  pointer to the RX pending

**Returns**
- ESP_OK
- ESP_FAIL

```
int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
```

Return the number of packets could be accepted from the specified address.

**Parameters**
- addr  -[in]  self address or an associate children address
- xseqno_in  -[out]  sequence number of the last received packet from the specified address

**Returns**  the number of upQ for a certain address

```
esp_err_t esp_mesh_set_xon_qsize (int qsize)
```

Set the number of queue.

**Attention**  This API shall be called before mesh is started.

**Parameters**  qsize  -[in]  default:32 (min:16)

**Returns**
- ESP_OK
- ESP_FAIL

```
int esp_mesh_get_xon_qsize (void)
```

Get queue size.

**Returns**  the number of queue

```
esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
```

Set whether allow more than one root existing in one network.

**Parameters**  allowed  -[in]  allow or not

**Returns**
- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

```
bool esp_mesh_is_root_conflicts_allowed (void)
```

Check whether allow more than one root to exist in one network.

**Returns**  true/false
**esp_err_t esp_mesh_set_group_id (const mesh_addr_t *addr, int num)**
Set group ID addresses.

**Parameters**
- *addr* [in] pointer to new group ID addresses
- *num* [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**esp_err_t esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)**
Delete group ID addresses.

**Parameters**
- *addr* [in] pointer to deleted group ID address
- *num* [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_group_num (void)**
Get the number of group ID addresses.

**Returns**
the number of group ID addresses

**esp_err_t esp_mesh_get_group_list (mesh_addr_t *addr, int num)**
Get group ID addresses.

**Parameters**
- *addr* [out] pointer to group ID addresses
- *num* [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**bool esp_mesh_is_my_group (const mesh_addr_t *addr)**
Check whether the specified group address is my group.

**Returns**
true/false

**esp_err_t esp_mesh_set_capacity_num (int num)**
Set mesh network capacity (max:1000, default:300)

**Attention**
This API shall be called before mesh is started.

**Parameters**
- *num* [in] mesh network capacity

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_capacity_num (void)**
Get mesh network capacity.

**Returns**
mesh network capacity

**esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)**
Set mesh IE crypto functions.

**Attention**
This API can be called at any time after mesh is initialized.
Parameters **crypto_funcs**  -[in] crypto functions for mesh IE
  • If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

**Returns**
  • ESP_OK

*esp_err_t* esp_mesh_set_ie_crypto_key (const char *key, int len)
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Parameters**
  • **key**  -[in] ASCII crypto key
  • **len**  -[in] length in bytes, range:8–64

**Returns**
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

*esp_err_t* esp_mesh_get_ie_crypto_key (char *key, int len)
Get mesh IE crypto key.

**Parameters**
  • **key**  -[out] ASCII crypto key
  • **len**  -[in] length in bytes, range:8–64

**Returns**
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

*esp_err_t* esp_mesh_set_root_healing_delay (int delay_ms)
Set delay time before starting root healing.

**Parameters**
  • **delay_ms**  -[in] delay time in milliseconds

**Returns**
  • ESP_OK

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

**Returns**
  delay time in milliseconds

*esp_err_t* esp_mesh_fix_root (bool enable)
Enable network Fixed Root Setting.

• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Parameters**
  • **enable**  -[in] enable or not

**Returns**
  • ESP_OK

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Returns**
  true/false
esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Parameters**

- **parent** - [in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** - [in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my_type** - [in] mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- **my_layer** - [in] mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

**Returns**

- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

esp_err_t esp_mesh_scan_get_ap_ie_len (int *len)

Get mesh networking IE length of one AP.

**Parameters** len - [out] mesh networking IE length

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)

Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Parameters**

- **ap_record** - [out] pointer to one AP record
- **buffer** - [out] pointer to the mesh networking IE of this AP

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t esp_mesh_flush_upstream_packets (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Returns**

- ESP_OK
Get the number of nodes in the subnet of a specific child.

**Parameters**
- `child_mac` - [in] an associated child address of this device
- `nodes_num` - [out] pointer to the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Get nodes in the subnet of a specific child.

**Parameters**
- `child_mac` - [in] an associated child address of this device
- `nodes` - [out] pointer to nodes in the subnet of a specific child
- `nodes_num` - [in] the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Disconnect from current parent.

**Returns**
- ESP_OK

Connect to current parent.

**Returns**
- ESP_OK

Flush scan result.

**Returns**
- ESP_OK

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**
- `new_bssid` - [in] the new router BSSID if the router changes
- `csa_newchan` - [in] the new channel number to which the whole network is moving
- `csa_count` - [in] channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**
- ESP_OK
\texttt{esp_err_t \_esp\_mesh\_get\_router\_bssid} (\texttt{uint8\_t \*router\_bssid})

Get the router BSSID.

**Parameters** \texttt{router\_bssid} – [out] pointer to the router BSSID

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

\texttt{int64\_t \_esp\_mesh\_get\_tsf\_time} (void)

Get the TSF time.

**Returns** the TSF time

\texttt{esp_err\_t \_esp\_mesh\_set\_topology} (\texttt{esp\_mesh\_topology\_t topo})

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters** \texttt{topo} – [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

**Returns**
- ESP_OK
- ESP\_Mesh\_Err\_Argument
- ESP\_Err\_Mesh\_Not\_Allowed

\texttt{esp\_mesh\_topology\_t \_esp\_mesh\_get\_topology} (void)

Get mesh topology.

**Returns** MESH_TOPO_TREE or MESH_TOPO_CHAIN

\texttt{esp_err\_t \_esp\_mesh\_enable\_ps} (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**
- ESP_OK
- ESP\_Err\_Wi\_Fi\_Not\_Init
- ESP\_Err\_Mesh\_Not\_Allowed

\texttt{esp_err\_t \_esp\_mesh\_disable\_ps} (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**
- ESP_OK
- ESP\_Err\_Wi\_Fi\_Not\_Init
- ESP\_Err\_Mesh\_Not\_Allowed

\texttt{bool \_esp\_mesh\_is\_ps\_enabled} (void)

Check whether the mesh Power Save function is enabled.

**Returns** true/false
bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)
Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters
- dev_duty [in] device duty cycle
- dev_duty_type [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

Returns
- ESP_OK
- ESP_FAIL

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)
Get device duty cycle and type.

Parameters
- dev_duty [out] device duty cycle
- dev_duty_type [out] device PS duty cycle type

Returns
- ESP_OK

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)
Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
Chapter 2. API Reference

- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention  This API can be called at any time after mesh is started.
- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)application_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Parameters
- nwk_duty  ⚶ [in] network duty cycle
- duration_mins  ⚶ [in] duration (unit: minutes)
- applied_rule  ⚶ [in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)`
Get the network duty cycle, duration, type and rule.

Parameters
- nwk_duty  ⚶ [out] current network duty cycle
- duration_mins  ⚶ [out] the duration of current nwk_duty
- dev_duty_type  ⚶ [out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- applied_rule  ⚶ [out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
- ESP_OK

`int esp_mesh_get_running_active_duty_cycle(void)`
Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PSDEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PSDEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns  the running active duty cycle
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)

Duty signaling.

Parameters
- fwd_times [in] the times of forwarding duty signaling packets

Returns
- ESP_OK

Unions

union mesh_addr_t

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t addr[6]

mac address

mip_t mip

mip address

union mesh_event_info_t

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t channel_switch

channel switch

mesh_event_child_connected_t child_connected

child connected

mesh_event_child_disconnected_t child_disconnected

child disconnected

mesh_event_routing_table_change_t routing_table

routing table change

mesh_event_connected_t connected

parent connected

mesh_event_disconnected_t disconnected

parent disconnected

mesh_event_no_parent_found_t no_parent

no parent found

mesh_event_layer_change_t layer_change

layer change
mesh_event_toDS_state_t toDS_state

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started

vote started

mesh_event_root_address_t root_addr

root address

mesh_event_root_switch_req_t switch_req

root switch request

mesh_event_root_conflict_t root_conflict

other powerful root

mesh_event_root_fixed_t root_fixed

fixed root

mesh_event_scan_done_t scan_done

scan done

mesh_event_network_state_t network_state

network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network

network found that can join

mesh_event_router_switch_t router_switch

new router information

mesh_event_ps_duty_t ps_duty

PS duty information

union mesh_rc_config_t

#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr

a new root address specified by users for API esp_mesh_waive_root()
Structures

struct `mip_t`

IP address and port.

Public Members

ip4_addr_t `ip4`
IP address

uint16_t `port`
port

struct `mesh_event_channel_switch_t`
Channel switch information.

Public Members

uint8_t `channel`
new channel

struct `mesh_event_connected_t`
Parent connected information.

Public Members

`wifi_event_sta_connected_t` `connected`
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t `self_layer`
layer

uint8_t `duty`
parent duty

struct `mesh_event_no_parent_found_t`
No parent found information.

Public Members

int `scan_times`
scan times being through

struct `mesh_event_layer_change_t`
Layer change information.
Chapter 2. API Reference

Public Members

uint16_t **new_layer**
new layer

struct **mesh_event_vote_started_t**
vote started information

Public Members

int **reason**
vote reason, vote could be initiated by children or by the root itself

int **attempts**
max vote attempts before stopped

**mesh_addr_t** **rc_addr**
root address specified by users via API esp_mesh_waive_root()

struct **mesh_event_find_network_t**
find a mesh network that this device can join

Public Members

uint8_t **channel**
channel number of the new found network

uint8_t **router_bssid[6]**
router BSSID

struct **mesh_event_root_switch_req_t**
Root switch request information.

Public Members

int **reason**
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

**mesh_addr_t** **rc_addr**
the address of root switch requester

struct **mesh_event_root_conflict_t**
Other powerful root address.
Chapter 2. API Reference

Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value

struct mesh_event_root_fixed_t
Root fixed.

Public Members

bool is_fixed
status

struct mesh_event_scan_done_t
Scan done event information.

Public Members

uint8_t number
the number of APs scanned

struct mesh_event_network_state_t
Network state information.

Public Members

bool is_rootless
whether current mesh network has a root
struct `mesh_event_ps_duty_t`
PS duty information.

**Public Members**

`uint8_t duty`
parent or child duty

`mesh_event_child_connected_t child_connected`
child info

struct `mesh_opt_t`
Mesh option.

**Public Members**

`uint8_t type`
option type

`uint16_t len`
option length

`uint8_t* val`
option value

struct `mesh_data_t`
Mesh data for `esp_mesh_send()` and `esp_mesh_recv()`

**Public Members**

`uint8_t* data`
data

`uint16_t size`
data size

`mesh_proto_t proto`
data protocol

`mesh_tos_t tos`
data type of service

struct `mesh_router_t`
Router configuration.
Public Members

uint8_t ssid[32]
SSID

uint8_t ssid_len
length of SSID

uint8_t bssid[6]
BSSID, if this value is specified, users should also specify “allow_router_switch”.

uint8_t password[64]
password

bool allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false.

There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct mesh_ap_cfg_t
Mesh softAP configuration.

Public Members

uint8_t password[64]
mesh softAP password

uint8_t max_connection
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t nonmesh_max_connection
max non-mesh connections

struct mesh_cfg_t
Mesh initialization configuration.

Public Members

uint8_t channel
channel, the mesh network on

bool allow_channel_switch
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.
mesh_addr_t mesh_id
    mesh network identification

mesh_router_t router
    router configuration

mesh_ap_cfg_t mesh_ap
    mesh softAP configuration

crypto_funcs_t *crypto_funcs
    crypto functions

struct mesh_vote_t
    Vote.

    Public Members

float percentage
    vote percentage threshold for approval of being a root

bool is_rc_specified
    if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
    network start root election.

mesh_rc_config_t config
    vote address configuration

struct mesh_tx_pending_t
    The number of packets pending in the queue waiting to be sent by the mesh stack.

    Public Members

int to_parent
    to parent queue

int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue
int broadcast
  broadcast and multicast queue

struct mesh_rx_pending_t
  The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
  to external DS

toSelf
  to self

Macros

MESH_ROOT_LAYER
  root layer value

MESH_MTU
  max transmit unit(in bytes)

MESH_MPS
  max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
  Mesh error code definition.
  Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
  mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
  mesh isn’t configured

ESP_ERR_MESH_NOT_START
  mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
  not supported yet

ESP_ERR_MESH_NOT_ALLOWED
  operation is not allowed

ESP_ERR_MESH_NO_MEMORY
  out of memory
ESP_ERR_MESH_ARGUMENT
  illegal argument

ESP_ERR_MESH_EXCEED_MTU
  packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
  timeout

ESP_ERR_MESH_DISCONNECTED
  disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
  queue fail

ESP_ERR_MESH_QUEUE_FULL
  queue full

ESP_ERR_MESH_NO_PARENT_FOUND
  no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
  no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
  no option found

ESP_ERR_MESH_OPTION_UNKNOWN
  unknown option

ESP_ERR_MESH_XON_NO_WINDOW
  no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
  low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
  discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
  discard the packet

ESP_ERR_MESH_VOTING
  vote in progress

ESP_ERR_MESH_XMIT
  XMIT
ESP_ERR_MESH_QUEUE_READ
  error in reading queue

ESP_ERR_MESH_PS
  mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
  release esp_mesh_recv_toDS

MESH_DATA_ENC
  Flags bitmap for esp_mesh_send() and esp_mesh_recv()
  data encrypted (Unimplemented)

MESH_DATA_P2P
  point-to-point delivery over the mesh network

MESH_DATA_FROMDS
  receive from external IP network

MESH_DATA_TODS
  identify this packet is target to external IP network

MESH_DATA_NONBLOCK
  esp_mesh_send() non-block

MESH_DATA_DROP
  in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
  identify this packet is target to a group address

MESH_OPT_SEND_GROUP
  Option definitions for esp_mesh_send() and esp_mesh_recv()
  data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
  return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
  Flag of mesh networking IE.
  vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
  no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
  root conflict is found
**MESH_ASSOC_FLAG_ROOT_FIXED**
fixed root

**MESH_PS_DEVICE_DUTY_REQUEST**
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT()**

### Type Definitions

typedef `mesh_addr_t mesh_event_root_address_t`
Root address.

typedef `wifi_event_sta_disconnected_t mesh_event_disconnected_t`
Parent disconnected information.

typedef `wifi_event_ap_staconnected_t mesh_event_child_connected_t`
Child connected information.

typedef `wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t`
Child disconnected information.

typedef `wifi_event_sta_connected_t mesh_event_router_switch_t`
New router information.

### Enumerations

enum `mesh_event_id_t`
Enumerated list of mesh event id.

*Values:*

enumerator **MESH_EVENT_STARTED**
mesh is started

enumerator **MESH_EVENT_STOPPED**
mesh is stopped
enumerator **MESH_EVENT_CHANNEL_SWITCH**
channel switch

enumerator **MESH_EVENT_CHILD_CONNECTED**
a child is connected on softAP interface

enumerator **MESH_EVENT_CHILD_DISCONNECTED**
a child is disconnected on softAP interface

enumerator **MESH_EVENT_ROUTING_TABLE_ADD**
routing table is changed by adding newly joined children

enumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**
routing table is changed by removing leave children

enumerator **MESH_EVENT_PARENT_CONNECTED**
parent is connected on station interface

enumerator **MESH_EVENT_PARENT_DISCONNECTED**
parent is disconnected on station interface

enumerator **MESH_EVENT_NO_PARENT_FOUND**
no parent found

enumerator **MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network

enumerator **MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.
enumerator **MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**

Device type.

**Values:**

enumerator **MESH_IDLE**

hasn’t joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability
enumerator **MESH_STA**
    connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**
    Protocol of transmitted application data.
    
    *Values:*

    enumerator **MESH_PROTO_BIN**
        binary

    enumerator **MESH_PROTO_HTTP**
        HTTP protocol

    enumerator **MESH_PROTO_JSON**
        JSON format

    enumerator **MESH_PROTO_MQTT**
        MQTT protocol

    enumerator **MESH_PROTO_AP**
        IP network mesh communication of node’s AP interface

    enumerator **MESH_PROTO_STA**
        IP network mesh communication of node’s STA interface

enum **mesh_tos_t**
    For reliable transmission, mesh stack provides three types of services.
    
    *Values:*

    enumerator **MESH_TOS_P2P**
        provide P2P (point-to-point) retransmission on mesh stack by default

    enumerator **MESH_TOS_E2E**
        provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

    enumerator **MESH_TOS_DEF**
        no retransmission on mesh stack

enum **mesh_vote_reason_t**
    Vote reason.
    
    *Values:*

    enumerator **MESH_VOTE_REASON_ROOT_INITIATED**
        vote is initiated by the root

    enumerator **MESH_VOTE_REASON_CHILD_INITIATED**
        vote is initiated by children
enum mesh_disconnect_reason_t
	Mesh disconnect reason code.

Values:

type MESH_REASON_CYCLIC
cyclic is detected

type MESH_REASON_PARENT_IDLE
parent is idle

type MESH_REASON_LEAF
the connected device is changed to a leaf

type MESH_REASON_DIFF_ID
in different mesh ID

type MESH_REASON_ROOTS
root conflict is detected

type MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

type MESH_REASON_SCAN_FAIL
scan fail

type MESH_REASON_IE_UNKNOWN
unknown IE

type MESH_REASON_WAIVE_ROOT
waive root

type MESH_REASON_PARENT_WORSE
parent with very poor RSSI

type MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

type MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
	Mesh topology.

Values:

type MESH_TOPO_TREE
tree topology
Chapter 2. API Reference

enumerator **MESH_TOPO_CHAIN**
chain topology

enum **mesh_event_toDS_state_t**
The reachability of the root to a DS (distribute system)

*Values:*

enumerator **MESH_TODS_UNREACHABLE**
the root isn’t able to access external IP network

enumerator **MESH_TODS_REACHABLE**
the root is able to access external IP network

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check Provisioning API.

**Application Example**  Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

**API Reference**

**Header File**
- components/esp_wifi/include/esp_smartconfig.h

**Functions**

const char *`esp_smartconfig_get_version` (void)
Get the version of SmartConfig.

Returns
- SmartConfig version const char.

`esp_err_t` `esp_smartconfig_start` (const `smartconfig_start_config_t` *config)
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.
2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

**Parameters**
- `config` - pointer to smartconfig start configure structure

Returns
- ESP_OK: succeed
- others: fail
**esp_err_t esp_smartconfig_stop**(void)
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config_start.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_esptouch_set_timeout**(uint8_t time_s)
Set timeout of SmartConfig process.

**Attention** Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Parameters**
- time_s –range 15s~255s, offset: 45s.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_set_type**(smartconfig_type_t type)
Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

**Parameters**
- type – Choose from the smartconfig_type_t.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_fast_mode**(bool enable)
Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API esp_smartconfig_start.
**Attention** 2. Fast mode have corresponding APP(phone).
**Attention** 3. Two mode is compatible.

**Parameters**
- enable –false-disable(default); true-enable;

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_get_rvd_data**(uint8_t *rvd_data, uint8_t len)
Get reserved data of ESPTouch v2.

**Parameters**
- rvd_data – reserved data
- len –length of reserved data

**Returns**
- ESP_OK: succeed
- others: fail
Chapter 2. API Reference

Structures

struct smartconfig_event_got_ssid_pswd_t
Argument structure for SC_EVENT_GOTSSID_PSWD event

Public Members

uint8_t ssid[32]
SSID of the AP. Null terminated string.

uint8_t password[64]
Password of the AP. Null terminated string.

bool bssid_set
whether set MAC address of target AP or not.

uint8_t bssid[6]
MAC address of target AP.

smartconfig_type_t type
Type of smartconfig(ESPTouch or AirKiss).

uint8_t token
Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
IP address of cellphone.

struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start

Public Members

bool enable_log
Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT ()
Enumerations

enum smartconfig_type_t
Values:

enumerator SC_TYPE_ESPTOUCH
protocol: ESPTouch

enumerator SC_TYPE_AIRKISS
protocol: AirKiss

enumerator SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

enumerator SC_TYPE_ESPTOUCH_V2
protocol: ESPTouch v2

enum smartconfig_event_t
Smartconfig event declarations
Values:

enumerator SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

enumerator SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

enumerator SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

enumerator SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking functionality. This includes configuration for:

• Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
• AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
• Station/AP-coexistence mode (ESP32 is concurrently an access point and a station connected to another access point).
• Various security modes for the above (WPA, WPA2, WEP, etc.)
• Scanning for access points (active & passive scanning).
• Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples The wifi directory of ESP-IDF examples contains the following applications:

• Code examples for Wi-Fi.
• A simple esp-idf-template application to demonstrate a minimal IDF project structure.
Chapter 2. API Reference

API Reference

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

`esp_err_t esp_wifi_init (const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

- **Attention 1.** This API must be called before all other WiFi API can be called
- **Attention 2.** Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Parameters**

- `config` — pointer to WiFi initialized configuration structure; can point to a temporary variable.

**Returns**

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

`esp_err_t esp_wifi_deinit (void)`

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

- **Attention 1.** This API should be called if you want to remove WiFi driver from the system

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

`esp_err_t esp_wifi_set_mode (wifi_mode_t mode)`

Set the WiFi operating mode.

In the function below:

```
Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.
```

- **Parameters**
  - `mode` — WiFi operating mode
- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  - ESP_ERR_INVALID_ARG: invalid argument
  - others: refer to error code in esp_err.h

`esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)`

Get current operating mode of WiFi.

- **Parameters**
  - `[out]` store current WiFi mode
- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_start(void)
```

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_stop(void)
```

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_restore(void)
```

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

• esp_wifi_set_bandwidth,
• esp_wifi_set_protocol,
• esp_wifi_set_config related
• esp_wifi_set_mode

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_connect(void)
```

Connect the ESP32 WiFi station to the AP.

**Attention**

1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

```c
esp_err_t esp_wifi_disconnect(void)
```

Disconnect the ESP32 WiFi station from the AP.
Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

**esp_err_t esp_wifi_clear_fast_connect**(void)
Currently this API is just a stub API.

Returns

- ESP_OK: succeed
- others: fail

**esp_err_t esp_wifi_deauth_sta**(uint16_t aid)
deauthenticate all stations or associated id equals to aid

Parameters

- **aid** – when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

**esp_err_t esp_wifi_scan_start**(const wifi_scan_config_t *config, bool block)
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done.

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Parameters

- **config** – configuration of scanning
- **block** – if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

**esp_err_t esp_wifi_scan_stop**(void)
Stop the scan in process.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_scan_get_ap_num**(uint16_t *number)
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.
Parameters **number** -[out] store number of APIs found in last scan

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
```

Get AP list found in last scan.

**Parameters**

- **number** -[inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** –wifi_ap_record_t array to hold the found APs

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

```c
esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** **ap_info** – the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_l in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

```c
esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)
```

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters** **type** –power save type

**Returns** ESP_OK: succeed

```c
esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)
```

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters** **type** –[out] store current power save type

**Returns** ESP_OK: succeed

```c
esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)
```

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)
**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

### Parameters
- `ifx` – interfaces
- `protocol_bitmap` – WiFi protocol bitmap

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```

Get the current protocol bitmap of the specified interface.

### Parameters
- `ifx` – interface
- `protocol_bitmap` – [out] store current WiFi protocol bitmap of interface ifx

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```

Set the bandwidth of ESP32 specified interface.

### Attention 1. API return false if try to configure an interface that is not enabled
### Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

### Parameters
- `ifx` – interface to be configured
- `bw` – bandwidth

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
```

Get the bandwidth of ESP32 specified interface.

### Attention 1. API return false if try to get a interface that is not enable

### Parameters
- `ifx` – interface to be configured
- `bw` – [out] store bandwidth of interface ifx

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t esp_wifi_set_channel** (uint8_t primary, wifi_second_chan_t second)

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Parameters**
- **primary** – for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** – for HT20, second is ignored, for HT40, second is the second channel

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_get_channel** (uint8_t* primary, wifi_second_chan_t* second)

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**
- **primary** – store current primary channel
- **second** [out] store current second channel

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_country** (const wifi_country_t* country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is CHINA {.cc=“ CN” , .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=“ USA” , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=“ JP” , .schan=1, .nchan=14} then the country info that will be used is {.cc=“ JP” , .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=“ US” , .schan=1, .nchan=11} in the example.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 6. The country configuration is stored into flash.

**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
Parameters **country** - the configured country info

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country (wifi_country_t *country)
```

get the current country info

Parameters **country** - country info

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled
**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.
**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

Parameters
- **ifx** - interface
- **mac** - the MAC address

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

Parameters
- **ifx** - interface
- **mac** - [out] store mac of the interface ifx

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Parameters **cb** - callback

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_promiscuous (bool en)
```

Enable the promiscuous mode.
**Parameters** `en` – false - disable, true - enable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_get_promiscuous (bool *en)`
Get the promiscuous mode.

**Parameters** `en` – [out] store the current status of promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)`
Enable the promiscuous mode packet type filter.

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC

`esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)`
Get the promiscuous filter.

**Parameters** `filter` – [out] store the current status of promiscuous filter

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)`
Enable subtype filter of the control packet in promiscuous mode.

**Note:** The default filter is to filter none control packet.

`esp_err_t esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)`
Get the subtype filter of the control packet in promiscuous mode.

**Parameters** `filter` – [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

`esp_err_t esp_wifi_set_config (wifi_interface_t interface, wifi_config_t *conf)`
Set the configuration of the ESP32 STA or AP.
Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail
Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Parameters
- interface – interface
- conf – station or soft-AP configuration

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

\[ \text{esp_err_t \ esp_wifi_get_config(wifi_interface_t \ interface, wifi_config_t \ *conf)} \]
Get configuration of specified interface.

Parameters
- interface – interface
- conf – [out] station or soft-AP configuration

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

\[ \text{esp_err_t \ esp_wifi_ap_get_ststa_list(wifi_sta_list_t \ *sta)} \]
Get STAs associated with soft-AP.

Attention SSC only API

Parameters sta – [out] station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

\[ \text{esp_err_t \ esp_wifi_ap_get_ststa_aid(const uint8_t \ mac[6], uint16_t \ *aid)} \]
Get AID of STA connected with soft-AP.

Parameters
- mac – STA’s mac address
- aid – [out] Store the AID corresponding to STA mac

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage(wifi_storage_t storage)`

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI_STORAGE_FLASH

**Parameters** storage #: storage type

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

**Parameters**
- enable #: If true, specified IE is enabled. If false, specified IE is removed.
- type #: Information Element type. Determines the frame type to associate with the IE.
- idx #: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie #: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID(0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

`esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)`

Register Vendor-Specific Information Element monitoring callback.

**Parameters**
- cb #: Callback function
- ctx #: Context argument, passed to callback function.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_max_tx_power(int8_t power)`

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table `{Power, max_tx_power} = {{18, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}`.

**Attention** 4. Param power unit is 0.25dBm, range is `[8, 84]` corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: `{set value range, actual value} = {{[18, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}`.

**Parameters** power #: Maximum WiFi transmitting power.

**Returns**
- ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

`esp_err_t esp_wifi_get_max_tx_power (int8_t *power)`
Get maximum transmitting power after WiFi start.

**Parameters**
- `power` – Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

`esp_err_t esp_wifi_set_event_mask (uint32_t mask)`
Set mask to enable or disable some WiFi events.

**Attention**
1. Mask can be created by logical OR of various WIFI_EVENT_MASK_constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Parameters**
- `mask` – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_get_event_mask (uint32_t *mask)`
Get mask of WiFi events.

**Parameters**
- `mask` – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

`esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`
Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**
- `ifx` – interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- `buffer` – raw ieee80211 buffer
- `len` – the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- `en_sys_seq` – indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq=false and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

**Returns**
Chapter 2. API Reference

• ESP_OK: success
• ESP_ERR_WIFI_IF: Invalid interface
• ESP_ERR_INVALID_ARG: Invalid parameter
• ESP_ERR_WIFI_NO_MEM: out of memory

`esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)`

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Parameters**
- `cb` - callback
- `ctx` - context argument, passed to callback function

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)`

Set CSI data configuration.

```c
return
```

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `config` - configuration

`esp_err_t esp_wifi_set_csi (bool en)`

Enable or disable CSI.

```c
return
```

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `en` - true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)`

Set antenna GPIO configuration.

**Parameters**
- `config` - Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid GPIO number etc
**esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)**

Get current antenna GPIO configuration.

**Parameters**
- config – Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)**

Set antenna configuration.

**Parameters**
- config – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

**esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)**

Get current antenna configuration.

**Parameters**
- config – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)**

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters**
- interface – The interface whose tsf_time is to be retrieved.

**Returns**
- 0 or the TSF time

**esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)**

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Parameters**
- ifx – interface to be configured.
- sec – Inactive time. Unit seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.
**esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)**
Get inactive time of specified interface.

**Parameters**
- **ifx** – Interface to be configured.
- **sec** – Inactive time. Unit: seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**esp_err_t esp_wifi_statis_dump (uint32_t modules)**
Dump WiFi statistics.

**Parameters**
- **modules** – statistic modules to be dumped

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)**
Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Parameters**
- **rssi** – threshold value in dbm between -100 to 0

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)**
Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Parameters**
- **cfg** – FTM Initiator session configuration

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_end_session (void)**
End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)**
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).
**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters**
- `offset_cm` – T1 Offset to be added in centimeters

**Returns**
- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)`
Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Parameters**
- `ifx` – Interface to be configured.
- `disable` – true means disable 11b rate while false means enable 11b rate.

**Returns**
- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_connectionless_module_set_wake_interval(uint16_t wake_interval)`
Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.
**Attention** 2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
**Attention** 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Parameters**
- `wake_interval` – Milliseconds after would the chip wake up, from 1 to 65535.

`esp_err_t esp_wifi_set_country_code(const char* country, bool ieee80211d_enabled)`
Configure country

**Attention** 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
**Attention** 2. When ieee80211d_enabled is disabled, then the configured country info is used always.
**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
**Attention** 4. The country configuration is stored into flash.
**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
**Attention** 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
**Attention** 8. The default country is “01” (world safe mode) and ieee80211d_enabled is TRUE.
Chapter 2. API Reference

Parameters
- **country** – the configured country ISO code
- **ieee80211d_enabled** – 802.11d is enabled or not

Returns
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument

```c
esp_err_t esp_wifi_get_country_code(char *country)
```

get the current country code

Parameters **country** – country code

Returns
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument

```c
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Parameters
- **ifx** – Interface to be configured.
- **rate** – Phy rate to be configured.

Returns
- **ESP_OK**: succeed
- **others**: failed

```c
esp_err_t esp_wifi_disable_pmf_config(wifi_interface_t ifx)
```

Disable PMF configuration for specified interface.

Attention This API should be called after esp_wifi_set_config() and before esp_wifi_start().

Parameters **ifx** – Interface to be configured.

Returns
- **ESP_OK**: succeed
- **others**: failed

Structures

```c
struct wifi_init_config_t
```

WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

```c
wifi_osi_funcs_t *osi_funcs
```

WiFi OS functions

```c
wpa_crypto_funcs_t wpa_crypto_funcs
```

WiFi station crypto functions when connect
int `static_rx_buf_num`
   WiFi static RX buffer number

int `dynamic_rx_buf_num`
   WiFi dynamic RX buffer number

int `tx_buf_type`
   WiFi TX buffer type

int `static_tx_buf_num`
   WiFi static TX buffer number

int `dynamic_tx_buf_num`
   WiFi dynamic TX buffer number

int `cache_tx_buf_num`
   WiFi TX cache buffer number

int `csi_enable`
   WiFi channel state information enable flag

int `ampdu_rx_enable`
   WiFi AMPDU RX feature enable flag

int `ampdu_tx_enable`
   WiFi AMPDU TX feature enable flag

int `amsdu_tx_enable`
   WiFi AMSDU TX feature enable flag

int `nvs_enable`
   WiFi NVS flash enable flag

int `nano_enable`
   Nano option for printf/scan family enable flag

int `rx_ba_win`
   WiFi Block Ack RX window size

int `wifi_task_core_id`
   WiFi Task Core ID

int `beacon_max_len`
   WiFi softAP maximum length of the beacon

int `mgmt_sbuf_num`
   WiFi management short buffer number, the minimum value is 6, the maximum value is 32
filesystem

uint64_t feature_caps
   Enables additional WiFi features and capabilities

bool sta_disconnected_pm
   WiFi Power Management for station at disconnected status

int magic
   WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT
   WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
   WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
   WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
   WiFi interface error

ESP_ERR_WIFI_MODE
   WiFi mode error

ESP_ERR_WIFI_STATE
   WiFi internal state error

ESP_ERR_WIFI_CONN
   WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
   WiFi internal NVS module error

ESP_ERR_WIFI_MAC
   MAC address is invalid

ESP_ERR_WIFI_SSID
   SSID is invalid

ESP_ERR_WIFI_PASSWORD
   Password is invalid

ESP_ERR_WIFI_TIMEOUT
   Timeout error

ESP_ERR_WIFI_WAKE_FAIL
   WiFi is in sleep state (RF closed) and wakeup fail
Chapter 2. API Reference

ESP_ERR_WIFI_WOULD_BLOCK
   The caller would block

ESP_ERR_WIFI_NOT_CONNECT
   Station still in disconnect status

ESP_ERR_WIFI_POST
   Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
   Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
   Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
   The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
   The WiFi TX is disallowed

WIFI_STATIC_TX_BUFFER_NUM

WIFI_CACHE_TX_BUFFER_NUM

WIFI_DYNAMIC_TX_BUFFER_NUM

WIFI_CSI_ENABLED

CONFIG_FEATURE_FTM_RESPONDER_BIT

WIFI_INIT_CONFIG_DEFAULT()

Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

    Param buf Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.

    Param type Promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

    Param ctx Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.

    Param type Information element type, based on frame type received.

    Param sa Source 802.11 address.

    Param vnd_ie Pointer to the vendor specific element data received.

    Param rssi Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information (CSI) data.

    Param ctx Context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.

    Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

    • components/esp_wifi/include/esp_wifi_types.h
Unions

union wifi_config_t

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

Structures

struct wifi_country_t
Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.

Public Members

uint32_t min
minimum active scan time per channel, units: millisecond
Maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

`struct wifi_scan_time_t`
Aggregate of active & passive scan time per channel.

**Public Members**

`wifi_active_scan_time_t active`
active scan time per channel, units: millisecond.

`uint32_t passive`
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

`struct wifi_scan_config_t`
Parameters for an SSID scan.

**Public Members**

`uint8_t *ssid`
SSID of AP

`uint8_t *bssid`
MAC address of AP

`uint8_t channel`
channel, scan the specific channel

`bool show_hidden`
enable to scan AP whose SSID is hidden

`wifi_scan_type_t scan_type`
scan type, active or passive

`wifi_scan_time_t scan_time`
scan time per channel

`struct wifi_ap_record_t`
Description of a WiFi AP.

**Public Members**

`uint8_t bssid[6]`
MAC address of AP
uint8_t ssid[33]
    SSID of AP

uint8_t primary
    channel of AP

wifi_second_chan_t second
    secondary channel of AP

int8_t rssi
    signal strength of AP

wifi_auth_mode_t authmode
    authmode of AP

wifi_cipher_type_t pairwise_cipher
    pairwise cipher of AP

wifi_cipher_type_t group_cipher
    group cipher of AP

wifi_ant_t ant
    antenna used to receive beacon from AP

uint32_t phy_11b
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t wps
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator
    bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved
    bit: 7..31 reserved
\textit{wifi\_country\_t} \texttt{country}

country information of AP

\textbf{struct} \textit{wifi\_scan\_threshold\_t}

Structure describing parameters for a WiFi fast scan.

**Public Members**

- \texttt{int8\_t \textit{rssi}}
  
  The minimum rssi to accept in the fast scan mode

- \textit{wifi\_auth\_mode\_t \textit{authmode}}
  
  The weakest authmode to accept in the fast scan mode

\textbf{struct} \textit{wifi\_pmf\_config\_t}

Configuration structure for Protected Management Frame

**Public Members**

- \texttt{bool \textit{capable}}
  
  Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

- \texttt{bool \textit{required}}
  
  Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

\textbf{struct} \textit{wifi\_ap\_config\_t}

Soft-AP configuration settings for the ESP32.

**Public Members**

- \texttt{uint8\_t \textit{ssid}[32]}
  
  SSID of ESP32 soft-AP. If ssid\_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid\_len.

- \texttt{uint8\_t \textit{password}[64]}
  
  Password of ESP32 soft-AP.

- \texttt{uint8\_t \textit{ssid\_len}}
  
  Optional length of SSID field.

- \texttt{uint8\_t \textit{channel}}
  
  Channel of ESP32 soft-AP

- \textit{wifi\_auth\_mode\_t \textit{authmode}}
  
  Auth mode of ESP32 soft-AP. Do not support AUTH\_WEP in soft-AP mode
Chapter 2. API Reference

uint8_t ssid_hidden
Broadcast SSID or not, default 0, broadcast the SSID

uint8_t max_connection
Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool ftm_responder
Enable FTM Responder mode

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame

struct wifi_sta_config_t
STA configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
SSID of target AP.

uint8_t password[64]
Password of target AP.

wifi_scan_method_t scan_method
do all channel scan or fast scan

bool bssid_set
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]
MAC address of target AP

uint8_t channel
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.
uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled
Whether MBO is enabled for the connection

uint32_t ft_enabled
Whether FT is enabled for the connection

uint32_t owe_enabled
Whether OWE is enabled for the connection

uint32_t sae_pwe_h2e
Whether SAE hash to element is enabled

uint32_t reserved
Reserved for future feature set

struct wifi_sta_info_t
Description of STA associated with AP.

Public Members

uint8_t mac[6]
mac address

int8_t rssi
current average rssi of sta connected

uint32_t phy_11b
bit: 0 flag to identify if 11b mode is enabled or not
uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_1r
    bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child
    bit: 4 flag to identify mesh child

uint32_t reserved
    bit: 5..31 reserved

struct wifi_sta_list_t
    List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
    station list

int num
    number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
    Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
    Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
    Vendor identifier (OUI).

uint8_t vendor_oui_type
    Vendor-specific OUI type.

uint8_t payload[0]
    Payload. Length is equal to value in ‘length’ field, minus 4.
Chapter 2. API Reference

struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi
Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
reserved

unsigned sig_mode
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
reserved

unsigned mcs
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__
reserved

unsigned smoothing
reserved

unsigned not_sounding
reserved

unsigned __pad3__
reserved

unsigned aggregation
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding
Flag is set for 11n packets which are LDPC
unsigned sgi
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed noise_floor
    noise floor of Radio Frequency Module(RF). unit: dBm

unsigned ampdu_cnt
    ampdu cnt

unsigned channel
    primary channel on which this packet is received

unsigned secondary_channel
    secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad4__
    reserved

unsigned timestamp
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
    is not enabled. unit: microsecond

unsigned __pad5__
    reserved

unsigned __pad6__
    reserved

unsigned ant
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned sig_len
    length of packet including Frame Check Sequence(FCS)

unsigned __pad7__
    reserved

unsigned rx_state
    state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
    Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

**Public Members**

* wifi_pkt_rx_ctrl_t rx_ctrl
  metadata header
**Chapter 2. API Reference**

```
uint8_t payload[0]
    Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t
    Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t filter_mask
    OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t
    Channel state information (CSI) configuration type.

Public Members

bool lltf_en
    enable to receive legacy long training field (lltf) data. Default enabled

bool htltf_en
    enable to receive HT long training field (htltf) data. Default enabled

bool stbc_htltf2_en
    enable to receive space time block code HT long training field (stbc-htltf2) data. Default enabled

bool ltf_merge_en
    enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool channel_filter_en
    enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
    manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
    manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
    CSI data type.

Public Members
```
```c
wifi_pkt_rx_ctrl_t rx_ctrl
    received packet radio metadata header of the CSI data

uint8_t_mac[6]
    source MAC address of the CSI data

bool first_word_invalid
    first four bytes of the CSI data is invalid or not

int8_t*buf
    buffer of CSI data

uint16_t_len
    length of CSI data
```

```c
struct wifi_ant_gpio_t
    WiFi GPIO configuration for antenna selection.

    Public Members

    uint8_t_gpio_select
        Whether this GPIO is connected to external antenna switch

    uint8_t_gpio_num
        The GPIO number that connects to external antenna switch
```

```c
struct wifi_ant_gpio_config_t
    WiFi GPIOs configuration for antenna selection.

    Public Members

    wifi_ant_gpio_t gpio_cfg[4]
        The configurations of GPIOs that connect to external antenna switch
```

```c
struct wifi_ant_config_t
    WiFi antenna configuration.

    Public Members

    wifi_ant_mode_t rx_ant_mode
        WiFi antenna mode for receiving

    wifi_ant_t rx_ant_default
        Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO
```
\textit{wifi\_ant\_mode\_t tx\_ant\_mode}

WiFi antenna mode for transmission, it can be set to WIFI\_ANT\_MODE\_AUTO only if \textit{rx\_ant\_mode} is set to WIFI\_ANT\_MODE\_AUTO

\texttt{uint8\_t enabled\_ant0}

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT0

\texttt{uint8\_t enabled\_ant1}

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT1

\textbf{struct wifi\_action\_tx\_req\_t}

Action Frame Tx Request.

\textbf{Public Members}

\textit{wifi\_interface\_t ifx}

WiFi interface to send request to

\texttt{uint8\_t dest\_mac[6]}

Destination MAC address

\texttt{bool no\_ack}

Indicates no ack required

\textit{wifi\_action\_rx\_cb\_t rx\_cb}

Rx Callback to receive any response

\texttt{uint32\_t data\_len}

Length of the appended Data

\texttt{uint8\_t data[0]}

Appended Data payload

\textbf{struct wifi\_ftm\_initiator\_cfg\_t}

FTM Initiator configuration.

\textbf{Public Members}

\texttt{uint8\_t resp\_mac[6]}

MAC address of the FTM Responder

\texttt{uint8\_t channel}

Primary channel of the FTM Responder

\texttt{uint8\_t frm\_count}

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)
Chapter 2. API Reference

```c
uint16_t burst_period
    Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)
```

```c
t struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event
```

**Public Members**

```c
uint32_t status
    status of scanning APs: 0 — success, 1 - failure

uint8_t number
    number of scan results

uint8_t scan_id
    scan sequence number, used for block scan
```

```c
t struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event
```

**Public Members**

```c
uint8_t ssid[32]
    SSID of connected AP

uint8_t ssid_len
    SSID length of connected AP

uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP
```

```c
wifi_auth_mode_t authmode
    authentication mode used by AP
```

```c
t struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event
```

**Public Members**

```c
uint8_t ssid[32]
    SSID of disconnected AP
```
- `uint8_t ssid_len`: SSID length of disconnected AP
- `uint8_t bssid[6]`: BSSID of disconnected AP
- `uint8_t reason`: reason of disconnection

**struct wifi_event_sta_authmode_change_t**

Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

**Public Members**

- `wifi_auth_mode_t old_mode`: the old auth mode of AP
- `wifi_auth_mode_t new_mode`: the new auth mode of AP

**struct wifi_event_sta_wps_er_pin_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

**Public Members**

- `uint8_t pin_code[8]`: PIN code of station in enrollee mode

**struct wifi_event_sta_wps_er_success_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

**Public Members**

- `uint8_t ap_cred_cnt`: Number of AP credentials received
- `uint8_t ssid[MAX_SSID_LEN]`: SSID of AP
- `uint8_t passphrase[MAX_PASSPHRASE_LEN]`: Passphrase for the AP

`struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]`: All AP credentials received from WPS handshake

**struct wifi_event_ap_staconnected_t**

Argument structure for WIFI_EVENT_AP_STACONNECTED event
Public Members

uint8_t mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for
**Public Members**

```c
uint8_t dlog_token
    Dialog Token of the FTM frame
int8_t rssi
    RSSI of the FTM frame received
uint32_t rtt
    Round Trip Time in pSec with a peer
uint64_t t1
    Time of departure of FTM frame from FTM Responder in pSec
uint64_t t2
    Time of arrival of FTM frame at FTM Initiator in pSec
uint64_t t3
    Time of departure of ACK from FTM Initiator in pSec
uint64_t t4
    Time of arrival of ACK at FTM Responder in pSec
```

**struct wifi_event_ftm_report_t**

Argument structure for WIFI_EVENT_FTM_REPORT event

**Public Members**

```c
uint8_t peer_mac[6]
    MAC address of the FTM Peer
wifi_ftm_status_t status
    Status of the FTM operation
uint32_t rtt_raw
    Raw average Round-Trip-Time with peer in Nano-Seconds
uint32_t rtt_est
    Estimated Round-Trip-Time with peer in Nano-Seconds
uint32_t dist_est
    Estimated one-way distance in Centi-Meters
wifi_ftm_report_entry_t *ftm_report_data
    Pointer to FTM Report with multiple entries, should be freed after use
uint8_t ftm_report_num_entries
    Number of entries in the FTM Report data
```
struct wifi_event_action_tx_status_t
  Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

  Public Members

  wifi_interface_t ifx
    WiFi interface to send request to

  uint32_t context
    Context to identify the request

  uint8_t da[6]
    Destination MAC address

  uint8_t status
    Status of the operation

struct wifi_event_roc_done_t
  Argument structure for WIFI_EVENT_ROC_DONE event

  Public Members

  uint32_t context
    Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM
  max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
  filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
  filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
  filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
  filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
  filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
  filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
  filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
  filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
  filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
  filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
  filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
  filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
  filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
  filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
  filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
  filter the control packets with subtype of ACK
**WIFI_PROMIS_CTRL_FILTER_MASK_CFEND**  
filter the control packets with subtype of CF-END

**WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK**  
filter the control packets with subtype of CF-END+CF-ACK

**WIFI_EVENT_MASK_ALL**  
mask all WiFi events

**WIFI_EVENT_MASK_NONE**  
mask none of the WiFi events

**WIFI_EVENT_MASK_AP_PROBEREQRECVED**  
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

**MAX_SSID_LEN**

**MAX_PASSPHRASE_LEN**

**MAX_WPS_AP_CRED**

**WIFI_STATIS_BUFFER**

**WIFI_STATIS_RXTX**

**WIFI_STATIS_HW**

**WIFI_STATIS_DIAG**

**WIFI_STATIS_PS**

**WIFI_STATIS_ALL**

**Type Definitions**

typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)

The Rx callback function of Action Tx operations.

- **Param hdr**  pointer to the IEEE 802.11 Header structure
- **Param payload**  pointer to the Payload following 802.11 Header
- **Param len**  length of the Payload
- **Param channel**  channel number the frame is received on

**Enumerations**

enum wifi_mode_t

*Values:*
enumerator WIFI_MODE_NULL
    null mode

enumerator WIFI_MODE_STA
    WiFi station mode

enumerator WIFI_MODE_AP
    WiFi soft-AP mode

enumerator WIFI_MODE_APSTA
    WiFi station + soft-AP mode

enumerator WIFI_MODE_MAX

enum wifi_interface_t
    Values:

enumerator WIFI_IF_STA

enumerator WIFI_IF_AP

enum wifi_country_policy_t
    Values:

enumerator WIFI_COUNTRY_POLICY_AUTO
    Country policy is auto, use the country info of AP to which the station is connected

enumerator WIFI_COUNTRY_POLICY_MANUAL
    Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
    Values:

enumerator WIFI_AUTH_OPEN
    authenticate mode : open

enumerator WIFI_AUTH_WEP
    authenticate mode : WEP

enumerator WIFI_AUTH_WPA_PSK
    authenticate mode : WPA_PSK

enumerator WIFI_AUTH_WPA2_PSK
    authenticate mode : WPA2_PSK

enumerator WIFI_AUTH_WPA_WPA2_PSK
    authenticate mode : WPA_WPA2_PSK
enumerator WIFI_AUTH_WPA2_ENTERPRISE
    authenticate mode : WPA2_ENTERPRISE

enumerator WIFI_AUTH_WPA3_PSK
    authenticate mode : WPA3_PSK

enumerator WIFI_AUTH_WPA2_WPA3_PSK
    authenticate mode : WPA2_WPA3_PSK

enumerator WIFI_AUTH_WAPI_PSK
    authenticate mode : WAPI_PSK

enumerator WIFI_AUTH_OWE
    authenticate mode : OWE

enumerator WIFI_AUTH_MAX

enum wifi_err_reason_t

Values:

enumerator WIFI_REASON_UNSPECIFIED
enumerator WIFI_REASON_AUTH_EXPIRE
enumerator WIFI_REASON_AUTH_LEAVE
enumerator WIFI_REASON_ASSOC_EXPIRE
enumerator WIFI_REASON_ASSOC_TOOMANY
enumerator WIFI_REASON_NOT_AUTHED
enumerator WIFI_REASON_NOT_ASSOCED
enumerator WIFI_REASON_ASSOC_LEAVE
enumerator WIFI_REASON_ASSOC_NOT_AUTHED
enumerator WIFI_REASON_DISASSOC_PWRCAP_BAD
enumerator WIFI_REASON_DISASSOC_SUPCHAN_BAD
enumerator WIFI_REASON_BSS_TRANSITION_DISASSOC
enumerator WIFI_REASON_IE_INVALID
enumerator WIFI_REASON_MIC_FAILURE
enumerator WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT
enumerator WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT
enumerator WIFI_REASON_IE_IN_4WAY_DIFFERS
enumerator WIFI_REASON_GROUP_CIPHER_INVALID
enumerator WIFI_REASON_PAIRWISE_CIPHER_INVALID
enumerator WIFI_REASON_AKMP_INVALID
enumerator WIFI_REASON_UNSUPP_RSN_IE_VERSION
enumerator WIFI_REASON_INVALID_RSN_IE_CAP
enumerator WIFI_REASON_802_1X_AUTH_FAILED
enumerator WIFI_REASON_CIPHER_SUITE_REJECTED
enumerator WIFI_REASON_INVALID_PMKID
enumerator WIFI_REASON_BEACON_TIMEOUT
enumerator WIFI_REASON_NO_AP_FOUND
enumerator WIFI_REASON_AUTH_FAIL
enumerator WIFI_REASON_ASSOC_FAIL
enumerator WIFI_REASON_HANDSHAKE_TIMEOUT
enumerator WIFI_REASON_CONNECTION_FAIL
enumerator WIFI_REASON_AP_TSF_RESET
enumerator WIFI_REASON_ROAMING

enum wifi_second_chan_t

   Values:

enumerator WIFI_SECOND_CHAN_NONE
   the channel width is HT20
enumerator **WIFI_SECOND_CHAN_ABOVE**
the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI_SECOND_CHAN_BELOW**
the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi_scan_type_t**

*Values:*

enumerator **WIFI_SCAN_TYPE_ACTIVE**
active scan

enumerator **WIFI_SCAN_TYPE_PASSIVE**
passive scan

enum **wifi_cipher_type_t**

*Values:*

enumerator **WIFI_CIPHER_TYPE_NONE**
the cipher type is none

enumerator **WIFI_CIPHER_TYPE_WEP40**
the cipher type is WEP40

enumerator **WIFI_CIPHER_TYPE_WEP104**
the cipher type is WEP104

enumerator **WIFI_CIPHER_TYPE_TKIP**
the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**
the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**
the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**
the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**
the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**
the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**
the cipher type is GCMP-256
enumerator WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

enumerator WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

enumerator WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.

Values:

enumerator WIFI_ANT_ANT0
WiFi antenna 0

enumerator WIFI_ANT_ANT1
WiFi antenna 1

enumerator WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t

Values:

enumerator WIFI_FAST_SCAN
Do fast scan, scan will end after find SSID match AP

enumerator WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t

Values:

enumerator WIFI_CONNECT_AP_BY_SIGNAL
Sort match AP in scan list by RSSI

enumerator WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t

Values:

enumerator WIFI_PS_NONE
No power save

enumerator WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period
enumerator WIFI_PS_MAX_MODEM
    Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
    Values:
    
    enumerator WIFI_BW_HT20
    enumerator WIFI_BW_HT40

enum wifi_storage_t
    Values:
    
    enumerator WIFI_STORAGE_FLASH
        all configuration will store in both memory and flash
    enumerator WIFI_STORAGE_RAM
        all configuration will only store in the memory

enum wifi_vendor_ie_type_t
    Vendor Information Element type.
    Determines the frame type that the IE will be associated with.
    Values:
    
    enumerator WIFI_VND_IE_TYPE_BEACON
    enumerator WIFI_VND_IE_TYPE_PROBE_REQ
    enumerator WIFI_VND_IE_TYPE_PROBE_RESP
    enumerator WIFI_VND_IE_TYPE_ASSOC_REQ
    enumerator WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
    Vendor Information Element index.
    Each IE type can have up to two associated vendor ID elements.
    Values:
    
    enumerator WIFI_VND_IE_ID_0
    enumerator WIFI_VND_IE_ID_1
enum wifi_promiscuous_pkt_type_t
    Promiscuous frame type.
    Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
    Values:

    enumerator WIFI_PKT_MGMT
        Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_CTRL
        Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_DATA
        Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_MISC
        Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
    WiFi antenna mode.
    Values:

    enumerator WIFI_ANT_MODE_ANT0
        Enable WiFi antenna 0 only

    enumerator WIFI_ANT_MODE_ANT1
        Enable WiFi antenna 1 only

    enumerator WIFI_ANT_MODE_AUTO
        Enable WiFi antenna 0 and 1, automatically select an antenna

    enumerator WIFI_ANT_MODE_MAX
        Invalid WiFi enabled antenna

enum wifi_phy_rate_t
    WiFi PHY rate encodings.
    Values:

    enumerator WIFI_PHY_RATE_1M_L
        1 Mbps with long preamble

    enumerator WIFI_PHY_RATE_2M_L
        2 Mbps with long preamble

    enumerator WIFI_PHY_RATE_5M_L
        5.5 Mbps with long preamble

    enumerator WIFI_PHY_RATE_11M_L
        11 Mbps with long preamble
enumerator `WIFI_PHY_RATE_2M_S`
2 Mbps with short preamble

denumerator `WIFI_PHY_RATE_5M_S`
5.5 Mbps with short preamble

denumerator `WIFI_PHY_RATE_11M_S`
11 Mbps with short preamble

denumerator `WIFI_PHY_RATE_48M`
48 Mbps

denumerator `WIFI_PHY_RATE_24M`
24 Mbps

denumerator `WIFI_PHY_RATE_12M`
12 Mbps

denumerator `WIFI_PHY_RATE_6M`
6 Mbps

denumerator `WIFI_PHY_RATE_54M`
54 Mbps

denumerator `WIFI_PHY_RATE_36M`
36 Mbps

denumerator `WIFI_PHY_RATE_18M`
18 Mbps

denumerator `WIFI_PHY_RATE_9M`
9 Mbps

denumerator `WIFI_PHY_RATE_MCS0_LGI`
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

denumerator `WIFI_PHY_RATE_MCS1_LGI`
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

denumerator `WIFI_PHY_RATE_MCS2_LGI`
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

denumerator `WIFI_PHY_RATE_MCS3_LGI`
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

denumerator `WIFI_PHY_RATE_MCS4_LGI`
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS5_LGI
    MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS6_LGI
    MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS7_LGI
    MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS0_SGI
    MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS1_SGI
    MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS2_SGI
    MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS3_SGI
    MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS4_SGI
    MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS5_SGI
    MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS6_SGI
    MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

denumerator WIFI_PHY_RATE_MCS7_SGI
    MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

denumerator WIFI_PHY_RATE_LORA_250K
    250 Kbps

denumerator WIFI_PHY_RATE_LORA_500K
    500 Kbps

denumerator WIFI_PHY_RATE_MAX

denum wifi_event_t
    WiFi event declarations

    Values:

    enumerator WIFI_EVENT_WIFI_READY
        ESP32 WiFi ready
enumerator WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

enumerator WIFI_EVENT_STA_START
ESP32 station start

enumerator WIFI_EVENT_STA_STOP
ESP32 station stop

enumerator WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

enumerator WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

enumerator WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

enumerator WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

enumerator WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

enumerator WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

enumerator WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

enumerator WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

enumerator WIFI_EVENT_AP_START
ESP32 soft-AP start

enumerator WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

enumerator WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

enumerator WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

enumerator WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface
enumerator WIFI EVENT FTM REPORT
   Receive report of FTM procedure

enumerator WIFI EVENT STA BSS RSSI LOW
   AP’s RSSI crossed configured threshold

enumerator WIFI EVENT ACTION_TX_STATUS
   Status indication of Action Tx operation

enumerator WIFI EVENT ROC DONE
   Remain-on-Channel operation complete

enumerator WIFI EVENT STA BEACON TIMEOUT
   ESP32 station beacon timeout

enumerator WIFI EVENT CONNECTIONLESS MODULE_WAKE_INTERVAL_START
   ESP32 connectionless module wake interval start

enumerator WIFI EVENT_MAX
   Invalid WiFi event ID

enum wifi event sta wps fail reason_t
   Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
   Values:

   enumerator WPS_FAIL_REASON_NORMAL
      ESP32 WPS normal fail reason

   enumerator WPS_FAIL_REASON_RECV_M2D
      ESP32 WPS receive M2D frame

   enumerator WPS_FAIL_REASON_MAX

enum wifi_ftm_status_t
   FTM operation status types.
   Values:

   enumerator FTM_STATUS_SUCCESS
      FTM exchange is successful

   enumerator FTM_STATUS_UNSUPPORTED
      Peer does not support FTM

   enumerator FTM_STATUS_CONF_REJECTED
      Peer rejected FTM configuration in FTM Request

   enumerator FTM_STATUS_NO_RESPONSE
      Peer did not respond to FTM Requests
enumerator **FTM_STATUS_FAIL**

Unknown error during FTM exchange

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```

Initialize DPP Supplicant.

- Starts DPP Supplicant and initializes related Data Structures.

```
return
```

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**

- `evt_cb` - Callback function to receive DPP related events

```c
void esp_supp_dpp_deinit (void)
```

De-initialize DPP Supplicant.
Frees memory from DPP Supplicant Data Structures.

```
esp_err_t esp_supp_dpp_bootstrap_gen(const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
```

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**
- `chan_list` – List of channels device will be available on for listening
- `type` – Bootstrap method type, only QR Code method is supported for now.
- `key` – (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- `info` – (Optional) Ancilliary Device Information like Serial Number

**Returns**
- ESP_OK: Success
- ESP_FAIL: Failure

```
esp_err_t esp_supp_dpp_start_listen(void)
```

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```
void esp_supp_dpp_stop_listen(void)
```

Stop listening on Channels.

**Stops listening on Channels and cancels ongoing listen operation.**

**Macros**

- `ESP_ERR_DPP_FAILURE` — Generic failure during DPP Operation
- `ESP_ERR_DPP_TX_FAILURE` — DPP Frame Tx failed OR not Acked
- `ESP_ERR_DPP_INVALID_ATTR` — Encountered invalid DPP Attribute

**Type Definitions**

```
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
```

Types of Bootstrap Methods for DPP.
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

**Param evt**  DPP event ID
**Param data**  Event data payload

**Enumerations**

enum dpp_bootstrap_type

Types of Bootstrap Methods for DPP.

*Values:*

enumerator DPP_BOOTSTRAP_QR_CODE
QR Code Method

denumerator DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method

denumerator DPP_BOOTSTRAP_NFC_URI
NFC URI record Method

enum esp_supp_dpp_event_t

Types of Callback Events received from DPP Supplicant.

*Values:*

enumerator ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping

denumerator ESP_SUPP_DPP_CFG_RECVD
Config received via DPP Authentication

denumerator ESP_SUPP_DPP_FAIL
DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

**2.5.2 Ethernet**

**Ethernet**
Overview  ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver

Basic Ethernet Concepts  Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless rage expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

![Ethetnet Data Frame Format](image)

**Fig. 4: Ethernet Data Frame Format**

Preamble and Start-of-Frame Delimiter  The preamble contains seven bytes of \(55H\), it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence \(10101011\) (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.
**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length**  The type/length field is a 2-byte field, if the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.
Configure MAC and PHY  Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface) and etc.

One of the obvious difference between MII and RMII is the signal consumption. For MII, it usually costs up to 18 signals. Instead, RMII interface can reduce the consumption to 9.

In RMII mode, both the receiver and transmitter signals are referenced to the REF_CLK. REF_CLK must be stable during any access to PHY and MAC. Generally there’re three ways to generate the REF_CLK depending on the PHY device in your design:

- Some PHY chip can derive the REF_CLK from its external connected 25MHz crystal oscillator (as seen the option a in the picture). In this case, you should select CONFIG_ETH_RMII_CLK_INPUT in CONFIG_ETH_RMII_CLK_MODE.
- Some PHY chip uses an external connected 50MHz crystal oscillator or other clock source, which can also be used as the REF_CLK for MAC side (as seen the option b in the picture). In this case, you still need to select CONFIG_ETH_RMII_CLK_INPUT in CONFIG_ETH_RMII_CLK_MODE.
- Some EMAC controller can generate the REF_CLK using its internal high precision PLL (as seen the option c in the picture). In this case, you should select CONFIG_ETH_RMII_CLK_OUTPUT in CONFIG_ETH_RMII_CLK_MODE.

Note:  REF_CLK is configured via Project Configuration as described above by default. However, it can be overwritten from user application code by appropriately setting eth_esp32_emac_config_t::interface and eth_esp32_emac_config_t::clock_config members. See emac_rmii_clock_mode_t and emac_rmii_clock_gpio_t for more details.

Warning:  If the RMII clock mode is selected to CONFIG_ETH_RMII_CLK_OUTPUT, then GPIO0 can be used to output the REF_CLK signal. See CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 for more information. What’s more, if you’re not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock. See CONFIG_ETH_RMII_CLK_OUT_GPIO for more information.

If the RMII clock mode is selected to CONFIG_ETH_RMII_CLK_INPUT, then GPIO0 is the only choice to input the REF_CLK signal. Please note that, GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround of this issue is disabling the REF_CLK in hardware by default, so that the strapping pin won’t be interfered by other signals in boot stage. Then re-enable the REF_CLK in Ethernet driver installation stage. The ways to disable the REF_CLK signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
- Force the PHY device in reset status (as the case a in the picture). This could fail for some PHY device (i.e. it still outputs signal to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of REF_CLK in your hardware design! Keep the trace as short as possible. Keep it away from RF devices. Keep it away from inductor elements.

Note:  ESP-IDF only supports the RMII interface (i.e. always select CONFIG_ETH_PHY_INTERFACE_RMII in Kconfig option CONFIG_ETH_PHY_INTERFACE).

Signals used in data plane are fixed to specific GPIOs via MUX, they can’t be modified to other GPIOs. Signals used in control plane can be routed to any free GPIOs via Matrix. Please refer to ESP32-Ethernet-Kit for hardware design example.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in eth_mac_config_t, including:
Fig. 5: Ethernet RMII Interface
• `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.

• `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.

• `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

• `eth_esp32_emac_config_t::smi_mdc_gpio_num` and `eth_esp32_emac_config_t::smi_mdio_gpio_num`: the GPIO number used to connect the SMI signals.

• `eth_esp32_emac_config_t::interface`: configuration of MAC Data interface to PHY (MII/RMII).

• `eth_esp32_emac_config_t::clock_config`: configuration of EMAC Interface clock (REF_CLK mode and GPIO number in case of RMII).

**Configuration for PHY** is described in `eth_phy_config_t`, including:

• `eth_phy_config_t::phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.

• `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.

• `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.

• `eth_phy_config_t::reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

**Internal EMAC + External PHY**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC

mac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO

mac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // alter the GPIO

esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY

phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // address according to your board design

phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO

esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance

// ESP-IDF officially supports several different Ethernet PHY chip driver
// esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
```

(continues on next page)
Optional Runtime MAC Clock Configuration  

EMAC REF_CLK can be optionally configured from user application code.

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration

// ...
mac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
mac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
mac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance
```

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1)); // Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = -0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don’t have other choices but the integrated PHY.
Chapter 2. API Reference

- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module’s spec and the examples in esp-idf.

**Install Driver**  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to **ESP Event**.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                 mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
        break;
    case ETHERNET_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "Ethernet Link Down");
        break;
    case ETHERNET_EVENT_START:
        ESP_LOGI(TAG, "Ethernet Started");
        break;
    case ETHERNET_EVENT_STOP:
        ESP_LOGI(TAG, "Ethernet Stopped");
        break;
    default:
        break;
    }
}
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
esp_event_loop_create_default(); // create a default event loop that running in
 esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);;
// register Ethernet event handler (to deal with user specific stuffs when event...
//like link up/down happened)
```

Start Ethernet Driver  After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

Connect Driver to TCP/IP Stack  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to **LwIP**.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to **Network Interface**.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~");
}
```

```c
esp_netif_init(); // Initialize TCP/IP network interface (should be called only...
 esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network...
 esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for...
 esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.
Chapter 2. API Reference

Misc control of Ethernet driver  The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: \texttt{esp_eth_stop()}
- Update Ethernet data input path: \texttt{esp_eth_update_input_path()}
- Misc get/set of Ethernet driver attributes: \texttt{esp_eth_ioctl()}

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, &mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

Flow control  Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Controlopcodesetto0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Examples

- Ethernet basic example: \texttt{ethernet/basic}.
- Ethernet iperf example: \texttt{ethernet/iperf}.
- Ethernet to Wi-Fi AP “router” : \texttt{ethernet/eth2ap}.
- Most of protocol examples should also work for Ethernet: \texttt{protocols}.

Advanced Topics

Custom PHY Driver  There are multiple PHY manufactures with their wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies user’s actual needs due to either price, features, stock availability etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in 22.2.4 Management functions section. It defines provisions of so called “MII Management Interface” for the purposes of controlling the PHY and gathering status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration etc. This basic management functionality is addressed by \texttt{esp_eth/src/esp_eth_phy_802_3.c} in ESP-IDF and so it makes a creation of new custom PHY chip driver quite a simple task.
Chapter 2. API Reference

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

Majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the `esp_eth/src/esp_eth_phy_802_3.c` however, the following may require developing chip specific management functions:

- link status which is almost always chip specific,
- chip initialization, even though it is not strictly required, should be customized to at least ensure that expected chip is used and
- chip specific features configuration.

**Steps to create custom PHY driver:**

1. Define vendor specific registry layout based on PHY datasheet. See `esp_eth/src/esp_eth_phy_ip101.c` as an example.
2. Prepare derived PHY management object infostructure which
   - must contain at least parent IEEE 802.3 `phy_802_3_t` object and
   - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See `esp_eth/src/esp_eth_phy_ksz80xx.c` as an example.
3. Define chip specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among with other users via IDF Component Registry.

**API Reference**

**Header File**

- `components/esp_eth/include/esp_eth.h`
- `components/esp_eth/include/esp_eth_driver.h`

**Functions**

`esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)`

Install Ethernet driver.

**Parameters**

- `config` [in] configuration of the Ethernet driver
- `out_hdl` [out] handle of Ethernet driver

**Returns**

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)`

Uninstall Ethernet driver.

**Note:** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.
Parameters hdl - [in] handle of Ethernet driver

Returns

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_start (esp_eth_handle_t hdl)`
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

Note: This API will start driver state machine and internal software timer (for checking link status).

Parameters hdl - [in] handle of Ethernet driver

Returns

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has already started
- ESP_FAIL: start esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_stop (esp_eth_handle_t hdl)`
Stop Ethernet driver.

Note: This function does the opposite operation of `esp_eth_start`.

Parameters hdl - [in] handle of Ethernet driver

Returns

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)`
Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note: After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Parameters

- hdl - [in] handle of Ethernet driver
- stack_input - [in] function pointer, which does the actual process on incoming packets
- priv - [in] private resource, which gets passed to stack_input callback without any modification

Returns

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred
**esp_err_t** **esp_eth_transmit** *(esp_eth_handle_t* hdl, void *buf, size_t length)*

General Transmit.

**Parameters**
- **hdl** - [in] handle of Ethernet driver
- **buf** - [in] buffer of the packet to transfer
- **length** - [in] length of the buffer to transfer

**Returns**
- **ESP_OK**: transmit frame buffer successfully
- **ESP_ERR_INVALID_ARG**: transmit frame buffer failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: invalid driver state (i.e. driver is not started)
- **ESP_ERR_TIMEOUT**: transmit frame buffer failed because HW was not get available in predefined period
- **ESP_FAIL**: transmit frame buffer failed because some other error occurred

**esp_err_t** **esp_eth_transmit_vargs** *(esp_eth_handle_t* hdl, uint32_t argc, ...)*

Special Transmit with variable number of arguments.

**Parameters**
- **hdl** - [in] handle of Ethernet driver
- **argc** - [in] number variable arguments
- **...** - variable arguments

**Returns**
- **ESP_OK**: transmit successfull
- **ESP_ERR_INVALID_STATE**: invalid driver state (i.e. driver is not started)
- **ESP_ERR_TIMEOUT**: transmit frame buffer failed because HW was not get available in predefined period
- **ESP_FAIL**: transmit frame buffer failed because some other error occurred

**esp_err_t** **esp_eth_ioctl** *(esp_eth_handle_t* hdl, esp_eth_io_cmd_t cmd, void*data)*

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. **data** argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. **data** argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. **data** argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. **data** argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. **data** argument is pointer to memory of bool datatype from which the configuration option is read. **Preconditions**: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. **data** argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. **data** argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. **Preconditions**: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. **data** argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. **data** argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. **data** argument is pointer to memory of bool datatype from which the configuration option is read.
• ETH_CMD_S_DUPLEX_MODE sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.

• ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

• Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

Parameters

• hdl –[in] handle of Ethernet driver
• cmd –[in] IO control command
• data –[inout] address of data for set command or address where to store the data when used with get command

Returns

• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
Increase Ethernet driver reference.
```

Note: Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

```c
Parameters hdl –[in] handle of Ethernet driver
```

Returns

• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

```c
esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)
Decrease Ethernet driver reference.
```

Parameters hdl –[in] handle of Ethernet driver

Returns

• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

```c
Structures
```

```c
struct esp_eth_config_t
Configuration of Ethernet driver.
```

```c
Public Members
```

```c
esp_eth_mac_t *mac
Ethernet MAC object.
```
`esp_eth_phy_t *phy`

Ethernet PHY object.

`uint32_t check_link_period_ms`

Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)`

Input frame buffer to user’s stack.

- **Param eth_handle** [in] handle of Ethernet driver
- **Param buffer** [in] frame buffer that will get input to upper stack
- **Param length** [in] length of the frame buffer
- **Return**
  - `ESP_OK`: input frame buffer to upper stack successfully
  - `ESP_FAIL`: error occurred when inputting buffer to upper stack

`esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when lowlevel initialization is finished.

- **Param eth_handle** [in] handle of Ethernet driver
- **Return**
  - `ESP_OK`: process extra lowlevel initialization successfully
  - `ESP_FAIL`: error occurred when processing extra lowlevel initialization

`esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when lowlevel deinitialization is finished.

- **Param eth_handle** [in] handle of Ethernet driver
- **Return**
  - `ESP_OK`: process extra lowlevel deinitialization successfully
  - `ESP_FAIL`: error occurred when processing extra lowlevel deinitialization

`esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Read PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

- **Param eth_handle** [in] handle of Ethernet driver
- **Param phy_addr** [in] PHY chip address (0-31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value
- **Return**
  - `ESP_OK`: read PHY register successfully
  - `ESP_ERR_INVALID_ARG`: read PHY register failed because of invalid argument
  - `ESP_ERR_TIMEOUT`: read PHY register failed because of timeout
  - `ESP_FAIL`: read PHY register failed because some other error occurred

`esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`

Write PHY register.
Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

```c
Param eth_handle  [in] handle of Ethernet driver
Param phy_addr   [in] PHY chip address (0~31)
Param phy_reg    [in] PHY register index code
Param reg_value  [in] PHY register value
Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred
```

Macros
```
ETH_DEFAULT_CONFIG (emac, ephy)
```

Default configuration for Ethernet driver.

Type Definitions
```
typedef void *esp_eth_handle_t
```

Handle of Ethernet driver.

Enumerations
```
enum esp_eth_io_cmd_t
```

Command list for ioctl API.
```
Values:
```
enumerator ETH_CMD_G_MAC_ADDR
        Get MAC address
enumerator ETH_CMD_S_MAC_ADDR
        Set MAC address
enumerator ETH_CMD_G_PHY_ADDR
        Get PHY address
enumerator ETH_CMD_S_PHY_ADDR
        Set PHY address
enumerator ETH_CMD_G_AUTONEGO
        Get PHY Auto Negotiation
enumerator ETH_CMD_S_AUTONEGO
        Set PHY Auto Negotiation
enumerator ETH_CMD_G_SPEED
        Get Speed
```
Chapter 2. API Reference

enumerator **ETH_CMD_S_SPEED**
Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**
Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**
Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**
Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**
Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**
Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

**Header File**

- components/esp_eth/include/esp_eth_com.h

**Structures**

struct **esp_eth_mediator_s**
Ethernet mediator.

**Public Members**

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

- **Param** eth [in] mediator of Ethernet driver
- **Param** phy_addr [in] PHY Chip address (0-31)
- **Param** phy_reg [in] PHY register index code
- **Param** reg_value [out] PHY register value

**Return**

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

```c
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.

- **Param** eth [in] mediator of Ethernet driver
- **Param** phy_addr [in] PHY Chip address (0-31)
Chapter 2. API Reference

**Param phy_reg**  [in]  PHY register index code

**Param reg_value**  [in]  PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```

Deliver packet to upper stack.

**Param eth**  [in]  mediator of Ethernet driver

**Param buffer**  [in]  packet buffer

**Param length**  [in]  length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

**Param eth**  [in]  mediator of Ethernet driver

**Param state**  [in]  new state

**Param args**  [in]  optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Type Definitions**

typedef struct esp_eth_mediator_s esp_eth_mediator_t

Ethernet mediator.

**Enumerations**

defined enum esp_eth_state_t

Ethernet driver state.

*Values:*

- enumerator ETH_STATE_LLINIT  Lowlevel init done
- enumerator ETH_STATE_DEINIT  Deinit done
- enumerator ETH_STATE_LINK  Link status changed
- enumerator ETH_STATE_SPEED  Speed updated
- enumerator ETH_STATE_DUPLEX  Duplex updated
enumerator **ETH_STATE_PAUSE**  
Pause ability updated

defined enum **eth_event_t**  
Ethernet event declarations.  
Values:

enumerator **ETHERNET_EVENT_START**  
Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**  
Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**  
Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**  
Ethernet lost a valid link

**Header File**

- components/esp_eth/include/esp_eth_mac.h

**Functions**

```c
esp_eth_mac_t *esp_eth_mac_new_esp32(const eth_esp32_emac_config_t *esp32_config, const eth_mac_config_t *config)
```

Create ESP32 Ethernet MAC instance.

**Parameters**

- `esp32_config` - EMAC specific configuration
- `config` - Ethernet MAC configuration

**Returns**

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

**Unions**

```c
union eth_mac_clock_config_t
```

#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

**Public Members**

```c
struct eth_mac_clock_config_t::[anonymous]
```

- `mii` - EMAC MII Clock Configuration
- `emac_rmii_clock_mode_t clock_mode` - RMII Clock Mode Configuration
- `emac_rmii_clock_gpio_t clock_gpio` - RMII Clock GPIO Configuration
struct eth_mac_clock_config_t:[anonymous] rmii

EMAC RMII Clock Configuration

Structures

struct esp_eth_mac_s

Ethernet MAC.

Public Members

esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)

Set mediator for Ethernet MAC.

Param mac [in] Ethernet MAC instance
Param eth [in] Ethernet mediator

Return

• ESP_OK: set mediator for Ethernet MAC successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (*init)(esp_eth_mac_t *mac)

Initialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

• ESP_OK: initialize Ethernet MAC successfully
• ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
• ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (*deinit)(esp_eth_mac_t *mac)

Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

• ESP_OK: deinitialize Ethernet MAC successfully
• ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred

esp_err_t (*start)(esp_eth_mac_t *mac)

Start Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (*stop)(esp_eth_mac_t *mac)

Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some other error occurred
`esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)`

Transmit packet from Ethernet MAC.

**Note:** Returned error codes may differ for each specific MAC chip.

<table>
<thead>
<tr>
<th>Param name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac</code></td>
<td>[in] Ethernet MAC instance</td>
</tr>
<tr>
<td><code>buf</code></td>
<td>[in] packet buffer to transmit</td>
</tr>
<tr>
<td><code>length</code></td>
<td>[in] length of packet</td>
</tr>
</tbody>
</table>

Return:
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

`esp_err_t (*transmit_vargs)(esp_eth_mac_t *mac, uint32_t argc, va_list args)`

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

**Note:** Returned error codes may differ for each specific MAC chip.

<table>
<thead>
<tr>
<th>Param name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac</code></td>
<td>[in] Ethernet MAC instance</td>
</tr>
<tr>
<td><code>argc</code></td>
<td>[in] number variable arguments</td>
</tr>
<tr>
<td><code>args</code></td>
<td>[in] variable arguments</td>
</tr>
</tbody>
</table>

Return:
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

`esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)`

Receive packet from Ethernet MAC.

**Note:** Memory of `buf` is allocated in the Layer2, make sure it get free after process.

**Note:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

<table>
<thead>
<tr>
<th>Param name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac</code></td>
<td>[in] Ethernet MAC instance</td>
</tr>
<tr>
<td><code>buf</code></td>
<td>[out] packet buffer which will preserve the received frame</td>
</tr>
<tr>
<td><code>length</code></td>
<td>[out] length of the received packet</td>
</tr>
</tbody>
</table>

Return:
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data.
  In this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred
`esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Read PHY register.

**Param**
- **mac** [in] Ethernet MAC instance
- **phy_addr** [in] PHY chip address (0~31)
- **phy_reg** [in] PHY register index code
- **reg_value** [out] PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

`esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`

Write PHY register.

**Param**
- **mac** [in] Ethernet MAC instance
- **phy_addr** [in] PHY chip address (0~31)
- **phy_reg** [in] PHY register index code
- **reg_value** [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

`esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)`

Set MAC address.

**Param**
- **mac** [in] Ethernet MAC instance
- **addr** [in] MAC address

**Return**
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

`esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)`

Get MAC address.

**Param**
- **mac** [in] Ethernet MAC instance
- **addr** [out] MAC address

**Return**
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

`esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)`

Set speed of MAC.

**Param**
- **mac** [in] Ethernet MAC instance
- **speed** [in] MAC speed

**Return**
- ESP_OK: set MAC speed successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

**Param**
- **mac** [in] Ethernet MAC instance
- **duplex** [in] MAC duplex

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

**Param**
- **mac** [in] Ethernet MAC instance
- **link** [in] Link status

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

**Param**
- **mac** [in] Ethernet MAC instance
- **enable** [in] set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```
Enable flow control on MAC layer or not.

**Param**
- **mac** [in] Ethernet MAC instance
- **enable** [in] set true to enable flow control; set false to disable flow control

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```
Set the PAUSE ability of peer node.

**Param**
- **mac** [in] Ethernet MAC instance
- **ability** [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
```
Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

**Note:** This function may not be assigned when the MAC chip supports only most common set of
configuration options.

**Param** mac [in] Ethernet MAC instance

**Param** cmd [in] IO control command

**Param** data [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t (*del)(esp_eth_mac_t *mac)
```

Free memory of Ethernet MAC.

**Param** mac [in] Ethernet MAC instance

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

```c
struct eth_mac_config_t
```
Configuration of Ethernet MAC object.

**Public Members**

```c
uint32_t sw_reset_timeout_ms
```
Software reset timeout value (Unit: ms)

```c
uint32_t rx_task_stack_size
```
Stack size of the receive task

```c
uint32_t rx_task_prio
```
Priority of the receive task

```c
uint32_t flags
```
Flags that specify extra capability for mac driver

```c
struct eth_esp32_emac_config_t
```
EMAC specific configuration.

**Public Members**

```c
int smi_mdc_gpio_num
```
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

```c
int smi_mdio_gpio_num
```
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration
Chapter 2. API Reference

eth_data_interface_t interface
EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t clock_config
EMAC Interface clock configuration

defmac_dma_burst_len_t dma_burst_len
EMAC DMA burst length for both Tx and Rx

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
Default configuration for Ethernet MAC object.

ETH_ESP32_EMAC_DEFAULT_CONFIG()
Default ESP32’s EMAC specific configuration.

Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
Ethernet MAC.

Enumerations

enum emac_rmii_clock_mode_t
RMII Clock Mode Options.

  Values:

    enumerator EMAC_CLK_DEFAULT
    Default values configured using Kconfig are going to be used when “Default” selected.

    enumerator EMAC_CLK_EXT_IN
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

    enumerator EMAC_CLK_OUT
    Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum emac_rmii_clock_gpio_t
RMII Clock GPIO number Options.

  Values:
enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

---

**Note:** ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

### Header File

- components/esp_eth/include/esp_eth_phy.h

### Functions

**esp_eth_phy_t** *esp_eth_phy_new_ip101*(const *eth_phy_config_t* *config)*

Create a PHY instance of IP101.

**Parameters**

- **config** – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**esp_eth_phy_t** *esp_eth_phy_new_rtl8201*(const *eth_phy_config_t* *config)*

Create a PHY instance of RTL8201.

**Parameters**

- **config** – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**esp_eth_phy_t** *esp_eth_phy_new_lan87xx*(const *eth_phy_config_t* *config)*

Create a PHY instance of LAN87xx.

**Parameters**

- **config** – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**esp_eth_phy_t** *esp_eth_phy_new_dp83848*(const *eth_phy_config_t* *config)*

Create a PHY instance of DP83848.

**Parameters**

- **config** – [in] configuration of PHY

**Returns**
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz80xx (const eth_phy_config_t *config)`

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters**
config — [in] configuration of PHY

**Returns**
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

**Structures**

`struct esp_ethPHY_s`

Ethernet PHY.

**Public Members**

`esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)`

Set mediator for PHY.

Param phy — [in] Ethernet PHY instance
Param mediator — [in] mediator of Ethernet driver

Return
• ESP_OK: set mediator for Ethernet PHY instance successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

`esp_err_t (*reset)(esp_eth_phy_t *phy)`

Software Reset Ethernet PHY.

Param phy — [in] Ethernet PHY instance

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t (*reset_hw)(esp_eth_phy_t *phy)`

Hardware Reset Ethernet PHY.

**Note:** Hardware reset is mostly done by pull down and up PHY’s nRST pin

Param phy — [in] Ethernet PHY instance

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t (*init)(esp_eth_phy_t *phy)`

Initialize Ethernet PHY.
Chapter 2. API Reference

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

`esp_err_t (*deinit)(esp_eth_phy_t *phy)`

Deinitialize Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

`esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)`

Configure auto negotiation.

**Param phy** [in] Ethernet PHY instance

**Param cmd** [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY autonegotiation

**Param autonego_en_stat** [out] Address where to store current status of auto negotiation configuration

**Return**
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

`esp_err_t (*get_link)(esp_eth_phy_t *phy)`

Get Ethernet PHY link status.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

`esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)`

Power control of Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Param enable** [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

`esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)`

Set PHY chip address.

**Param phy** [in] Ethernet PHY instance

**Param addr** [in] PHY chip address

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

`esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)`

Get PHY chip address.

**Param phy** [in] Ethernet PHY instance

**Param addr** [out] PHY chip address

**Return**
• ESP_OK: get Ethernet PHY address successfully
• ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

```c
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
```
Advertise pause function supported by MAC layer.

**Param**
- **phy** [in] Ethernet PHY instance
- **addr** [out] Pause ability

**Return**
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

```c
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
```
Sets the PHY to loopback mode.

**Param**
- **phy** [in] Ethernet PHY instance
- **enable** [in] enables or disables PHY loopback

**Return**
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```
Sets PHY speed mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param**
- **phy** [in] Ethernet PHY instance
- **speed** [in] Speed mode to be set

**Return**
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param**
- **phy** [in] Ethernet PHY instance
- **duplex** [in] Duplex mode to be set

**Return**
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_ethphy_t *phy, uint32_t cmd, void *data)
```
Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.
**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

```c
void eth_phy_set_config(eth_phy_config_t *phy)
```

Set PHY configuration.

**Param**
- `phy`: Ethernet PHY configuration.

```c
void del(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Param**
- `phy`: Ethernet PHY instance

**Return**
- Returns `ESP_OK` if the PHY instance was successfully freed.
- Returns `ESP_FAIL` if an error occurred during the process.

**Public Members**

```c
int32_t phy_addr
```

PHY address, set -1 to enable PHY address detection at initialization stage.

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset

**Macros**

- `ESP_ETH_PHY_ADDR_AUTO`
- `ETH_PHY_DEFAULT_CONFIG()`
  - Default configuration for Ethernet PHY object.

**Type Definitions**

typedef struct esp_eth_phy_s esp_eth_phy_t

- Ethernet PHY.
Enumerations

enum eth_phy_autoneg_cmd_t

Auto-negotiation control commands.

Values:

enumerator ESP_ETH_PHY_AUTONEGO_RESTART
enumerator ESP_ETH_PHY_AUTONEGO_EN
enumerator ESP_ETH_PHY_AUTONEGO_DIS
enumerator ESP_ETH_PHY_AUTONEGO_G_STAT

Header File

Components/esp_eth/include/esp_eth_phy_802_3.h

Functions

esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)

Performs hardware reset with specific reset pin assertion time.

Parameters

• phy_802_3 – IEEE 802.3 PHY object info structure
• reset_assert_us – Hardware reset pin assertion time

Returns

• ESP_OK: reset Ethernet PHY successfully

esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)

Detect PHY address.

Parameters

• eth – Mediator of Ethernet driver
• detected_addr – [out] a valid address after detection

Returns

• ESP_OK: detect phy address successfully
• ESP_ERR_INVALID_ARG: invalid parameter
• ESP_ERR_NOT_FOUND: can’t detect any PHY device
• ESP_FAIL: detect phy address failed because some error occurred

esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)

Performs basic PHY chip initialization.

Parameters

phy_802_3 – IEEE 802.3 PHY object info structure

Returns

• ESP_OK: initialized Ethernet PHY successfully
• ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NOT_FOUND: PHY device not detected
• ESP_ERR_TIMEOUT: MII Management read/write operation timeout
• ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation
**esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)**

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t*oui)**

Reads raw content of OUI field.

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure
- `oui` - [out] OUI value

**Returns**
- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid oui argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t*model, uint8_t*rev)**

Reads manufacturer’s model and revision number.

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure
- `model` - [out] Manufacturer’s model number (can be NULL when not required)
- `rev` - [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**
- ESP_OK: Manufacturer info read successfully
- ESP_FAIL: Manufacturer info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**phy_802_3_t *esp_eth_phy_into_phy_802_3 (esp_eth_phy_t *phy)**

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy` - Ethernet PHY instance

**Returns**
- `phy_802_3_t` - address to parent IEEE 802.3 PHY object infostructure

**esp_err_t esp_eth_phy_802_3_obj_config_init (phy_802_3_t *phy_802_3, const eth_phy_config_t *config)**

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy_802_3` - Address to IEEE 802.3 PHY object infostructure
- `config` - Configuration of the IEEE 802.3 PHY object

**Returns**
- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid config argument
Chapter 2. API Reference

**Structures**

```c
struct phy_802_3_t
IEEE 802.3 PHY object info structure.
```

**Public Members**

```c
esp_eth_phy_t *parent
Parent Ethernet PHY instance
```

```c
esp_eth_mediator_t *eth
Mediator of Ethernet driver
```

```c
int addr
PHY address
```

```c
uint32_t reset_timeout_ms
Reset timeout value (Unit: ms)
```

```c
uint32_t autonego_timeout_ms
Auto-negotiation timeout value (Unit: ms)
```

```c
eth_link_t link_status
Current Link status
```

```c
intreset_gpio_num
Reset GPIO number, -1 means no hardware reset
```

**Header File**

- `components/esp_eth/include/esp_eth_netif_glue.h`

**Functions**

```c
esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
Create a netif glue for Ethernet driver.
```

**Note:** netif glue is used to attach io driver to TCP/IP netif

**Parameters**

- `eth_hdl` - Ethernet driver handle

**Returns**

- glue object, which inherits esp_netif_driver_base_t

```c
esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
Delete netif glue of Ethernet driver.
```

**Parameters**

- `eth_netif_glue` - netif glue

**Returns**

- ESP_OK: delete netif glue successfully

**Type Definitions**

```c
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
Handle of netif glue - an intermediate layer between netif and Ethernet driver.
```

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

Chapter 2. API Reference

2.5.3 Thread

Introduction  Thread is an IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

Application Examples  The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcp.

API Reference  For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- components/openthread/include/esp_openthread.h

Functions

```c
esp_err_t esp_openthread_init (const esp_openthread_platform_config_t *init_config)
```

Initializes the full OpenThread stack.

**Note:** The OpenThread instance will also be initialized in this function.

**Parameters**

- **init_config**  [in] The initialization configuration.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

```c
esp_err_t esp_openthread_launch_mainloop (void)
```

Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_deinit (void)
```

This function performs OpenThread stack and platform driver deinitialization.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
otInstance *esp_openthread_get_instance (void)
This function acquires the underlying OpenThread instance.

Note: This function can be called on other tasks without lock.

Returns The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

struct esp_openthread_mainloop_context_t
This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t
The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

int rx_pin
UART RX pin
int tx_pin
    UART TX pin

struct esp_openthread_radio_config_t
    The OpenThread radio configuration.

Public Members

    esp_openthead_radio_mode_t radio_mode
        The radio mode

    esp_openthead_uart_config_t radio_uart_config
        The uart configuration to RCP

struct esp_openthread_host_connection_config_t
    The OpenThread host connection configuration.

Public Members

    esp_openthead_host_connection_mode_t host_connection_mode
        The host connection mode

    esp_openthead_uart_config_t host_uart_config
        The uart configuration to host

struct esp_openthead_port_config_t
    The OpenThread port specific configuration.

Public Members

    const char *storage_partition_name
        The partition for storing OpenThread dataset

    uint8_t netif_queue_size
        The packet queue size for the network interface

    uint8_t task_queue_size
        The task queue size

struct esp_openthead_platform_config_t
    The OpenThread platform configuration.

Public Members

    esp_openthead_radio_config_t radio_config
        The radio configuration
Chapter 2. API Reference

```c
typedef void (*esp_openthread_rcp_failure_handler)(void)
```

**Type Definitions**

typedef void (*esp_openthread_rcp_failure_handler)(void)

**Enumerations**

```c
typedef void (*esp_openthread_rcp_failure_handler)(void)
```

```c
enum esp_openthread_event_t
```

OpenThread event declarations.

**Values:**

- `OPENTHREAD_EVENT_START`
  
  OpenThread stack start

- `OPENTHREAD_EVENT_STOP`
  
  OpenThread stack stop

- `OPENTHREAD_EVENT_IF_UP`
  
  OpenThread network interface up

- `OPENTHREAD_EVENT_IF_DOWN`
  
  OpenThread network interface down

- `OPENTHREAD_EVENT_GOT_IP6`
  
  OpenThread stack added IPv6 address

- `OPENTHREAD_EVENT_LOST_IP6`
  
  OpenThread stack removed IPv6 address

- `OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN`
  
  OpenThread stack joined IPv6 multicast group

- `OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE`
  
  OpenThread stack left IPv6 multicast group

- `OPENTHREAD_EVENT_TREL_ADD_IP6`
  
  OpenThread stack added TREL IPv6 address

- `OPENTHREAD_EVENT_TREL_REMOVE_IP6`
  
  OpenThread stack removed TREL IPv6 address

- `OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN`
  
  OpenThread stack joined TREL IPv6 multicast group
enum **esp_openthread_radio_mode_t**  
The radio mode of OpenThread.  

*Values:*  

enumerator **RADIO_MODE_NATIVE**  
Use the native 15.4 radio  

enumerator **RADIO_MODE_UART_RCP**  
UART connection to a 15.4 capable radio co-processor (RCP)  

enumerator **RADIO_MODE_SPI_RCP**  
SPI connection to a 15.4 capable radio co-processor (RCP)  

enum **esp_openthread_host_connection_mode_t**  
How OpenThread connects to the host.  

*Values:*  

enumerator **HOST_CONNECTION_MODE_NONE**  
Disable host connection  

enumerator **HOST_CONNECTION_MODE_CLI_UART**  
CLI UART connection to the host  

enumerator **HOST_CONNECTION_MODE_RCP_UART**  
RCP UART connection to the host  

**Header File**  
- components/openthread/include/esp_openthread_lock.h

**Functions**

*esp_err_t* esp_openthread_lock_init (void)  
This function initializes the OpenThread API lock.  

*Returns*  
- ESP_OK on success  
- ESP_ERR_NO_MEM if allocation has failed  
- ESP_ERR_INVALID_STATE if already initialized

*void* esp_openthread_lock_deinit (void)  
This function deinitializes the OpenThread API lock.  

*bool* esp_openthread_lock_acquire (TickType_t block_ticks)  
This function acquires the OpenThread API lock.  

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

`Parameters`  
block_ticks - [in] The maximum number of RTOS ticks to wait for the lock.  

*Returns*  
- True on lock acquired
void esp_openthread_lock_release (void)
This function releases the OpenThread API lock.

Header File

• components/openthread/include/esp_openthread_netif_glue.h

Functions

void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
This function initializes the OpenThread network interface glue.

Returns

• glue pointer on success
• NULL on failure

void esp_openthread_netif_glue_deinit (void)
This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
This function acquires the OpenThread netif.

Returns The OpenThread netif or NULL if not initialized.

Macros

ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD ()
Default configuration reference of OT esp-netif.

ESP_NETIF_DEFAULT_OPENTHREAD ()

Header File

• components/openthread/include/esp_openthread_border_router.h

Functions

void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.

Note: This function must be called before esp_openthread_init

Parameters backbone_netif – [in] The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.

Note: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Returns

• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if feature not supported
• ESP_ERR_INVALID_STATE if already initialized
• ESP_FAIL on other failures
esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

Returns
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not initialized
• ESP_FAIL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
Gets the backbone interface of OpenThread border router.

Returns
The backbone interface or NULL if border router not initialized.

void esp_openthread_register_rcp_failure_handler (esp_openthread_rcp_failure_handler handler)
Registers the callback for RCP failure.

void esp_openthread_rcp_deinit (void)
Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:
• It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
• The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF architecture

(continues on next page)
Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   • use default handlers for common interfaces defined in IO drivers; or define a specific handlers for
     customised behaviour/new interfaces
   • register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
   • Getting and setting TCP/IP related parameters (DHCP, IP, etc)
   • Receiving IP events (connect/disconnect)
   • Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver
   Communication driver plays these two important roles in relation with ESP-NETIF:
   1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up ->
      turn netif on)
   2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
      • Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are
        passed to the IO driver
      • Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF
   ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime)
   and configuring a network stack (compile time). In addition to that a set of API is provided to control network
   interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into
   these 6 groups:
   1) Initialization APIs (to create and configure ESP-NETIF instance)
   2) Input/Output API (for passing data between IO driver and network stack)
   3) Event or Action API
      • Used for network interface lifecycle management
      • ESP-NETIF provides building blocks for designing event handlers
   4) Setters and Getters for basic network interface properties
   5) Network stack abstraction: enabling user interaction with TCP/IP stack
      • Set interface up or down
      • DHCP server and client API
      • DNS API
   6) Driver conversion utilities

D) Network stack
   Network stack has no public interaction with application code with regard to public interfaces
   and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface
   The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access
   Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in
   embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note
   that only Ethernet (IEEE 802.3) is currently supported.

   From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a
   file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component
   to learn more.

   There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with
   different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic
   entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be
configured to give an access to specific Network Interface identified by \texttt{if\_key} (e.g. \texttt{ETH\_DEF}) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

**ESP-NETIF L2 TAP Interface Usage Manual**

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by \texttt{CONFIG\_ESP\_NETIF\_L2\_TAP} first and then registered by \texttt{esp\_vfs\_l2tap\_intf\_register()} prior usage of any VFS function.

\texttt{open()} Once the ESP-NETIF L2 TAP is registered, it can be opened at path name \texttt{“/dev/net/tap”}. The same path name can be opened multiple times up to \texttt{CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FD\_S} and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with \texttt{O\_NONBLOCK} file status flag to the \texttt{read()} does not block. Note that the \texttt{write()} may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using \texttt{fcntl()}. On success, \texttt{open()} returns the new file descriptor (a nonnegative integer). On error, -1 is returned and \texttt{errno} is set to indicate the error.

\texttt{ioctl()} The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

\begin{itemize}
  \item \texttt{L2TAP\_S\_INTF\_DEVICE} - bounds the file descriptor to specific Network Interface which is identified by its \texttt{if\_key}. ESP-NETIF Network Interface \texttt{if\_key} is passed to \texttt{ioctl()} as the third parameter. Note that default Network Interfaces \texttt{if\_key}’s used in ESP-IDF can be found in \texttt{esp\_netif/include/esp\_netif\_defaults.h}.
  \item \texttt{L2TAP\_S\_DEVICE\_DRV\_HNDL} is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. \texttt{esp\_eth\_handle\_t} in case of Ethernet). The IO Driver handle is passed to \texttt{ioctl()} as the third parameter.
  \item \texttt{L2TAP\_S\_RCV\_FILTER} - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval \textless 0, 0x05DC\textgreater at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.
\end{itemize}

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by \texttt{L2TAP\_S\_INTF\_DEVICE} or \texttt{L2TAP\_S\_DEVICE\_DRV\_HNDL} to be \texttt{L2TAP\_S\_RCV\_FILTER} option available.

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.
Chapter 2. API Reference

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user’s application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()**

`fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- **F_GETFD** - the function returns the file descriptor flags, the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**read()**

Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()**

A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+-------------------------------
| Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/data) |
+-------------------+-------------------+-------------+-------------------------------
| 6B                | 6B                | 2B          | 0-1486B                        
```

Espressif Systems 920 Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

`close()`  Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

`select()`  Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**ESP-NETIF programmer’s manual**  Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- L2TAP: `protocols/l2tap/main/l2tap_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

**WiFi default initialization**  The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are not provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

**API Reference**
Chapter 2. API Reference

Header File

- components/esp_netif/include/esp_netif.h

Functions

`esp_err_t esp_netif_init (void)`
Initialize the underlying TCP/IP stack.

**Note:** This function should be called exactly once from application code, when the application starts up.

**Returns**

- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit (void)`
Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Returns**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new (const esp_netif_config_t *esp_netif_config)`
Creates an instance of new esp-netif object based on provided config.

**Parameters**

- `esp_netif_config` - pointer esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

`void esp_netif_destroy (esp_netif_t *esp_netif)`
Destroys the esp_netif object.

**Parameters**

- `esp_netif` - [in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`
Configures driver related options of esp_netif object.

**Parameters**

- `esp_netif` - [inout] pointer to the object to be configured
- `driver_config` - [in] pointer esp-netif io driver related configuration

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

`esp_err_t esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`
Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**

- `esp_netif` - [inout] pointer to esp_netif object to be attached
- `driver_handle` - [in] pointer to the driver handle

**Returns**
Chapter 2. API Reference

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s pot_attach callback failed

`esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)`

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `buffer` [in] Received data
- `len` [in] Length of the data frame
- `eb` [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**
- ESP_OK

`void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `base`
- `event_id`
- `data`

`void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver stop event.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `base`
- `event_id`
- `data`

`void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver connected event.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `base`
- `event_id`
- `data`
void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif [in] Handle to esp-netif instance
- base
- event_id
- data

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif [in] Handle to esp-netif instance
- base
- event_id
- data

void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif [in] Handle to esp-netif instance
- base
- event_id
- data

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif [in] Handle to esp-netif instance
- base
- event_id
- data

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.
**Note:** This API can be directly used as event handler

**Parameters**

- `esp_netif` [:in] Handle to esp-netif instance
- `base`
- `event_id`
- `data`

```c
void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note:** This API can be directly used as event handler

**Parameters**

- `esp_netif` [:in] Handle to esp-netif instance
- `base`
- `event_id`
- `data`

```c
esp_err_t esp_netif_set_default_netif (esp_netif_t *esp_netif)
```

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

**Parameters**

- `esp_netif` [:in] Handle to esp-netif instance

**Returns**

- ESP_OK on success

```c
esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])
```

Set the mac address for the interface instance.

**Parameters**

- `esp_netif` [:in] Handle to esp-netif instance
- `mac` [:in] Desired mac address for the related network interface

**Returns**

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])
```

Get the mac address for the interface instance.

**Parameters**

- `esp_netif` [:in] Handle to esp-netif instance
- `mac` [:out] Resultant mac address for the related network interface

**Returns**

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.
Parameters
• `esp_netif` - [in] Handle to esp-netif instance

Returns
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

`esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)`

Get interface hostname.

Parameters
• `esp_netif` - [in] Handle to esp-netif instance
• `hostname` - [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

Returns
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

`bool esp_netif_is_netif_up (esp_netif_t *esp_netif)`

Test if supplied interface is up or down.

Parameters `esp_netif` - [in] Handle to esp-netif instance

Returns
• true - Interface is up
• false - Interface is down

`esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

Parameters
• `esp_netif` - [in] Handle to esp-netif instance
• `ip_info` - [out] If successful, IP information will be returned in this argument.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

`esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Parameters
• `esp_netif` - [in] Handle to esp-netif instance
• `ip_info` - [out] If successful, IP information will be returned in this argument.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

`esp_err_t esp_netif_set_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.
The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note:** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

### Parameters
- `esp_netif` - [in] Handle to esp-netif instance
- `ip_info` - [in] IP information to set on the specified interface

### Returns
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

```c
esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

### Parameters
- `esp_netif` - [in] Handle to esp-netif instance
- `ip_info` - [in] Store the old IP information for the specified interface

### Returns
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

### Parameters `esp_netif` - [in] Handle to esp-netif instance

### Returns implementation specific index of interface represented with supplied `esp_netif`

```c
esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)
```

Get net interface name from network stack implementation.

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

### Parameters
- `esp_netif` - [in] Handle to esp-netif instance
• **name** - [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhc_option_mode_t opt_op, esp_netif_dhc_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP server option.

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **opt_op** - [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** - [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** - [inout] Pointer to the option parameter.
- **opt_len** - [in] Length of the option parameter.

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

```c
esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhc_option_mode_t opt_op, esp_netif_dhc_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP client option.

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **opt_op** - [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** - [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** - [inout] Pointer to the option parameter.
- **opt_len** - [in] Length of the option parameter.

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

```c
esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)
```

Start DHCP client (only if enabled in interface object)

**Note:** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

```c
esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)
```

Stop DHCP client (only if enabled in interface object)
Chapter 2. API Reference

**Note:** Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

**Parameters** `esp_netif` -[in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP client status.

**Parameters**

- `esp_netif` -[in] Handle to esp-netif instance
- `status` -[out] If successful, the status of the DHCP client will be returned in this argument.

**Returns**

- ESP_OK

**esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP Server status.

**Parameters**

- `esp_netif` -[in] Handle to esp-netif instance
- `status` -[out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP_OK

**esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)**

Start DHCP server (only if enabled in interface object)

**Parameters** `esp_netif` -[in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)**

Stop DHCP server (only if enabled in interface object)

**Parameters** `esp_netif` -[in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**esp_err_t esp_netif_dhcps_get_clients_by_mac (esp_netif_t *esp_netif, int num, esp_netif_pair_mac_ip_t *mac_ip_pair)**

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- `esp_netif` -[in] Handle to esp-netif instance
- `num` -[in] Number of clients with specified MAC addresses in the array of pairs
- `mac_ip_pair` -[inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
• ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

```c
esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                   esp_netif_dns_info_t *dns)
```

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled
If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.
If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the DHCP server itself.
• This function can override it by setting server type ESP_NETIF_DNS_MAIN.
• Other DNS Server types are not supported for the DHCP server.
• To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**
- `esp_netif` -in] Handle to esp-netif instance
- `type` -in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -in] DNS Server address to set

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                   esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**
- `esp_netif` -in] Handle to esp-netif instance
- `type` -in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -out] DNS Server result is written here on success

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.
This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Parameters**
- `esp_netif` -in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.
If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Parameters
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] IPv6 information will be returned in this argument if successful.

Returns
- `ESP_OK`
- `ESP_FAIL` If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Parameters
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] IPv6 information will be returned in this argument if successful.

Returns
- `ESP_OK`
- `ESP_FAIL` If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

```c
int esp_netif_get_all_ip6(esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
```

Get all IPv6 addresses of the specified interface.

Parameters
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] Array of IPv6 addresses will be copied to the argument

Returns
- Number of returned IPv6 addresses

```c
void esp_netif_set_ip4_addr(esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```

Sets IPv4 address to the specified octets.

Parameters
- `addr` [out] IP address to be set
- `a` - the first octet (127 for IP 127.0.0.1)
- `b`
- `c`
- `d`

```c
char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)
```

Converts numeric IP address into decimal dotted ASCII representation.

Parameters
- `addr` - IP address in network order to convert
- `buf` - target buffer where the string is stored
- `buflen` - length of buf

Returns
- Either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

```c
uint32_t esp_ip4addr_aton(const char *addr)
```

Ascii internet address interpretation routine. The value returned is in network order.

Parameters
- `addr` - IP address in ascii representation (e.g. "127.0.0.1")

Returns
- IP address in network order

```c
esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)
```

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Parameters
- `src` [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
• `dst` – [out] Address of the target `esp_ip4_addr_t` structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

```c
esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst)
```

Converts Ascii internet IPv6 address into `esp_ip4_addr_t` Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

**Parameters**
- `src` – [in] IPv6 address in ascii representation (e.g. “2001:db8:85a3:0:0:0:2:1”)
- `dst` – [out] Address of the target `esp_ip6_addr_t` structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

```c
esp_netif_iowrapper_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
```

Gets media driver handle for this esp-netif instance.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance

**Returns**
- opaque pointer of related IO driver

```c
esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)
```

Searches over a list of created objects to find an instance with supplied if key.

**Parameters**
- `if_key` – Textual description of network interface

**Returns**
- Handle to esp-netif instance

```c
esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)
```

Returns configured flags for this interface.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance

**Returns**
- Configuration flags

```c
const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)
```

Returns configured interface key for this esp-netif instance.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance

**Returns**
- Textual description of related interface

```c
const char *esp_netif_get_desc (esp_netif_t *esp_netif)
```

Returns configured interface type for this esp-netif instance.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance

**Returns**
- Enumerated type of this interface, such as station, AP, ethernet

```c
int esp_netif_get_route_prio (esp_netif_t *esp_netif)
```

Returns configured routing priority number.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance

**Returns**
- Integer representing the instance’s route-prio, or -1 if invalid parameters

```c
int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
```

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- `esp_netif` – [in] Handle to esp-netif instance
- `event_type` – (either get or lost IP)

**Returns**
- specific event id which is configured to be raised if the interface lost or acquired IP address
- -1 if supplied event_type is not known
**esp_netif_t** *esp_netif_next (esp_netif_t *esp_netif)*

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- First netif from the list if supplied parameter is NULL, next one otherwise

```c
size_t esp_netif_get_nr_of_ifs (void)
```

Returns number of registered esp_netif objects.

**Parameters**
- None

**Returns**
- Number of esp_netifs

```c
void esp_netif_netstack_buf_ref (void *netstack_buf)
```

Increase the reference counter of net stack buffer

**Parameters**
- `netstack_buf` - [in] the net stack buffer

```c
void esp_netif_netstack_buf_free (void *netstack_buf)
```

Free the netstack buffer

**Parameters**
- `netstack_buf` - [in] the net stack buffer

struct ip_event_got_ip6_t
```
Event structure for IP_EVENT_GOT_IP6 event

Public Members

```
int if_index
```
Interface index for which the event is received (left for legacy compilation)

```
exp_netif_t *esp_netif
```
Pointer to corresponding esp-netif object

```
exp_netif_ip6_info_t ip6_info
```
IPv6 address of the interface

```
int ip_index
```
IPv6 address index

```
struct ip_event_add_ip6_t
```
Event structure for ADD_IP6 event

Public Members

```
exp_ip6_addr_t addr
```
The address to be added to the interface
bool preferred
   The default preference of the address

struct ip_event_ap_staipassigned_t
   Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

esp_netif_t *esp_netif
   Pointer to the associated netif handle

esp_ip4_addr_t ip
   IP address which was assigned to the station

uint8_t mac[6]
   MAC address of the connected client

struct bridgeif_config
   LwIP bridge configuration

Public Members

uint16_t max_fdb_dyn_entries
   maximum number of entries in dynamic forwarding database

uint16_t max_fdb_sta_entries
   maximum number of entries in static forwarding database

uint8_t max_ports
   maximum number of ports the bridge can consist of

struct esp_netif_inherent_config
   ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t flags
   flags that define esp-netif behavior

uint8_t mac[6]
   initial mac address for this interface

const esp_netif_ip_info_t *ip_info
   initial ip address for this interface
printf(String)
struct esp_netif_config
  Generic esp_netif configuration.

  **Public Members**

  const esp_netif_inherent_config_t *base
      base config

ESP-netif inherent config parameters.

typedef struct esp_netif_config esp_netif_config_t

typedef void *esp_netif_iodriver_handle

IO driver handle type.

typedef struct esp_netif_driver_base_s esp_netif_driver_base_t

ESP-netif driver base handle.

typedef struct esp_netif_driver_ifconfig esp_netif_driver_ifconfig_t

typedef struct esp_netif_netstack_config esp_netif_netstack_config_t

Specific L3 network stack configuration.

typedef esp_err_t (*esp_netif_receive_t)(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

ESP-NETIF Receive function type.
Enumerations

enum esp_netif_dns_type_t

Type of DNS server.

Values:

enumerator ESP_NETIF_DNS_MAIN
    DNS main server address

enumerator ESP_NETIF_DNS_BACKUP
    DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_FALLBACK
    DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_MAX

enum esp_netif_dhcp_status_t

Status of DHCP client or DHCP server.

Values:

enumerator ESP_NETIF_DHCP_INIT
    DHCP client/server is in initial state (not yet started)

enumerator ESP_NETIF_DHCP_STARTED
    DHCP client/server has been started

enumerator ESP_NETIF_DHCP_STOPPED
    DHCP client/server has been stopped

enumerator ESP_NETIF_DHCP_STATUS_MAX

enum esp_netif_dhcp_option_mode_t

Mode for DHCP client or DHCP server option functions.

Values:

enumerator ESP_NETIF_OP_START

enumerator ESP_NETIF_OP_SET
    Set option

enumerator ESP_NETIF_OP_GET
    Get option

enumerator ESP_NETIF_OP_MAX

enum esp_netif_dhcp_option_id_t

Supported options for DHCP client or DHCP server.

Values:
enumerator **ESP_NETIF_SUBNET_MASK**
  Network mask

enumerator **ESP_NETIF_DOMAIN_NAME_SERVER**
  Domain name server

enumerator **ESP_NETIF_ROUTER_SOLICITATION_ADDRESS**
  Solicitation router address

enumerator **ESP_NETIF_REQUESTED_IP_ADDRESS**
  Request specific IP address

enumerator **ESP_NETIF_IP_ADDRESSLEASE_TIME**
  Request IP address lease time

enumerator **ESP_NETIF_IP_REQUEST_RETRY_TIME**
  Request IP address retry counter

enumerator **ESP_NETIF_VENDOR_CLASS_IDENTIFIER**
  Vendor Class Identifier of a DHCP client

enumerator **ESP_NETIF_VENDOR_SPECIFIC_INFO**
  Vendor Specific Information of a DHCP server

enum **ip_event_t**
  IP event declarations

  Values:

enumerator **IP_EVENT_STA_GOT_IP**
  station got IP from connected AP

enumerator **IP_EVENT_STA_LOST_IP**
  station lost IP and the IP is reset to 0

enumerator **IP_EVENT_AP_STAIPASSIGNED**
  soft-AP assign an IP to a connected station

enumerator **IP_EVENT_GOT_IP6**
  station or ap or ethernet interface v6IP addr is preferred

enumerator **IP_EVENT_ETH_GOT_IP**
  ethernet got IP from connected AP

enumerator **IP_EVENT_ETH_LOST_IP**
  ethernet lost IP and the IP is reset to 0

enumerator **IP_EVENT_PPP_GOT_IP**
  PPP interface got IP
enumerator IP_EVENT_PPP_LOST_IP
    PPP interface lost IP

enum esp_netif_flags
    Values:
    enumerator ESP_NETIF_DHCP_CLIENT
    enumerator ESP_NETIF_DHCP_SERVER
    enumerator ESP_NETIF_FLAG_AUTOUP
    enumerator ESP_NETIF_FLAG_GARP
    enumerator ESP_NETIF_FLAG_EVENT_IP_MODIFIED
    enumerator ESP_NETIF_FLAG_IS_PPP
    enumerator ESP_NETIF_FLAG_IS_SLIP

Functions

    esp_ip6_addr_type_t esp_netif_ip6_get_addr_type (esp_ip6_addr_t *ip6_addr)
    Get the IPv6 address type.
        Parameters
            ip6_addr – [in] IPv6 type
        Returns
            IPv6 type in form of enum esp_ip6_addr_type_t

    static inline void esp_netif_ip_addr_copy (esp_ip_addr_t *dest, const esp_ip_addr_t *src)
    Copy IP addresses.
        Parameters
            • dest – [out] destination IP
            • src – [in] source IP

Structures

    struct esp_ip6_addr
        IPv6 address.

Functions

\[\text{esp_err_t} \ \text{esp_vfs_l2tap_intf_register}(l2tap_vfs_config_t *config)\]
Add L2 TAP virtual filesystem driver.
This function must be called prior usage of ESP-NETIF L2 TAP Interface

Parameters config - L2 TAP virtual filesystem driver configuration. Default base path
/dev/net/tap is used when this parameter is NULL.

Returns esp_err_t
\- ESP_OK on success

\[\text{esp_err_t} \ \text{esp_vfs_l2tap_intf_unregister}(\text{const char *}\text{base_path})\]
Removes L2 TAP virtual filesystem driver.

Parameters base_path - Base path to the L2 TAP virtual filesystem driver. Default path
/dev/net/tap is used when this parameter is NULL.

Returns esp_err_t
\- ESP_OK on success

\[\text{esp_err_t} \ \text{esp_vfs_l2tap_eth_filter}(l2tap_iodriver_handle \ \text{driver_handle}, \ \text{void} *\text{buff}, \ \text{size_t} *\text{size})\]
Filters received Ethernet L2 frames into L2 TAP infrastructure.

Parameters
\- \text{driver_handle} - handle of driver at which the frame was received
\- \text{buff} - received L2 frame
\- \text{size} - input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

Returns esp_err_t
\- ESP_OK is always returned

Structures

\[\text{struct} \ l2tap_vfs_config_t\]
L2Tap VFS config parameters.

WiFi default API reference

Header File

• components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.

Parameters esp_netif — instance to attach the wifi station to

Returns

• ESP_OK on success
• ESP_FAIL if attach failed

esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.

Parameters esp_netif — instance to attach the wifi AP to

Returns

• ESP_OK on success
• ESP_FAIL if attach failed

esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)
Sets default wifi event handlers for STA interface.

Returns

• ESP_OK on success, error returned from esp_event_handler_register if failed
**esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)**

Sets default wifi event handlers for AP interface.

**Parameters**

- void

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)**

Clears default wifi event handlers for supplied network interface.

**Parameters**

- esp_netif

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_netif_t *esp_netif_create_default_wifi_ap (void)**

Creates default WIFI AP. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

**Returns**

- pointer to esp_netif instance

**esp_netif_t *esp_netif_create_default_wifi_sta (void)**

Creates default WIFI STA. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**Returns**

- pointer to esp_netif instance

**void esp_netif_destroy_default_wifi (void *esp_netif)**

Destroys default WIFI netif created with esp_netif_create_default_wifi... () API.

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (This function is a no-operation if esp_netif is NULL)

**Parameters**

- esp_netif [in] object to detach from WiFi and destroy

**esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)**

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**

- wifi_if [in] type of wifi interface
- esp_netif_config [in] inherent esp_netif configuration pointer

**Returns**

- pointer to esp_netif instance

**esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)**

Creates default STA and AP network interfaces for esp-mesh.
Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node. Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Parameters

- `p_netif_sta` [out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` [out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success

2.5.5 IP Network Layer

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle *driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;        /*!< base structure reserved as...
    esp_netif_driver */
    driver_impl *h;                     /*!< handle of driver...
    implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}

Default handlers

I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example driver start -> network start, etc. An example of such a default handler is provided below:

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}

Network stack connection

The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)
Returns esp-netif handle.

Parameters
dev -- [in] opaque ptr to network interface of specific TCP/IP stack

Returns
handle to related esp-netif instance

void *esp_netif_get_netif_impl(esp_netif_t * esp_netif)
Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Parameters
esp_netif -- [in] Handle to esp-netif instance

Returns
handle to related network stack netif handle

esp_err_t esp_netif_set_link_speed(esp_netif_t *esp_netif, uint32_t speed)
Set link-speed for the specified network interface.

Parameters
- esp_netif -- [in] Handle to esp-netif instance
  - speed -- [in] Link speed in bit/s

Returns
ESP_OK on success
**esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void* data, size_t len)**

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

---

**Parameters**
- *esp_netif* [in] Handle to esp-netif instance
- *data* [in] Data to be transmitted
- *len* [in] Length of the data frame

**Returns**
- ESP_OK on success, an error passed from the I/O driver otherwise

---

**esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void* data, size_t len, void *netstack_buf)**

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

---

**Parameters**
- *esp_netif* [in] Handle to esp-netif instance
- *data* [in] Data to be transmitted
- *len* [in] Length of the data frame
- *netstack_buf* [in] net stack buffer

**Returns**
- ESP_OK on success, an error passed from the I/O driver otherwise

---

**void esp_netif_free_rx_buffer(void *esp_netif, void *buffer)**

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

---

**Parameters**
- *esp_netif* [in] Handle to esp-netif instance
- *buffer* [in] Rx buffer pointer

---

Code examples for TCP/IP socket APIs are provided in the **protocols/sockets** directory of ESP-IDF examples.

---

### 2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in *Application Protocols*.

---

### 2.6 Peripherals API

#### 2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

**Introduction**

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32 can be used in scenario(s) like:
- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.
Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- **Resource Allocation** - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- **Unit Configuration** - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- **Read Conversion Result** - covers how to get ADC conversion raw result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - describes tips on how to read ADC conversion raw result when cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**  The ADC oneshot mode driver is implemented based on ESP32 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under super low power mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = false,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));

ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Create an ADC Unit Handle under Normal Oneshot Mode**

**Unit Configuration**  After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IO to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten` - ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_oneshot_chan_cfg_t::channel` - the IO corresponding ADC channel number. See below note.
- `adc_oneshot_chan_cfg_t::bitwidth` - the bitwidth of the raw conversion result.
**Note:** For the IO corresponding ADC channel number. Check datasheet to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. Especially, this `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. Driver will save these per channel configurations internally.

### Configure Two ADC Channels

```c
adc_oneshot_chan_cfg_t config = {
  .channel = EXAMPLE_ADC1_CHAN0,
  .bitwidth = ADC_BITWIDTH_DEFAULT,
  .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, &config));
config.channel = EXAMPLE_ADC1_CHAN1;
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, &config));
```

### Read Conversion Result

After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safer. ADC(s) are shared by some other drivers / peripherals, see Hardware Limitations. This function takes some mutexes, to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

- **Vout**: Digital output result, standing for the voltage.
- **Dout**: ADC raw digital reading result.
- **Vmax**: Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
- **Dmax**: Maximum of the output ADC raw digital reading result, which is \(2^\text{bitwidth}\), where `bitwidth` is the `cpp:member::adc_oneshot_chan_cfg_t:bitwidth` configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc Analog to Digital Converter (ADC) Calibration Driver.

### Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adcl_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, -adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adcl_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1, -adc_raw[0][1]);
```
Hardware Limitations

- Random Number Generator uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. `adc_oneshot_read()` has provided the protection.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Power Management  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won’t be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe  By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in thread-safe APIs fail.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see IRAM Safe for more details.

Application Examples

- ADC oneshot mode example: peripherals/adc/oneshot_read.

API Reference

Header File

- components/hal/include/hal/adc_types.h

Structures

struct `adc_digi_pattern_config_t`
ADC digital controller pattern configuration.
Public Members

```c
uint8_t atten
  Attenuation of this ADC channel.

uint8_t channel
  ADC channel.

uint8_t unit
  ADC unit.

uint8_t bit_width
  ADC output bit width.
```

```c
struct adc_digi_output_data_t
  ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.
```

**Note:** ESP32: Only `type1` is valid. ADC2 does not support DMA mode.

**Note:** ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

Public Members

```c
uint16_t data
  ADC real output data info. Resolution: 12 bit.
  ADC real output data info. Resolution: 11 bit.

uint16_t channel
  ADC channel index info.
  ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.
```

```c
struct adc_digi_output_data_t::[anonymous]::[anonymous] type1
  ADC type 1
```

```c
uint16_t unit
  ADC unit index info. 0: ADC1; 1: ADC2.
```

```c
struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
  When the configured output format is 11bit.
```

```c
uint16_t val
  Raw data value
```
Enumerations

enum **adc_unit_t**
ADC unit.

Values:

enumerator **ADC_UNIT_1**
SAR ADC 1.

enumerator **ADC_UNIT_2**
SAR ADC 2.

enum **adc_channel_t**
ADC channels.

Values:

enumerator **ADC_CHANNEL_0**
ADC channel.

enumerator **ADC_CHANNEL_1**
ADC channel.

enumerator **ADC_CHANNEL_2**
ADC channel.

enumerator **ADC_CHANNEL_3**
ADC channel.

enumerator **ADC_CHANNEL_4**
ADC channel.

enumerator **ADC_CHANNEL_5**
ADC channel.

enumerator **ADC_CHANNEL_6**
ADC channel.

enumerator **ADC_CHANNEL_7**
ADC channel.

enumerator **ADC_CHANNEL_8**
ADC channel.

enumerator **ADC_CHANNEL_9**
ADC channel.

enum **adc_atten_t**
ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:
enumerator **ADC_ATTEN_DB_0**
No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator **ADC_ATTEN_DB_6**
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator **ADC_ATTEN_DB_11**
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum **adc_bitwidth_t**
*Values:*

enumerator **ADC_BITWIDTH_DEFAULT**
Default ADC output bits, max supported width will be selected.

enumerator **ADC_BITWIDTH_9**
ADC output width is 9Bit.

enumerator **ADC_BITWIDTH_10**
ADC output width is 10Bit.

enumerator **ADC_BITWIDTH_11**
ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**
ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**
ADC output width is 13Bit.

enum **adc_ulp_mode_t**
*Values:*

enumerator **ADC_ULP_MODE_FSM**
ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**
ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**
ADC digital controller (DMA mode) work mode.
*Values:*

enumerator **ADC_CONV_SINGLE_UNIT_1**
Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**
Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ····

enum **adc_digi_output_format_t**
ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**
See **adc_digi_output_data_t.type1**

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**
See **adc_digi_output_data_t.type2**

**Header File**

- components/esp_adc/include/esp_adc/adc_oneshot.h

**Functions**

```c
esp_err_t adc_oneshot_new_unit (const adc_oneshot_unit_init_cfg_t *init_config,
                        adc_oneshot_unit_handle_t *ret_unit)
```

Create a handle to a specific ADC unit.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- **init_config** - [in] Driver initial configurations
- **ret_unit** - [out] ADC unit handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use

```c
esp_err_t adc_oneshot_config_channel (adc_oneshot_unit_handle_t handle,
                          adc_channel_t channel,
                        const adc_oneshot_chan_cfg_t *config)
```

Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**
• *handle* - [in] ADC handle
• *channel* - [in] ADC channel to be configured
• *config* - [in] ADC configurations

**Returns**

• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid arguments

```c
esp_err_t adc_oneshot_read(adc_oneshot_unit_handle_t handle, adc_channel_t chan, int *out_raw)
```

Get one ADC conversion raw result.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Note:** This API should NOT be called in an ISR context

**Parameters**

• *handle* - [in] ADC handle
• *chan* - [in] ADC channel
• *out_raw* - [out] ADC conversion raw result

**Returns**

• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid arguments
• ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit(adc_oneshot_unit_handle_t handle)
```

Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

• *handle* - [in] ADC handle

**Returns**

• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid arguments
• ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn’t in use

```c
esp_err_t adc_oneshot_io_to_channel(int io_num, adc_unit_t *unit_id, adc_channel_t *channel)
```

Get ADC channel from the given GPIO number.

**Parameters**

• *io_num* - [in] GPIO number
• *unit_id* - [out] ADC unit
• *channel* - [out] ADC channel

**Returns**

• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_oneshot_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**

• *unit_id* - [in] ADC unit
• *channel* - [in] ADC channel
• *io_num* - [out] GPIO number

• - ESP_OK: On success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

```c
struct adc_oneshot_unit_init_cfg_t
ADC oneshot driver initial configurations.
```

**Public Members**

```c
adc_unit_t unit_id
ADC unit.
```

```c
adc_ulp_mode_t ulp_mode
ADC controlled by ULP, see adc_ulp_mode_t
```

**Struct**

```c
struct adc_oneshot_chan_cfg_t
ADC channel configurations.
```

**Public Members**

```c
adc_atten_t atten
ADC attenuation.
```

```c
adc_bitwidth_t bitwidth
ADC conversion result bits.
```

**Type Definitions**

```c
typedef struct adc_oneshot_unit_ctx_t *adc_oneshot_unit_handle_t
Type of ADC unit handle for oneshot mode.
```

### 2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

**Introduction**

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads. The ADC on ESP32 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

**Driver Concepts**

ADC continuous mode conversion is made up with multiple Conversion Frames. - Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes. - Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.
Chapter 2. API Reference

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from a group of ADC channels continuously:

- **Resource Allocation** - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations** - describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control** - describes ADC control functions.
- **Register Event Callbacks** - describes how to hook user-specific code to an ADC continuous mode event callback function.
- **Read Conversion Result** - covers how to get ADC conversion result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - covers the IRAM safe functions.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation**  The ADC continuous mode driver is implemented based on ESP32 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the I2S0 peripheral is in use. See **Hardware Limitations** for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

**Initialize the ADC Continuous Mode Driver**

```c
adc_continuous_handle_cfg_t adc_config = {
   .max_store_buf_size = 1024,
   .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

**Recycle the ADC Unit**
Chapter 2. API Reference

ESP_ERROR_CHECK(adc_continuous_deinit());

ADC Configurations After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

Note: For the IO corresponding ADC channel number. Check datasheet to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t call this API at this moment.

See ADC continuous mode example `peripherals/adc/continuous_read` to see configuration codes.

ADC Control

Start and Stop Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

ESP_ERROR_CHECK(adc_continuous_stop());

Register Event Callbacks By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t`:

- `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes.
- `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren’t in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t add callback at this moment.
Conversion Done Event

The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

Pool Overflow Event

The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won’t fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

Read Conversion Result

After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn’t reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \tag{1}
\]

where:

| \(V_{out}\) | Digital output result, standing for the voltage. |
| \(D_{out}\) | ADC raw digital reading result. |
| \(V_{max}\) | Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM. |
| \(D_{max}\) | Maximum of the output ADC raw digital reading result, which is \(2^\text{bitwidth}\), where bitwidth is the \text{cpp:member::}adc_digi_pattern_config_t::bit_width configured before. |

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. `adc_continuous_start()` has provided the protection.
Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.

ADC continuous mode driver uses I2S peripheral as hardware DMA fifo. Therefore, if I2S is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.

ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.

ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

**Power Management**  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe**  All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety**  ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See Hardware Limitations for more details.

**Application Examples**

- ADC continuous mode example: `peripherals/adc/continuous_read`.

**API Reference**

**Header File**

- `components/esp_adc/include/esp_adc/adc_continuous.h`

**Functions**

```c
esp_err_t adc_continuous_new_handle(const adc_continuous_handle_cfg_t *hdl_config, adc_continuous_handle_t *ret_handle)
```

Initialize ADC continuous driver and get a handle to it.

**Parameters**

- `hdl_config`  
  - [in] Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- `ret_handle`  
  - [out] ADC continuous mode driver handle

**Returns**

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_NO_MEM` If out of memory
- `ESP_OK` On success

```c
esp_err_t adc_continuous_config(adc_continuous_handle_t handle, const adc_continuous_config_t *config)
```

Set ADC continuous mode required configurations.

**Parameters**

- `handle`  
  - [in] ADC continuous mode driver handle
• **config** [in] Refer to `adc_digi_config_t`.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_register_event_callbacks (adc_continuous_handle_t handle, const adc_continuous_evt_cbs_t *cbs, void *user_data)
```

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member int the `cbs` structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn’t started. Check return value to know this.

**Parameters**
- **handle** [in] ADC continuous mode driver handle
- **cbs** [in] Group of callback functions
- **user_data** [in] User data, which will be delivered to the callback functions directly

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

```c
esp_err_t adc_continuous_start (adc_continuous_handle_t handle)
```

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters**
- **handle** [in] ADC continuous mode driver handle

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_read (adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)
```

Read bytes from ADC under continuous mode.

**Parameters**
- **handle** [in] ADC continuous mode driver handle
- **buf** [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See `@brief` Driver Backgrounds to know this concept.
- **length_max** [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** [in] Time to wait for data via this API, in millisecond.

**Returns**
• ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
• ESP_ERR_TIMEOUT Operation timed out
• ESP_OK On success

_esp_err_t adc_continuous_stop (adc_continuous_handle_t handle)_
Stop the ADC. After this, the hardware stops working.

**Parameters**
- handle –[in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

_esp_err_t adc_continuous_deinit (adc_continuous_handle_t handle)_
Deinitialize the ADC continuous driver.

**Parameters**
- handle –[in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

_esp_err_t adc_continuous_io_to_channel (int io_num, adc_unit_t *unit_id, adc_channel_t *channel)_
Get ADC channel from the given GPIO number.

**Parameters**
- io_num –[in] GPIO number
- unit_id –[out] ADC unit
- channel –[out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

_esp_err_t adc_continuous_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *io_num)_
Get GPIO number from the given ADC channel.

**Parameters**
- unit_id –[in] ADC unit
- channel –[in] ADC channel
- io_num –[out] GPIO number
- – –ESP_OK: On success
- – ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

struct _adc_continuous_handle_cfg_t_
ADC continuous mode driver initial configurations.

**Public Members**

uint32_t _max_store_buf_size_
Max length of the conversion Results that driver can store, in bytes.

uint32_t _conv_frame_size_
Conversion frame size, in bytes. This should be in multiples of
SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

struct _adc_continuous_config_t_
ADC continuous mode driver configurations.
Public Members

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available sampling frequency range

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

struct adc_continuous_evt_data_t
Event data structure.

Note: The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t *conv_frame_buffer
Pointer to conversion result buffer for one conversion frame.

uint32_t size
Conversion frame size.

struct adc_continuous_evt_cbs_t
Group of ADC continuous mode callbacks.

Note: These callbacks are all running in an ISR environment.

Note: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

adc_continuous_callback_t on_conv_done
Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.
**adc_continuous_callback_t on_pool_ovf**

Event callback, invoked when the internal pool is full.

### Macros

**ADC_MAX_DELAY**

Driver Backgrounds.

### Type Definitions

typedef struct adc_continuous_ctx_t *adc_continuous_handle_t

Type of adc continuous mode driver handle.

typedef bool (*adc_continuous_callback_t)(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data)

Prototype of ADC continuous mode event callback.

- **Param handle [in]** ADC continuous mode driver handle
- **Param edata [in]** Pointer to ADC continuous mode event data
- **Param user_data [in]** User registered context, registered when in `adc_continuous_register_event_callbacks()`

**Return** Whether a high priority task is woken up by this function

### 2.6.3 Analog to Digital Converter (ADC) Calibration Driver

#### Introduction

Based on series of comparisons with the reference voltage, ESP32 ADC determines each bit of the output digital result. Per design the ESP32 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

#### Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- **Calibration Scheme Creation** - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- **Calibration Configuration** - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
- **Result Conversion** - covers how to convert ADC raw result to calibrated result.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Minimize Noise** - describes a general way to minimize the noise.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From calibration driver’s point of view, an ADC calibration scheme is created to an ADC calibration handle `adc.cali_handle_t`. `adc.cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc.cali_check_scheme()`, or just skip this step and call your custom creation function.
ADC Calibration Line Fitting Scheme

ESP32 supports ADC_CALI_SCHEME_VER_LINE_FITTING scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

There is also a configuration `adc_cali_line_fitting_config_t::default_vref`. Normally this can be simply set to 0. Line Fitting scheme doesn’t rely on this value. However, if the Line Fitting scheme required eFuse bits are not burnt on your board, driver will rely on this value to do the calibration.

You can use `adc_cali_scheme_line_fitting_check_efuse()` to check the eFuse bits. Normally the Line Fitting scheme eFuse value will be ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP or ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF. This means Line Fitting scheme will use calibration parameters burnt in the eFuse to do the calibration.

When the Line Fitting scheme eFuse value is ADC_CALI_LINE_FITTING_EFUSE_VAL_DEFAULT_VREF, you need to set the `esp_adc_cali_line_fitting_init::default_vref`. Default vref is an estimate of the ADC reference voltage provided by the users as a parameter during calibration.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
dcali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

Delete Line Fitting Scheme

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**Note:** For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in components/esp_adc/interface/adc_cali_interface.h to know the ESP ADC calibration interface.

Result Conversion

After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns ESP_ERR_INVALID_STATE, this means the calibration scheme isn’t created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "%d Channel%d Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, voltage[0][0]);
```
Thread Safety  The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Kconfig Options  

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP` isn’t this one.
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF` isn’t this one.
- `CONFIG_ADC_CAL_LUT_ENABLE`, disable this to decrease the code size, if you don’t calibrate the ADC raw results under `ADC_ATTEN_DB_11`.

Minimize Noise  The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

![Fig. 6: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.](image)

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`

Functions

`esp_err_t esp_adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

Parameters  

- `scheme_mask` - [out] Supported ADC calibration scheme(s)
Returns
• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

`esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

Convert ADC raw data to calibrated voltage.

Parameters
• `handle` — [in] ADC calibration handle
• `raw` — [in] ADC raw data
• `voltage` — [out] Calibrated ADC voltage (in mV)

Returns
• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered

Type Definitions

typedef struct adc_cali_scheme_t *adc_cali_handle_t
ADC calibration handle.

Enumerations

enum adc_cali_scheme_ver_t
ADC calibration scheme.

Values:

enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
Line fitting scheme.

enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
Curve fitting scheme.

Header File
• components/esp_adc/include/esp_adc/adc_cali_scheme.h

2.6.4 Clock Tree

This section lists definitions of the ESP32’s supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32’s root clocks are listed in `soc_root_clk_t`:

• Internal 8MHz RC Oscillator (RC_FAST)
This RC oscillator generates a ~8.5MHz clock signal output as the RC_FAST_CLK. The ~8.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a RC_FAST_D256_CLK. The exact frequency of RC_FAST_CLK can be computed in runtime through calibration on the RC_FAST_D256_CLK.

- External 2~40MHz Crystal (XTAL)
- Internal 150kHz RC Oscillator (RC_SLOW)

This RC oscillator generates a ~150kHz clock signal output as the RC_SLOW_CLK. The exact frequency of this clock can be computed in runtime through calibration.

- External 32kHz Crystal - optional (XTAL32K)

The clock source for this XTAL32K_CLK can be either a 32kHz crystal connecting to the 32K_XP and 32K_XN pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the 32K_XN pin. Additionally, a 1nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin.

XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to RTC Timer Clock Sources for more details).

Module Clocks

ESP32’s available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Reference

Header File

- components/soc/esp32/include/soc/clk_tree_defs.h

Macros

**SOC_CLK_RC_FAST_FREQ_APPROX**

Approximate RC_FAST_CLK frequency in Hz

**SOC_CLK_RC_SLOW_FREQ_APPROX**

Approximate RC_SLOW_CLK frequency in Hz

**SOC_CLK_RC_FAST_D256_FREQ_APPROX**

Approximate RC_FAST_D256_CLK frequency in Hz

**SOC_CLK_XTAL32K_FREQ_APPROX**

Approximate XTAL32K_CLK frequency in Hz

**SOC_GPTIMER_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    // Use gptimer_clks[i]...
}
```

(continues on next page)
soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
// Test GPTimer with the clock 'clk'
}

**SOC_LCD_CLKS**
Array initializer for all supported clock sources of LCD.

**SOC_RMT_CLKS**
Array initializer for all supported clock sources of RMT.

**SOC_MCPWM_TIMER_CLKS**
Array initializer for all supported clock sources of MCPWM Timer.

**SOC_MCPWM_CAPTURE_CLKS**
Array initializer for all supported clock sources of MCPWM Capture Timer.

**SOC_I2S_CLKS**
Array initializer for all supported clock sources of I2S.

**SOC_I2C_CLKS**
Array initializer for all supported clock sources of I2C.

**SOC_SDM_CLKS**
Array initializer for all supported clock sources of SDM.

**Enumerations**

**enum soc_root_clk_t**
Root clock.

**Values:**

- **enumerator SOC_ROOT_CLK_INT_RC_FAST**
  Internal 8MHz RC oscillator

- **enumerator SOC_ROOT_CLK_INT_RC_SLOW**
  Internal 150kHz RC oscillator

- **enumerator SOC_ROOT_CLK_EXT_XTAL**
  External 2~40MHz crystal

- **enumerator SOC_ROOT_CLK_EXT_XTAL32K**
  External 32kHz crystal/clock signal

**enum soc_cpu_clk_src_t**
CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

**Note:** Enum values are matched with the register field values on purpose

**Values:**
enumerator **SOC_CPU_CLK_SRC_XTAL**
Select XTAL_CLK as CPU_CLK source

eumerator **SOC_CPU_CLK_SRC_PLL**
Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

eumerator **SOC_CPU_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as CPU_CLK source

eumerator **SOC_CPU_CLK_SRC_APLL**
Select APLL_CLK as CPU_CLK source

eumerator **SOC_CPU_CLK_SRC_INVALID**
Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**
RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

**Values:**

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**
Select RC_SLOW_CLK as RTC_SLOW_CLK source

eumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
Select XTAL32K_CLK as RTC_SLOW_CLK source

eumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

eumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

**Values:**

eumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D4**
Select XTAL_D4_CLK (may referred as XTAL_CLK_DIV_4) as RTC_FAST_CLK source

eumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D4**
Chapter 2. API Reference

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

**Note:** enum starts from 1, to save 0 for special purpose

**Values:**

enumerator **SOC_MOD_CLK_CPU**
CPU_CLK can be sourced from XTAL, PLL, RC_FAST, or APLL by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**
RTC_FAST_CLK can be sourced from XTAL_D4 or RC_FAST by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**
RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_APB**
APB_CLK is highly dependent on the CPU_CLK source

enumerator **SOC_MOD_CLK_PLL_D2**
PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

enumerator **SOC_MOD_CLK_XTAL32K**
XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**
RC_FAST_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST_D256**
RC_FAST_D256_CLK comes from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**
XTAL_CLK comes from the external crystal (2~40MHz)

enumerator **SOC_MOD_CLK_REF_TICK**
REF_TICK is derived from APB, it has a fixed frequency of 1MHz even when APB frequency changes

enumerator **SOC_MOD_CLK_APLL**
APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers
enum `soc_periph_gptimer_clk_src_t`
Type of GPTimer clock source.

Values:

enumerator **GPTIMER_CLK_SRC_APB**
Select APB as the source clock

denumerator **GPTIMER_CLK_SRC_DEFAULT**
Select APB as the default choice

enum `soc_periph_tg_clk_src_legacy_t`
Type of Timer Group clock source, reserved for the legacy timer group driver.

Values:

enumerator **TIMER_SRC_CLK_APB**
Timer group source clock is APB

denumerator **TIMER_SRC_CLK_DEFAULT**
Timer group source clock default choice is APB

enum `soc_periph_lcd_clk_src_t`
Type of LCD clock source.

Values:

enumerator **LCD_CLK_SRC_PLL160M**
Select PLL_D2 (default to 160MHz) as the source clock

denumerator **LCD_CLK_SRC_APLL**
Select APLL as the source clock

denumerator **LCD_CLK_SRC_XTAL**
Select XTAL as the source clock

denumerator **LCD_CLK_SRC_DEFAULT**
Select PLL_D2 (default to 160MHz) as the default choice

enum `soc_periph_rmt_clk_src_t`
Type of RMT clock source.

Values:

enumerator **RMT_CLK_SRC_APB**
Select APB as the source clock

denumerator **RMT_CLK_SRC_REF_TICK**
Select REF_TICK as the source clock

denumerator **RMT_CLK_SRC_DEFAULT**
Select APB as the default choice
enum `soc_periph_rmt_clk_src_legacy_t`  
Type of RMT clock source, reserved for the legacy RMT driver.  
*Values:*  
enumerator `RMT_BASECLK_APB`  
RMT source clock is APB CLK  
enumerator `RMT_BASECLK_REF`  
RMT source clock is REF_TICK  
enumerator `RMT_BASECLK_DEFAULT`  
RMT source clock default choice is APB  

eenum `soc_periph_uart_clk_src_legacy_t`  
Type of UART clock source, reserved for the legacy UART driver.  
*Values:*  
enumerator `UART_SCLK_APB`  
UART source clock is APB CLK  
enumerator `UART_SCLK_REF_TICK`  
UART source clock is REF_TICK  
enumerator `UART_SCLK_DEFAULT`  
UART source clock default choice is APB  

eenum `soc_periph_mcpwm_timer_clk_src_t`  
Type of MCPWM timer clock source.  
*Values:*  
enumerator `MCPWM_TIMER_CLK_SRC_PLL160M`  
Select PLL_D2 (160MHz) as the source clock  
enumerator `MCPWM_TIMER_CLK_SRC_DEFAULT`  
Select PLL_D2 as the default clock choice  

eenum `soc_periph_mcpwm_capture_clk_src_t`  
Type of MCPWM capture clock source.  
*Values:*  
enumerator `MCPWM_CAPTURE_CLK_SRC_APB`  
Select APB as the source clock  
enumerator `MCPWM_CAPTURE_CLK_SRC_DEFAULT`  
Select APB as the default clock choice
enum soc_periph_i2s_clk_src_t
I2S clock source enum.

Values:

enumerator I2S_CLK_SRC_DEFAULT
Select PLL D2 as the default source clock

denumerator I2S_CLK_SRC_PLL_160M
Select PLL D2 as the source clock

denumerator I2S_CLK_SRC_APLL
Select APLL as the source clock

denum soc_periph_i2c_clk_src_t
Type of I2C clock source.

Values:

denumerator I2C_CLK_SRC_APB

denumerator I2C_CLK_SRC_DEFAULT

enum soc_periph_sdm_clk_src_t
Sigma Delta Modulator clock source.

Values:

enumerator SDM_CLK_SRC_APB
Select APB as the source clock

denumerator SDM_CLK_SRC_DEFAULT
Select APB as the default clock choice

2.6.5 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PDM/PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.
Chapter 2. API Reference

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V.

```c
#include <driver/dac.h>
...
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

API Reference

Header File

- components/driver/esp32/include/driver/dac.h

Functions

```c
dac_i2s_enable (void)

Enable DAC output data from I2S.

Returns
- ESP_OK success
```

```c
dac_i2s_disable (void)

Disable DAC output data from I2S.

Returns
- ESP_OK success
```

Header File

- components/driver/include/driver/dac_common.h

Functions

```c
dac_pad_get_io_num (dac_channel_t channel, gpio_num_t *gpio_num)

Get the GPIO number of a specific DAC channel.

Parameters
- channel – Channel to get the gpio number
- gpio_num – output buffer to hold the gpio number

Returns
- ESP_OK if success
```

```c
dac_output_voltage (dac_channel_t channel, uint8_t dac_value)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

Parameters
- channel – DAC channel
- dac_value – DAC output value

Returns
- ESP_OK success
```

Note: Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26
Chapter 2. API Reference

```c
esp_err_t dac_output_enable(dac_channel_t channel)

DAC pad output enable.
```

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

**Parameters**
- **channel** - DAC channel

```c
esp_err_t dac_output_disable(dac_channel_t channel)

DAC pad output disable.
```

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Parameters**
- **channel** - DAC channel

**Returns**
- ESP_OK success

```c
esp_err_t dac_cw_generator_enable(void)

Enable cosine wave generator output.
```

**Returns**
- ESP_OK success

```c
esp_err_t dac_cw_generator_disable(void)

Disable cosine wave generator output.
```

**Returns**
- ESP_OK success

```c
esp_err_t dac_cw_generator_config(dac_cw_config_t *cw)

Config the cosine wave generator function in DAC module.
```

**Parameters**
- **cw** - Configuration.

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG The parameter is NULL.

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa.

1. DAC_CHANNEL_1_GPIO_NUM is the GPIO number of channel 1 (GPIO25);
2. DAC_GPIO26_CHANNEL is the channel number of GPIO 26 (channel 2).

**Header File**
- components/soc/esp32/include/soc/dac_channel.h

**Macros**

- DAC_GPIO25_CHANNEL
- DAC_CHANNEL_1_GPIO_NUM
- DAC_GPIO26_CHANNEL
DAC_CHANNEL_2_GPIO_NUM

Header File

- components/hal/include/hal/dac_types.h

Structures

struct dac_cw_config_t

Config the cosine wave generator function in DAC module.

Public Members

dac_channel_t en_ch

Enable the cosine wave generator of DAC channel.

dac_cw_scale_t scale

Set the amplitude of the cosine wave generator output.

dac_cw_phase_t phase

Set the phase of the cosine wave generator output.

uint32_t freq

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8_t offset

Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations

enum dac_channel_t

Values:

dac_channel_t DAC_CHANNEL_1

DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)

dac_channel_t DAC_CHANNEL_2

DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

dac_channel_t DAC_CHANNEL_MAX

enum dac_cw_scale_t

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

dac_cw_scale_t DAC_CW_SCALE_1

1/1. Default.
Chapter 2. API Reference

enumerator DAC_CW_SCALE_2
    1/2.
enumerator DAC_CW_SCALE_4
    1/4.
enumerator DAC_CW_SCALE_8
    1/8.

enum dac_cw_phase_t
    Set the phase of the cosine wave generator output.
    Values:
enumerator DAC_CW_PHASE_0
    Phase shift +0°
enumerator DAC_CW_PHASE_180
    Phase shift +180°

2.6.6 GPIO & RTC GPIO

Overview

The ESP32 chip features 34 physical GPIO pins (GPIO0 ~ GPIO19, GPIO21 ~ GPIO23, GPIO25 ~ GPIO27, and GPIO32 ~ GPIO39). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</table>

**Note:**

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to ESP32 datasheet.
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you are having trouble getting the value from an ADC2 GPIO while using Wi-Fi, you may consider using an ADC1 GPIO instead, which should solve your problem. For more details, please refer to ADC limitations.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

**Application Example**

GPIO output and input interrupt example: *peripherals/gpio/generic_gpio*.

**API Reference - Normal GPIO**

**Header File**

- `components/driver/include/driver/gpio.h`

**Functions**
**Chapter 2. API Reference**

**esp_err_t gpio_config** (const gpio_config_t *pGPIOConfig)

Configure GPIO's Mode, pull-up, PullDown, IntrType

Parameters **pGPIOConfig** – Pointer to GPIO configure struct

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_reset_pin** (gpio_num_t gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Parameters **gpio_num** – GPIO number.

Returns Always return ESP_OK.

**esp_err_t gpio_set_intr_type** (gpio_num_t gpio_num, gpio_int_type_t intr_type)

GPIO set interrupt trigger type.

Parameters

- **gpio_num** – GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type** – Interrupt type, select from gpio_int_type_t

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_intr_enable** (gpio_num_t gpio_num)

Enable GPIO module interrupt signal.

Note: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Parameters **gpio_num** – GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_intr_disable** (gpio_num_t gpio_num)

Disable GPIO module interrupt signal.

Note: This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM
Parameters `gpio_num` – GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

Returns
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

GPIO set output level.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

Parameters
- `gpio_num` – GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level` – Output level. 0: low; 1: high

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

`int gpio_get_level (gpio_num_t gpio_num)`

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

Parameters `gpio_num` – GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

Returns
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

`esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)`

GPIO set direction.

Configure GPIO direction, such as output_only,input_only,output_and_input

Parameters
- `gpio_num` – Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` – GPIO direction

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

`esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)`

Configure GPIO pull-up/pull-down resistors.

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters
- `gpio_num` – GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` – GPIO pull up/down mode.
Chapter 2. API Reference

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

`esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)`
Enable GPIO wake-up function.

Parameters
- `gpio_num` - GPIO number.
- `intr_type` - GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)`
Disable GPIO wake-up function.

Parameters `gpio_num` - GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_isr_register (void (*)(void*), void* arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

Parameters
- `fn` - Interrupt handler function.
- `arg` - Parameter for handler function
- `intr_alloc_flags` - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle` - Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns
- ESP_OK Success;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en (gpio_num_t gpio_num)`
Enable pull-up on GPIO.

Parameters `gpio_num` - GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)`
Disable pull-up on GPIO.

Parameters `gpio_num` - GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)`
Enable pull-down on GPIO.
**Parameters**
gpio_num – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)
```

Disable pull-down on GPIO.

**Parameters**
gpio_num – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_install_isr_service (int intr_alloc_flags)
```

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register()- if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

**Parameters**
intr_alloc_flags - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

```c
void gpio_uninstall_isr_service (void)
```

Uninstall the driver’s GPIO ISR service, freeing related resources.

```c
esp_err_t gpio_isr_handler_add (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
```

Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**
- gpio_num – GPIO number
- isr_handler – ISR handler function for the corresponding GPIO number.
- args – parameter for ISR handler.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)
```

Remove ISR handler for the corresponding GPIO pin.

**Parameters**
gpio_num – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
```

Set GPIO pad drive capability.
Parameters
- **gpio_num** - GPIO number, only support output GPIOs
- **strength** - Drive capability of the pad

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```

Get GPIO pad drive capability.

Parameters
- **gpio_num** - GPIO number, only support output GPIOs
- **strength** - Pointer to accept drive capability of the pad

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpis. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call gpio_hold_dis will disable this function.

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

```c
void gpio_deep_sleep_hold_en (void)
```

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

```c
void gpio_deep_sleep_hold_dis (void)
```

Disable all digital gpio pad hold function during Deep-sleep.
void **gpio_iomux_in**(uint32_t gpio_num, uint32_t signal_idx)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- **gpio_num** – GPIO number of the pad.
- **signal_idx** – Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void **gpio_iomux_out**(uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- **gpio_num** – gpio_num GPIO number of the pad.
- **func** – The function number of the peripheral pin to output pin. One of the FUNC_X_ * of specified pin (X) in soc/io_mux_reg.h.
- **oen_inv** – True if the output enable needs to be inverted, otherwise False.

**esp_err_t gpio_sleep_sel_en**(gpio_num_t gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

**Parameters**

- **gpio_num** – GPIO number of the pad.

**Returns**

- ESP_OK Success

**esp_err_t gpio_sleep_sel_dis**(gpio_num_t gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

**Parameters**

- **gpio_num** – GPIO number of the pad.

**Returns**

- ESP_OK Success

**esp_err_t gpio_sleep_set_direction**(gpio_num_t gpio_num, gpio_mode_t mode)

GPIO set direction at sleep.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Parameters**

- **gpio_num** – Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** – GPIO direction

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**esp_err_t gpio_sleep_set_pull_mode**(gpio_num_t gpio_num, gpio_pull_mode_t pull)

Configure GPIO pull-up/pull-down resistors at sleep.

**Parameters**

- **gpio_num** – GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** – GPIO pull up/down mode.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Macros**
**Chapter 2. API Reference**

**GPIO_PIN_COUNT**

**GPIO_IS_VALID_GPIO**(gpio_num)
Check whether it is a valid GPIO number.

**GPIO_IS_VALID_OUTPUT_GPIO**(gpio_num)
Check whether it can be a valid GPIO number of output mode.

**Type Definitions**

typedef intr_handle_t gpio_isr_handle_t

**Header File**

- components/hal/include/hal/gpio_types.h

**Structures**

struct gpio_config_t
Configuration parameters of GPIO pad for gpio_config function.

**Public Members**

- uint64_t pin_bit_mask
  GPIO pin: set with bit mask, each bit maps to a GPIO

- gpio_mode_t mode
  GPIO mode: set input/output mode

- gpio_pullup_t pull_up_en
  GPIO pull-up

- gpio_pulldown_t pull_down_en
  GPIO pull-down

- gpio_int_type_t intr_type
  GPIO interrupt type

**Macros**

- GPIO_PIN_REG_0
- GPIO_PIN_REG_1
- GPIO_PIN_REG_2
- GPIO_PIN_REG_3

    GPIO interrupt type: input low level trigger

enumerator GPIO_INTR_HIGH_LEVEL
    GPIO interrupt type: input high level trigger

enumerator GPIO_INTR_MAX

enum gpio_mode_t
    Values:

enumerator GPIO_MODE_DISABLE
    GPIO mode: disable input and output

enumerator GPIO_MODE_INPUT
    GPIO mode: input only

enumerator GPIO_MODE_OUTPUT
    GPIO mode: output only mode

enumerator GPIO_MODE_OUTPUT_OD
    GPIO mode: output only with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT_OD
    GPIO mode: output and input with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT
    GPIO mode: output and input mode

enum gpio_pullup_t
    Values:

enumerator GPIO_PULLUP_DISABLE
    Disable GPIO pull-up resistor

enumerator GPIO_PULLUP_ENABLE
    Enable GPIO pull-up resistor

enum gpio_pulldown_t
    Values:

enumerator GPIO_PULLDOWN_DISABLE
    Disable GPIO pull-down resistor

enumerator GPIO_PULLDOWN_ENABLE
    Enable GPIO pull-down resistor

enum gpio_pull_mode_t
    Values:
enumerator GPIO_PULLUP_ONLY
   Pad pull up
enumerator GPIO_PULLDOWN_ONLY
   Pad pull down
enumerator GPIO_PULLUP_PULLDOWN
   Pad pull up + pull down
enumerator GPIO_FLOATING
   Pad floating

enum gpio_drive_cap_t
   Values:

   enumerator GPIO_DRIVE_CAP_0
      Pad drive capability: weak
   enumerator GPIO_DRIVE_CAP_1
      Pad drive capability: stronger
   enumerator GPIO_DRIVE_CAP_2
      Pad drive capability: medium
   enumerator GPIO_DRIVE_CAP_DEFAULT
      Pad drive capability: medium
   enumerator GPIO_DRIVE_CAP_3
      Pad drive capability: strongest
   enumerator GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File

- components/driver/include/driver/rtc_io.h

Functions

bool rtc_gpio_is_valid_gpio(gpio_num_t gpio_num)
   Determine if the specified GPIO is a valid RTC GPIO.
   Parameters gpio_num - GPIO number
   Returns true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get(gpio_num_t gpio_num)
   Get RTC IO index number by gpio number.
   Parameters gpio_num - GPIO number
   Returns >=0: Index of rtcio. -1 : The gpio is not rtcio.
**esp_err_t rtc_gpio_init** (gpio_num_t gpio_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_deinit** (gpio_num_t gpio_num)

Init a GPIO as digital GPIO.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**uint32_t rtc_gpio_get_level** (gpio_num_t gpio_num)

Get the RTC IO input level.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_level** (gpio_num_t gpio_num, uint32_t level)

Set the RTC IO output level.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)
- level – output level

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_direction** (gpio_num_t gpio_num, rtc_gpio_mode_t mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)
- mode – GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_direction_in_sleep** (gpio_num_t gpio_num, rtc_gpio_mode_t mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)
- mode – GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO
**esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)**

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

**Parameters**  
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)**

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

**Parameters**  
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)**

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

**Parameters**  
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)**

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

**Parameters**  
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)**

Set RTC GPIO pad drive capability.

**Parameters**  
• gpio_num – GPIO number, only support output GPIOs  
• strength – Drive capability of the pad

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)**

Get RTC GPIO pad drive capability.

**Parameters**  
• gpio_num – GPIO number, only support output GPIOs  
• strength – Pointer to accept drive capability of the pad

**Returns**  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG Parameter error
```c
esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters**
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Parameters**
gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Parameters**
gpio_num – GPIO number (e.g. GPIO_NUM_12).

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_force_hold_all(void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

```c
esp_err_t rtc_gpio_force_hold_dis_all(void)

Disable force hold signal for all RTC IOs.

```c
esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**
• gpio_num – GPIO number
• intr_type – Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.
```

```c
esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters**
gpio_num – GPIO number

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Macros**

```c
RTC_GPIO_IS_VALID_GPIO(gpio_num)
```

**Header File**

- components/hal/include/hal/rtc_io_types.h

**Enumerations**

```c
eenum rtc_gpio_mode_t

RTCIO output/input mode type.

Values:

enumerator RTC_GPIO_MODE_INPUT_ONLY
    Pad input

enumerator RTC_GPIO_MODE_OUTPUT_ONLY
    Pad output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT
    Pad input + output

enumerator RTC_GPIO_MODE_DISABLED
    Pad (output + input) disable

enumerator RTC_GPIO_MODE_OUTPUT_OD
    Pad open-drain output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT_OD
    Pad input + open-drain output
```

### 2.6.7 General Purpose Timer (GPTimer)

**Introduction**

GPTimer (General Purpose Timer) is the driver of ESP32 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time
Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get Count Value** - covers how to force the timer counting from a start point and how to get the count value anytime.
- **Set up Alarm Action** - covers the parameters that should be set up to enable the alarm event.
- **Register Event Callbacks** - covers how to hook user specific code to the alarm event callback function.
- **Enable and Disable Timer** - covers how to enable and disable the timer.
- **Start and Stop Timer** - shows some typical use cases that start the timer with different alarm behavior.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**  Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.¹

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

```c
  .clk_src = GPTIMER_CLK_SRC_DEFAULT,
  .direction = GPTIMER_COUNT_UP,
```

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```c
  gptimer_handle_t gptimer = NULL;
  gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
  };
```

---

¹ Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to ESP32 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).
Set and Get Count Value When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

Set up Alarm Action For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

Note: If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

Register Event Callbacks After the timer starts up, it can generate a specific event (e.g. the “Alarm Event”) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section Enable and Disable Timer for more information.

Enable and Disable Timer Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from `init` to `enable`. 
• Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
• Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section *Power Management* for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the *init* state, disable the interrupts service and release the power management lock.

### Start and Stop Timer

The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

#### Start Timer as a Wall Clock

```c
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

#### Trigger Period Events

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this
    // callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

#### Trigger One-Shot Event
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

**Dynamic Alarm Update**  Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

**Power Management**  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep mode, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a GPTimer instance that has selected `GPTIMER_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enabling the timer by `gptimer_enable()`. Likewise, the driver releases the lock when `gptimer_disable()` is called for that timer.

If other gptimer clock sources are selected such as `GPTIMER_CLK_SRC_XTAL`, then the driver will not install power management lock. The XTAL clock source is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe**  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
- Place all functions that used by the ISR into IRAM
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety**  The factory function `gptimer_new_timer()` is guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to be run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

- `gptimer_start()`

---

2 `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.
Chapter 2. API Reference

- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Other functions that take `gptimer_handle_t` as the first positional parameter, are not treated as thread safe, which means you should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash), see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Examples**

- Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.

**API Reference**

**Header File**

- `components/driver/include/driver/gptimer.h`

**Functions**

`esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)`

Create a new General Purpose Timer, and return the handle.

**Note:** The newly created timer is put in the init state.

**Parameters**

- `config` [in] GPTimer configuration
- `ret_timer` [out] Returned timer handle

**Returns**

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

`esp_err_t gptimer_del_timer(gptimer_handle_t timer)`

Delete the GPTimer handle.

**Note:** A timer can’t be in the enable state when this function is invoked. See also `gptimer_disable()` for how to disable a timer.

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
• ESP_FAIL: Delete GPTimer failed because of other error

```c
void gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value);
```

Set GPTimer raw count value.

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note:** This function is allowed to run within ISR context

**Note:** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Parameters**
- **timer** [in] Timer handle created by `gptimer_new_timer()`
- **value** [in] Count value to be set

**Returns**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

```c
void gptimer_get_raw_count(gptimer_handle_t timer, uint64_t* value);
```

Get GPTimer raw count value.

**Note:** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

**Note:** This function is allowed to run within ISR context

**Note:** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Parameters**
- **timer** [in] Timer handle created by `gptimer_get_new_timer()`
- **value** [out] Returned GPTimer count value

**Returns**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

```c
void gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t* cbs, void* user_data);
```

Set callbacks for GPTimer.
**Note:** User registered callbacks are expected to be runnable within ISR context

**Note:** This function should be called when the timer is in the init state (i.e. before calling `gptimer_enable()`)

### Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer()`
- `cbs` [in] Group of callback functions
- `user_data` [in] User data, which will be passed to callback functions directly

### Returns
- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

```c
esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

**Note:** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

### Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer()`
- `config` [in] Alarm configuration, especially, set config to NULL means disabling the alarm function

### Returns
- `ESP_OK`: Set alarm action for GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Set alarm action for GPTimer failed because of invalid argument
- `ESP_FAIL`: Set alarm action for GPTimer failed because of other error

```c
esp_err_t gptimer_enable (gptimer_handle_t timer)
```

Enable GPTimer.

**Note:** This function will transit the timer state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks()`.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.
Note: Enable a timer doesn’t mean to start it. See also `gptimer_start()` for how to make the timer start counting.

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

`esp_err_t gptimer_disable(gptimer_handle_t timer)`

Disable GPTimer.

Note: This function will do the opposite work to the `gptimer_enable()`

Note: Disable a timer doesn’t mean to stop it. See also `gptimer_stop()` for how to make the timer stop counting.

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

`esp_err_t gptimer_start(gptimer_handle_t timer)`

Start GPTimer (internal counter starts counting)

Note: This function should be called when the timer is in the enable state (i.e. after calling `gptimer_enable()`)

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Start GPTimer failed because of other error

`esp_err_t gptimer_stop(gptimer_handle_t timer)`

Stop GPTimer (internal counter stops counting)
Chapter 2. API Reference

**Note:** This function should be called when the timer is in the enable state (i.e. after calling `gptimer_enable()`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**

`timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- **ESP_OK:** Stop GPTimer successfully
- **ESP_ERR_INVALID_ARG:** Stop GPTimer failed because of invalid argument
- **ESP_ERR_INVALID_STATE:** Stop GPTimer failed because the timer is not enabled yet
- **ESP_FAIL:** Stop GPTimer failed because of other error

**Structures**

- **struct gptimer_alarm_event_data_t**
  
  GPTimer alarm event data.

  **Public Members**

  - `uint64_t count_value`
    
    Current count value
  
  - `uint64_t alarm_value`
    
    Current alarm value

- **struct gptimer_event_callbacks_t**
  
  Group of supported GPTimer callbacks.

  **Note:** The callbacks are all running under ISR environment

  **Note:** When `CONFIG_GPTIMER_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM.

  **Public Members**

  - `gptimer_alarm_cb_t on_alarm`
    
    Timer alarm callback

  - **struct gptimer_config_t**
    
    General Purpose Timer configuration.
Public Members

```c

gptimer_clock_source_t clk_src
GPTimer clock source

gptimer_count_direction_t direction
Count direction
```

```c

uint32_t resolution_hz
Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds
```

```c

uint32_t intr_shared
Set true, the timer interrupt number can be shared with other peripherals
```

```c

struct gptimer_config_t::[anonymous] flags
GPTimer config flags
```

```c

struct gptimer_alarm_config_t
General Purpose Timer alarm configuration.
```

Public Members

```c

uint64_t alarm_count
Alarm target count value
```

```c

uint64_t reload_count
Alarm reload count value, effect only when auto_reload_on_alarm is set to true
```

```c

uint32_t auto_reload_on_alarm
Reload the count value by hardware, immediately at the alarm event
```

```c

struct gptimer_alarm_config_t::[anonymous] flags
Alarm config flags
```

Type Definitions

typedef struct gptimer_t *gptimer_handle_t
Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
Timer alarm callback prototype.

Param timer [in] Timer handle created by gptimer_new_timer()
Param edata [in] Alarm event data, fed by driver
Param user_ctx [in] User data, passed from gptimer_register_event_callbacks()
Return Whether a high priority task has been waken up by this function
Chapter 2. API Reference

Header File

- components/hal/include/hal/timer_types.h

Type Definitions
typedef `soc_periph_gptimer_clk_src_t` gptimer_clock_source_t
GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

Enumerations
enum gptimer_count_direction_t
GPTimer count direction.

**Values:**

enumerator GPTIMER_COUNT_DOWN
Decrease count value

enumerator GPTIMER_COUNT_UP
Increase count value

### 2.6.8 Inter-Integrated Circuit (I2C)

**Overview**

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has 2 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

**Driver Features**

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master
Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master or slave from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

**Configuration example (master):**

```c
int i2c_master_port = 0;
i2c_config_t conf = {
  .mode = I2C_MODE_MASTER,
  .sda_io_num = I2C_MASTER_SDA_IO, // select GPIO specific to your project
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_io_num = I2C_MASTER_SCL_IO, // select GPIO specific to your project
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your project
  // .clk_flags = 0, /**< Optional, you can use I2C_SCLK_SRC_FLAG_* flags to choose i2c source clock here. */
};
```

**Configuration example (slave):**

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
  .sda_io_num = I2C_SLAVE_SDA_IO, // select GPIO specific to your project
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_io_num = I2C_SLAVE_SCL_IO, // select GPIO specific to your project
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .mode = I2C_MODE_SLAVE,
  .slave.addr_10bit_en = 0,
  .slave.slave_addr = ESP_SLAVE_ADDR, // address of your project
};
```
At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see *Customized Configuration*.

**Source Clock Configuration**  **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`). When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB clock</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock’s baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver**  After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- `master or slave, selected from i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in esp_hw_support/include/esp_intr_alloc.h)
**Communication as Master**  After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**  The example below shows how to build a command link for an I2C master to send n bytes to a slave.

![Fig. 7: I2C command link - master write example](image_url)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.
   Then, populate it with the series of data to be sent to the slave:
   a) **Start bit** - `i2c_master_start()`
   b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) **Data** - One or more bytes as an argument of `i2c_master_write()`
   d) **Stop bit** - `i2c_master_stop()`

   Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`.
   Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read**  The example below shows how to build a command link for an I2C master to read n bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read**  After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.
For this reason, the command link sent by the master to write data to the slave contains the address (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

---

Chapter 2.  
### API Reference

![Diagram of I2C communication](image)

For Fig. 8: I2C command link - master read example

---

![Diagram of I2C communication](image)

For this reason, the command link sent by the master to write data to the slave contains the address (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.
Table 4: Other Configurable I2C Communication Parameters

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <em>start</em> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <em>stop</em> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt I2C_TIME_OUT_INT will be triggered. For detailed information, see Interrupt Handling.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C examples: `peripherals/i2c`.

**API Reference**

**Header File**
- components/driver/include/driver/i2c.h
### Functions

**esp_err_t i2c_driver_install**(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)

Install an I2C driver.

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Parameters**
- **i2c_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv_rx_buf_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**esp_err_t i2c_driver_delete**(i2c_port_t i2c_num)

Delete I2C driver.

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Parameters** i2c_num – I2C port to delete

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_param_config**(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)

Configure an I2C bus with the given configuration.

**Parameters**
- **i2c_num** – I2C port to configure
- **i2c_conf** – Pointer to the I2C configuration

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_reset_tx_fifo**(i2c_port_t i2c_num)

reset I2C tx hardware fifo

**Parameters** i2c_num – I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
### esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)

reset I2C rx fifo

**Parameters**
- `i2c_num`: I2C port number

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Parameter error

### esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)

Configure GPIO pins for I2C SCK and SDA signals.

**Parameters**
- `i2c_num`: I2C port number
- `sda_io_num`: GPIO number for I2C SDA signal
- `scl_io_num`: GPIO number for I2C SCL signal
- `sda_pullup_en`: Enable the internal pullup for SDA pin
- `scl_pullup_en`: Enable the internal pullup for SCL pin
- `mode`: I2C mode

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Parameter error

### esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Parameter error
- `ESP_FAIL`: Sending command error, slave hasn’t ACK the transfer.
- `ESP_ERR_INVALID_STATE`: I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT`: Operation timeout because the bus is busy.

### esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Parameter error
- `ESP_FAIL`: Sending command error, slave hasn’t ACK the transfer.
- `ESP_ERR_INVALID_STATE`: I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT`: Operation timeout because the bus is busy.
**esp_err_t** i2c_master_write_read_device(i2c_num_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc... It shall only be called in I2C master mode.

**Parameters**
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Parameter error
- ESP_FAIL: Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE: I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT: Operation timeout because the bus is busy.

**i2c_cmd_handle_t** i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete_static().

**Note:** It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro I2C_LINK_RECOMMENDED_SIZE would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

**Parameters**
- buffer: Buffer to use for commands allocations
- size: Size in bytes of the buffer

**Returns** Handle to the I2C command link or NULL if the buffer provided is too small, please use I2C_LINK_RECOMMENDED_SIZE macro to get the recommended size for the buffer.

**i2c_cmd_handle_t** i2c_cmd_link_create(void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete() to release and return the resources. The required bytes will be dynamically allocated.

**Returns** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list allocated statically with i2c_cmd_link_create_static.

**Parameters** cmd_handle: I2C commands list allocated statically. This handle should be created thanks to i2c_cmd_link_create_static() function.

void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

**Parameters** cmd_handle: I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function.
esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode.
Call i2c_master_cmd_begin() to send all the queued commands.

Parameters

 cmd_handle - I2C commands list

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write_byte (i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

• cmd_handle - I2C commands list
• data - Byte to send on the port
• ack_en - Enable ACK signal

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write (i2c_cmd_handle_t cmd_handle, const uint8_t* data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

• cmd_handle - I2C commands list
• data - Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and intr_flag is set to ESP_INTR_FLAG_IRAM, data should be allocated from internal RAM.
• data_len - Length, in bytes, of the data buffer
• ack_en - Enable ACK signal

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t* data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

• cmd_handle - I2C commands list
• data - Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
• ack - ACK signal

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_read (i2c_cmd_handle_t cmd_handle, uint8_t* data, size_t data_len, i2c_ack_type_t ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.
Chapter 2. API Reference

bus. This function shall only be called in I2C master mode. Call \texttt{i2c\_master\_cmd\_begin()} to send all queued commands.

**Parameters**
- \texttt{cmd\_handle} – I2C commands list
- \texttt{data} – Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
- \texttt{data\_len} – Size, in bytes, of the data buffer
- \texttt{ack} – ACK signal

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create \texttt{cmd\_handler} is too small
- ESP_FAIL No more memory left on the heap

\texttt{esp\_err\_t i2c\_master\_stop(i2c\_cmd\_handler\_t cmd\_handle)}

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call \texttt{i2c\_master\_cmd\_begin()} to send all the queued commands.

**Parameters** \texttt{cmd\_handle} – I2C commands list

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create \texttt{cmd\_handler} is too small
- ESP_FAIL No more memory left on the heap

\texttt{esp\_err\_t i2c\_master\_cmd\_begin(i2c\_port\_t i2c\_num, i2c\_cmd\_handler\_t cmd\_handle, TickType\_t ticks\_to\_wait)}

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

**Parameters**
- \texttt{i2c\_num} – I2C port number
- \texttt{cmd\_handle} – I2C commands list
- \texttt{ticks\_to\_wait} – Maximum ticks to wait before issuing a timeout.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP_ERR\_TIMEOUT Operation timeout because the bus is busy.

\texttt{int i2c\_slave\_write\_buffer(i2c\_port\_t i2c\_num, const uint8\_t *data, int size, TickType\_t ticks\_to\_wait)}

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**
- \texttt{i2c\_num} – I2C port number
- \texttt{data} – Bytes to write into internal buffer
- \texttt{size} – Size, in bytes, of \texttt{data} buffer
- \texttt{ticks\_to\_wait} – Maximum ticks to wait.

**Returns**
- ESP_FAIL (-1) Parameter error
- Other (\(\geq 0\)) The number of data bytes pushed to the I2C slave buffer.
int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**
- **i2c_num** – I2C port number
- **data** – Buffer to fill with ringbuffer’s bytes
- **max_size** – Maximum bytes to read
- **ticks_to_wait** – Maximum waiting ticks

**Returns**
- ESP_FAIL (-1) Parameter error
- Others (>=0) The number of data bytes read from I2C slave buffer.

esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)

Set I2C master clock period.

**Parameters**
- **i2c_num** – I2C port number
- **high_period** – Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** – Clock cycle number during SCL is low level, low_period is a 14 bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_period (i2c_port_t i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

**Parameters**
- **i2c_num** – I2C port number
- **high_period** – pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** – pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_filter_enable (i2c_port_t i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note:** Enable filter will slow down the SCL clock.

**Parameters**
- **i2c_num** – I2C port number to filter
- **cyc_num** – the APB cycles need to be filtered (0 <= cyc_num <= 7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`

Disable filter on I2C bus.

**Parameters**
- `i2c_num` - I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master start signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- `hold_time` - clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master start signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - pointer to get setup time
- `hold_time` - pointer to get hold time

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master stop signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
- `hold_time` - clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master stop signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - pointer to get setup time.
- `hold_time` - pointer to get hold time.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)`

set I2C data signal timing

**Parameters**
- `i2c_num` - I2C port number
- `sample_time` - clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
• **hold_time** – clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```
get I2C data signal timing

**Parameters**
- **i2c_num** – I2C port number
- **sample_time** – pointer to get sample time
- **hold_time** – pointer to get hold time

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```
set I2C timeout value

**Parameters**
- **i2c_num** – I2C port number
- **timeout** – timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```
get I2C timeout value

**Parameters**
- **i2c_num** – I2C port number
- **timeout** – pointer to get timeout value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```
set I2C data transfer mode

**Parameters**
- **i2c_num** – I2C port number
- **tx_trans_mode** – I2C sending data mode
- **rx_trans_mode** – I2C receiving data mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```
get I2C data transfer mode

**Parameters**
- **i2c_num** – I2C port number
- **tx_trans_mode** – pointer to get I2C sending data mode
- **rx_trans_mode** – pointer to get I2C receiving data mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Structures

```c
struct i2c_config_t
  I2C initialization parameters.
```

Public Members

```c
i2c_mode_t mode
  I2C mode

int sda_io_num
  GPIO number for I2C sda signal

int scl_io_num
  GPIO number for I2C scl signal

bool sda_pullup_en
  Internal GPIO pull mode for I2C sda signal

bool scl_pullup_en
  Internal GPIO pull mode for I2C scl signal

uint32_t clk_speed
  I2C clock frequency for master mode, (no higher than 1MHz for now)

struct i2c_config_t::[anonymous]::[anonymous] master
  I2C master config

uint8_t addr_10bit_en
  I2C 10bit address mode enable for slave mode

uint16_t slave_addr
  I2C address for slave mode

uint32_t maximum_speed
  I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]::[anonymous] slave
  I2C slave config

uint32_t clk_flags
  Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice
```

Macros

```c
I2C_APB_CLK_FREQ
  I2C source clock is APB clock, 80MHz

I2C_NUM_MAX
  I2C port max
```
**I2C_NUM_0**
- I2C port 0

**I2C_NUM_1**
- I2C port 1

**I2C_SCLK_SRC_FLAG_FOR_NOMAL**
- Any one clock source that is available for the specified frequency may be chosen

**I2C_SCLK_SRC_FLAG_AWARE_DFS**
- For REF tick clock, it won’t change with APB.

**I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**
- For light sleep mode.

**I2C_INTERNAL_STRUCT_SIZE**
- Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C_LINK_RECOMMENDED_SIZE** (TRANSACTIONS)
- The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

  - write device register
  - read register content

  Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

**Type Definitions**

typedef void *i2c_cmd_handle_t
- I2C command handle

**Header File**

- components/hal/include/hal/i2c_types.h

**Type Definitions**

typedef int i2c_port_t
- I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

typedef soc_periph_i2c_clk_src_t i2c_clock_source_t
- I2C group clock source.

**Enumerations**

enum i2c_mode_t
- Values:
enumerator **I2C_MODE_SLAVE**
I2C slave mode

enumerator **I2C_MODE_MASTER**
I2C master mode

enumerator **I2C_MODE_MAX**

enum **i2c_rwlock_t**
Values:

enumerator **I2C_MASTER_WRITE**
I2C write data

enumerator **I2C_MASTER_READ**
I2C read data

enum **i2c_trans_mode_t**
Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**
I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**
I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**
Values:

enumerator **I2C_ADDR_BIT_7**
I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**
I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**
Values:

enumerator **I2C_MASTER_ACK**
I2C ack for each byte read

enumerator **I2C_MASTER_NACK**
I2C nack for each byte read
enumerator **I2C_MASTER_LAST_NACK**
I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

### 2.6.9 Inter-IC Sound (I2S)

#### Introduction

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicate in Standard or TDM mode consists of the following lines:

- **MCLK**: Master clock line. It’s an optional signal depends on slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK**: Bit clock line. The bit clock for data line.
- **WS**: Word(Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT**: Serial data input/output line. (Data will loopback internally if din and dout are set to a same GPIO)

And for the I2S bus that communicate in PDM mode, the lines are:

- **CLK**: PDM clock line.
- **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in simplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

#### I2S File Structure

**Public headers that need to be included in the I2S application**

- **i2s.h**: The header file of legacy I2S APIs (for apps using legacy driver).
- **i2s_std.h**: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- **i2s_pdm.h**: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- **i2s_tdm.h**: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note:** The legacy driver can’t coexist with the new driver. Including **i2s.h** to use the legacy driver or the other three headers to use the new driver. The legacy driver might be removed in future.

**Public headers that have been included in the headers above**

- **i2s_types_legacy.h**: The legacy public types that only used in the legacy driver.
- **i2s_types.h**: The header file that provides public types.
- **i2s_common.h**: The header file that provides common APIs for all communication modes.
I2S Clock

Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate, but if APLL has been occupied by emac or other channels already, the APLL frequency is not allowed to change, the driver will try to work under this APLL frequency, if this APLL frequency can’t meet the requirements of I2S, the clock configuration will fail.

Clock Terminology

- **sample rate**: The number of sampled data in one second per slot.
- **sclk**: Source clock frequency. It is the frequency of the clock source.
- **mclk**: Master clock frequency. bclk is generate from this clock, mclk is mostly needed in the case that requires the MCLK signal as a reference clock to synchronize BCLK and WS between I2S master role and slave role.
- **bclk**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. It means there will be 8/16/24/32 bclk ticks in one slot, because the number of bclk ticks in one slot is equal to the `i2s_std_slot_config_t::slot_bit_width`.
- **lrck / ws**: Left/Right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

Note: Normally mclk should be the multiple of sample rate and bclk at the same time. This field `i2s_std_clk_config_t::mclk_multiple` means the multiple of mclk to the sample rate. If `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep mclk a multiple to the bclk, `i2s_std_clk_config_t::mclk_multiple` should be set to `I2S_MCLK_MULTIPLE_384`, otherwise the ws will be inaccurate. But in the most other cases, `I2S_MCLK_MULTIPLE_256` should be enough.

I2S Communication Mode

Overview of All Modes
Standard Mode  Standard mode always has left and right two sound channels which are called ‘slots’. These slots can support 8/16/24/32 bits width sample data. And the communication format for the slots mainly includes these following formats:

- **Philip Format**: Data signal have one bit shift comparing to the WS(word select) signal. And the duty of WS signal is 50%.

- **MSB Format**: Almost same as philip format, but its data have no shift.

- **PCM Short Format**: Data have one bit shift and meanwhile WS signal becomes a pulse lasting one BCLK(Bit Clock) cycle.
**PDM Mode (TX)** PDM(Pulse-density Modulation) mode for tx channel can convert PCM data into PDM format which always has left and right slots. PDM TX can only support 16 bits width sample data. PDM TX only needs CLK pin for clock signal and DOUT pin for data signal (i.e. WS and SD signal in the following figure, the BCK signal is an internal bit sampling clock, not needed between PDM devices). This mode allows user to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by `up_sample_rate = fp / fs`, there are up-sampling modes in PDM TX:

- **Fixed Clock Frequency**: In this mode the up-sampling rate will change according to the sample rate. Setting `fp = 960 and fs = sample_rate / 100`, then the clock frequency(Fpdm) on CLK pin will be fixed to `128 * 48 KHz = 6.144 MHz`, note that this frequency is not equal to the sample rate(Fpcm).

- **Fixed Up-sampling Rate**: In this mode the up-sampling rate is fixed to 2. Setting `fp = 960 and fs = 480`, then the clock frequency(Fpdm) on CLK pin will be `128 * sample_rate`

**PDM Timing Diagram**

![PDM Timing Diagram](PDM_Timing_Diagram.png)

**PDM Mode (RX)** PDM(Pulse-density Modulation) mode for rx channel can receive PDM format data and convert the data into PCM format. PDM RX can only support 16 bits width sample data. PDM RX only need WS pin for clock signal and DIN pin for data signal. This mode allows user to configure the down-sampling parameter `i2s_pdm_rx_clk_config_t::dn_sample_mode`, there are two down-sampling modes in PDM RX:

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`: In this mode, the clock frequency(Fpdm) on WS pin will be `sample_rate(Fpcm) * 64`.

- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`: In this mode, the clock frequency(Fpdm) on WS pin will be `sample_rate(Fpcm) * 128`.

**ADC/DAC Mode** ADC and DAC modes only exist on ESP32 and are only supported on I2S0. Actually, they are two sub-modes of LCD/Camera mode. I2S0 can be routed directly to the internal analog-to-digital converter(ADC) and digital-to-analog converter(DAC). In other words, ADC and DAC peripherals can read or write continuously via I2S0 DMA. As they are not an actual communication mode, the I2S driver does not implement them.

**Functional Overview**

The I2S driver offers following services:

**Resources Management** There are three levels’ resources in I2S driver:

- **platform level**: Resources of all I2S controllers in the current target.
- **controller level**: Resources in one I2S controller.
- **channel level**: Resources of tx or rx channel in one I2S controller.

The public APIs are all channel level APIs, the channel handle `i2s_chan_handle_t` can help user to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and will be managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before going into light sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.
I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if target support APLL), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever user is reading or writing via I2S (i.e. calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after reading or writing finished.

**Finite-State Machine**  There are three states for an I2S channel, they are `registered`, `ready` and `running`. Their relationship is shown in the following diagram:

```
Start

<table>
<thead>
<tr>
<th>REGISTERED</th>
</tr>
</thead>
<tbody>
<tr>
<td>i2s_new_channel</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>REGISTERED</th>
</tr>
</thead>
<tbody>
<tr>
<td>i2s_channel_init_&lt;mode&gt;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>i2s_channel_reconfig_&lt;mode&gt; slot</td>
</tr>
<tr>
<td>i2s_channel_reconfig_&lt;mode&gt; clock</td>
</tr>
<tr>
<td>i2s_channel_reconfig_&lt;mode&gt; gpio</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>RUNNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>i2s_channel_write</td>
</tr>
<tr>
<td>i2s_channel_read</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>STOP</th>
</tr>
</thead>
<tbody>
<tr>
<td>i2s_del_channel</td>
</tr>
</tbody>
</table>
```

The `<mode>` in the diagram can be replaced by corresponding I2S communication mode like `std` for standard two-slot mode, for other information of communication mode, please refer to I2S Communication Mode section.

**Data Transport**  The data transport of I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reach the size of one DMA buffer, `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`, one frame here means all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the transmit case, users can input the data by calling `i2s_channel_write()`. This function will help users to copy the data from the source buffer to the DMA tx buffer and wait for the transmission finished. Then it’ll repeat until the sent bytes reach the given size. For the receive case, the function `i2s_channel_read()` will wait for receiving the message queue which contains the DMA buffer address, it will help users to copy the data from DMA rx buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions, they will keep waiting until the whole source buffer are sent or the whole destination buffer loaded, unless they exceed the max blocking time, then the error code `ESP_ERR_TIMEOUT` will return in this case. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`, users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions.
However, please be aware that it is an interrupt callback, don’t do complex logic, floating operation or call non-reentrant functions in the callback.

**Configuration Setting** Users can initialize a channel by corresponding function (i.e. `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` or `i2s_channel_init_tdm_mode()`), the channel will be initialized to the specific mode. If the configurations need to be updated after initialization, `i2s_channel_disable()` has to be called first to ensure the channel has stopped, and then calling corresponding ‘reconfig’ functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the EOF interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Notice that I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Example**

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by following helper macros for standard mode. As described above, there are three formats in standard mode, their helper macros are:

- `I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to Standard Mode for STD API information. And for more details, please refer to `driver/include/driver/i2s_std.h`. 
**STD TX Mode**  Take 16-bit data width for example, when the data in a `uint16_t` writing buffer are:

<table>
<thead>
<tr>
<th>data 0</th>
<th>data 1</th>
<th>data 2</th>
<th>data 3</th>
<th>data 4</th>
<th>data 5</th>
<th>data 6</th>
<th>data 7</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
<td>...</td>
</tr>
</tbody>
</table>

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`

<table>
<thead>
<tr>
<th>data bit width</th>
<th>slot mode</th>
<th>slot mask</th>
<th>ws low</th>
<th>ws high</th>
<th>ws low</th>
<th>ws high</th>
<th>ws low</th>
<th>ws high</th>
<th>ws low</th>
<th>ws high</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 bit</td>

<td>0x0002</td>
<td>0x0000</td>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0000</td>
<td>0x0001</td>
<td>0x0000</td>
<td>0x0000</td>
</tr>
</tbody>
</table>

Note: It’s similar when the data is 32-bit width, but take care when using 8-bit and 24-bit data width. For 8-bit width, the written buffer should still using `uint16_t` (i.e. align with 2 bytes), and only the high 8 bits will be valid, the low 8 bits are dropped, and for 24-bit width, the buffer is supposed to use `uint32_t` (i.e. align with 4 bytes), and only the high 24 bits valid, the low 8 bits are dropped.

Another point is that, for the 8-bit and 16-bit mono mode, the real data on the line are swapped. To get the correct sequence, the writing buffer need to swap the data every two bytes.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by helper macro. * This helper macro is defined in 'i2s_common.h' and shared by all the i2s communication mode. * It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros is defined in 'i2s_std.h' which can only be used in STD mode. */
/* They can help to specify the slot and clock configurations for initialization or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        }
    }
};
```

(continues on next page)
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before write data, start the tx channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_wait);

/* If the configurations of slot or clock need to be updated,
* stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel-resources */
i2s_del_channel(tx_handle);

STD RX Mode  Take 16-bit data width for example, when the data on the line are:

<table>
<thead>
<tr>
<th>0x0001</th>
<th>0x0002</th>
<th>0x0003</th>
<th>0x0004</th>
<th>0x0005</th>
<th>0x0006</th>
<th>0x0007</th>
<th>0x0008</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>wslow</td>
<td>wshigh</td>
<td>wslow</td>
<td>wshigh</td>
<td>wslow</td>
<td>wshigh</td>
<td>wslow</td>
<td>wshigh</td>
<td></td>
</tr>
</tbody>
</table>

Here is the table of the data that received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`

<table>
<thead>
<tr>
<th>data width</th>
<th>slot mode</th>
<th>slot mask</th>
<th>data 0</th>
<th>data 1</th>
<th>data 2</th>
<th>data 3</th>
<th>data 4</th>
<th>data 5</th>
<th>data 6</th>
<th>data 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 bit</td>
<td>mono</td>
<td>left</td>
<td>0x0001</td>
<td>0x0000</td>
<td>0x0005</td>
<td>0x0003</td>
<td>0x0009</td>
<td>0x0007</td>
<td>0x000d</td>
<td>0x000b</td>
</tr>
<tr>
<td></td>
<td></td>
<td>right</td>
<td>0x0002</td>
<td>0x0000</td>
<td>0x0006</td>
<td>0x0004</td>
<td>0x001a</td>
<td>0x0008</td>
<td>0x000e</td>
<td>0x000c</td>
</tr>
<tr>
<td></td>
<td>stereo</td>
<td>any</td>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
</tr>
</tbody>
</table>

**Note:** The receive case is a little bit complicated on ESP32. Firstly, when the data width are 8-bit or 24-bit, the received data will still align with two bytes or four bytes, which means the valid data are put in the high 8 bits in every two bytes and high 24 bits in every four bytes. For example, the received data will be 0x005A00 when the data on the line is 0x5A in 8-bit width, and receive 0x0000 5A00 if the data 0x00 005A on the line. Secondly, for 8-bit and 16-bit mono case, the data in buffer are swapped every two data, they may need to be swapped back manually to get the correct order.
/* Allocate a new rx channel and get the handle of this channel */
i2s_new_channel(schan_cfg, NULL, rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros
* These two helper macros is defined in 'i2s_std.h' which can only be used in STD_mode.
* They can help to specify the slot and clock configurations for initialization or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false, 
            .bclk_inv = false, 
            .ws_inv = false, 
        },
    },
};

/** Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before read data, start the rx channel first */
i2s_channel_enable(rx_handle);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);

/* If the handle is not needed any more, delete it to release the channel resources */
i2s_del_channel(rx_handle);

** PDM TX usage **

For PDM mode in tx channel, the slot configuration helper macro is:

* I2S_PDM_TX_SLOT_DEFAULT_CONFIG

The clock configuration helper macro is:

* I2S_PDM_TX_CLK_DEFAULT_CONFIG

Please refer to **PDM Mode** for PDM TX API information. And for more details, please refer to driver/include/driver/i2s_pdm.h.

The PDM data width is fixed to 16-bit, when the data in a int16_t writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|------
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different i2s_pdm_tx_slot_config_t::slot_mode and i2s_pdm_tx_slot_config_t::slot_mask (The PDM format on the line is transferred to PCM format for better comprehension).

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S tx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);
...
```

---

**PDM RX usage**  
For PDM mode in RX channel, the slot configuration helper macro is:

- `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

Please refer to *PDM Mode* for PDM RX API information. And for more details, please refer to driver/include/driver/i2s_pdm.h.

The PDM data width is fixed to 16-bit, when the data on the line (The PDM format on the line is transferred to PCM format for easier comprehension) are:

<table>
<thead>
<tr>
<th>Left</th>
<th>Right</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0001</td>
<td>0x0002</td>
</tr>
<tr>
<td>0x0003</td>
<td>0x0004</td>
</tr>
<tr>
<td>0x0005</td>
<td>0x0006</td>
</tr>
<tr>
<td>0x0007</td>
<td>0x0008</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

Here is the table of the data that received in a `int16_t` buffer with different `i2s_pdm_rx_slot_config_t::slot_mode` and `i2s_pdm_rx_slot_config_t::slot_mask`:

<table>
<thead>
<tr>

<td>0x00006</td>
<td>0x00007</td>
<td>0x00008</td>
</tr>
</tbody>
</table>
```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S rx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
   .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
   .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
   .gpio_cfg = {
      .clk = GPIO_NUM_5,
      .din = GPIO_NUM_19,
      .invert_flags = {
         .clk_inv = false,
      },
   },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);
```

**Full-duplex**  
Full-duplex mode will register tx and rx channel in an I2S port at the same time, and they will share the BCLK and WS signal. Currently STD and TDM communication mode are able to adopt full-duplex mode in following way, but PDM full-duplex is not supported because PDM TX and RX clock are not same.

Note that one handle can only stand for one channel, the slot and clock configurations for both tx and rx channel should be set one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate for tx and rx channel at the same time, then they will work in full-duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);
/* Set the configurations for BOTH TWO channels, since tx and rx channel have to be same in full-duplex mode */
i2s_std_config_t std_cfg = {
   .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
   .slot_cfg = I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
   .gpio_cfg = {
      .mclk = I2S_GPIO_UNUSED,
      .bclk = GPIO_NUM_4,
      .ws = GPIO_NUM_5,
      .dout = GPIO_NUM_18,
      .din = GPIO_NUM_19,
   },
};
```
.invert_flags = {
    .mclk_inv = false,
    .bclk_inv = false,
    .ws_inv = false,
},
};
i2s_init_channel(tx_handle, &std_cfg);
i2s_init_channel(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);
...

**Simplex Mode**  To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and gpio pins of TX/RX channel on ESP32 are not separate, therefore TX and RX channel can’t coexist on a same I2S port in simplex mode.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
i2s_new_channel(chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* rx channel will be registered on another I2S, if no other available I2S unit found */
/* it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
    },
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
.ws = GPIO_NUM_7,
.dout = I2S_GPIO_UNUSED,
.din = GPIO_NUM_19,
.invert_flags = {
    .mclk_inv = false,
    .bclk_inv = false,
    .ws_inv = false,
},
);
```

```c
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);
```

Application Notes

How to Prevent Data Lost  
For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering isr callback function to receive event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle rx queue overflow event ...
    return false;
}
```

```c
i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
```

```c
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));
```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., dma_frame_num should be as big as possible while the DMA buffer size won’t exceed its maximum value 4092. The relationships are:

   ```c
   interrupt_interval(unit: sec) = dma_frame_num / sample_rate
   dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092
   ```

2. Determine the `dma_desc_num`. The `dma_desc_num` is decided by the max time of `i2s_channel_read` polling cycle, all the received data are supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

   ```c
dma_desc_num > polling_cycle / interrupt_interval
   ```

3. Determine the receiving buffer size. The receiving buffer that offered by user in `i2s_channel_read` should be able to take all the data in all DMA buffers, that means it should be bigger than the total size of all the DMA buffers:

   ```c
   recv_buffer_size > dma_desc_num * dma_buffer_size
   ```

For example, if there is an I2S application, and the known values are:

```c
sample_rate = 144000 Hz
data_bit_width = 32 bits
```
slot_num = 2  
polling_cycle = 10ms

Then the parameters dma_frame_num, dma_desc_num and recv_buf_size can be calculated according to the given known values:

dma_frame_num * slot_num * data_bit_width / 8 <= dma_buffer_size <= 4092  
dma_frame_num <= 511  
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.549 ms  
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)  
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

API Reference

Standard Mode

Header File

- components/driver/include/driver/i2s_std.h

Functions

- esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)
  
  Initialize i2s channel to standard mode.

  **Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

  **Parameters**

  - handle - [in] I2S channel handler
  - std_cfg - [in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_STD_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG or I2S_STD_MSB_SLOT_DEFAULT_CONFIG

  **Returns**

  - ESP_OK Initialize successfully
  - ESP_ERR_NO_MEM No memory for storing the channel information
  - ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
  - ESP_ERR_INVALID_STATE This channel is not registered

- esp_err_t i2s_channel_reconfig_std_clock(i2s_chan_handle_t handle, const i2s_std_clk_config_t *clk_cfg)

  Reconfigure the I2S clock for standard mode.

  **Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.
Chapter 2. API Reference

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- handle [in] I2S channel handler
- clk_cfg [in] Standard mode clock configuration, can be generated by I2S_STD_CLK_DEFAULT_CONFIG

Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_slot(i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- handle [in] I2S channel handler
- slot_cfg [in] Standard mode slot configuration, can be generated by I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG and I2S_STD_MSB_SLOT_DEFAULT_CONFIG.

Returns
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_gpio(i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- handle [in] I2S channel handler
- gpio_cfg [in] Standard mode gpio configuration, specified by user

Returns
• ESP_OK Set clock successfully
• ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
• ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct i2s_std_slot_config_t
I2S slot configuration for standard mode.

Public Members

i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample)

i2s_slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot)

i2s_slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

i2s_std_slot_mask_t slot_mask
Select the left, right or both slot

uint32_t ws_width
WS signal width (i.e. the number of clock ticks that ws signal is high)

bool ws_pol
WS signal polarity, set true to enable high level first

bool bit_shift
Set to enable bit shift in Philip mode

bool msb_right
Set to place right channel data at the MSB in the FIFO

struct i2s_std_clk_config_t
I2S clock configuration for standard mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source
### i2s_mclk_multiple

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of ‘3’ (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate.

```c
struct i2s_std_gpio_config_t
```

I2S standard mode GPIO pins configuration.

#### Public Members

- **gpio_num_t mclk**
  - MCK pin, output
- **gpio_num_t bclk**
  - BCK pin, input in slave role, output in master role
- **gpio_num_t ws**
  - WS pin, input in slave role, output in master role
- **gpio_num_t dout**
  - DATA pin, output
- **gpio_num_t din**
  - DATA pin, input
- **uint32_t mclk_inv**
  - Set 1 to invert the mclk output
- **uint32_t bclk_inv**
  - Set 1 to invert the bclk input/output
- **uint32_t ws_inv**
  - Set 1 to invert the ws input/output

- **struct i2s_std_gpio_config_t::[anonymous] invert_flags**
  - GPIO pin invert flags

```c
struct i2s_std_config_t
```

I2S standard mode major configuration that including clock/slot/gpio configuration.

#### Public Members

- **i2s_std_clk_config_t clk_cfg**
  - Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG
- **i2s_std_slot_config_t slot_cfg**
  - Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIP/MSB/PCM
Chapter 2. API Reference

**i2s_std_gpio_config_t gpio_cfg**

Standard mode gpio configuration, specified by user

**Macros**

`I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)`

Philip format in 2 slots.

This file is specified for I2S standard communication mode. Features:

- Philip/MSB/PCM are supported in standard mode
- Fixed to 2 slots

**Parameters**

- `bits_per_sample` - i2s data bit width
- `mono_or_stereo` - `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

`I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)`

PCM (short) format in 2 slots.

**Note:** PCM (long) is sample as philip in 2 slots

**Parameters**

- `bits_per_sample` - i2s data bit width
- `mono_or_stereo` - `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

`I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)`

MSB format in 2 slots.

**Parameters**

- `bits_per_sample` - i2s data bit width
- `mono_or_stereo` - `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

`I2S_STD_CLK_DEFAULT_CONFIG (rate)`

i2s default standard clock configuration

**Note:** Please set the mclk_multiple to `I2S_MCLK_MULTIPLE_384` while using 24 bits data width. Otherwise, the sample rate might be imprecise since the bclk division is not an integer

**Parameters**

- `rate` - sample rate

**PDM Mode**

**Header File**

- `components/driver/include/driver/i2s_pdm.h`

**Functions**

`esp_err_t i2s_channel_init_pdm_rx_mode (i2sChanHandle_t handle, const i2sPdmRxConfig_t *pdm_rx_cfg)`
Initialize i2s channel to PDM RX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

### Parameters
- **handle** [in] I2S rx channel handler
- **pdm_rx_cfg** [in] Configurations for PDM RX mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`.

### Returns
- ESP_OK: Initialize successfully
- ESP_ERR_NO_MEM: No memory for storing the channel information
- ESP_ERR_INVALID_ARG: NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE: This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_rx_clock(i2s_chan_handle_t handle, const i2s_pdm_rx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM RX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., ‘i2s_channel_init_pdm_rx_mode’ has been called before reconfiguring.

### Parameters
- **handle** [in] I2S rx channel handler
- **clk_cfg** [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

### Returns
- ESP_OK: Set clock successfully
- ESP_ERR_INVALID_ARG: NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE: This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_rx_slot(i2s_chan_handle_t handle, const i2s_pdm_rx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM RX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., ‘i2s_channel_init_pdm_rx_mode’ has been called before reconfiguring.

### Parameters
Chapter 2. API Reference

- **handle**  - [in] I2S rx channel handler
- **slot_cfg**  - [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_rx_gpio(i2s_chan_handle_t handle, const i2s_pdm_rx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM RX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Parameters**
- **handle**  - [in] I2S rx channel handler
- **gpio_cfg**  - [in] PDM RX mode gpio configuration, specified by user

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_init_pdm_tx_mode(i2s_chan_handle_t handle, const i2s_pdm_tx_config_t *pdm_tx_cfg)
```

Initialize i2s channel to PDM TX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**
- **handle**  - [in] I2S tx channel handler
- **pdm_tx_cfg**  - [in] Configurations for PDM TX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**
- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock(i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring.

**Parameters**
- `handle` [in] I2S tx channel handler
- `clk_cfg` [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_slot (i2s_chan_handle_t handle, const i2s_pdm_tx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring.

**Parameters**
- `handle` [in] I2S tx channel handler
- `slot_cfg` [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio (i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring.
Chapter 2. API Reference

Parameters
• handle [in] I2S tx channel handler
• gpio_cfg [in] PDM TX mode gpio configuration, specified by user

Returns
• ESP_OK Set clock successfully
• ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
• ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct i2s_pdm_rx_slot_config_t
I2S slot configuration for pdm rx mode.

Public Members

i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

i2s_slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

i2s_pdm_slot_mask_t slot_mask
Choose the slots to activate

struct i2s_pdm_rx_clk_config_t
I2S clock configuration for pdm rx mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source

i2s_mclk_multiple_t mclk_multiple
The multiple of mclk to the sample rate

i2s_pdm_dsr_t dn_sample_mode
Down-sampling rate mode

struct i2s_pdm_rx_gpio_config_t
I2S PDM tx mode GPIO pins configuration.
Chapter 2. API Reference

Public Members

gpio_num_t clk
  PDM clk pin, output

gpio_num_t din
  DATA pin, input

uint32_t clk_inv
  Set 1 to invert the clk output

struct i2s_pdm_rx_gpio_config_t::[anonymous] invert_flags
  GPIO pin invert flags

struct i2s_pdm_rx_config_t
  I2S PDM RX mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_pdm_rx_clk_config_t clk_cfg
  PDM RX clock configurations, can be generated by macro I2S_PDM_RX_CLK_DEFAULT_CONFIG

i2s_pdm_rx_slot_config_t slot_cfg
  PDM RX slot configurations, can be generated by macro I2S_PDM_RX_SLOT_DEFAULT_CONFIG

i2s_pdm_rx_gpio_config_t gpio_cfg
  PDM RX slot configurations, specified by user

struct i2s_pdm_tx_slot_config_t
  I2S slot configuration for pdm tx mode.

Public Members

i2s_data_bit_width_t data_bit_width
  I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_slot_bit_width_t slot_bit_width
  I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

i2s_slot_mode_t slot_mode
  Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

i2s_pdm_slot_mask_t slot_mask
  Slot mask to choose left or right slot
uint32_t sd_prescale
Sigma-delta filter prescale

i2s_pdm_sig_scale_t sd_scale
Sigma-delta filter scaling value

i2s_pdm_sig_scale_t hp_scale
High pass filter scaling value

i2s_pdm_sig_scale_t lp_scale
Low pass filter scaling value

i2s_pdm_sig_scale_t sinc_scale
Sinc filter scaling value

struct i2s_pdm_tx_clk_config_t
I2S clock configuration for pdm tx mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source

i2s_mclk_multiple_t mclk_multiple
The multiple of mclk to the sample rate

uint32_t up_sample_fp
Up-sampling param fp

uint32_t up_sample_fs
Up-sampling param fs

struct i2s_pdm_tx_gpio_config_t
I2S PDM tx mode GPIO pins configuration.

Public Members

gpio_num_t clk
PDM clk pin, output

gpio_num_t dout
DATA pin, output
uint32_t clk_inv
    Set 1 to invert the clk output

struct i2s_pdm_tx_gpio_config_t::[anonymous] invert_flags
    GPIO pin invert flags

struct i2s_pdm_tx_config_t
    I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_pdm_tx_clk_config_t clk_cfg
    PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t slot_cfg
    PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t gpio_cfg
    PDM TX gpio configurations, specified by user

Macros

I2S_PDM_RX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    PDM format in 2 slots(RX)
    This file is specified for I2S PDM communication mode Features:
    • Only support PDM tx/rx mode
    • Fixed to 2 slots
    • Data bit width only support 16 bits

Parameters
    • bits_per_sample – i2s data bit width, only support 16 bits for PDM mode
    • mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_RX_CLK_DEFAULT_CONFIG (rate)
    i2s default pdm rx clock configuration

Parameters
    • rate – sample rate

I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    PDM style in 2 slots(TX)

Parameters
    • bits_per_sample – i2s data bit width, only support 16 bits for PDM mode
    • mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)
    i2s default pdm tx clock configuration

Note: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.
### Parameters

- **rate** - sample rate

### I2S Driver

### Header File

- components/driver/include/driver/i2s_common.h

### Functions

**esp_err_t i2s_new_channel** (const `i2s_chan_config_t *chan_cfg`, `i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle`)

Allocate new I2S channel(s)

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**

- **chan_cfg** - [in] I2S controller channel configurations
- **ret_tx_handle** - [out] I2S channel handler used for managing the sending channel(optional)
- **ret_rx_handle** - [out] I2S channel handler used for managing the receiving channel(optional)

**Returns**

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in `i2s_chan_config_t`
- ESP_ERR_NOT_FOUND No available I2S channel found

**esp_err_t i2s_del_channel** (`i2s_chan_handle_t handle`)

Delete the i2S channel.

**Note:** Only allowed to be called when the i2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).
Note: Resource will be free automatically if all channels in one port are deleted

Parameters handle - [in] I2S channel handler
  • ESP_OK Delete successfully
  • ESP_ERR_INVALID_ARG NULL pointer

esp_err_t i2s_channel_get_info (i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
Get I2S channel information.

Parameters
  • handle - [in] I2S channel handler
  • chan_info - [out] I2S channel basic information

Returns
  • ESP_OK Get i2s channel information success
  • ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an i2s channel handle or not available any more
  • ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

esp_err_t i2s_channel_enable (i2s_chan_handle_t handle)
Enable the i2s channel.

Note: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

Note: Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mcclk signal, it will start to output when initialization is finished

Parameters handle - [in] I2S channel handler
  • ESP_OK Start successfully
  • ESP_ERR_INVALID_ARG NULL pointer
  • ESP_ERR_INVALID_STATE This channel has not initialized or already started

esp_err_t i2s_channel_disable (i2s_chan_handle_t handle)
Disable the i2s channel.

Note: Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

Note: Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mcclk signal

Parameters handle - [in] I2S channel handler

Returns
  • ESP_OK Stop successfully
  • ESP_ERR_INVALID_ARG NULL pointer
  • ESP_ERR_INVALID_STATE This channel has not stated

esp_err_t i2s_channel_write (i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)
I2S write data.

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the Running only stands for the software state, it doesn’t mean there is no the signal transporting on line.

### Parameters
- **handle** [in] I2S channel handler
- **src** [in] The pointer of sent data buffer
- **size** [in] Max data buffer length
- **bytes_written** [out] Byte number that actually be sent
- **timeout_ms** [in] Max block time

### Returns
- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not tx handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

```
esp_err_t i2s_channel_write(i2s_chan_handle_t handle, void*src, size_t size, size_t*bytes_written, uint32_t timeout_ms)
```

I2S read data.

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

### Parameters
- **handle** [in] I2S channel handler
- **dest** [in] The pointer of receiving data buffer
- **size** [in] Max data buffer length
- **bytes_read** [out] Byte number that actually be read
- **timeout_ms** [in] Max block time

### Returns
- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void*dest, size_t size, size_t*bytes_read, uint32_t timeout_ms)
```

Set event callbacks for I2S channel.

**Note:** Only allowed to be called when the channel state is REGISTARED / READY, (i.e., before channel starts)

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

```
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```
Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM or internal RAM as well.

Parameters

- **handle** - [in] I2S channel handler
- **callbacks** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

Returns

- **ESP_OK** Set event callbacks successfully
- **ESP_ERR_INVALID_ARG** Set event callbacks failed because of invalid argument
- **ESP_ERR_INVALID_STATE** Set event callbacks failed because the current channel state is not REGISTARED or READY

Structures

**struct i2s_event_callbacks_t**

Group of I2S callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

**i2s_isr_callback_t** **on_recv**

Callback of data received event, only for rx channel. The event data includes DMA buffer address and size that just finished receiving data

**i2s_isr_callback_t** **on_recv_q_ovf**

Callback of receiving queue overflowed event, only for rx channel. The event data includes buffer size that has been overwritten

**i2s_isr_callback_t** **on_sent**

Callback of data sent event, only for tx channel. The event data includes DMA buffer address and size that just finished sending data

**i2s_isr_callback_t** **on_send_q_ovf**

Callback of sending queue overflowed event, only for tx channel. The event data includes buffer size that has been overwritten

**struct i2s_chan_config_t**

I2S controller channel configuration.

Public Members
**i2s_port_t id**
I2S port id

**i2s_role_t role**
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

```c
uint32_t dma_desc_num
```
I2S DMA buffer number, it is also the number of DMA descriptor

```c
uint32_t dma_frame_num
```
I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of ‘3’ when the data bit width is 24.

```c
bool auto_clear
```
Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

```c
struct i2s_chan_info_t
```
I2S channel information.

### Public Members

**i2s_port_t id**
I2S port id

**i2s_role_t role**
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

**i2s_dir_t dir**
I2S channel direction

**i2s_comm_mode_t mode**
I2S channel communication mode

**i2s_chan_handle_t pair_chan**
I2S pair channel handle in duplex mode, always NULL in simplex mode

### Macros

**I2S_CHANNEL_DEFAULT_CONFIG** (i2s_num, i2s_role)
get default I2S property

**I2S_GPIO_UNUSED**
Used in i2s_gpio_config_t for signals which are not used

### I2S Types

#### Header File
- components/driver/include/driver/i2s_types.h
Chapter 2. API Reference

Structures

struct i2s_event_data_t
Event structure used in I2S event queue.

Public Members

void *data
The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback
NULL for on_recv_q_ovf and on_send_q_ovf callback

size_t size
The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_t *i2s_chan_handle_t
i2s channel handle, the control unit of the i2s driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from
i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t
I2S controller port number, the max port number is (SOC_I2S_NUM -1).
Values:
enumerator I2S_NUM_0
I2S controller port 0
enumerator I2S_NUM_1
I2S controller port 1
enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t
I2S controller communication mode.
Values:
enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support philip/MSB/PCM format
enumerator **I2S_COMM_MODE_PDM**
I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_NONE**
Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**
The multiple of mclk to sample rate.
**Values:**

enumerator **I2S_MCLK_MULTIPLE_128**
mclk = sample_rate * 128

enumerator **I2S_MCLK_MULTIPLE_256**
mclk = sample_rate * 256

enumerator **I2S_MCLK_MULTIPLE_384**
mclk = sample_rate * 384

enumerator **I2S_MCLK_MULTIPLE_512**
mclk = sample_rate * 512

**Header File**

- components/hal/include/hal/i2s_types.h

**Type Definitions**

typedef *soc_periph_i2s_clk_src_t* **i2s_clock_src_t**
I2S clock source

**Enumerations**

enum **i2s_slot_mode_t**
I2S channel slot mode.
**Values:**

enumerator **I2S_SLOT_MODE_MONO**
I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**
I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**
I2S channel direction.
**Values:**
Chapter 2. API Reference

**enumerator I2S_DIR_RX**
I2S channel direction RX

**enumerator I2S_DIR_TX**
I2S channel direction TX

**enum i2s_role_t**
I2S controller role.

*Values:*

**enumerator I2S_ROLE_MASTER**
I2S controller master role, bclk and ws signal will be set to output

**enumerator I2S_ROLE_SLAVE**
I2S controller slave role, bclk and ws signal will be set to input

**enum i2s_data_bit_width_t**
Available data bit width in one slot.

*Values:*

**enumerator I2S_DATA_BIT_WIDTH_8BIT**
I2S channel data bit-width: 8

**enumerator I2S_DATA_BIT_WIDTH_16BIT**
I2S channel data bit-width: 16

**enumerator I2S_DATA_BIT_WIDTH_24BIT**
I2S channel data bit-width: 24

**enumerator I2S_DATA_BIT_WIDTH_32BIT**
I2S channel data bit-width: 32

**enum i2s_slot_bit_width_t**
Total slot bit width in one slot.

*Values:*

**enumerator I2S_SLOT_BIT_WIDTH_AUTO**
I2S channel slot bit-width equals to data bit-width

**enumerator I2S_SLOT_BIT_WIDTH_8BIT**
I2S channel slot bit-width: 8

**enumerator I2S_SLOT_BIT_WIDTH_16BIT**
I2S channel slot bit-width: 16

**enumerator I2S_SLOT_BIT_WIDTH_24BIT**
I2S channel slot bit-width: 24
enumerator **I2S_SLOT_BIT_WIDTH_32BIT**
   I2S channel slot bit-width: 32

enum **i2s_pdm_dsr_t**
I2S PDM RX down-sampling mode.

*Values:*

enumerator **I2S_PDM_DSR_8S**
   down sampling number is 8 for PDM RX mode

enumerator **I2S_PDM_DSR_16S**
   down sampling number is 16 for PDM RX mode

enumerator **I2S_PDM_DSR_MAX**

enum **i2s_pdm_sig_scale_t**
pdm tx signal scaling mode

*Values:*

enumerator **I2S_PDM_SIG_SCALING_DIV_2**
   I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**
   I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**
   I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**
   I2S TX PDM signal scaling: x4

enum **i2s_std_slot_mask_t**
I2S slot select in standard mode.

*Note:* It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference

*Values:*

enumerator **I2S_STD_SLOT_LEFT**
   I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**
   I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**
   I2S transmits or receives both left and right slot
Chapter 2. API Reference

enum i2s_pdm_slot_mask_t
I2S slot select in PDM mode.

Values:

enumerator I2S_PDM_SLOT_RIGHT
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator I2S_PDM_SLOT_LEFT
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator I2S_PDM_SLOT_BOTH
I2S PDM transmits or receives both two slots

2.6.10 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- i80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- GC9A01 user customized driver and dash board UI - peripherals/lcd/gc9a01
- RGB panel example with scatter chart UI - peripherals/lcd/rgb_panel
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Type Definitions

typedef soc_periph_lcd_clk_src_t lcd_clock_source_t

LCD clock source.
Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
   Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
   Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t
   LCD color space type definition.
   Values:

   enumerator ESP_LCD_COLOR_SPACE_RGB
      Color space: RGB

   enumerator ESP_LCD_COLOR_SPACE_BGR
      Color space: BGR

   enumerator ESP_LCD_COLOR_SPACE_MONOCHROME
      Color space: monochrome

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

esp_err_t esp_lcd_panel_io_rx_param (esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- io [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- lcd_cmd [in] The specific LCD command, set to -1 if no command needed
- param [out] Buffer for the command data
- param_size [in] Size of param buffer

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success
```
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Parameters**
- `io` - [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- `lcd_cmd` - [in] The specific LCD command (set to -1 if no command needed - only in SPI and I2C)
- `param` - [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- `param_size` - [in] Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

**Parameters**
- `io` - [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- `lcd_cmd` - [in] The specific LCD command
- `color` - [in] Buffer that holds the RGB color data
- `color_size` - [in] Size of `color` in memory, in bytes

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters**
- `io` - [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```
esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for SPI interface.

**Parameters**
- `bus` - [in] SPI bus handle
Chapter 2. API Reference

- **io_config** - [in] IO configuration, for SPI interface
- **ret_io** - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const
esp_lcd_panel_io_i2c_config_t *io_config,
esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

**Parameters**
- **bus** - [in] I2C bus handle
- **io_config** - [in] IO configuration, for I2C interface
- **ret_io** - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config,
esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

**Parameters**
- **bus_config** - [in] Bus configuration
- **ret_bus** - [out] Returned bus handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

**Parameters**
- **bus** - [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const
esp_lcd_panel_io_i80_config_t *io_config,
esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

**Parameters**
- **bus** - [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io_config** - [in] IO configuration, for i80 interface
- **ret_io** - [out] Returned panel IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Structures**
struct esp_lcd_panel_io_event_data_t
Type of LCD panel IO event data.

struct esp_lcd_panel_io_spi_config_t
Panel IO configuration structure, for SPI interface.

**Public Members**

int cs_gpio_num
GPIO used for CS line

int dc_gpio_num
GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int spi_mode
Traditional SPI mode (0~3)

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Size of internal transaction queue

*esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_low_on_data
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int octal_mode
transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int lsb_first
transmit LSB bit first

struct esp_lcd_panel_io_spi_config_t::[anonymous] flags
Extra flags to fine-tune the SPI device

struct esp_lcd_panel_io_i2c_config_t
Panel IO configuration structure, for I2C interface.
Public Members

```c
uint32_t dev_addr
I2C device address
```

```c
esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished
```

```c
void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx
```

```c
size_t control_phase_bytes
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes
```

```c
unsigned int dc_bit_offset
Offset of the D/C selection bit in control phase
```

```c
int lcd_cmd_bits
Bit-width of LCD command
```

```c
int lcd_param_bits
Bit-width of LCD parameter
```

```c
unsigned int dc_low_on_data
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
```

```c
unsigned int disable_control_phase
If this flag is enabled, the control phase isn’t used
```

```c
struct esp_lcd_panel_io_i2c_config_t::[anonymous] flags
Extra flags to fine-tune the I2C device
```

```c
struct esp_lcd_i80_bus_config_t
LCD Intel 8080 bus configuration structure.
```

Public Members

```c
int dc_gpio_num
GPIO used for D/C line
```

```c
int wr_gpio_num
GPIO used for WR line
```

```c
lcd_clock_source_t clk_src
Clock source for the I80 LCD peripheral
```

```c
int data_gpio_nums[(24)]
GPIOs used for data lines
```
size_t bus_width
   Number of data lines, 8 or 16

size_t max_transfer_bytes
   Maximum transfer size, this determines the length of internal DMA link

size_t psram_trans_align
   DMA transfer alignment for data allocated from PSRAM

size_t sram_trans_align
   DMA transfer alignment for data allocated from SRAM

struct esp_lcd_panel_io_i80_config_t
   Panel IO configuration structure, for intel 8080 interface.

Public Members

int cs_gpio_num
   GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
   Frequency of pixel clock

size_t trans_queue_depth
   Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
   Callback invoked when color data was transferred done

void *user_ctx
   User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
   Bit-width of LCD command

int lcd_param_bits
   Bit-width of LCD parameter

unsigned int dc_idle_level
   Level of DC line in IDLE phase

unsigned int dc_cmd_level
   Level of DC line in CMD phase

unsigned int dc_dummy_level
   Level of DC line in DUMMY phase
unsigned int `dc_data_level`
Level of DC line in DATA phase

struct `esp_lcd_panel_io_i80_config_t`::[anonymous] `dc_levels`
Each i80 device might have its own D/C control logic

unsigned int `cs_active_high`
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int `reverse_color_bits`
Reverse the data bits, D[N:0] -> D[0:N]

unsigned int `swap_color_bytes`
Swap adjacent two color bytes

unsigned int `pclk_active_neg`
The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int `pclk_idle_low`
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct `esp_lcd_panel_io_i80_config_t`::[anonymous] `flags`
Panel IO config flags

**Type Definitions**

typedef void *`esp_lcd_spi_bus_handle_t`
Type of LCD SPI bus handle

typedef void *`esp_lcd_i2c_bus_handle_t`
Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *`esp_lcd_i80_bus_handle_t`
Type of LCD intel 8080 bus handle

typedef bool (*`esp_lcd_panel_io_color_trans_done_cb_t`)(`esp_lcd_panel_io_handle_t` panel_io, `esp_lcd_panel_io_event_data_t` *edata, void *user_ctx)
Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user_ctx [in]** User data, passed from `esp_lcd_panel_io_xxx_config_t`

**Return** Whether a high priority task has been waken up by this function

**Header File**

- components/esp_lcd/include/esp_lcd_panel_ops.h
Functions

esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
Reset LCD panel.

Note: Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

Parameters panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
Initialize LCD panel.

Note: Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().

Parameters panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.

Parameters panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)
Draw bitmap on LCD panel.

Parameters
• panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• x_start –[in] Start index on x-axis (x_start included)
• y_start –[in] Start index on y-axis (y_start included)
• x_end –[in] End index on x-axis (x_end not included)
• y_end –[in] End index on y-axis (y_end not included)
• color_data –[in] RGB color data that will be dumped to the specific window range

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
Mirror the LCD panel on specific axis.

Note: Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation

Parameters
• panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• mirror_x –[in] Whether the panel will be mirrored about the x axis
• mirror_y –[in] Whether the panel will be mirrored about the y axis
stats

Chapter 2. API Reference

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)
```
Swap/Exchange x and y axis.

Note: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

Parameters
- `panel` -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `swap_axes` -[in] Whether to swap the x and y axis

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
```
Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Parameters
- `panel` -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `x_gap` -[in] Extra gap on x axis, in pixels
- `y_gap` -[in] Extra gap on y axis, in pixels

Returns
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)
```
Invert the color (bit-wise invert the color data line)

Parameters
- `panel` -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `invert_color_data` -[in] Whether to invert the color data

Returns
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_disp_on_off(esp_lcd_panel_handle_t panel, bool on_off)
```
Turn on or off the display.

Parameters
- `panel` -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `on_off` -[in] True to turns on display, False to turns off display

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
```
Turn off the display.
Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** – [in] Whether to turn off the screen

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File

- components/esp_lcd/include/esp_lcd_panel_rgb.h

Functions

```
esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

Parameters

- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

Parameters

- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

Parameters

- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

Structures

struct esp_lcd_panel_dev_config_t
Configuration structure for panel device.

Public Members

int reset_gpio_num
GPIO used to reset the LCD panel, set to -1 if it’s not used

esp_lcd_color_space_t color_space
Set the color space used by the LCD panel

unsigned int bits_per_pixel
Color depth, in bpp

unsigned int reset_active_high
Setting this if the panel reset is high level active

struct esp_lcd_panel_dev_config_t::[anonymous] flags
LCD panel config flags

void *vendor_config
vendor specific configuration, optional, left as NULL if not used

2.6.11 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be
used to generate PWM signals for other purposes. It has 16 channels which can generate independent waveforms that
can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high
speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty
cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver
in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any
processor interference.

Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. Timer Configuration by specifying the PWM signal’s frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the
   full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.
Timer Configuration

Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 5: Characteristics of ESP32 LEDC source clocks

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock freq</th>
<th>Speed mode</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB_CLK</td>
<td>80 MHz</td>
<td>High / Low</td>
<td></td>
</tr>
<tr>
<td>REF_TICK</td>
<td>1 MHz</td>
<td>High / Low</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
<tr>
<td>RTC8M_CLK</td>
<td>~8 MHz</td>
<td>Low</td>
<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
</tbody>
</table>

Note:

1. On ESP32, if RTCxM_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

Channel Configuration

When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.
Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section **Change PWM Frequency**.

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `get` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section **Channel Configuration**.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2^{\text{duty\_resolution}}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes. Due to hardware limitations, there is no way to stop a fade before it reaches its target duty.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`
The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**LEDC High and Low Speed Mode**

High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF].

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.

The LEDC basic example: peripherals/ledc/ledc_basic.
API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

```c
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LED channel configuration
Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Parameters

- `ledc_conf` - Pointer of LEDC channel configure struct

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)
```

LED timer configuration
Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Parameters

- `timer_conf` - Pointer of LEDC timer configure struct

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

```c
esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LED update channel parameters.

Note: Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

Note: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

Parameters

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)
```

Set LEDC output gpio.

Note: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use ledc_channel_config() instead to fully configure a LEDC channel.

Parameters

- `gpio_num` - The LEDC output gpio
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- **`ledc_channel`** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**`esp_err_t` ledc_stop** (`ledc_mode_t` speed_mode, `ledc_channel_t` channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

**Parameters**
- **`speed_mode`** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **`channel`** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **`idle_level`** - Set output idle level after LEDC stops.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**`esp_err_t` ledc_set_freq** (`ledc_mode_t` speed_mode, `ledc_timer_t` timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

**Parameters**
- **`speed_mode`** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **`timer_num`** - LEDC timer index (0-3), select from `ledc_timer_t`
- **`freq_hz`** - Set the LEDC frequency

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **`ledc_get_freq`** (`ledc_mode_t` speed_mode, `ledc_timer_t` timer_num)

LEDC get channel frequency (Hz)

**Parameters**
- **`speed_mode`** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **`timer_num`** - LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**
- 0 error
- Others Current LEDC frequency

**`esp_err_t` ledc_set_duty_with_hpoint** (`ledc_mode_t` speed_mode, `ledc_channel_t` channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value. Only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
• **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
• **hpoint** - Set the LEDC hpoint value (max: 0xfffff)

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```
LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**
• **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
• LEDC_ERR_VAL if parameter error
• Others Current hpoint value of LEDC channel

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```
LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note:** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```
LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.

**Parameters**
• **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
### Chapter 2. API Reference

#### esp_err_t ledc_set_fade (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,

`ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num,
uint32_t duty_scale`)

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the start of the gradient duty, the range of duty setting is [0, $(2^{*duty\_resolution}) - 1]$
- fade_direction: Set the direction of the gradient
- step_num: Set the number of the gradient
- duty_cycle_num: Set how many LEDC tick each time the gradient lasts
- duty_scale: Set gradient change amplitude

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

#### esp_err_t ledc_isr_register (void (*fn)(void*), void* arg, int intr_alloc_flags, ledc_isr_handle_t *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- fn: Interrupt handler function.
- arg: User-supplied argument passed to the handler function.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

#### esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,

uint32_t duty_resolution, ledc_clk_src_t clk_src)

Configure LEDC settings.

**Parameters**

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: Timer index (0-3), there are 4 timers in LEDC module
- clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
- duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, $(2^{*duty\_resolution})]
- clk_src: Select LEDC source clock.

**Returns**

- (-1) Parameter error
- Other Current LEDC duty

#### esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)

Reset LEDC timer.
Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** - LEDC timer index (0-3), select from ledc_timer_t

Returns
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Pause LEDC timer counter.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** - LEDC timer index (0-3), select from ledc_timer_t

Returns
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Resume LEDC timer.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** - LEDC timer index (0-3), select from ledc_timer_t

Returns
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`
Bind LEDC channel with the selected timer.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel** - LEDC timer index (0-3), select from ledc_timer_t

Returns
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_set_fade_with_step (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`
Set LEDC fade function.

**Note:** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note:** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress
on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution) - 1]
- **scale** - Controls the increase or decrease step scale.
- **cycle_num** - Increase or decrease the duty every cycle_num cycles

**Returns**

- ESP_ERR_INVALID_ARG - Parameter error
- ESP_OK - Success
- ESP_ERR_INVALID_STATE - Fade function not installed.
- ESP_FAIL - Fade function init error

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note:** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note:** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution) - 1]
- **max_fade_time_ms** - The maximum time of the fading (ms).

**Returns**

- ESP_ERR_INVALID_ARG - Parameter error
- ESP_OK - Success
- ESP_ERR_INVALID_STATE - Fade function not installed.
- ESP_FAIL - Fade function init error

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** `intr_alloc_flags` - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK - Success
- ESP_ERR_INVALID_STATE - Fade function already installed.
Chapter 2. API Reference

void **ledc_fade_func_uninstall** (void)
Uninstall LEDC fade function.

```c
esp_err_t **ledc_fade_start** (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
Start LEDC fading.
```

**Note:** Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

**Note:** Starting fade operation with this API is not thread-safe, use with care.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets supports high speed mode.
- **channel** - LEDC channel number
- **fade_mode** - Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

```c
esp_err_t **ledc_set_duty_and_update** (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
A thread-safe API to set duty for LEDC channel and return when duty updated.
```

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **hpoint** - Set the LEDC hpoint value(max: 0xffffffff)

```c
esp_err_t **ledc_set_fade_time_and_start** (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
A thread-safe API to set and start LEDC fade function, with a limited time.
```

**Note:** Call ledc_fade_func_install() once, before calling this function.
**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `max.fade.time_ms` - The maximum time of the fading (ms).
- `fade_mode` - choose blocking or non-blocking mode

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `scale` - Controls the increase or decrease step scale.
- `cycle_num` - increase or decrease the duty every cycle_num cycles
- `fade_mode` - choose blocking or non-blocking mode

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Parameters**
Chapter 2. API Reference

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** – Group of LEDC callback functions
- **user_arg** – user registered data for the callback function

Returns
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Structures

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for ledc_channel_config function.

**Public Members**

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - 7)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - 3)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the max value is 0xffffffff

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct **ledc_channel_config_t::[anonymous]** **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC Timer timer for ledc_timer_config function.
Chapter 2. API Reference

Public Members

```c
lede_mode_t speed_mode
```
LEDC speed speed_mode, high-speed mode or low-speed mode

```c
lede_timer_bit_t duty_resolution
```
LEDC channel duty resolution

```c
lede_timer_t timer_num
```
The timer source of channel (0 - 3)

```c
uint32_t freq_hz
```
LEDC timer frequency (Hz)

```c
lede_clk_cfg_t clk_cfg
```
Configure LEDC source clock from lede_clk_cfg_t. Note that LEDC_USE_RTC8M_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RTC8M_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

```c
struct lede_cb_param_t
```
LEDC callback parameter.

Public Members

```c
lede_cb_event_t event
```
Event name

```c
uint32_t speed_mode
```
Speed mode of the LEDC channel group

```c
uint32_t channel
```
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

```c
uint32_t duty
```
LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

```c
struct lede_cbs_t
```
Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

Public Members

```c
lede_cb_t fade_cb
```
LEDC fade_end callback function
Chapter 2. API Reference

### Macros

**LEDC_APB_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, APB_CLK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible

**LEDC_REF_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, REF_TICK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible

**LEDC_ERR_DUTY**

**LEDC_ERR_VAL**

### Type Definitions

typedef `intr_handle_t` **ledc_isr_handle_t**

typedef `bool(*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)`

Type of LEDC event callback.

- **Param param** LEDC callback parameter
- **Param user_arg** User registered data

### Enumerations

enum **ledc_cb_event_t**

LEDC callback event type.

*Values:*

- **enumerator LEDC_FADE_END_EVT**
  LEDC fade end event

### Header File

- *components/hal/include/hal/ledc_types.h*

### Enumerations

enum **ledc_mode_t**

*Values:*

- **enumerator LEDC_HIGH_SPEED_MODE**
  LEDC high speed speed_mode

- **enumerator LEDC_LOW_SPEED_MODE**
  LEDC low speed speed_mode
Chapter 2. API Reference

enumerator **LEDC_SPEED_MODE_MAX**
LEDC speed limit

enum **ledc_intr_type_t**
**Values:**

enumerator **LEDC_INTR_DISABLE**
Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**
Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**
**Values:**

enumerator **LEDC_DUTY_DIR_DECREASE**
LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**
LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**
**Values:**

enumerator **LEDC_SLOW_CLK_RTC8M**
LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**
LEDC low speed timer clock source is 80MHz APB clock

enum **ledc_clk_cfg_t**
In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, **ledc_clk_src_t**, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

**Values:**

enumerator **LEDC_AUTO_CLK**
The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**
LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
enumerator **LEDC_USE_REF_TICK**
   LEDC timer select REF_TICK clock as source clock

definition **ledc_clk_src_t**
   Values:

enumerator **LEDC_REF_TICK**
   LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC_APB_CLK**
   LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**
   Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

definition **ledc_timer_t**
   Values:

enumerator **LEDC_TIMER_0**
   LEDC timer 0

enumerator **LEDC_TIMER_1**
   LEDC timer 1

enumerator **LEDC_TIMER_2**
   LEDC timer 2

enumerator **LEDC_TIMER_3**
   LEDC timer 3

enumerator **LEDC_TIMER_MAX**

definition **ledc_channel_t**
   Values:

enumerator **LEDC_CHANNEL_0**
   LEDC channel 0

enumerator **LEDC_CHANNEL_1**
   LEDC channel 1

enumerator **LEDC_CHANNEL_2**
   LEDC channel 2

enumerator **LEDC_CHANNEL_3**
   LEDC channel 3
Chapter 2. API Reference

enumerator LEDC_CHANNEL_4
   LEDC channel 4

enumerator LEDC_CHANNEL_5
   LEDC channel 5

enumerator LEDC_CHANNEL_6
   LEDC channel 6

enumerator LEDC_CHANNEL_7
   LEDC channel 7

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
   Values:

enumerator LEDC_TIMER_1_BIT
   LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
   LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
   LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
   LEDC PWM duty resolution of 4 bits

enumerator LEDC_TIMER_5_BIT
   LEDC PWM duty resolution of 5 bits

enumerator LEDC_TIMER_6_BIT
   LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
   LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
   LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
   LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
   LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
   LEDC PWM duty resolution of 11 bits
enumerator **LEDC_TIMER_12_BIT**
LED PWM duty resolution of 12 bits

denumerator **LEDC_TIMER_13_BIT**
LED PWM duty resolution of 13 bits

denumerator **LEDC_TIMER_14_BIT**
LED PWM duty resolution of 14 bits

denumerator **LEDC_TIMER_15_BIT**
LED PWM duty resolution of 15 bits

denumerator **LEDC_TIMER_16_BIT**
LED PWM duty resolution of 16 bits

denumerator **LEDC_TIMER_17_BIT**
LED PWM duty resolution of 17 bits

denumerator **LEDC_TIMER_18_BIT**
LED PWM duty resolution of 18 bits

denumerator **LEDC_TIMER_19_BIT**
LED PWM duty resolution of 19 bits

denumerator **LEDC_TIMER_20_BIT**
LED PWM duty resolution of 20 bits

denumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**
Values:

denumerator **LEDC_FADE_NO_WAIT**
LED PWM fade function will return immediately

denumerator **LEDC_FADE_WAIT_DONE**
LED PWM fade function will block until fading to the target duty

denumerator **LEDC_FADE_MAX**

### 2.6.12 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of
PWM outputs.

Further in documentation the outputs of a single unit are labeled PWMx_A / PWMx_B.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the
three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit
is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or
overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.
Fig. 10: MCPWM Overview

Fig. 11: MCPWM Block Diagram
Description of this API starts with configuration of MCPWM’s **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture** and **Carrier**.

**Contents**

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Synchronize** sync timers to work together
- **Capture** external signals to provide additional control over the outputs
- Use **Fault Handler** to detect and manage faults
- Add a higher frequency **Carrier**, if output signals are passed through an isolation transformer
- **Extra configuration of Resolution.**

**Configure**

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

---

![Figure 12: Example of Brushed DC Motor Control with MCPWM](image_url)

Fig. 12: Example of Brushed DC Motor Control with MCPWM
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

**Operate**

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

**Adjust**

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For
explanation of how A/B PWM output signals are generated, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].

**Synchronize**

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

**Capture**

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.
Fig. 13: Example of Brushless DC Motor Control with MCPWM

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
• State of MCPWM unit will be locked until reset - \texttt{mcpwm\_fault\_set\_oneshot\_mode()}.  
• The MCPWM will resume operation once fault signal becoming inactive - \texttt{mcpwm\_fault\_set\_cyc\_mode()}.  

The function call parameters include selection of one of three fault inputs defined in \texttt{mcpwm\_fault\_signal\_t} and specific action on outputs A and B defined in \texttt{mcpwm\_action\_on\_pwmx\_a\_t} and \texttt{mcpwm\_action\_on\_pwmx\_b\_t}.

Particular fault signal may be disabled at the runtime by calling \texttt{mcpwm\_fault\_deinit()}.  

 Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling \texttt{mcpwm\_carrier\_init()}. The carrier parameters are defined in \texttt{mcpwm\_carrier\_config\_t} structure invoked within the function call. Then the carrier functionality may be enabled by calling \texttt{mcpwm\_carrier\_enable()}.  

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the \texttt{mcpwm\_carrier\_config\_t} structure, like \texttt{mcpwm\_carrier\_set\_period()}, \texttt{mcpwm\_carrier\_set\_duty\_cycle()}, \texttt{mcpwm\_carrier\_output\_invert()}, etc.

This includes enabling and setting duration of the first pulse of the career with \texttt{mcpwm\_carrier\_oneshot\_mode\_enable()}. For more details, see \texttt{ESP32\ Technical\ Reference\ Manual >\ Motor\ Control\ PWM\ (MCPWM) >\ PWM\ Carrier\ Submodule}.  

To disable carrier functionality call \texttt{mcpwm\_carrier\_disable()}.  

 Interrupts

Registering of the MCPWM interrupt handler is possible by calling \texttt{mcpwm\_isr\_register()}. Note if \texttt{mcpwm\_capture\_enable\_channel()} is used then a default ISR routine will be installed hence please do not call this function to register any more.

 Resolution

The default resolution for MCPWM group and MCPWM timer are configured to \texttt{10MHz} and \texttt{1MHz} in \texttt{mcpwm\_init()}, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: \texttt{mcpwm\_group\_set\_resolution()} and \texttt{mcpwm\_timer\_set\_resolution()}.  

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call \texttt{mcpwm\_set\_frequency()} and \texttt{mcpwm\_set\_duty()} accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

 Application Example

MCPWM example are located under: \texttt{peripherals/mcpwm}:  
• Control of BLDC (brushless DC) motor with hall sensor feedback - \texttt{peripherals/mcpwm/mcpwm\_bldc\_hall\_control}  
• Brushed DC motor control - \texttt{peripherals/mcpwm/mcpwm\_bdc\_speed\_control}  
• Servo motor control - \texttt{peripherals/mcpwm/mcpwm\_servo\_control}  
• HC-SR04 sensor with capture - \texttt{peripherals/mcpwm/mcpwm\_capture\_hc\_sr04}
API Reference

Header File

- components/hal/include/hal/mcpwm_types.h

Type Definitions

typedef `soc_periph_mcpwm_timer_clk_src_t` mcpwm_timer_clock_source_t
MCPWM timer clock source.

typedef `soc_periph_mcpwm_capture_clk_src_t` mcpwm_capture_clock_source_t
MCPWM capture clock source.

Enumerations

enum mcpwm_timer_direction_t
MCPWM timer count direction.

Values:

enumerator MCPWM_TIMER_DIRECTION_UP
Counting direction: Increase

enumerator MCPWM_TIMER_DIRECTION_DOWN
Counting direction: Decrease

enum mcpwm_timer_event_t
MCPWM timer events.

Values:

enumerator MCPWM_TIMER_EVENT_EMPTY
MCPWM timer counts to zero (i.e. counter is empty)

enumerator MCPWM_TIMER_EVENT_FULL
MCPWM timer counts to peak (i.e. counter is full)

enumerator MCPWM_TIMER_EVENT_INVALID
MCPWM timer invalid event

enum mcpwm_timer_count_mode_t
MCPWM timer count modes.

Values:

enumerator MCPWM_TIMER_COUNT_MODE_PAUSE
MCPWM timer paused

enumerator MCPWM_TIMER_COUNT_MODE_UP
MCPWM timer counting up

enumerator MCPWM_TIMER_COUNT_MODE_DOWN
MCPWM timer counting down
enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**
  MCPWM timer counting up and down

enum **mcpwm_timer_start_stop_cmd_t**
MCPWM timer commands, specify the way to start or stop the timer.

  * Values: *

  enumerator **MCPWM_TIMER_STOP_EMPTY**
  MCPWM timer stops when next count reaches zero

  enumerator **MCPWM_TIMER_STOP_FULL**
  MCPWM timer stops when next count reaches peak

  enumerator **MCPWM_TIMER_START_NO_STOP**
  MCPWM timer starts counting, and don’t stop until received stop command

  enumerator **MCPWM_TIMER_START_STOP_EMPTY**
  MCPWM timer starts counting and stops when next count reaches zero

  enumerator **MCPWM_TIMER_START_STOP_FULL**
  MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm_generator_action_t**
MCPWM generator actions.

  * Values: *

  enumerator **MCPWM_GEN_ACTION_KEEP**
  Generator action: Keep the same level

  enumerator **MCPWM_GEN_ACTION_LOW**
  Generator action: Force to low level

  enumerator **MCPWM_GEN_ACTION_HIGH**
  Generator action: Force to high level

  enumerator **MCPWM_GEN_ACTION_TOGGLE**
  Generator action: Toggle level

enum **mcpwm_operator_brake_mode_t**
MCPWM operator brake mode.

  * Values: *

  enumerator **MCPWM_OPER_BRAKE_MODE_CBC**
  Brake mode: CBC (cycle by cycle)

  enumerator **MCPWM_OPER_BRAKE_MODE_OST**
  Brake mode, OST (one shot)
enumerator MCPWM_OPER_BRAKE_MODE_INVALID
    MCPWM operator invalid brake mode

enum mcpwm_capture_edge_t
    MCPWM capture edge.
Values:

enumerator MCPWM_CAP_EDGE_POS
    Capture on the positive edge

enumerator MCPWM_CAP_EDGE_NEG
    Capture on the negative edge

Header File
    • components/driver/include/driver/mcpwm.h

Functions
    esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
    This function initializes each gpio signal for MCPWM.

    Note: This function initializes one gpio at a time.

Parameters
    • mcpwm_num – set MCPWM unit(0-1)
    • io_signal – set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
    • gpio_num – set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

Returns
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
    Initialize MCPWM gpio structure.

    Note: This function initialize a group of MCPWM GPIOs at a time.

Parameters
    • mcpwm_num – set MCPWM unit(0-1)
    • mcpwm_pin – MCPWM pin structure

Returns
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
    Initialize MCPWM parameters.
Chapter 2. API Reference

Note: The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M. The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.

Parameters
- `mcpwm_num`—set MCPWM unit(0-1)
- `timer_num`—set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- `mcpwm_conf`—configure structure `mcpwm_config_t`

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_group_set_resolution(mcpwm_unit_t mcpwm_num, unsigned long int resolution)`
Set resolution of the MCPWM group.

Note: This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

Parameters
- `mcpwm_num`—set MCPWM unit(0-1)
- `resolution`—set expected frequency resolution

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_timer_set_resolution(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)`
Set resolution of each timer.

Note: This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

Parameters
- `mcpwm_num`—set MCPWM unit(0-1)
- `resolution`—set expected frequency resolution

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)`
Set frequency(in Hz) of MCPWM timer.

Parameters
- `mcpwm_num`—set MCPWM unit(0-1)
- `timer_num`—set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `frequency`—set the frequency in Hz of each timer

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

esp_err_t mcpwm_set_duty (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

Parameters
• mcpwm_num – set MCPWM unit(0-1)
• timer_num – set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen – set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
• duty – set duty cycle in % (i.e. for 62.3% duty cycle, duty = 62.3) of each operator

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t mcpwm_set_duty_in_us (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

Parameters
• mcpwm_num – set MCPWM unit(0-1)
• timer_num – set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen – set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
• duty_in_us – set duty value in microseconds of each operator

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t mcpwm_set_duty_type (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)

Set duty either active high or active low(out of phase/inverted)

Note: Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

Parameters
• mcpwm_num – set MCPWM unit(0-1)
• timer_num – set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen – set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
• duty_type – set active low or active high duty type

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

uint32_t mcpwm_get_frequency (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Get frequency of timer.

Parameters
• mcpwm_num – set MCPWM unit(0-1)
• timer_num – set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

Returns
• frequency of timer

float mcpwm_get_duty (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)

Get duty cycle of each operator.

Parameters
• mcpwm_num – set MCPWM unit(0-1)
• timer_num – set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen – set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected

Returns
• duty cycle in % of each operator (56.7 means duty is 56.7%)

```c
uint32_t mcpwm_get_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```

Get duty cycle of each operator in us.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen` – set the generator (MCPWMXA/MCPWMXB), ‘x’ is operator number selected

**Returns**

- duty cycle in us of each operator

```c
esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal high.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen` – set the operator (MCPWMXA/MCPWMXB), ‘x’ is timer number selected

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_set_signal_low(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal low.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen` – set the operator (MCPWMXA/MCPWMXB), ‘x’ is timer number selected

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```

Initialize carrier configuration.

**Parameters**

- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf` – carrier configuration struct
• `mcpwm_num` – set MCPWM unit (0-1)
• `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_conf` – configure structure `mcpwm_carrier_config_t`

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_carrier_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`
Enable MCPWM carrier submodule, for respective timer.

Parameters
• `mcpwm_num` – set MCPWM unit (0-1)
• `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_carrier_disable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`
Disable MCPWM carrier submodule, for respective timer.

Parameters
• `mcpwm_num` – set MCPWM unit (0-1)
• `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_carrier_set_period (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)`
Set period of carrier.

Parameters
• `mcpwm_num` – set MCPWM unit (0-1)
• `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_period` – set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_carrier_set_duty_cycle (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)`
Set duty_cycle of carrier.

Parameters
• `mcpwm_num` – set MCPWM unit (0-1)
• `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_duty` – set duty cycle of carrier, carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mcpwm_carrier_oneshot_mode_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)`
Enable and set width of first pulse in carrier oneshot mode.

Note: The carrier oneshot pulse can’t disabled.

Parameters
• **mcpwm_num** – set MCPWM unit (0-1)
• **timer_num** – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• **pulse_width** – set pulse width of first pulse in oneshot mode, width = \((\text{carrier period}) \times (\text{pulse width} + 1)\) \((\text{pulse width} \leq 15)\)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_carrier_output_invert (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_int_t carrier_int)
```

Enable or disable carrier output inversion.

**Parameters**
- **mcpwm_num** – set MCPWM unit (0-1)
- **timer_num** – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_int** – enable or disable carrier output inversion

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_deadtime_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)
```

Enable and initialize deadtime for each MCPWM timer.

**Parameters**
- **mcpwm_num** – set MCPWM unit (0-1)
- **timer_num** – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **dt_mode** – set deadtime mode
- **red** – set rising edge delay = \(\text{red} \times 100\text{ns}\)
- **fed** – set rising edge delay = \(\text{fed} \times 100\text{ns}\)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_deadtime_disable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable deadtime on MCPWM timer.

**Parameters**
- **mcpwm_num** – set MCPWM unit (0-1)
- **timer_num** – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_fault_init (mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)
```

Initialize fault submodule, currently low level triggering is not supported.

**Parameters**
- **mcpwm_num** – set MCPWM unit (0-1)
- **input_level** – set fault signal level, which will cause fault to occur
- **fault_sig** – set the fault pin, which needs to be enabled

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_fault_set_oneshot_mode (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Espressif Systems 1105 Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note:** currently low level triggering is not supported

**Parameters**
- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig` – set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa` – action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb` – action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note:** currently low level triggering is not supported

**Parameters**
- `mcpwm_num` – set MCPWM unit (0-1)
- `timer_num` – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig` – set the fault pin, which needs to be enabled for cyc mode
- `action_on_pwmxa` – action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb` – action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Parameters**
- `mcpwm_num` – set MCPWM unit (0-1)
- `fault_sig` – fault pin, which needs to be disabled

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)
```

Enable capture channel.

**Parameters**
- `mcpwm_num` – set MCPWM unit (0-1)
- `cap_channel` – capture channel, which needs to be enabled
- `cap_conf` – capture channel configuration
Chapter 2. API Reference

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_capture_disable_channel(mcpwm_unit_t mcpwm_num,
                                        mcpwm_capture_channel_id_t cap_channel)
```

Disable capture channel.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• cap_channel – capture channel, which needs to be disabled

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num,
                                         mcpwm_capture_signal_t cap_sig)
```

Get capture value.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• cap_sig – capture channel on which value is to be measured

Returns
Captured value

```c
uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num,
                                        mcpwm_capture_signal_t cap_sig)
```

Get edge of capture signal.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• cap_sig – capture channel of whose edge is to be determined

Returns
Capture signal edge: 1 - positive edge, 2 - negative edge

```c
esp_err_t mcpwm_sync_configure(mcpwm_unit_t mcpwm_num,
                                mcpwm_timer_t timer_num,
                                const mcpwm_sync_config_t *sync_conf)
```

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• timer_num – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• sync_conf – sync configuration on this timer

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num,
                              mcpwm_timer_t timer_num)
```

Disable sync submodule on given timer.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• timer_num – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num,
                                       mcpwm_timer_t timer_num,
                                       mcpwm_timer_sync_trigger_t trigger)
```

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

Parameters
• mcpwm_num – set MCPWM unit (0-1)
• timer_num – set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• **trigger** - set the trigger that will cause the timer to generate a software sync signal. Specifically, `MCPWM_SWSYNC_SOURCE_DISABLED` will disable the timer from generating sync signal.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mcpwm_timer_trigger_soft_sync(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Trigger a software sync event and sends it to a specific timer.

**Note:** This software sync event will have the same effect as hw one, except that:

- On esp32s3 the soft sync event can be routed to its output if `MCPWM_SWSYNC_SOURCE_SYNCIN` is selected via `mcpwm_set_timer_sync_output()`.
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and cannot be propagated to others.

**Parameters**
- `mcpwm_num` - set MCPWM unit (0-1)
- `timer_num` - set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

```c
esp_err_t mcpwm_sync_invert_gpio_synchro(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)
```

Set external GPIO sync input inverter.

**Parameters**
- `mcpwm_num` - set MCPWM unit (0-1)
- `sync_sig` - set sync signal of MCPWM, only supports GPIO sync signal
- `invert` - whether GPIO sync source input is inverted (to get negative edge trigger)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Structures**

```c
struct mcpwm_pin_config_t
```

pin number for MCPWM

**Public Members**

```c
int mcpwm0a_out_num
MCPWM0A out pin
```

```c
int mcpwm0b_out_num
MCPWM0A out pin
```

```c
int mcpwm1a_out_num
MCPWM0A out pin
```
Chapter 2. API Reference

int mcpwm1b_out_num
    MCPWM0A out pin

int mcpwm2a_out_num
    MCPWM0A out pin

int mcpwm2b_out_num
    MCPWM0A out pin

int mcpwm_sync0_in_num
    SYNC0 in pin

int mcpwm_sync1_in_num
    SYNC1 in pin

int mcpwm_sync2_in_num
    SYNC2 in pin

int mcpwm_fault0_in_num
    FAULT0 in pin

int mcpwm_fault1_in_num
    FAULT1 in pin

int mcpwm_fault2_in_num
    FAULT2 in pin

int mcpwm_cap0_in_num
    CAP0 in pin

int mcpwm_cap1_in_num
    CAP1 in pin

int mcpwm_cap2_in_num
    CAP2 in pin

struct cap_event_data_t
    event data that will be passed into ISR callback

Public Members

mcpwm_capture_on_edge_t cap_edge
    Which signal edge is detected

uint32_t cap_value
    Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct mcpwm_config_t
    MCPWM config structure.
Chapter 2. API Reference

Public Members

```c
uint32_t frequency
    Set frequency of MCPWM in Hz

float cmpr_a
    Set % duty cycle for operator a (MCPWMXA), i.e. for 62.3% duty cycle, duty_a = 62.3

float cmpr_b
    Set % duty cycle for operator b (MCPWMXB), i.e. for 48% duty cycle, duty_b = 48.0
```

```c
mcpwm_duty_type_t duty_mode
    Set type of duty cycle

mcpwm_counter_type_t counter_mode
    Set type of MCPWM counter
```

```c
struct mcpwm_carrier_config_t
    MCPWM carrier configuration structure.
```

Public Members

```c
uint8_t carrier_period
    Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

uint8_t carrier_duty
    Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t pulse_width_in_os
    Set pulse width of first pulse in one shot mode = (carrier_period)*(pulse_width_in_os + 1), should be less than 16

mcpwm_carrier_out_ipt_t carrier_ivt_mode
    Invert output of carrier
```

```c
struct mcpwm_capture_config_t
    MCPWM config capture structure.
```

Public Members

```c
mcpwm_capture_on_edge_t cap_edge
    Set capture edge

uint32_t cap_prescale
    Prescale of capture signal, ranging from 1 to 256
```

```c
cap_isr_cb_t capture_cb
    User defined capture event callback, running under interrupt context
```
void *user_data
    User defined ISR callback function args

struct mcpwm_sync_config_t
    MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t sync_sig
    Set sync input signal that will cause timer to sync

uint32_t timer_val
    Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

mcpwm_timer_direction_t count_direction
    Counting direction to be set after sync

typedef mcpwm_generator_t mcpwm_operator_t

 Deprecated:

typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t

 Deprecated:
 MCPWM select action to be taken on MCPWMXA when fault occurs

typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t

 Deprecated:
 MCPWM select action to be taken on MCPWMXB when fault occurs

typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t

 MCPWM capture channel ID alias.

typedef bool (*cap_isr_cb_t)(mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel, const cap_event_data_t *edata, void *user_data)

 Type of capture event callback.

**Note:** Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has ‘_ISR’ postfix)

**Param mcpwm** MCPWM unit(0-1)

**Param cap_channel** capture channel ID
**Param edata** Capture event data, contains capture edge and capture value, fed by the driver
**Param user_data** User registered data, passed from `mcpwm_capture_config_t`
**Return** Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

### Enumerations

```c
enum mcpwm_io_signals_t
{
  6 MCPWM output pins that generate PWM signals
  3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
  3 MCPWM sync input pins to synchronize MCPWM outputs signals
  3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors
};
```

**Values:**

- **enumerator MCPWM0A**
  - PWM0A output pin
- **enumerator MCPWM0B**
  - PWM0B output pin
- **enumerator MCPWM1A**
  - PWM1A output pin
- **enumerator MCPWM1B**
  - PWM1B output pin
- **enumerator MCPWM2A**
  - PWM2A output pin
- **enumerator MCPWM2B**
  - PWM2B output pin
- **enumerator MCPWM_SYNC_0**
  - SYNC0 input pin
- **enumerator MCPWM_SYNC_1**
  - SYNC1 input pin
- **enumerator MCPWM_SYNC_2**
  - SYNC2 input pin
- **enumerator MCPWM_FAULT_0**
  - FAULT0 input pin
- **enumerator MCPWM_FAULT_1**
  - FAULT1 input pin
enumerator **MCPWM_FAULT_2**  
FAULT2 input pin

enumerator **MCPWM_CAP_0**  
CAP0 input pin

enumerator **MCPWM_CAP_1**  
CAP1 input pin

enumerator **MCPWM_CAP_2**  
CAP2 input pin

**enum mcpwm_unit_t**  
Select MCPWM unit.

**Values:**

enumerator **MCPWM_UNIT_0**  
MCPWM unit 0 selected

enumerator **MCPWM_UNIT_1**  
MCPWM unit 1 selected

enumerator **MCPWM_UNIT_MAX**  
Max number of MCPWM units

**enum mcpwm_timer_t**  
Select MCPWM timer.

**Values:**

enumerator **MCPWM_TIMER_0**  
Select MCPWM timer 0

enumerator **MCPWM_TIMER_1**  
Select MCPWM timer 1

enumerator **MCPWM_TIMER_2**  
Select MCPWM timer 2

enumerator **MCPWM_TIMER_MAX**  
Max number of timers in a unit

**enum mcpwm_generator_t**  
Select MCPWM operator.

**Values:**

enumerator **MCPWM_GEN_A**  
Select MCPWMXA, where ‘X’ is operator number
enumerator `MCPWM_GEN_B`
Select MCPWMXB, where ‘X’ is operator number

enumerator `MCPWM_GEN_MAX`
Num of generators to each operator of MCPWM

enum `mcpwm_carrier_out_ivt_t`
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

enumerator `MCPWM_CARRIER_OUT_IVT_DIS`
Enable carrier output inversion

enumerator `MCPWM_CARRIER_OUT_IVT_EN`
Disable carrier output inversion

enum `mcpwm_fault_signal_t`
MCPWM select fault signal input.

Values:

enumerator `MCPWM_SELECT_F0`
Select F0 as input

enumerator `MCPWM_SELECT_F1`
Select F1 as input

enumerator `MCPWM_SELECT_F2`
Select F2 as input

enum `mcpwm_sync_signal_t`
MCPWM select sync signal input.

Values:

enumerator `MCPWM_SELECT_NO_INPUT`
No sync input selected

enumerator `MCPWM_SELECT_TIMER0_SYNC`
Select software sync signal from timer0 as input

enumerator `MCPWM_SELECT_TIMER1_SYNC`
Select software sync signal from timer1 as input

enumerator `MCPWM_SELECT_TIMER2_SYNC`
Select software sync signal from timer2 as input

enumerator `MCPWM_SELECT_GPIO_SYNC0`
Select GPIO SYNC0 as input
enumerator `MCPWM_SELECT_GPIO_SYNC1`
   Select GPIO SYNC1 as input

enumerator `MCPWM_SELECT_GPIO_SYNC2`
   Select GPIO SYNC2 as input

enum `mcpwm_timer_sync_trigger_t`
   MCPWM timer sync event trigger.
   Values:

enumerator `MCPWM_SWSYNC_SOURCE_SYNCIN`
   the input sync signal will be routed to its sync output path

enumerator `MCPWM_SWSYNC_SOURCE_TEZ`
   sync signal generated when timer counts to zero

enumerator `MCPWM_SWSYNC_SOURCE_TEP`
   sync signal generated when timer counts to peak

enumerator `MCPWM_SWSYNC_SOURCE_DISABLED`
   timer does not generate sync signals

enum `mcpwm_fault_input_level_t`
   MCPWM select triggering level of fault signal.
   Values:

enumerator `MCPWM_LOW_LEVEL_TGR`
   Fault condition occurs when fault input signal goes from high to low

enumerator `MCPWM_HIGH_LEVEL_TGR`
   Fault condition occurs when fault input signal goes low to high

enum `mcpwm_capture_on_edge_t`
   MCPWM select capture starts from which edge.
   Values:

enumerator `MCPWM_NEG_EDGE`
   Capture the negative edge

enumerator `MCPWM_POS_EDGE`
   Capture the positive edge

enumerator `MCPWM_BOTH_EDGE`
   Capture both edges

enum `mcpwm_counter_type_t`
   Select type of MCPWM counter.
   Values:
enumerator `MCPWM_FREEZE_COUNTER`  
Counter freeze

enumerator `MCPWM_UP_COUNTER`  
For asymmetric MCPWM

enumerator `MCPWM_DOWN_COUNTER`  
For asymmetric MCPWM

enumerator `MCPWM_UP_DOWN_COUNTER`  
For symmetric MCPWM, frequency is half of MCPWM frequency set

enumerator `MCPWM_COUNTER_MAX`  
Maximum counter mode

enum `mcpwm_duty_type_t`  
Select type of MCPWM duty cycle mode. 

*Values:*

enumerator `MCPWM_DUTY_MODE_0`  
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

enumerator `MCPWM_DUTY_MODE_1`  
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

enumerator `MCPWM_HAL_GENERATOR_MODE_FORCE_LOW`  

enumerator `MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH`  

enumerator `MCPWM_DUTY_MODE_MAX`  
Num of duty cycle modes

enum `mcpwm_deadtime_type_t`  
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay. 

*Values:*

enumerator `MCPWM_DEADTIME_BYPASS`  
Bypass the deadtime

enumerator `MCPWM_BYPASS_RED`  
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator `MCPWM_BYPASS_FED`  
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay
Chapter 2. API Reference

enumerator MCPWM_ACTIVE_HIGH_MODE
    MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator MCPWM_ACTIVE_LOW_MODE
    MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

enumerator MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
    MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

enumerator MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
    MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator MCPWM_ACTIVE_RED_FED_FROM_PWMXA
    MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

enumerator MCPWM_ACTIVE_RED_FED_FROM_PWMXB
    MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

enumerator MCPWM_DEADTIME_TYPE_MAX
    Maximum number of supported dead time modes

enum mcpwm_output_action_t
    MCPWM select action to be taken on the output when event happens.
    Values:

    enumerator MCPWM_ACTION_NO_CHANGE
        No change in the output

    enumerator MCPWM_ACTION_FORCE_LOW
        Make output low

    enumerator MCPWM_ACTION_FORCE_HIGH
        Make output high

    enumerator MCPWM_ACTION_TOGGLE
        Make output toggle

enum mcpwm_capture_signal_t
    MCPWM select capture signal input.
    Values:

    enumerator MCPWM_SELECT_CAP0
        Select CAP0 as input
2.6.13 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32 contains multiple pulse counter units in the module. Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Set Up Channel Actions** - covers how to configure the PCNT channel to behave on different signal edges and levels.
- **Watch Points** - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- **Register Event Callbacks** - describes how to hook your specific code to the watch point event callback function.
- **Set Glitch Filter** - describes how to enable and set the timing parameters for the internal glitch filter.
- **Enable and Disable Unit** - describes how to enable and disable the PCNT unit.
- **Unit IO Control** - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- **Power Management** - describes what functionality will prevent the chip from going into low power mode.
- **IRAM Safe** - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

---

1 Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more PCNT units and channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `pcnt_new_unit()`).
Install PCNT Unit  To install a PCNT unit, there’s a configuration structure that needs to be given in advance:

```c
pcnt_unit_config_t:
    • pcnt_unit_config_t::low_limit and pcnt_unit_config_t::high_limit specify the range for the internal counter. Counter will back to zero when it crosses either limit value.
```

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e. unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it’s recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

• The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
• The attached PCNT channels are all removed by `pcnt_del_channel()`.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

Install PCNT Channel  To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

• `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by edge type signal and level type signal. Please note, either of them can be assigned to -1 if it’s not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO will cause that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.

• `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for edge and level input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to -1.

• `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.

• `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO’s input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e. channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.
If a previously created PCNT channel is no longer needed, it’s recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

cnt_chan_config_t chan_config = { .edge_gpio_num = EXAMPLE_CHAN_GPIO_A, .level_gpio_num = EXAMPLE_CHAN_GPIO_B,);
cnt_channel_handle_t cnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &cnt_chan));
```

**Set Up Channel Actions**  
The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `cnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `cnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `cnt_chan_config_t::level_gpio_num` is set to -1 when allocating PCNT channel by `pcnt_new_channel()`.

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(cnt_chan, PCNT_CHANNEL_EDGE_ACTION_DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));

// keep the counting mode when the control signal is high level, and reverse the counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(cnt_chan, PCNT_CHANNEL_LEVEL_ACTION_KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points**  
Each PCNT unit can be configured to watch several different values that you’re interested in. The value to be watched is also called Watch Point. The watch point itself can’t exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See **Register Event Callbacks** for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly used watch points are: zero cross, maximum / minimum count and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can’t find any free hardware resource to save the watch point. You can’t add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```c
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));

// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Register Event Callbacks**  
When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should
hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`.

Usually different zero cross mode means different counting direction and counting step size.

Registering callback function will result in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

### Set Glitch Filter

The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and won’t increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a `NULL` filter configuration.

This function should be called when the the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (usually 12.5 ns if APB equals 80MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter won’t work as expect in that case. So the driver will install a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see *Power Management*. 
Enable and Disable Unit    Before doing IO control to the PCNT unit, you need to enable it first, by calling
\texttt{pcnt\_unit\_enable()}. Internally, this function will:

- switch the PCNT driver state from \texttt{init} to \texttt{enable}.
- enable the interrupt service if it has been lazy installed in \texttt{pcnt\_unit\_register\_event\_callbacks}.  
- acquire a proper power management lock if it has been lazy installed in \texttt{pcnt\_unit\_set\_glitch\_filter}. See also \textit{Power Management} for more information.

On the contrary, calling \texttt{pcnt\_unit\_disable()} will do the opposite, that is, put the PCNT driver back to the \texttt{init} state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear   Calling \texttt{pcnt\_unit\_start()} will make the PCNT unit start to work, increase
or decrease counter according to pulse signals. On the contrary, calling \texttt{pcnt\_unit\_stop()} will stop
the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling\texttt{pcnt\_unit\_clear\_count }.  

Note, \texttt{pcnt\_unit\_start()} and \texttt{pcnt\_unit\_stop()} should be called when the unit has been enabled by\texttt{pcnt\_unit\_enable()}. Otherwise, it will return \texttt{ESP\_ERR\_INVALID\_STATE} error.

Get Count Value   You can check current count value at any time by calling \texttt{pcnt\_unit\_get\_count ()}. 

**Note:** The returned count value is a \texttt{signed} integer, where the sign can be used to reflect the direction. The internal
counter will overflow when it reaches high or low limit, but this function doesn’t compensate for that loss.

```c
int pulse_count = 0;
ESP\_ERROR\_CHECK(pcnt\_unit\_get\_count(pcnt\_unit, \&pulse\_count));
```

Power Management   When power management is enabled (i.e. \texttt{CONFIG\_PM\_ENABLE} is on), the system will
adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter
and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power
management lock of type \texttt{ESP\_PM\_APB\_FREQ\_MAX}. Whenever you enable the glitch filter by\texttt{pcnt\_unit\_set\_glitch\_filter()}, the driver will guarantee that the power management lock is ac-
quired after the PCNT unit is enabled by \texttt{pcnt\_unit\_enable()}. Likewise, the driver releases the lock after \texttt{pcnt\_unit\_disable()} is called.

IRAM Safe   By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a \texttt{Kconfig} option \texttt{CONFIG\_PCNT\_ISR\_IRAM\_SAFE} that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM\footnote{\texttt{pcnt\_event\_callbacks\_t::on\_reach} callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.}

Espressif Systems Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option CONFIG_PCNT_CTRL_FUNC_IN_IRAM that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- pcnt_unit_start()
- pcnt_unit_stop()
- pcnt_unit_clear_count()
- pcnt_unit_get_count()

**Thread Safety** The factory functions pcnt_new_unit() and pcnt_new_channel() are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- pcnt_unit_start()
- pcnt_unit_stop()
- pcnt_unit_clear_count()
- pcnt_unit_get_count()

Other functions that take the pcnt_unit_handle_t and pcnt_channel_handle_t as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

**Kconfig Options**

- CONFIG_PCNT_CTRL_FUNC_IN_IRAM controls where to place the PCNT control functions (IRAM or Flash), see IRAM Safe for more information.
- CONFIG_PCNT_ISR_IRAM_SAFE controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- CONFIG_PCNT_ENABLE_DEBUG_LOG is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Examples**

- Decode the quadrature signals from rotary encoder: peripherals/pcnt/rotary_encoder.

**API Reference**

**Header File**

- components/driver/include/driver/pulse_cnt.h

**Functions**

esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- **config** [in] PCNT unit configuration
- **ret_unit** [out] Returned PCNT unit handle

**Returns**
• ESP_OK: Create PCNT unit successfully
• ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
• ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
• ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
• ESP_FAIL: Create PCNT unit failed because of other error

```
esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)
```

Delete the PCNT unit handle.

**Note:** A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

```
esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)
```

Set glitch filter for PCNT unit.

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**
- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

```
esp_err_t pcnt_unit_enable (pcnt_unit_handle_t unit)
```

Enable the PCNT unit.

**Note:** This function will transit the unit state from init to enable.
Note: This function will enable the interrupt service, if it’s lazy installed in pcnt_unit_register_event_callbacks().

Note: This function will acquire the PM lock if it’s lazy installed in pcnt_unit_set_glitch_filter().

Note: Enable a PCNT unit doesn’t mean to start it. See also pcnt_unit_start() for how to start the PCNT counter.

Parameters  
unit –[in] PCNT unit handle created by pcnt_new_unit()

Returns
- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error

esp_err_t pcnt_unit_disable (pcnt_unit_handle_t unit)
Disables the PCNT unit.

Note: This function will do the opposite work to the pcnt_unit_enable()

Note: Disable a PCNT unit doesn’t mean to stop it. See also pcnt_unit_stop() for how to stop the PCNT counter.

Parameters  
unit –[in] PCNT unit handle created by pcnt_new_unit()

Returns
- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

esp_err_t pcnt_unit_start (pcnt_unit_handle_t unit)
Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

Note: This function should be called when the unit is in the enable state (i.e. after calling pcnt_unit_enable())

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCIE_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters  
unit –[in] PCNT unit handle created by pcnt_new_unit()
Chapter 2. API Reference

Returns

- ESP_OK: Start PCNT unit successfully
- ESP_ERR_INVALID_ARG: Start PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Start PCNT unit failed because of other error

```
int esp_err_t pcnt_unit_stop (pcnt_unit_handle_t unit);
```

Stop PCNT from counting.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

Parameters  
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- ESP_OK: Stop PCNT unit successfully
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Stop PCNT unit failed because of other error

```
int esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit);
```

Clear PCNT pulse count value to zero.

**Note:** It’s recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled

Parameters  
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- ESP_OK: Clear PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument
- ESP_FAIL: Clear PCNT pulse count failed because of other error

```
int esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int *value);
```

Get PCNT count value.
Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled

Parameters
- unit -[in] PCNT unit handle created by pcnt_new_unit()
- value -[out] Returned count value

Returns
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

Esp_err_t pcnt_unit_register_event_callbacks (pcnt_unit_handle_t unit, const pcnt_event_callbacks_t *cbs, void *user_data)

Set event callbacks for PCNT unit.

Note: User registered callbacks are expected to be runnable within ISR context

Note: This function is only allowed to be called when the unit is in the init state (i.e. before calling pcnt_unit_enable())

Parameters
- unit -[in] PCNT unit handle created by pcnt_new_unit()
- cbs -[in] Group of callback functions
- user_data -[in] User data, which will be passed to callback functions directly

Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the unit is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

Esp_err_t pcnt_unit_add_watch_point (pcnt_unit_handle_t unit, int watch_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

Parameters
- unit -[in] PCNT unit handle created by pcnt_new_unit()
- watch_point -[in] Value to be watched

Returns
- ESP_OK: Add watch point successfully
- ESP_ERR_INVALID_ARG: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in pcnt_unit_config_t)
- ESP_ERR_INVALID_STATE: Add watch point failed because the same watch point has already been added
- ESP_ERR_NOT_FOUND: Add watch point failed because no more hardware watch point can be configured
- ESP_FAIL: Add watch point failed because of other error

Esp_err_t pcnt_unit_remove_watch_point (pcnt_unit_handle_t unit, int watch_point)

Remove a watch point for PCNT unit.
### Parameters

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Watch point value

### Returns

- **ESP_OK**: Remove watch point successfully
- **ESP_ERR_INVALID_ARG**: Remove watch point failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()`
- **ESP_FAIL**: Remove watch point failed because of other error

```c
esp_err_t pcnt_new_channel(pcnt_unit_handle_t unit, const pcnt_chan_config_t *config, pcnt_channel_handle_t *ret_chan)
```

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Note**: This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

### Parameters

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** - [in] PCNT channel configuration
- **ret_chan** - [out] Returned channel handle

### Returns

- **ESP_OK**: Create PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Create PCNT channel failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create PCNT channel failed because of insufficient memory
- **ESP_ERR_NOT_FOUND**: Create PCNT channel failed because all PCNT channels are used up and no more free one
- **ESP_ERR_INVALID_STATE**: Create PCNT channel failed because the unit is not in the init state
- **ESP_FAIL**: Create PCNT channel failed because of other error

```c
esp_err_t pcnt_del_channel(pcnt_channel_handle_t chan)
```

Delete the PCNT channel.

**Parameters**

- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`

### Returns

- **ESP_OK**: Delete the PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Delete the PCNT channel failed because of invalid argument
- **ESP_FAIL**: Delete the PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_edge_action(pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
```

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**

- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`
- **pos_act** - [in] Action on posedge signal
- **neg_act** - [in] Action on negedge signal

### Returns

- **ESP_OK**: Set edge action for PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Set edge action for PCNT channel failed because of invalid argument
- **ESP_FAIL**: Set edge action for PCNT channel failed because of other error
esp_err_t pcnt_channel_set_level_action (pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the level_gpio_num configured in pcnt_chan_config_t. We use these actions to control when and how to change the counting mode.

**Parameters**
- chan  [in] PCNT channel handle created by pcnt_new_channel()
- high_act  [in] Action on high level signal
- low_act  [in] Action on low level signal

**Returns**
- ESP_OK: Set level action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set level action for PCNT channel failed because of other error

**Structures**

struct pcnt_watch_event_data_t

PCNT watch event data.

**Public Members**

int watch_point_value

Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t zero_cross_mode

Zero cross mode

struct pcnt_event_callbacks_t

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

**Public Members**

pcnt_watch_cb_t on_reach

Called when PCNT unit counter reaches any watch point

struct pcnt_unit_config_t

PCNT unit configuration.

**Public Members**
int low_limit
    Low limitation of the count unit, should be lower than 0

int high_limit
    High limitation of the count unit, should be higher than 0

struct pcnt_chan_config_t
    PCNT channel configuration.

    Public Members

    int edge_gpio_num
        GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

    int level_gpio_num
        GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

    uint32_t invert_edge_input
        Invert the input edge signal

    uint32_t invert_level_input
        Invert the input level signal

    uint32_t virt_edge_io_level
        Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

    uint32_t virt_level_io_level
        Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

    uint32_t io_loop_back
        For debug/test, the signal output from the GPIO will be fed to the input path as well

    struct pcnt_chan_config_t::[anonymous] flags
        Channel config flags

struct pcnt_glitch_filter_config_t
    PCNT glitch filter configuration.

    Public Members

    uint32_t max_glitch_ns
        Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions
typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.
typedef struct pcnt_chan_t *pcnt_channel_handle_t
  Type of PCNT channel handle.

typedef bool (*pcnt_watch_cb_t)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
  PCNT watch event callback prototype.

Note: The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

  Param unit [in] PCNT unit handle
  Param edata [in] PCNT event data, fed by the driver
  Param user_ctx [in] User data, passed from pcnt_unit_register_event_callbacks()
  Return Whether a high priority task has been woken up by this function

Header File
  • components/hal/include/hal/pcnt_types.h

Enumerations
enum pcnt_channel_level_action_t
  PCNT channel action on control level.
    Values:
    enumerator PCNT_CHANNEL_LEVEL_ACTION_KEEP
      Keep current count mode
    enumerator PCNT_CHANNEL_LEVEL_ACTION_INVERSE
      Invert current count mode (increase -> decrease, decrease -> increase)
    enumerator PCNT_CHANNEL_LEVEL_ACTION_HOLD
      Hold current count value

enum pcnt_channel_edge_action_t
  PCNT channel action on signal edge.
    Values:
    enumerator PCNT_CHANNEL_EDGE_ACTION_HOLD
      Hold current count value
    enumerator PCNT_CHANNEL_EDGE_ACTION_INCREASE
      Increase count value
    enumerator PCNT_CHANNEL_EDGE_ACTION_DECREASE
      Decrease count value

enum pcnt_unit_zero_cross_mode_t
  PCNT unit zero cross mode.
    Values:
enumerator **PCNT_UNIT_ZERO_CROSS_POS_ZERO**
start from positive value, end to zero, i.e. +N->0

enumerator **PCNT_UNIT_ZERO_CROSS_NEG_ZERO**
start from negative value, end to zero, i.e. -N->0

enumerator **PCNT_UNIT_ZERO_CROSS_NEG_POS**
start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT_UNIT_ZERO_CROSS_POS_NEG**
start from positive value, end to negative value, i.e. +N->-M

## 2.6.14 Remote Control Transceiver (RMT)

### Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, the functionality of RMT can be extended to a versatile and general purpose transceiver. From the perspective of network layering, the RMT hardware contains both physical and data link layer. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called RMT symbol, which is represented by `rmt_symbol_word_t` in the driver.

ESP32 contains multiple channels in the RMT peripheral. Each channel can be configured as either transmitter or receiver, independently.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g. NEC
- General purpose sequence generator
- Transmit signals in a hardware controlled loop, with finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

### Layout of RMT Symbols

The RMT hardware defines data in its own pattern – the RMT symbol. Each symbol consists of two pairs of two values. The first value in a pair describes the signal duration in RMT ticks and is 15 bits long. The second provides the signal level (high or low) and is contained in a single bit, as shown below:

### RMT Transmitter Overview

The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver will encode user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high frequency carrier signal before being routed to a GPIO pad.

### RMT Receiver Overview

The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It’s feasible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high frequency carrier from the base signal.

---

1 Different ESP chip series might have different number of RMT channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more RMT channels, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.
Fig. 14: Structure of RMT symbols (L - signal level)

Fig. 15: RMT Transmitter Overview

Fig. 16: RMT Receiver Overview
Functional Overview

Description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate RMT channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Carrier Modulation and Demodulation** - describes how to modulate carrier for TX channel and demodulate carrier for RX channel.
- **Register Event Callbacks** - covers how to hook user specific code to RMT channel specific events.
- **Enable and Disable channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group and start transaction at the same time.
- **RMT Encoder** - focuses on how to write a customized encoder in a combination way, with the help of the primitive encoders provided by the driver.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation**  Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The available channels are managed in a resource pool, which will hand out a free channel on request.

**Install RMT TX Channel**  To install an RMT TX channel, there’s a configuration structure that needs to be given in advance: `rmt_tx_channel_config_t`:

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that is used to store RMT encoding artifacts.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.
- `rmt_tx_channel_config_t::io_od_mode` configures the GPIO as open-drain mode. It is useful for simulating bi-directional buses, such as 1-wire bus, combined with `rmt_tx_channel_config_t::io_loop_back`.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return `ESP_ERR_NOT_FOUND` error. If some feature (e.g. DMA backend) is not supported by hardware, it will return `ESP_ERR_NOT_SUPPORTED` error.
Installs an RMT RX channel, there’s a configuration structure that needs to be given in advance: `rmt_rx_channel_config_t`:

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to the Power Management section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
- `rmt_rx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that used to store RMT encoding artifacts.
- `rmt_rx_channel_config_t::invert_in` is used to decide whether to invert the input signals before they going into RMT receiver. The inversion is done by GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize a RX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return `ESP_ERR_NOT_FOUND` error. If some feature (e.g. DMA backend) is not supported by hardware, it will return `ESP_ERR_NOT_SUPPORTED` error.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it’s recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying hardware to be usable for other purposes.
Carrier Modulation and Demodulation  The RMT transmitter can generate a carrier wave and modulate it onto the base signal. Compared to the base signal, the carrier frequency is usually high. In addition, user can only set the frequency and duty cycle for the carrier. The RMT receiver can demodulate the carrier from the incoming signal. Note that, carrier modulation and demodulation is not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a ESP_ERR_NOT_SUPPORTED error.

Carrier related configurations lie in rmt_carrier_config_t:

- rmt_carrier_config_t::frequency_hz sets the carrier frequency, in Hz.
- rmt_carrier_config_t::duty_cycle sets the carrier duty cycle.
- rmt_carrier_config_t::polarity_active_low sets the carrier polarity, i.e. on which level the carrier is applied.
- rmt_carrier_config_t::always_on sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for TX channel.

Note: For RX channel, we shouldn’t set the carrier frequency exactly to the theoretical value. It’s recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25KHz, instead of the 38KHz that configured on the TX side. The reason is that reflection and refraction will occur when a signal travels through the air, leading to a distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,  // duty cycle 33%
    .frequency_hz = 38000,  // 38KHz
    .flags.polarity_active_low = false, // carrier should modulated to high level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,  // duty cycle 33%
    .frequency_hz = 25000,  // 25KHz carrier, should be smaller than transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks  When an RMT channel finishes transmitting or receiving, a specific event will be generated and notify the CPU by interrupt. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling rmt_tx_register_event_callbacks() and rmt_rx_register_event_callbacks() for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

TX channel supported event callbacks are listed in the rmt_tx_event_callbacks_t:

- rmt_tx_event_callbacks_t::on_trans_done sets a callback function for trans done event. The function prototype is declared in rmt_tx_done_callback_t.

RX channel supported event callbacks are listed in the rmt_rx_event_callbacks_t:

- rmt_rx_event_callbacks_t::on_recv_done sets a callback function for receive complete event. The function prototype is declared in rmt_rx_done_callback_t.

User can save own context in rmt_tx_register_event_callbacks() and rmt_rx_register_event_callbacks() as well, via the parameter user_data. The user data will be directly passed to each callback function.
In the callback function, users can fetch the event specific data that is filled by the driver in the \texttt{edata}. Note that the \texttt{edata} pointer is only valid for the duration of the callback.

The TX done event data is defined in \texttt{rmt.tx.done.event.data.t}:

- \texttt{rmt.tx.done.event.data.t::num_symbols} tells the number of transmitted RMT symbols. This also reflects the size of encoding artifacts.

The RX complete event data is defined in \texttt{rmt.rx.done.event.data.t}:

- \texttt{rmt.rx.done.event.data.t::received_symbols} points to the received RMT symbols. These symbols are saved in the \texttt{buffer} parameter of \texttt{rmt.receive()} function. User shouldn’t free this receive buffer before the callback returns.
- \texttt{rmt.rx.done.event.data.t::num_symbols} tells the number of received RMT symbols. This value won’t be bigger than \texttt{buffer.size} parameter of \texttt{rmt.receive()} function. If the \texttt{buffer.size} is not sufficient to accommodate all the received RMT symbols, the driver will truncate it.

\textbf{Enable and Disable channel} \quad \texttt{rmt.enable()} must be called in advance before transmitting or receiving RMT symbols. For transmitters, enabling a channel will enable a specific interrupt and prepare the hardware to dispatch transactions. For RX channels, enabling a channel will enable an interrupt, but the receiver is not started during this time, as it has no idea about the characteristics of the incoming signals. The receiver will be started in \texttt{rmt.receive()}. \texttt{rmt.disable()} does the opposite work by disabling the interrupt and clearing pending status. The transmitter and receiver will be disabled as well.

\begin{verbatim}
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
\end{verbatim}

\textbf{Initiate TX Transaction} \quad RMT is a special communication peripheral as it’s unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format \texttt{rmt.symbol.word.t}. However, the hardware doesn’t help to convert the user data into RMT symbols, this can only be done in software — by the so-called \textbf{RMT Encoder}. The encoder is responsible for encoding user data into RMT symbols and then write to RMT memory block or DMA buffer. For how to create an RMT encoder, please refer to \textbf{RMT Encoder}.

Once we got an encoder, we can initiate a TX transaction by calling \texttt{rmt.transmit()}. This function takes several positional parameters like channel handle, encoder handle, payload buffer. Besides that, we also need to provide a transmission specific configuration in \texttt{rmt.transmit.config.t}:

- \texttt{rmt.transmit.config.t::loop_count} sets the number of transmission loop. After the transmitter finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences at the cost of a very little CPU intervention. Specially, setting \texttt{rmt.transmit.config.t::loop_count} to -1 means an infinite loop transmission. In this situation, the channel won’t stop until manually call of \texttt{rmt.disable()}. And the trans done event won’t be generated as well. If \texttt{rmt.transmit.config.t::loop_count} is set to a positive number, the trans done event won’t be generated until target number of loop transmission have finished. Note that, the \textbf{loop transmit} feature is not supported on all ESP chips, please refer to \textbf{TRM} before you configure this option. Or you might encounter \texttt{ESP.ERR.NOT_SUPPORTED} error.
- \texttt{rmt.transmit.config.t::eot_level} sets the output level when the transmitter finishes working or stops working by calling \texttt{rmt.disable()}.

\begin{verbatim}
Note: There’s a limitation in the transmission size if the \texttt{rmt.transmit.config.t::loop_count} is set to non-zero (i.e. to enable the loop feature). The encoded RMT symbols should not exceed the capacity of RMT hardware memory block size. Or you might see error message like \texttt{encoding artifacts can’t exceed hw memory block for loop transmission}. If you have to start a large transaction by loop, you can try either:
\end{verbatim}
• Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach doesn’t work if the DMA backend is also enabled.
• Customize an encoder and construct a forever loop in the encoding function. See also `RMT Encoder`.

Internally, `rmt_transmit()` will construct a transaction descriptor and send to a job queue, which will be dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transaction to complete, user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications, we don’t want any time drift in between when startup multiple TX channels. For example, to make two robotic arms move simultaneously. The RMT driver can help to manage this by creating a so-called `Sync Manager`. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

![Fig. 17: RMT TX Sync](image)

**Install RMT Sync Manager** To create a sync manager, user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Specially, when the sync manager has been installed before, and there’re no hardware resources to create another manager, this function will report `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it will report `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it won’t start the machine until all the channels in the `rmt_sync_manager_config_t::tx_channel_array` are called with `rmt_transmit()`. Before that, the channel is just put in a waiting state. Different channel usually take different time to finish the job if the transaction is different, which results in a loss of sync. So user needs to call `rmt_sync_reset()` to pull the channels back to the starting line again before restarting a simultaneous transmission.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterwards.
# Chapter 2. API Reference

```c
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that...
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
−num * 3, &transmit_config));
// tx_channels[0] won't start transmission until call of `rmt_transmit()` for tx_
−channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
−num * 3, &transmit_config));
```

## Initiate RX Transaction

As also discussed in the *Enable and Disable channel*, the RX channel still doesn’t get ready to receive RMT symbols even user calls `rmt_enable()`. User needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration (either high or low level). A pulse whose width is smaller than this value will be treated as glitch and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration (either high or low level). A pulse whose width is bigger than this value will be treated as Stop Signal, and the receiver will generate receive complete event immediately.

The RMT receiver will start the RX machine after user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, user needs to sets the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames will be truncated by the hardware, and the driver will report an error message: `hw buffer too small, received symbols truncated`.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer size is not sufficient, the receiver can continue to work but later incoming symbols will be dropped and report an error message: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, user shouldn’t recycle the buffer before the receiver finished or stopped working.

The receiver will be stopped by the driver when it finishes working (i.e. received a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`). User needs to call `rmt_receive()` again to restart the receiver, if necessary. User can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, rmt_rx_done_event_data_t *edata, void *user_data) {
    BaseType_t high_task_wakeup = pdFALSE;
    TaskHandle_t task_to_notify = (TaskHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xTaskNotifyFromISR(task_to_notify, (uint32_t)edata, eSetValueWithOverwrite, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

TaskHandle_t cur_task = xTaskGetCurrentTaskHandle();
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, cur_task));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is...
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is...
};
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a...
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_config));
// wait for RX done signal
rmt_rx_done_event_data_t *rx_data = NULL;
xTaskNotifyWait(0x00, ULONG_MAX, (uint32_t *)&rx_data, portMAX_DELAY);
// parse the receive symbols
example_parse_nec_frame(rx_data->received_symbols, rx_data->num_symbols);

RMT Encoder  An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory (or DMA buffer) at specific time. There’re some special restrictions for an encoding function:

- An encoding function might be called for several times within a single transaction. This is because the target RMT memory block can’t accommodate all the artifacts at once. We have to use the memory in a ping-pong way, thus the encoding session is divided into multiple parts. This requires the encoder to be stateful.
- The encoding function is running in the ISR context. To speed up the encoding session, it’s high recommend to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with RMT driver faster, some commonly used encoders are provided out-of-the box. They can either work alone or chained together into a new encoder. See also Composite Pattern for the principle behind. The driver has defined the encoder interface in rmt_encoder_t, it contains the following functions:

- rmt_encoder_t::encode is the fundamental function of an encoder. This is where the encoding session happens. Please note, the rmt_encoder_t::encode function might be called for multiple times within a single transaction. The encode function should return the state of current encoding session. The supported states are listed in the rmt_encode_state_t. If the result contains RMT_ENCODING_COMPLETE, it means the current encoder has finished work. If the result contains RMT_ENCODING_MEM_FULL, we need to yield from current session, as there’s no space to save more encoding artifacts.
- rmt_encoder_t::reset should reset the encoder state back to initial. The RMT encoder is stateful, if RMT transmitter stopped manually without its corresponding encoder being reset, then the following encoding session can be wrong. This function is also called implicitly in rmt_disable().
- rmt_encoder_t::del function should free the resources allocated by the encoder.
Copy Encoder A copy encoder is created by calling `rmt_new_copy_encoder()`. Copy encoder’s main functionality is to copy the RMT symbols from user space into the driver layer. It’s usually used to encode const data (i.e. data won’t change at runtime after initialization), for example, the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion.

Bytes Encoder A bytes encoder is created by calling `rmt_new_bytes_encoder()`. Bytes encoder’s main functionality is to convert the user space byte stream into RMT symbols dynamically. It’s usually used to encode dynamic data, for example, the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to tell the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the encoding order for of byte. If it is set to true, the encoder will encode the Most Significant Bit first. Otherwise, it will encode the Least Significant Bit first.

Besides the primitive encoders provided by the driver, user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

![Encoder Chain Diagram](image)

Fig. 18: RMT Encoder Chain

Customize RMT Encoder for NEC Protocol In this section, we will demonstrate on how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5µs in length, logical bits are transmitted as follows. It is worth mentioning, the bytes of data bits are sent least significant bit first.

- Logical 0: a 562.5µs pulse burst followed by a 562.5µs space, with a total transmit time of 1.125ms
- Logical 1: a 562.5µs pulse burst followed by a 1.6875ms space, with a total transmit time of 2.25ms

When a key is pressed on the remote controller, the message transmitted consists of the following, in order:

![NEC Frame](image)

Fig. 19: IR NEC Frame
• 9ms leading pulse burst (also called the “AGC pulse”)
• 4.5ms space
• 8-bit address for the receiving device
• 8-bit logical inverse of the address
• 8-bit command
• 8-bit logical inverse of the command
• a final 362.5µs pulse burst to signify the end of message transmission

Then we can construct the NEC \texttt{rmt\_encoder\_t::encode} function in the same order, for example:

```c
// IR NEC scan code representation
typedef struct
{
  uint16_t address;
  uint16_t command;
} ir_nec_scan_code_t;

// construct a encoder by combining primitive encoders
typedef struct
{
  rmt_encoder_t base; // the base "class", declares the standard
  rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading
  rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address
  rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT
  rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT
  int state; // record the current encoding state (i.e. we're in which encoding phase)
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t *channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)
{
  rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t, base);
  rmt_encode_state_t session_state = 0;
  rmt_encode_state_t state = 0;
  size_t encoded_symbols = 0;
  ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
  rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
  rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
  switch (nec_encoder->state) {
    case 0: // send leading code
      encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol, sizeof(rmt_symbol_word_t), &session_state);
      if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 1; // we can only switch to next state when current encoder finished
      }
      if (session_state & RMT_ENCODING_MEM_FULL) {
        state = RMT_ENCODING_MEM_FULL;
        goto out; // yield if there's no free space to put other encoding artifacts
      }
    }
    // fall-through
    case 1: // send address
      encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->address, sizeof(uint16_t), &session_state);
    }
    (continues on next page)
```
if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = 2; // we can only switch to next state when current encoder finished
}

if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding
}

// fall-through

if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding
}

// fall-through

// send command
encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->command, sizeof(uint16_t), &session_state);

if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = 3; // we can only switch to next state when current encoder finished
}

if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding
}

// send ending code
encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_ending_symbol, sizeof(rmt_symbol_word_t), &session_state);

if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = 0; // back to the initial encoding session
    state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding has finished
}

if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding
}

out:
    *ret_state = state;
    return encoded_symbols;
}

A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a switch-case plus several goto statements to implement a state machine. With this pattern, user can construct a lot more complex IR protocols.

Power Management When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever user creates an RMT channel that has selected RMT_CLK_SRC_APB as the clock source, the driver will guarantee that the power management lock is acquired after the channel enabled by rmt_enable(). Likewise, the driver releases the lock after rmt_disable() is called for the same channel. This also reveals that the rmt_enable() and rmt_disable() should appear in pairs. If the channel clock source is selected to others like RMT_CLK_SRC_XTAL, then the driver won’t install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.
**IRAM Safe**  By default, the RMT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing the main Flash. Thus the transaction done interrupt will not get executed in time, which is not expected in a real-time application. What’s worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, such delayed response can lead to an unpredictable result.

There’s a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that will:
1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This Kconfig option will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety**  The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread safe. which means the user should avoid calling them from multiple tasks.

**Kconfig Options**
- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also `IRAM Safe` for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enabled the debug log at the cost of increased firmware binary size.

**Application Examples**
- RMT based RGB LED strip customized encoder: peripherals/rmt/led_strip
- RMT IR NEC protocol encoding and decoding: peripherals/rmt/ir_nec_transceiver
- RMT transactions in queue: peripherals/rmt/musical_buzzer
- RMT based stepper motor with S-curve algorithm: peripherals/rmt/stepper_motor
- RMT infinite loop for driving DShot ESC: peripherals/rmt/dshot_esc
- RMT simulate 1-wire protocol (take DS18B20 as example): peripherals/rmt/onewire_ds18b20

**API Reference**

**Header File**
- components/driver/include/driver/rmt_tx.h

**Functions**

```c
esp_err_t rmt_new_tx_channel(const rmt_tx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
```

Create a RMT TX channel.

**Parameters**
- `config` - [in] TX channel configurations
- `ret_chan` - [out] Returned generic RMT channel handle

**Returns**
- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one

2 Callback function (e.g. rmt_tx_event_callbacks_t::on_trans_done) and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.
Chapter 2. API Reference

- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

```c
esp_err_t rmt_transmit(rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const rmt_transmit_config_t *config)
```

Transmit data by RMT TX channel.

**Note:** This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific encoder.

**Parameters**
- `tx_channel` [-in] RMT TX channel that created by `rmt_new_tx_channel()`
- `encoder` [-in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- `payload` [-in] The raw data to be encoded into RMT symbols
- `payload_bytes` [-in] Size of the payload in bytes
- `config` [-in] Transmission specific configuration

**Returns**
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

```c
esp_err_t rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)
```

Wait for all pending TX transactions done.

**Note:** This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

**Parameters**
- `tx_channel` [-in] RMT TX channel that created by `rmt_new_tx_channel()`

**Returns**
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for RMT TX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it...
should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM.

Parameters
- **tx_channel** – [in] RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** – [in] Group of callback functions
- **user_data** – [in] User data, which will be passed to callback functions directly

Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t rmt_new_sync_manager (const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```
Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

Note: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

Parameters
- **config** – [in] Synchronization manager configuration
- **ret_synchro** – [out] Returned synchronization manager handle

Returns
- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

```c
esp_err_t rmt_del_sync_manager (rmt_sync_manager_handle_t synchro)
```
Delete synchronization manager.

Parameters **synchro** – [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns
- ESP_OK: Delete the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error

```c
esp_err_t rmt_sync_reset (rmt_sync_manager_handle_t synchro)
```
Reset synchronization manager.

Parameters **synchro** – [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns
- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error
Chapter 2. API Reference

**Structures**

struct `rmt_tx_event_callbacks_t`

Group of RMT TX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

int `gpio_num`

GPIO number used by RMT TX channel. Set to -1 if unused

`rmt_clock_source_t clk_src`

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t `resolution_hz`

Channel clock resolution, in Hz

size_t `mem_block_symbols`

Size of memory block, in number of `rmt_symbol_word_t`, must be an even

size_t `trans_queue_depth`

Depth of internal transfer queue, increase this value can support more transfers pending in the background

uint32_t `invert_out`

Whether to invert the RMT channel signal before output to GPIO pad

uint32_t `with_dma`

If set, the driver will allocate an RMT channel with DMA capability

uint32_t `io_loop_back`

The signal output from the GPIO will be fed to the input path as well

uint32_t `io_od_mode`

Configure the GPIO as open-drain mode
struct rmt_tx_channel_config_t::[anonymous] flags
TX channel config flags

struct rmt_transmit_config_t
RMT transmit specific configuration.

Public Members

int loop_count
Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level
Set the output level for the “End Of Transmission”

struct rmt_transmit_config_t::[anonymous] flags
Transmit config flags

struct rmt_sync_manager_config_t
Synchronous manager configuration.

Public Members

const rmt_channel_handle_t *tx_channel_array
Array of TX channels that are about to be managed by a synchronous controller

size_t array_size
Size of the tx_channel_array

Header File
- components/driver/include/driver/rmt_rx.h

Functions
esp_err_t rmt_new_rx_channel (const rmt_rx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
Create a RMT RX channel.

Parameters
- config [in] RX channel configurations
- ret_chan [out] Returned generic RMT channel handle

Returns
- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error
**esp_err_t** `rmt_receive` *(rmt_channel_handle_t rx_channel, void* buffer, size_t buffer_size, const rmt_receive_config_t* config)*

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

**Parameters**
- **rx_channel** - [in] RMT RX channel that created by `rmt_new_rx_channel()`  
- **buffer** - [in] The buffer to store the received RMT symbols  
- **buffer_size** - [in] size of the buffer, in bytes  
- **config** - [in] Receive specific configurations

**Returns**
- ESP_OK: Initiate receive job successfully  
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled  
- ESP_FAIL: Initiate receive job failed because of other error

**esp_err_t** `rmt_rx_register_event_callbacks` *(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t* cbs, void* user_data)*

Set callbacks for RMT RX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Parameters**
- **rx_channel** - [in] RMT generic channel that created by `rmt_new_rx_channel()`  
- **cbs** - [in] Group of callback functions  
- **user_data** - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully  
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument  
- ESP_FAIL: Set event callbacks failed because of other error

**Structures**

`struct rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.
Public Members

```c
rmt_rx_done_callback_t on_recv_done
```
Event callback, invoked when one RMT channel receiving transaction completes

```c
struct rmt_rx_channel_config_t
```
RMT RX channel specific configuration.

Public Members

```c
int gpio_num
```
GPIO number used by RMT RX channel. Set to -1 if unused

```c
rmt_clock_source_t clk_src
```
Clock source of RMT RX channel, channels in the same group must use the same clock source

```c
uint32_t resolution_hz
```
Channel clock resolution, in Hz

```c
size_t mem_block_symbols
```
Size of memory block, in number of `rmt_symbol_word_t`, must be an even

```c
uint32_t invert_in
```
Whether to invert the incoming RMT channel signal

```c
uint32_t with_dma
```
If set, the driver will allocate an RMT channel with DMA capability

```c
uint32_t io_loop_back
```
For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
struct rmt_rx_channel_config_t::[anonymous] flags
```
RX channel config flags

```c
struct rmt_receive_config_t
```
RMT receive specific configuration.

Public Members

```c
uint32_t signal_range_min_ns
```
A pulse whose width is smaller than this threshold will be treated as glitch and ignored

```c
uint32_t signal_range_max_ns
```
RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

Functions

`esp_err_t rmt_del_channel(rmt_channel_handle_t channel)`
Delete an RMT channel.

Parameters channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
• ESP_OK: Delete RMT channel successfully
• ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Delete RMT channel failed because it's still in working
• ESP_FAIL: Delete RMT channel failed because of other error

`esp_err_t rmt_apply_carrier(rmt_channel_handle_t channel, const rmt_carrier_config_t *config)`
Apply modulation feature for TX channel or demodulation feature for RX channel.

Parameters
• channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
• config - [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

Returns
• ESP_OK: Apply carrier configuration successfully
• ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
• ESP_FAIL: Apply carrier configuration failed because of other error

`esp_err_t rmt_enable(rmt_channel_handle_t channel)`
Enable the RMT channel.

Note: This function will acquire a PM lock that might be installed during channel allocation

Parameters channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
• ESP_OK: Enable RMT channel successfully
• ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
• ESP_FAIL: Enable RMT channel failed because of other error

`esp_err_t rmt_disable(rmt_channel_handle_t channel)`
Disable the RMT channel.

Note: This function will release a PM lock that might be installed during channel allocation

Parameters channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
• ESP_OK: Disable RMT channel successfully
• ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Disable RMT channel failed because it’s not enabled yet
• ESP_FAIL: Disable RMT channel failed because of other error

Structures

`struct rmt_carrier_config_t`
RMT carrier wave configuration (for either modulation or demodulation)
Public Members

```c
uint32_t frequency_hz
Carrier wave frequency, in Hz, 0 means disabling the carrier
```

```c
float duty_cycle
Carrier wave duty cycle (0~100%)
```

```c
uint32_t polarity_active_low
Specify the polarity of carrier, by default it’s modulated to base signal’s high level
```

```c
uint32_t always_on
If set, the carrier can always exist even there’s not transfer undergoing
```

```c
struct rmt_carrier_config_t::[anonymous] flags
Carrier config flags
```

Header File

- components/driver/include/driver/rmt_encoder.h

Functions

```c
esp_err_t rmt_new_bytes_encoder (const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
Create RMT bytes encoder, which can encode byte stream into RMT symbols.
```

Parameters

- `config` [in] Bytes encoder configuration
- `ret_encoder` [out] Returned encoder handle

Returns

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

```c
esp_err_t rmt_new_copy_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
Create RMT copy encoder, which copies the given RMT symbols into RMT memory.
```

Parameters

- `config` [in] Copy encoder configuration
- `ret_encoder` [out] Returned encoder handle

Returns

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

```c
esp_err_t rmt_del_encoder (rmt_encoder_handle_t encoder)
Delete RMT encoder.
```

Parameters

- `encoder` [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

Returns
• ESP_OK: Delete RMT encoder successfully
• ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
• ESP_FAIL: Delete RMT encoder failed because of other error

`esp_err_t rmt_encoder_reset (rmt_encoder_handle_t encoder)`
Reset RMT encoder.

Parameters
encoder [out] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

Returns
• ESP_OK: Reset RMT encoder successfully
• ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
• ESP_FAIL: Reset RMT encoder failed because of other error

Structures

struct rmt_encoder_t
Interface of RMT encoder.

Public Members

size_t (*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)
Encode the user data into RMT symbols and write into RMT memory.

Note: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

Note: It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle
Param tx_channel [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`
Param primary_data [in] App data to be encoded into RMT symbols
Param data_size [in] Size of primary_data, in bytes
Param ret_state [out] Returned current encoder’s state
Return Number of RMT symbols that the primary data has been encoded into

`esp_err_t (*reset)(rmt_encoder_t *encoder)`
Reset encoding state.

Param encoder [in] Encoder handle
Return
• ESP_OK: reset encoder successfully
• ESP_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`
Delete encoder object.

Param encoder [in] Encoder handle
Return
• ESP_OK: delete encoder successfully
• ESP_FAIL: delete encoder failed

struct rmt_bytes_encoder_config_t
    Bytes encoder configuration.

    Public Members

    rmt_symbol_word_t bit0
        How to represent BIT0 in RMT symbol

    rmt_symbol_word_t bit1
        How to represent BIT1 in RMT symbol

    uint32_t msb_first
        Whether to encode MSB bit first

    struct rmt_bytes_encoder_config_t::[anonymous] flags
        Encoder config flag

struct rmt_copy_encoder_config_t
    Copy encoder configuration.

    Type Definitions

typedef struct rmt_encoder_t rmt_encoder_t
    Type of RMT encoder.

    Enumerations

enum rmt_encode_state_t
    RMT encoding state.

    Values:

    enumerator RMT_ENCODING_COMPLETE
        The encoding session is finished, the caller can continue with subsequent encoding

    enumerator RMT_ENCODING_MEM_FULL
        The encoding artifact memory is full, the caller should return from current encoding session

    Header File

    • components/driver/include/driver/rmt_types.h

    Structures

struct rmt_tx_done_event_data_t
    Type of RMT TX done event data.
Chapter 2. API Reference

Public Members

```
size_t num_symbols
```

The number of transmitted RMT symbols (only one round is counted if it’s a loop transmission)

```
struct rmt_rx_done_event_data_t
```

Type of RMT RX done event data.

Public Members

```
rmt_symbol_word_t *received_symbols
```

Point to the received RMT symbols

```
size_t num_symbols
```

The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t

Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t

Type of RMT synchronization manager handle.

typedef struct rmt_encoder_t *rmt_encoder_handle_t

Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, rmt_tx_done_event_data_t *edata, void *user_ctx)

Prototype of RMT event callback.

- **Param tx_chan [in]** RMT channel handle, created from rmt_new_tx_channel()
- **Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
- **Param user_ctx [in]** User registered context, passed from rmt_tx_register_event_callbacks()

**Return** Whether a high priority task has been waken up by this callback function

```
unsigned int
```

Prototype of RMT event callback.

- **Param rx_chan [in]** RMT channel handle, created from rmt_new_rx_channel()
- **Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
- **Param user_ctx [in]** User registered context, passed from rmt_rx_register_event_callbacks()

**Return** Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/rmt_types.h
Unions

union rmt_symbol_word_t
#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

unsigned int duration0
Duration of level0

unsigned int level0
Level of the first part

unsigned int duration1
Duration of level1

unsigned int level1
Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

unsigned int val
Equivalent unsigned value for the RMT symbol

Type Definitions

typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement

2.6.15 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

• Overview of compatibility between the default pull states on pins of Espressif’s products and the states required by the SD bus
• Solutions - ideas on how to resolve compatibility issues
• Related information - other relevant information
Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip
- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Modules

  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - No Pull-ups
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  - Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  - Download Mode Not Working (minor issue) (v2, v1)
  You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
  - ESP32-WROVER-B on v4.1
  - ESP32-WROVER on v3
  - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSC
  - Required pull-ups are provided
  - Conflicts Between Bootstrap and SDIO on DAT2

You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
Chapter 2. API Reference

- ESP32-LyraT
  - Required pull-ups are provided
  - Pull-up Conflicts on GPIO13

Non-Espressif Hosts  Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

Solutions

No Pull-ups  If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13  If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode
- Perform one of the following actions on the GPIO13 pin:
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2  There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   Warning:  Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on https://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:
If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`.

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and reflash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

### No Pull-up on GPIO12
Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

### Download Mode Not Working (minor issue)
When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

### Related Information

**MTDI Strapping Pin**
MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see [Overview of Compatibility](https://esp32.com/technical-reference-manual).

**Internal Pull-ups and Strapping Requirements**
Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.
The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### Table 6: Default pull-up and pull-down states of the CMD and DATA pins

### 2.6.16 SDMMC Host Driver

**Overview**

ESP32’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

- Slot 0 ([SDMMC_HOST_SLOT_0](#)) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 ([SDMMC_HOST_SLOT_1](#)) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD</td>
<td>GPIO11</td>
<td>GPIO15</td>
</tr>
<tr>
<td>CLK</td>
<td>GPIO6</td>
<td>GPIO14</td>
</tr>
<tr>
<td>D0</td>
<td>GPIO7</td>
<td>GPIO2</td>
</tr>
<tr>
<td>D1</td>
<td>GPIO8</td>
<td>GPIO4</td>
</tr>
<tr>
<td>D2</td>
<td>GPIO9</td>
<td>GPIO12</td>
</tr>
<tr>
<td>D3</td>
<td>GPIO10</td>
<td>GPIO13</td>
</tr>
<tr>
<td>D4</td>
<td>GPIO16</td>
<td></td>
</tr>
<tr>
<td>D5</td>
<td>GPIO17</td>
<td></td>
</tr>
<tr>
<td>D6</td>
<td>GPIO5</td>
<td></td>
</tr>
<tr>
<td>D7</td>
<td>GPIO18</td>
<td></td>
</tr>
<tr>
<td>CD</td>
<td>any input via GPIO matrix</td>
<td></td>
</tr>
<tr>
<td>WP</td>
<td>any input via GPIO matrix</td>
<td></td>
</tr>
</tbody>
</table>

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the cd and wp members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1_* ) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

**Supported Speed Modes**

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
• High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
• High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:
• High Speed DDR mode, 8-line eMMC
• UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

• sdmmc_host_init()
• sdmmc_host_init_slot()
• sdmmc_host_deinit()

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the sdmmc_host_t structure:

• sdmmc_host_set_bus_width()
• sdmmc_host_set_card_clk()
• sdmmc_host_do_transaction()

Configuring Bus Width and Frequency

With the default initializers for sdmmc_host_t and sdmmc_slot_config_t (SDMMC_HOST_DEFAULT and SDMMC_SLOT_CONFIG_DEFAULT), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the max_freq_khz field of sdmmc_host_t:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the width field of sdmmc_slot_config_t. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

DDR Mode for eMMC chips

By default, DDR mode will be used if:

• SDMMC host frequency is set to SDMMC_FREQ_HIGHSPEED in sdmmc_host_t structure, and
• eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping SDMMC_FREQ_HIGHSPEED frequency, clear SDMMC_HOST_FLAG_DDR bit in flags field of sdmmc_host_t:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

See also

See SD/SDIO/MMC Driver for the higher level driver which implements the protocol layer.

See SD SPI Host Driver for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See SD Pull-up Requirements for pullup support and compatibilities of modules and development kits.
API Reference

Header File

- components/driver/include/driver/sdmmc_host.h

Functions

```c
esp_err_t sdmmc_host_init(void)
```

Initialize SDMMC host peripheral.

**Note:** This function is not thread safe

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
- ESP_ERR_NO_MEM if memory cannot be allocated

```c
esp_err_t sdmmc_host_init_slot(int slot, const sdmmc_slot_config_t *slot_config)
```

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:
- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note:** This function is not thread safe

**Parameters**
- `slot` – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config` – additional configuration for the slot

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

```c
esp_err_t sdmmc_host_set_bus_width(int slot, size_t width)
```

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. `SD_APP_SET_BUS_WIDTH`)

**Note:** This function is not thread safe

**Parameters**
- `slot` – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `width` – bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

```c
size_t sdmmc_host_get_slot_width(int slot)
```

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

**Parameters**
- `slot` – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
Returns configured bus width of the specified slot.

\[ \text{esp_err_t sdmmc_host_set_card_clk}(\text{int slot, uint32_t freq_khz}) \]

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

**Parameters**
* slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
* freq_khz - card clock frequency, in kHz

**Returns**
* ESP_OK on success
* other error codes may be returned in the future

\[ \text{esp_err_t sdmmc_host_set_bus_ddr_mode}(\text{int slot, bool ddr_enabled}) \]

Enable or disable DDR mode of SD interface.

**Parameters**
* slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
* ddr_enabled - enable or disable DDR mode

**Returns**
* ESP_OK on success
* ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

\[ \text{esp_err_t sdmmc_host_do_transaction}(\text{int slot, sdmmc_command_t *cmdinfo}) \]

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

**Parameters**
* slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
* cmdinfo - pointer to structure describing command and data to transfer

**Returns**
* ESP_OK on success
* ESP_ERR_TIMEOUT if response or data transfer has timed out
* ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
* ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
* ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
* ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

\[ \text{esp_err_t sdmmc_host_io_int_enable}(\text{int slot}) \]

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Parameters**
* slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**Returns** returns ESP_OK, other errors possible in the future
**esp_err_t sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

- **Parameters**
  - `slot` - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
  - `timeout_ticks` - number of RTOS ticks to wait for the interrupt

- **Returns**
  - ESP_OK on success (interrupt received)
  - ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**esp_err_t sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

---

**Note:** This function is not thread safe

---

- **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

---

**Structures**

struct **sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

---

**Public Members**

- **gpio_num_t gpio_cd**
  
  GPIO number of card detect signal.

- **gpio_num_t cd**
  
  GPIO number of card detect signal; shorter name.

- **gpio_num_t gpio_wp**
  
  GPIO number of write protect signal.

- **gpio_num_t wp**
  
  GPIO number of write protect signal; shorter name.

- **uint8_t width**
  
  Bus width used by the slot (might be less than the max width supported)

- **uint32_t flags**
  
  Features used by this slot.

---

**Macros**

- **SDMMC_HOST_SLOT_0**
  
  SDMMC slot 0.

- **SDMMC_HOST_SLOT_1**
  
  SDMMC slot 1.
### SDMMC_HOST_DEFAULT()

Default `sdmmc_host_t` structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

### SDMMC_SLOT_FLAG_INTERNAL_PULLUP

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

### SDMMC_SLOT_NO_CD

indicates that card detect line is not used

### SDMMC_SLOT_NO_WP

indicates that write protect line is not used

### SDMMC_SLOT_WIDTH_DEFAULT

use the maximum possible width for the slot

### SDMMC_SLOT_CONFIG_DEFAULT()

Macro defining default configuration of SDMMC host slot

### 2.6.17 SD SPI Host Driver

**Overview**

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See SDMMC Host) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

**How to Use**

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!
Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see `Sharing the SPI bus among SD card and other SPI devices`.

Related Docs

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD cad, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.
DC loading  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

Initialization sequence

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.
   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

API Reference

**Header File**
- components/driver/include/driver/sdspi_host.h

**Functions**

`esp_err_t sdspi_host_init` (void)
   Initialize SD SPI driver.

   **Note:** This function is not thread safe

   **Returns**
   - ESP_OK on success
   - other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` *dev_config, `sdspi_dev_handle_t` *out_handle)
   Attach and initialize an SD SPI device on the specific SPI bus.

   **Note:** This function is not thread safe
Chapter 2. API Reference

Note: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

Note: The SDIO oversdsdpi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

### Parameters
- `dev_config` - pointer to device configuration structure
- `out_handle` - Output of the handle to the sdsdpi device.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdsdpi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

```c
esp_err_t sdspi_host_remove_device(sdsdpi_dev_handle_t handle)
```
Remove an SD SPI device.

#### Parameters
- `handle` - Handle of the SD SPI device

#### Returns
- Always ESP_OK

```c
esp_err_t sdspi_host_do_transaction(sdsdpi_dev_handle_t handle, sdmmc_command_t *cmdinfo)
```
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note: This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

#### Parameters
- `handle` - Handle of the sdsdpi device
- `cmdinfo` - pointer to structure describing command and data to transfer

#### Returns
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

```c
esp_err_t sdspi_host_set_card_clk(sdsdpi_dev_handle_t host, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note: This function is not thread safe

#### Parameters
- `host` - Handle of the sdsdpi device
- `freq_khz` - card clock frequency, in kHz

#### Returns
- ESP_OK on success
- other error codes may be returned in the future
**Chapter 2. API Reference**

`esp_err_t sdspi_host_deinit (void)`

Release resources allocated using `sdspi_host_init`.

**Note:** This function is not thread safe

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdspi_host_init` function has not been called

`esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)`

Enable SDIO interrupt.

**Parameters**
- handle – Handle of the sdspi device

**Returns**
- ESP_OK on success

`esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)`

Wait for SDIO interrupt until timeout.

**Parameters**
- handle – Handle of the sdspi device
- timeout_ticks – Ticks to wait before timeout.

**Returns**
- ESP_OK on success

**Structures**

struct `sdspi_device_config_t`

Extra configuration for SD SPI device.

**Public Members**

`spi_host_device_t host_id`

SPI host to use, SPIx_HOST (see spi_types.h).

`gpio_num_t gpio_cs`

GPIO number of CS signal.

`gpio_num_t gpio_cd`

GPIO number of card detect signal.

`gpio_num_t gpio_wp`

GPIO number of write protect signal.

`gpio_num_t gpio_int`

GPIO number of interrupt line (input) for SDIO card.

**Macros**

`SDSPI_DEFAULT_HOST`

`SDSPI_DEFAULT_DMA`
SDSPI_HOST_DEFAULT()

Default sdmmc_host_t structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by sdspi_host_init_device().

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT()

Macro defining default configuration of SD SPI device.

Type Definitions

typedef int sdspi_dev_handle_t

Handle representing an SD SPI device.

2.6.18 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>
<th>Slot1 GPIO Number</th>
<th>Slot2 GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLK</td>
<td>SCLK</td>
<td>6</td>
<td>14</td>

<td>9</td>
<td>12</td>
</tr>
<tr>
<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

• 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
• 4-bit SD mode: Connect all pins and the ground.
• SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

Note: Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check Overview of Compatibility to see whether your development boards have such pullups.
**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using an ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See Overview of Compatibility to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:
