- **Modules:** ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- **Kits:** ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to **SD Pull-up Requirements** for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology**

The SDIO slave driver uses the following terms:

- **Transfer:** a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending:** slave to host transfers.
- **Receiving:** host to slave transfers.

**Note:** Register names in ESP32 Technical Reference Manual > SDIO Slave Controller [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO:** specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \( \text{requested length} = 0x1F800 - \text{address} \).
- **Ownership:** When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length:** The length requested in one transfer determined by the FIFO address.
- **Transfer length:** The length requested in one transfer determined by the CMD53 byte/block count field.

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the **requested length** rather than the **transfer length**. The **transfer length** should be no shorter than the **requested length**, and the rest part will be filled with 0 (sending) or discard (receiving).

- **Receiving buffer size:** The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the \( \text{recv\_buffer\_size} \) member of \( \text{sdio\_slave\_config\_t} \).
- **Interrupts:** the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in **Interrupts**.
• Registers: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave**  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of **SDIO Simplified Specification**), which is described briefly in **ESP SDIO Slave Initialization**.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to **ESP SDIO Slave Protocol**. There is also a component **ESP Serial Slave Link** for ESP32 master to communicate with ESP32 SDIO slave, see example **peripherals/sdio** when programming your host.

**Interrupts**  There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts**  The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.

**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts**  The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers**  There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO**  When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If non-blocking call is needed, set `wait=0`. The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet. If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.
Note: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

Sending FIFO Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

Note: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the sending_mode member of sdio_slave_config_t, and the buffer numbers can be set in the send_queue_size. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call sdio_slave_transmit to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an arg indicating the buffer) to sdio_slave_send_queue. If non-blocking call is needed, set wait=0. If the wait is not portMAX_DELAY (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call sdio_slave_send_get_finished to get and deal with a finished transfer. A buffer should be keep unmodified until returned from sdio_slave_send_get_finished. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the arg in the queue parameter:

1. Directly point arg to a dynamic-allocated buffer, and use the arg to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point arg to the structure. You can use the structure to do more things like:

```c
typedef struct {
  uint8_t *buffer;
  size_t size;
  int id;
}sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
  .buffer = ADDRESS_TO_SEND,
  .size = 8,
  .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);
//... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t *arg = NULL;
sdio_slave_send_get_finished((void**)arg, portMAX_DELAY);
```
(continues on next page)
ESP_LOGI("tag", "(d) successfully send d bytes of p", arg->id, arg->size,...
->arg->buffer);
some_post_callback(arg); // do more things

3. Working with the receiving part of this driver, point arg to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256] = {1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

// ... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see peripherals/sdio.

**Application Example**

Slave/master communication: peripherals/sdio.

**API Reference**

**Header File**

- components/hal/include/hal/sdio_slave_types.h

**Enumerations**

`enum sdio_slave_hostint_t`  
Mask of interrupts sending to the host.

*Values:*

- `enumerator SDIO_SLAVE_HOSTINT_BIT0`  
  General purpose interrupt bit 0.

- `enumerator SDIO_SLAVE_HOSTINT_BIT1`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT2`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT3`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT4`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT5`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT6`  
- `enumerator SDIO_SLAVE_HOSTINT_BIT7`
enumerator **SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET**
New packet available.

**enum** **sdio_slave_timing_t**
Timing of SDIO slave.

*Values:*

enumerator **SDIO_SLAVE_TIMING_PSEND_PSAMPLE**
Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.

enumerator **SDIO_SLAVE_TIMING_NSEND_PSAMPLE**
Send at negedge, and sample at posedge. Default value for DS mode and below.

enumerator **SDIO_SLAVE_TIMING_PSEND_NSAMPLE**
Send at posedge, and sample at negedge.

enumerator **SDIO_SLAVE_TIMING_NSEND_NSAMPLE**
Send at negedge, and sample at negedge.

**enum** **sdio_slave_sending_mode_t**
Configuration of SDIO slave mode.

*Values:*

enumerator **SDIO_SLAVE_SEND_STREAM**
Stream mode, all packets to send will be combined as one if possible.

enumerator **SDIO_SLAVE_SEND_PACKET**
Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

**Header File**
- components/driver/include/driver/sdio_slave.h

**Functions**

```c
esp_err_t sdio_slave_initialize (sdio_slave_config_t *config)
```

Initialize the sdio slave driver

*Parameters*: `config` — Configuration of the sdio slave driver.

*Returns*
- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

```c
void sdio_slave_deinit (void)
```

De-initialize the sdio slave driver to release the resources.

```c
esp_err_t sdio_slave_start (void)
```

Start hardware for sending and receiving, as well as set the IREADY1 to 1.
Note: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.

**Returns**
- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

void sdio_slave_stop(void)
Stop hardware from sending and receiving, also set IOREADY1 to 0.

Note: this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call sdio_slave_reset to do that.

esp_err_t sdio_slave_reset(void)
Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Returns** always return ESP_OK.

sdio_slave_buf_handle_t sdio_slave_recv_register_buf(uint8_t* start)
Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

Note: The driver will use and only use the amount of space specified in the recv_buffer_size member set in the sdio_slave_config_t. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Parameters**
- `start` - The start address of the buffer.

**Returns**
The buffer handle if success, otherwise NULL.

esp_err_t sdio_slave_recv_unregister_buf(sdio_slave_buf_handle_t handle)
Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Parameters**
- `handle` - Handle to the buffer to release.

**Returns**
ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

esp_err_t sdio_slave_recv_load_buf(sdio_slave_buf_handle_t handle)
Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

**Parameters**
- `handle` - Handle to the buffer ready to receive data.

**Returns**
- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by sdio_slave_recv can you load it again.
- ESP_OK if success

esp_err_t sdio_slave_recv_packet(sdio_slave_buf_handle_t *handle_ret, TickType_t wait)
Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler sdio_slave_recv instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).
Chapter 2. API Reference

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

### Parameters
- **handle_ret** – Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **wait** – Time to wait before data received.

### Returns
- ESP_ERR_INVALID_ARG if `handle_ret` is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

```c
esp_err_t sdio_slave_recv(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)
```

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

### Parameters
- **handle_ret** – Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **out_addr** – [out] Output of the start address, set to NULL if not needed.
- **out_len** – [out] Actual length of the data in the buffer, set to NULL if not needed.
- **wait** – Time to wait before data received.

### Returns
- ESP_ERR_INVALID_ARG if `handle_ret` is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

```c
uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)
```

Retrieve the buffer corresponding to a handle.

### Parameters
- **handle** – Handle to get the buffer.
- **len_o** – Output of buffer length

### Returns
Buffer address if success, otherwise NULL.

```c
esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TICK_TYPE_t wait)
```

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

### Parameters
- **addr** – Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len** – Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg** – Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- **wait** – Time to wait if the buffer is full.

### Returns
• ESP_ERR_INVALID_ARG if the length is not greater than 0.
• ESP_ERR_TIMEOUT if the queue is still full until timeout.
• ESP_OK if success.

`esp_err_t sdio_slave_send_get_finished (void **out_arg, TickType_t wait)`
Return the ownership of a finished transaction.

**Parameters**
- `out_arg` – Argument of the finished transaction. Set to NULL if unused.
- `wait` – Time to wait if there’s no finished sending transaction.

**Returns**
- ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

`esp_err_t sdio_slave_transmit (uint8_t *addr, size_t len)`
Start a new sending transfer, and wait for it (blocked) to be finished.

**Parameters**
- `addr` – Start address of the buffer to send
- `len` – Length of buffer to send.

**Returns**
- ESP_ERR_INVALID_ARG if length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

`uint8_t sdio_slave_read_reg (int pos)`
Read the spi slave register shared with host.

**Note:** register 28 to 31 are reserved for interrupt vector.

**Parameters**
- `pos` – register address, 0-27 or 32-63.

**Returns**
- value of the register.

`esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)`
Write the spi slave register shared with host.

**Note:** register 29 and 31 are used for interrupt vector.

**Parameters**
- `pos` – register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- `reg` – the value to write.

**Returns**
- ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

`sdio_slave_hostint_t sdio_slave_get_host_intena (void)`
Get the interrupt enable for host.

**Returns**
- the interrupt mask.

void `sdio_slave_set_host_intena (sdio_slave_hostint_t mask)`
Set the interrupt enable for host.

**Parameters**
- `mask` – Enable mask for host interrupt.

`esp_err_t sdio_slave_send_host_int (uint8_t pos)`
Interrupt the host by general purpose interrupt.

**Parameters**
- `pos` – Interrupt num, 0-7.

**Returns**
- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise
void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
Clear general purpose interrupt to host.

Parameters
mask – Interrupt bits to clear, by bit mask.

esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)
Wait for general purpose interrupt from host.

Note: this clears the interrupt at the same time.

Parameters
• pos – Interrupt source number to wait for. is set.
• wait – Time to wait before interrupt triggered.

Returns ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

Structures

struct sdio_slave_config_t
Configuration of SDIO slave.

Public Members

sdio_slave_timing_t timing
 timing of sdio_slave. see sdio_slave_timing_t.

sdio_slave_sending_mode_t sending_mode
 mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible; SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

int send_queue_size
max buffers that can be queued before sending.

size_t recv_buffer_size
If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

sdio_event_cb_t event_cb
 when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32_t flags
Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_*.

Macros

SDIO_SLAVE_RECV_MAX_BUFFER
**SDIO_SLAVE_FLAG_DAT2_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

**SDIO_SLAVE_FLAG_HOST_INTR_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

**SDIO_SLAVE_FLAG_INTERNAL_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

**Type Definitions**

typedef void (*sdio_event_cb_t)(uint8_t event)

typedef void *sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

**2.6.19 Sigma-Delta Modulation (SDM)**

**Introduction**

ESP32 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available. Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

**Functional Overview**

The following sections of this document cover the typical steps to install and operate a SDM channel:

- **Resource Allocation** - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- **Enable and Disable Channel** - covers how to enable and disable the channel.
- **Set Equivalent Duty Cycle** - describes how to set the equivalent duty cycle of the PDM pulses.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - lists which functions are supposed to work even when the cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

---

1 Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32 Technical Reference Manual for more details. The driver won’t forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `sdm_new_channel()`).
### Resource Allocation

A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don’t need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

#### Creating a SDM Channel with Sample Rate of 1MHz

```c
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

### Enable and Disable Channel

Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from `init` to `enable`
- acquire a proper power management lock is a specific clock source (e.g. APB clock) is selected. See also `Power management` for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the `init` state and release the power management lock.

### Set Equivalent Duty Cycle

For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by $V_{out} = \frac{V_{DD\_IO} - VDD\_IO}{256} * \text{duty} + \frac{V_{DD\_IO}}{2}$. Thus the range of the `duty` input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal’s duty will be about 50%.

### Power Management

When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.
**IRAM Safe** There’s a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see `IRAM Safe` for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Sallen-Key Low Pass Filter](image)

*Fig. 20: Sallen-Key Low Pass Filter*
Application Example

- LED driven by a GPIO that is modulated with Sigma-Delta: peripherals/sigma_delta.

Functions

\texttt{esp_err_t sdm_new_channel} (const \texttt{sdm_config_t *config, sdm_channel_handle_t *ret\_chan})

Create a new Sigma Delta channel.

\textbf{Parameters}

- \texttt{config} ⚖ \texttt{[in]} SDM configuration
- \texttt{ret\_chan} ⚖ \texttt{[out]} Returned SDM channel handle

\textbf{Returns}

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

\texttt{esp_err_t sdm_del_channel} (\texttt{sdm_channel_handle_t chan})

Delete the Sigma Delta channel.

\textbf{Parameters} \texttt{chan} ⚖ \texttt{[in]} SDM channel created by \texttt{sdm_new_channel}

\textbf{Returns}

- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

\texttt{esp_err_t sdm_channel_enable} (\texttt{sdm_channel_handle_t chan})

Enable the Sigma Delta channel.

\textbf{Note}: This function will transit the channel state from init to enable.

\textbf{Note}: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the \texttt{sdm_config_t}, while CONFIG_PM_ENABLE is enabled.

\textbf{Parameters} \texttt{chan} ⚖ \texttt{[in]} SDM channel created by \texttt{sdm_new_channel}

\textbf{Returns}

- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

\texttt{esp_err_t sdm_channel_disable} (\texttt{sdm_channel_handle_t chan})

Disable the Sigma Delta channel.
**Note:** This function will do the opposite work to the `sdm_channel_enable()`

**Parameters**  
`chan` -[in] SDM channel created by `sdm_new_channel`

**Returns**  
- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

```
esp_err_t sdm_channel_set_duty (sdm_channel_handle_t chan, int8_t duty)
```

Set the duty cycle of the PDM output signal.

**Note:** For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be \( V_{out} = \frac{VDD_{IO}}{256} \times \text{duty} + \frac{VDD_{IO}}{2} \)

**Note:** If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around \( \frac{\text{sample\_rate\_hz}}{4} \).

**Note:** The duty is proportional to the equivalent output voltage after a low-pass-filter.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

**Parameters**  
- `chan` -[in] SDM channel created by `sdm_new_channel`
- `duty` -[in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of \([-90, 90]\) can provide a better randomness.

**Returns**  
- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

**Structures**

```
struct sdm_config_t
```

Sigma Delta channel configuration.

**Public Members**

```
int gpio_num
```

GPIO number

```
sdm_clock_source_t clk_src
    Clock source

uint32_t sample_rate_hz
    Sample rate in Hz, it determines how frequent the modulator outputs a pulse

uint32_t invert_out
    Whether to invert the output signal

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct sdm_config_t::[anonymous] flags
    Extra flags
```

**Type Definitions**

typedef struct sdm_channel_t *sdm_channel_handle_t
    Type of Sigma Delta channel handle.

**Header File**

- components/hal/include/hal/sdm_types.h

**Type Definitions**

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

### 2.6.20 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

**Overview of ESP32’s SPI peripherals**

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see *Notes on Using the SPI Master driver on SPI1 Bus*.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.

**Terminology**

The terms used in relation to the SPI master driver are given in the table below.
## Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA4</strong></td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA5</strong></td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA6</strong></td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA7</strong></td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>Assert</strong></td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td><strong>Deassert</strong></td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

### Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using xSemaphoreCreateMutex.

### SPI Features
**SPI Master**

**SPI Bus Lock**  To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after device releases the lock. No devices on SPI1 is allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled.

  There are quite a few limitations when using SPI Master driver on the SPI1 bus. See *Notes on Using the SPI Master driver on SPI1 Bus.*

- For other buses, the driver may register its ISR as the BG. When a device task requests for exclusive use of the bus, the bus lock will block the task and try to disable ISR. After ISR is successfully disabled, the bus lock will then unblock the device task and allow it to exclusively use the bus. When the task releases the lock, the lock will also try to resume ISR if there are pending transactions in ISR.

**SPI Transactions**

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is
skipped. If \texttt{spi_transaction_t::tx_buffer} is NULL and \texttt{SPI_TRANS_USE_TXDATA} is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see \textit{Notes on Sending Mixed Transactions to the Same Device}.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The \texttt{spi_device_polling_end()} routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions \texttt{spi_device_acquire_bus()} and \texttt{spi_device_release_bus()} to avoid the overhead. For more information, see \textit{Bus Acquiring}.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member \texttt{flags} in the struct \texttt{spi_transaction_t} as shown in the \textit{Transaction Flag} column. If you want to check if corresponding IO pins are set or not, set the member \texttt{flags} in the \texttt{spi_bus_config_t} as shown in the \textit{Bus IO setting Flag} column.

<table>
<thead>

<td>SPI_TRANS_MULTILINE_ADDR</td>
</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members \texttt{spi_transaction_t::cmd} and \texttt{spi_transaction_t::addr} are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in \texttt{spi_device_interface_config_t} by calling \texttt{spi_bus_add_device()}. If the flags \texttt{SPI_TRANS_VARIABLE_CMD} and \texttt{SPI_TRANS_VARIABLE_ADDR} in the member \texttt{spi_transaction_t::flags} are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct \texttt{spi_transaction_ext_t}, set the flags \texttt{SPI_TRANS_VARIABLE_CMD} and/or \texttt{SPI_TRANS_VARIABLE_ADDR} in the member \texttt{spi_transaction_ext_t::base} and configure the rest
of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see `Transaction Line Mode`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If `external PSRAM is enabled`, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.  
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).  

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in `Transaction Line Mode`.

**Note**: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see `Known Issues`.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.
Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the \texttt{spi\_transaction\_t::tx\_data} member and setting the \texttt{SPI\_TRANS\_USE\_TXDATA} flag on the transmission. For received data, use \texttt{spi\_transaction\_t::rx\_data} and set \texttt{SPI\_TRANS\_USE\_RXDATA}. In both cases, do not touch the \texttt{spi\_transaction\_t::tx\_buffer} or \texttt{spi\_transaction\_t::rx\_buffer} members, because they use the same memory locations as \texttt{spi\_transaction\_t::tx\_data} and \texttt{spi\_transaction\_t::rx\_data}.

Transactions with Integers Other Than \texttt{uint8\_t} An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if \texttt{0b00010} needs to be sent, it should be written into a \texttt{uint8\_t} variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of \texttt{uint16\_t} and \texttt{uint32\_t} variables is stored at the smallest address. Hence, if \texttt{uint16\_t} is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from \texttt{uint8\_t} arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- \texttt{SPI\_SWAP\_DATA\_TX} for data to be transmitted
- \texttt{SPI\_SWAP\_DATA\_RX} for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function \texttt{spi\_device\_polling\_end()} after \texttt{spi\_device\_polling\_start()} to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with \texttt{spi\_device\_polling\_transmit()} so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call \texttt{spi\_device\_polling\_start()}. To do that, you can keep calling \texttt{spi\_device\_get\_trans\_result()} until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus

\textbf{Note:} Though the \texttt{SPI Bus Lock} feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between \texttt{spi\_device\_acquire\_bus()} and \texttt{spi\_device\_release\_bus()}.  

Espressif Systems 1191 Release v5.0-dev-4379-g36f49f361c
Submit Document Feedback
• Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`). During the time above, all other tasks and most ISRs will be disabled (see *IRAM-Safe Interrupt Handlers*). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a *Cache disabled but cached memory region accessed* exception. For differences between IRAM, DRAM, and flash cache, please refer to the `application memory layout` documentation.

To place functions into the IRAM, you can either:
1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:
   ```c
   IRAM_ATTR void foo(void) {
   }
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.
2. Use the `noflash` placement in the `linker.elf`. See more in *Linker Script Generation*. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:
1. Add `DRAM_ATTR` (include `esp_attr.h`) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;
   ```
2. Use the `noflash` placement in the `linker.elf`. See more in *Linker Script Generation*.

Please also see the example `peripherals/spi_master/hd_eeprom`.

**GPIO Matrix and IO_MUX**  Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

* Only the first Device attached to the bus can use the CS0 pin.

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks
The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration  Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

SPI Clock Frequency  Transferring each byte takes eight times the clock period \( 8/f_{spi} \).

If the clock frequency is too high, the use of some functions might be limited. See Timing Considerations.

Cache Miss  The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select CONFIG_SPI_MASTER_IN_IRAM to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is \( 20+8n/f_{spi}/MHz \) [us] for \( n \) bytes transferred in one transaction. Hence, the transferring speed is: \( n/(20+8n/f_{spi}) \). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable CONFIG_SPI_MASTER_ISR_IN_IRAM and set ESP_INTR_FLAG_IRAM in the member spi_bus_config_t::intr_flags. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see IRAM-Safe Interrupt Handlers.

Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed.
When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.

The maximum allowed frequency is dependent on:

- `spi_device_interface_config_t::input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing input delay. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Half-duplex, no DMA allowed

If the Host only writes data, the dummy bit workaround and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver still works even if the `spi_device_interface_config_t::input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.
Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s *input delay* plus master’s *GPIO matrix delay*. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{(\text{floor}(\text{MISO delay}[\text{ns}]/12.5) + 1)}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>

</tbody>
</table>
Known Issues

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. **Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:**
      
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      
      This can prohibit you from transmitting and receiving data longer than 64 bytes.
   3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See *dummy bit speed-up workaround*.

3. `dummy_bits` in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).

4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- components/hal/include/hal/spi_types.h

Structures

```c
struct spi_line_mode_t

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
```

Public Members

```c
uint8_t cmd_lines

The line width of command phase, e.g. 2-line-cmd-phase.
```

```c
uint8_t addr_lines

The line width of address phase, e.g. 1-line-addr-phase.
```

```c
uint8_t data_lines

The line width of data phase, e.g. 4-line-data-phase.
```

Enumerations

```c
enum spi_host_device_t

Enum with the three SPI peripherals that are software-accessible in it.
```

Values:

- `SPI1_HOST`
- `SPI1`
enumerator SPI2_HOST
  SPI2.

enumerator SPI3_HOST
  SPI3.

enumerator SPI_HOST_MAX
  invalid host value

enum spi_clock_source_t
  Values:

  enumerator SPI_CLK_APB
    Select APB as the source clock.

  enumerator SPI_CLK_XTAL
    Select XTL as the source clock.

enum spi_event_t
  SPI Events.
  Values:

  enumerator SPI_EV_BUF_TX
    The buffer has sent data to master.

  enumerator SPI_EV_BUF_RX
    The buffer has received data from master.

  enumerator SPI_EV_SEND_DMA_READY
    Slave has loaded its TX data buffer to the hardware (DMA).

  enumerator SPI_EV_SEND
    Master has received certain number of the data, the number is determined by Master.

  enumerator SPI_EV_RECV_DMA_READY
    Slave has loaded its RX data buffer to the hardware (DMA).

  enumerator SPI_EV_RECV
    Slave has received certain number of data from master, the number is determined by Master.

  enumerator SPI_EV_CMD9
    Received CMD9 from master.

  enumerator SPI_EV_CMDA
    Received CMDA from master.

  enumerator SPI_EV_TRANS
    A transaction has done.

### Functions

#### `esp_err_t spi_bus_initialize`

```c
spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma-chan)
```

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host_id` – SPI peripheral that controls this bus
- `bus_config` – Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma-chan` – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

#### `esp_err_t spi_bus_free`

```c
spi_bus_free(spi_host_device_t host_id)
```

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters**

- `host_id` – SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn’t been initialized before, or not all devices on the bus are freed
- ESP_OK on success

### Structures

```c
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.
You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

- **int mosi_io_num**
  
  GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

- **int data0_io_num**
  
  GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

- **int miso_io_num**
  
  GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

- **int data1_io_num**
  
  GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

- **int sclk_io_num**
  
  GPIO pin for SPI Clock signal, or -1 if not used.

- **int quadwp_io_num**
  
  GPIO pin for WP (Write Protect) signal, or -1 if not used.

- **int data2_io_num**
  
  GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

- **int quadhd_io_num**
  
  GPIO pin for HD (Hold) signal, or -1 if not used.

- **int data3_io_num**
  
  GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

- **int data4_io_num**
  
  GPIO pin for spi data4 signal in octal mode, or -1 if not used.

- **int data5_io_num**
  
  GPIO pin for spi data5 signal in octal mode, or -1 if not used.

- **int data6_io_num**
  
  GPIO pin for spi data6 signal in octal mode, or -1 if not used.

- **int data7_io_num**
  
  GPIO pin for spi data7 signal in octal mode, or -1 if not used.
### Chapter 2. API Reference

**int max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

**uint32_t flags**

Ableities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

**int intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

### Macros

**SPI_MAX_DMA_LEN**

**SPI_SWAP_DATA_TX**(DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

**SPI_SWAP_DATA_RX**(DATA, LEN)

Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)tx_buffer, 15);
```

### Parameters

- **DATA** - Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** - Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPICOMMON_BUSFLAG_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**

Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**

Check using iOMUX pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.
Chapter 2. API Reference

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**

```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```c
enum spi_common_dma_t
```
SPI DMA channels.

*Values:*

- **SPI_DMA_DISABLED**
  Do not enable DMA for SPI.

- **SPI_DMA_CH1**
  Enable DMA, select DMA Channel 1.

- **SPI_DMA_CH2**
  Enable DMA, select DMA Channel 2.

- **SPI_DMA_CH_AUTO**
  Enable DMA, channel is automatically selected by driver.
Chapter 2. API Reference

API Reference - SPI Master

Header File

- components/driver/include/driver/spi_master.h

Functions

**esp_err_t spi_bus_add_device**

```
spi_host_device_t host_id, const spi_device_interface_config_t *dev_config,
spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Parameters**

- **host_id** - SPI peripheral to allocate device on
- **dev_config** - SPI interface protocol config for the device
- **handle** - Pointer to variable to hold the device handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t spi_bus_remove_device**

```
(spi_device_handle_t handle)
```

Remove a device from the SPI bus.

**Parameters**

- **handle** - Device handle to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

**esp_err_t spi_device_queue_trans**

```
(spi_device_handle_t handle, spi_transaction_t *trans_desc,
TickType_t ticks_to_wait)
```

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**

- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
Chapter 2. API Reference

**esp_err_t spi_device_get_trans_result** (spi_device_handle_t handle, spi_transaction_t **trans_desc, 
TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by spi_device_queue_trans.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by spi_device_get_trans_result.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

**esp_err_t spi_device_transmit** (spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_queue_trans() followed by spi_device_get_trans_result(). Do not use this when there is still a transaction separately queued (started) from spi_device_queue_trans() or polling_start/transmit that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t spi_device_polling_start** (spi_device_handle_t handle, spi_transaction_t *trans_desc, 
TickType_t ticks_to_wait)

Immediately start a polling transaction.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Parameters**
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; currently only portMAX_DELAY is supported.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
• ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
• ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

`esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)`

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait` - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

`esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)`

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

`esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)`

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- `device` - The device to occupy the bus.
- `wait` - Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

**Returns**
- ESP_ERR_INVALID_ARG : `wait` is not set to `portMAX_DELAY`.
- ESP_OK : Success.

`void spi_device_release_bus(spi_device_handle_t dev)`

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev` - The device to release the bus.
Chapter 2. API Reference

int spi_get_actual_clock (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

Parameters

• fapb - The frequency of apb clock, should be APB_CLK_FREQ.
• hz - Desired working frequency
• duty_cycle - Duty cycle of the spi clock

Returns 
Actual working frequency that most fit.

void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

Note: If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters

• gpio_is_used - True if using GPIO matrix, or False if iomux pins are used.
• input_delay_ns - Input delay from SCLK launch edge to MISO data valid.
• eff_clk - Effective clock frequency (in Hz) from spi_get_actual_clock().
• dummy_o - Address of dummy bits used output. Set to NULL if not needed.
• cycles_remain_o - Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Parameters

• gpio_is_used - True if using GPIO matrix, or False if native pins are used.
• input_delay_ns - Input delay from SCLK launch edge to MISO data valid.

Returns 
Frequency limit of current configurations.

Structures

struct spi_device_interface_config_t

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t command_bits

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.

uint8_t address_bits

Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

uint8_t dummy_bits

Amount of dummy bits to insert between address and data phase.
uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz

Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int input_delay_ns

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num

CS GPIO pin for this device, or -1 if not used.

uint32_t flags

Bitwise OR of SPI_DEVICE_* flags.

int queue_size

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.
struct `spi_transaction_t`

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

- `uint32_t flags`
  Bitwise OR of `SPI_TRANS_*` flags.

- `uint16_t cmd`
  Command data, of which the length is set in the `command_bits` of `spi_device_interface_config_t`.
  
  **Note:** this field, used to be `command` in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

  Example: write `0x0123` and `command_bits=12` to send command `0x12`, `0x3_` (in previous version, you may have to write `0x3_12`).

- `uint64_t addr`
  Address data, of which the length is set in the `address_bits` of `spi_device_interface_config_t`.
  
  **Note:** this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

  Example: write `0x123400` and `address_bits=24` to send address of `0x12`, `0x34`, `0x00` (in previous version, you may have to write `0x12340000`).

- `size_t length`
  Total data length, in bits.

- `size_t rxlength`
  Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

- `void *user`
  User-defined variable. Can be used to store eg transaction ID.

- `const void *tx_buffer`
  Pointer to transmit buffer, or NULL for no MOSI phase.

- `uint8_t tx_data[4]`
  If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

- `void *rx_buffer`
  Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

- `uint8_t rx_data[4]`
  If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

struct `spi_transaction_ext_t`

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.
Chapter 2. API Reference

Public Members

```c
struct spi_transaction_t base
    Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.
```

```c
uint8_t command_bits
    The command length in this transaction, in bits.
```

```c
uint8_t address_bits
    The address length in this transaction, in bits.
```

```c
uint8_t dummy_bits
    The dummy length in this transaction, in bits.
```

Macros

**SPI_MASTER_FREQ_8M**
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

**8MHz**

**SPI_MASTER_FREQ_9M**
8.89MHz

**SPI_MASTER_FREQ_10M**
10MHz

**SPI_MASTER_FREQ_11M**
11.43MHz

**SPI_MASTER_FREQ_13M**
13.33MHz

**SPI_MASTER_FREQ_16M**
16MHz

**SPI_MASTER_FREQ_20M**
20MHz

**SPI_MASTER_FREQ_26M**
26.67MHz

**SPI_MASTER_FREQ_40M**
40MHz

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.
SPI_DEVICE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
Transmit and receive LSB first.

SPI_DEVICE_3WIRE
Use MOSI (=spid) for both sending and receiving data.

SPI DEVICE_POSITIVE_CS
Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX
Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS
Output clock on CS line if CS is active.

SPI DEVICE_NO_DUMMY
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_TRANS_MODE_DIO
Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO
Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.
SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_CS_KEEP_ACTIVE
Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.6.21 SPI Slave Driver
SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

Overview of ESP32’s SPI peripherals
ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master.
• SPI2, sometimes referred to as HSPI
• SPI3, sometimes referred to as VSPI
SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology
The terms used in relation to the SPI slave driver are given in the table below.
### Term | Definition
--- | ---
Host | The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device | SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.
Bus | A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO | Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI | Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK | Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS | Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP | Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD | Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion | The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.
Transaction | One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge | Edge of the clock at which the source register launches the signal onto the line.
Latch Edge | Edge of the clock at which the destination register latches in the signal.

### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).
Chapter 2. API Reference

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1.

If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>GPIO Number (SPI2)</th>
<th>GPIO Number (SPI3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>

<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th>/</th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency reaches the maximum limitation, random errors may occur. 2. The clock uncertainty between the Host and the Device (12.5 ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.

**Restrictions and Known Issues**

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:
If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

**Application Example**

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

**API Reference**

**Header File**

- `components/driver/include/driver/spi_slave.h`

**Functions**

```c
esp_err_t spi_slave_initialize (spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host` - SPI peripheral to use as a SPI slave interface
- `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `slave_config` - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
Chapter 2. API Reference

- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Parameters**

- `host` – SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc,
                                   TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Parameters**

- `host` – SPI peripheral that is acting as a slave
- `trans_desc` – Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait` – Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc,
                                        TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Parameters**

- `host` – SPI peripheral to that is acting as a slave
- `trans_desc` – [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- `ticks_to_wait` – Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`. 
Parameters

- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

```c
struct spi_slave_interface_config_t
```

This is a configuration for a SPI host acting as a slave device.

**Public Members**

```c
int spics_io_num
```

CS GPIO pin for this device.

```c
uint32_t flags
```

Bitwise OR of SPI_SLAVE_* flags.

```c
int queue_size
```

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
slave_transaction_cb_t post_setup_cb
```

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

```c
slave_transaction_cb_t post_trans_cb
```

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

```c
struct spi_slave_transaction_t
```

This structure describes one SPI transaction
Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer % 4 == 0), and has length of a multiple of 4 bytes.

void *user
User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.22 ESP32-WROOM-32SE (Secure Element)

Overview

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

Application Example

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

How to configure and provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility
How to use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer ATECC608A with ESP-TLS in ESP-TLS documentation.

2.6.23 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32 can support up to 10 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note.

For more information about testing touch sensors in various configurations, please check the Guide for ESP32-Sense-Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several ..._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.
Touch State Measurements  The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section Filtering of Measurements.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`.

Method of Measurements  The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified by `touch_pad_set_measurement_clock_cycles()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor will sleep until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

**Note:** If the specified clock cycles for measurement is too small, the result may be inaccurate, but increasing clock cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

Optimization of Measurements  A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_measurement_clock_cycles()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Clock cycles of one measurement: `touch_pad_set_measurement_clock_cycles()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

The last chart Output represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

Filtering of Measurements  If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.
You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in `Touch State Measurements` to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see `Filtering of Measurements`) does
Wakeup from Sleep Mode If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- `touch_pad_set_group_mask() / touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

Application Examples

- Touch sensor read example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`.
- Touch sensor interrupt example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`.

API Reference

Header File

- `components/driver/esp32/include/driver/touch_sensor.h`

Functions

```c
esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)
```

Configure touch pad interrupt threshold.

**Note:** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Parameters**

- `touch_num` – touch pad index
- `threshold` – interrupt threshold,

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

```c
esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t *touch_value)
```

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note:** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

**Parameters**

- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of ‘touch_value’ is 0.
• ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_read_filtered(touch_pad_t touch_num, uint16_t *touch_value)
```
get filtered touch sensor counter value by IIR filter.

**Note:** touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

**Parameters**
- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t *touch_value)
```
get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note:** touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

**Parameters**
- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_set_filter_read_cb(filter_cb_t read_cb)
```
Register the callback function that is called after each IIR filter calculation.

**Note:** The ‘read_cb’ callback is called in timer task in each filtering cycle.

**Parameters**
- `read_cb` – Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG set error

```c
esp_err_t touch_pad_isr_register(intr_handler_t fn, void *arg)
```
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**
- `fn` – Pointer to ISR handler
- `arg` – Parameter for ISR

**Returns**
- ESP_OK Success ;
• ESP_ERR_INVALID_ARG GPIO error
• ESP_ERR_NO_MEM No memory

```
esp_err_t touch_pad_set_measurement_clock_cycles (uint16_t clock_cycle)
```

Set the clock cycles of each measurement.

**Note:** This function will specify the clock cycles of each measurement and the clock is sourced from SOC_MOD_CLK_RTC_FAST, its default frequency is SOC_CLK_RC_FAST_FREQ_APPRX. The touch sensor will record the charge and discharge times during these clock cycles as the final result (raw value).

**Note:** If clock cycles is too small, it may lead to inaccurate results.

**Parameters**

- `clock_cycle` - The clock cycles of each measurement

**Returns**

- ESP_OK Set the clock cycle success

```
esp_err_t touch_pad_get_measurement_clock_cycles (uint16_t *clock_cycle)
```

Get the clock cycles of each measurement.

**Parameters**

- `clock_cycle` - The clock cycles of each measurement

**Returns**

- ESP_OK Get the clock cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

```
esp_err_t touch_pad_set_measurement_interval (uint16_t interval_cycle)
```

Set the interval between two measurements.

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPRX.

**Parameters**

- `interval_cycle` - The interval between two measurements

**Returns**

- ESP_OK Set interval cycle success

```
esp_err_t touch_pad_get_measurement_interval (uint16_t *interval_cycle)
```

Get the interval between two measurements.

**Parameters**

- `interval_cycle` - The interval between two measurements

**Returns**

- ESP_OK Get interval cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

```
esp_err_t touch_pad_set_meas_time (uint16_t sleep_cycle, uint16_t meas_cycle)
```

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note:** The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified as the second parameter). That means the number of cycles (raw value) will decrease as the capacity of the touch pad is increasing.
Chapter 2. API Reference

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

### Parameters

- **sleep_cycle** – The touch sensor will sleep after each measurement. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.

- **meas_cycle** – The duration of the touch sensor measurement. The maximum measure time is `0xffff / SOC_CLK_RC_FAST_FREQ_APPROX`.

### Returns

- ESP_OK on success

```c
esp_err_t touch_pad_get_meas_time(uint16_t* sleep_cycle, uint16_t* meas_cycle)
```

Get touch sensor measurement and sleep time.

### Parameters

- **sleep_cycle** – Pointer to accept sleep cycle number
- **meas_cycle** – Pointer to accept measurement cycle count.

### Returns

- ESP_OK on success
- ESP_INVALID_ARG The input parameter is NULL

```c
esp_err_t touch_pad_sw_start(void)
```

Trigger a touch sensor measurement, only support in SW mode of FSM.

### Returns

- ESP_OK on success

```c
esp_err_t touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)
```

Set touch sensor interrupt threshold.

### Parameters

- **touch_num** – Touch pad index
- **threshold** – Threshold of touch pad count, refer to `touch_pad_set_trigger_mode` to see how to set trigger mode.

### Returns

- ESP_OK on success
- ESP_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint16_t* threshold)
```

Get touch sensor interrupt threshold.

### Parameters

- **touch_num** – Touch pad index
- **threshold** – Pointer to accept threshold

### Returns

- ESP_OK on success
- ESP_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_set_trigger_mode(touch_trigger_mode_t mode)
```

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

### Parameters

- **mode** – Touch sensor interrupt trigger mode

### Returns

- ESP_OK on success
- ESP_INVALID_ARG if argument is wrong
`esp_err_t touch_pad_get_trigger_mode (touch_trigger_mode_t *mode)`

Get touch sensor interrupt trigger mode.

**Parameters**
- **mode** - pointer to accept touch sensor interrupt trigger mode

**Returns**
- ESP_OK on success

`esp_err_t touch_pad_set_trigger_source (touch_trigger_src_t src)`

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

**Parameters**
- **src** - touch sensor interrupt trigger source

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t *src)`

Get touch sensor interrupt trigger source.

**Parameters**
- **src** - pointer to accept touch sensor interrupt trigger source

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)`

Set touch sensor group mask. Touchpad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

**Parameters**
- **set1_mask** - bitmask of touch sensor signal group1, it’s a 10-bit value
- **set2_mask** - bitmask of touch sensor signal group2, it’s a 10-bit value
- **en_mask** - bitmask of touch sensor work enable, it’s a 10-bit value

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)`

Get touch sensor group mask.

**Parameters**
- **set1_mask** - pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
- **set2_mask** - pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
- **en_mask** - pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

**Returns**
- ESP_OK on success

`esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)`

Clear touch sensor group mask. Touchpad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

**Parameters**
- **set1_mask** - bitmask touch sensor signal group1, it’s a 10-bit value
- **set2_mask** - bitmask touch sensor signal group2, it’s a 10-bit value
- **en_mask** - bitmask of touch sensor work enable, it’s a 10-bit value

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_intr_enable (void)`

To enable touch pad interrupt.
Returns

- ESP_OK on success

`esp_err_t touch_pad_intr_disable (void)`
To disable touch pad interrupt.

Returns

- ESP_OK on success

`esp_err_t touch_pad_intr_clear (void)`
To clear touch pad interrupt.

Returns

- ESP_OK on success

`esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)`
set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

Parameters

- `new_period_ms` – filter period, in ms

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

`esp_err_t touch_pad_get_filter_period (uint32_t *p_period_ms)`
get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

Parameters

- `p_period_ms` – pointer to accept period

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

`esp_err_t touch_pad_filter_start (uint32_t filter_period_ms)`
start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

Parameters

- `filter_period_ms` – filter calibration period, in ms

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM Nomemory for driver
- ESP_ERR_INVALID_STATE driver state error

`esp_err_t touch_pad_filter_stop (void)`
stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

`esp_err_t touch_pad_filter_delete (void)`
delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

Returns

- ESP_OK Success

Note: This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.
• ESP_ERR_INVALID_STATE driver state error

**Type Definitions**

typedef void (*filter_cb_t)(uint16_t *raw_value, uint16_t *filtered_value)

Callback function that is called after each IIR filter calculation.

**Note:** This callback is called in timer task in each filtering cycle.

**Note:** This callback should not be blocked.

**Param raw_value** The latest raw data (touch sensor counter value) that points to all channels (raw_value[0..TOUCH_PAD_MAX-1]).

**Param filtered_value** The latest IIR filtered data (calculated from raw data) that points to all channels (filtered_value[0..TOUCH_PAD_MAX-1]).

**Header File**

• components/driver/include/driver/Touch_sensor_common.h

**Functions**

**esp_err_t touch_pad_init (void)**

Initialize touch module.

**Note:** If default parameter don’t match the usage scenario, it can be changed after this function.

**Returns**

• ESP_OK Success
• ESP_ERR_NO_MEM Touch pad init error
• ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

**esp_err_t touch_pad_deinit (void)**

Un-install touch pad driver.

**Note:** After this function is called, other touch functions are prohibited from being called.

**Returns**

• ESP_OK Success
• ESP_FAIL Touch pad driver not initialized

**esp_err_t touch_pad_io_init (touch_pad_t touch_num)**

Initialize touch pad GPIO.

**Parameters**

**touch_num**—touch pad index

**Returns**

• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong
**esp_err_t** `touch_pad_set_voltage` *(touch_high_volt_t* `refh`, *touch_low_volt_t* `refl`, *touch_volt_atten_t* `atten`)*

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**
- `refh` – the value of DREFH
- `refl` – the value of DREFL
- `atten` – the attenuation on DREFH

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t** `touch_pad_get_voltage` *(touch_high_volt_t* `*refh`, *touch_low_volt_t* `*refl`, *touch_volt_atten_t* `*atten`)*

Get touch sensor reference voltage.

**Parameters**
- `refh` – pointer to accept DREFH value
- `refl` – pointer to accept DREFL value
- `atten` – pointer to accept the attenuation on DREFH

**Returns**
- ESP_OK on success

**esp_err_t** `touch_pad_set_cnt_mode` *(touch_pad_t* `touch_num`, *touch_cnt_slope_t* `slope`, *touch_tie_opt_t* `opt`)*

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Parameters**
- `touch_num` – touch pad index
- `slope` – touch pad charge/discharge speed
- `opt` – the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t** `touch_pad_get_cnt_mode` *(touch_pad_t* `touch_num`, *touch_cnt_slope_t* `*slope`, *touch_tie_opt_t* `*opt`)*

Get touch sensor charge/discharge speed for each pad.

**Parameters**
- `touch_num` – touch pad index
- `slope` – pointer to accept touch pad charge/discharge slope
- `opt` – pointer to accept the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t** `touch_pad_isr_deregister` *(void (*fn)(void*), void* arg)*

Deregister the handler previously registered using touch_pad_isr_handler_register.

**Parameters**
- `fn` – handler function to call (as passed to touch_pad_isr_handler_register)
- `arg` – argument of the handler (as passed to touch_pad_isr_handler_register)

**Returns**
**Chapter 2. API Reference**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

```c
esp_err_t touch_pad_get_wakeup_status (touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

**Parameters**
- `pad_num` - pointer to touch pad which caused wakeup

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_set_fsm_mode (touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters**
- `mode` - FSM mode

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_fsm_mode (touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

**Parameters**
- `mode` - pointer to accept FSM mode

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_clear_status (void)
```

To clear the touch sensor channel active status.

---

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

```c
uint32_t touch_pad_get_status (void)
```

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

```c
bool touch_pad_meas_is_done (void)
```

Check touch sensor measurement status.

**Returns**
- True measurement is under way
- False measurement done

### GPIO Lookup Macros

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

Values:

enumerator TOUCH_PAD_NUM0

Touch pad channel 0 is GPIO4(ESP32)

eumerator TOUCH_PAD_NUM1

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
enumerator TOUCH_PAD_NUM2
    Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator TOUCH_PAD_NUM3
    Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator TOUCH_PAD_NUM4
    Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator TOUCH_PAD_NUM5
    Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator TOUCH_PAD_NUM6
    Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator TOUCH_PAD_NUM7
    Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator TOUCH_PAD_NUM8
    Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator TOUCH_PAD_NUM9
    Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator TOUCH_PAD_MAX

enum touch_high_volt_t
    Touch sensor high reference voltage

Values:

enumerator TOUCH_HVOLT_KEEP
    Touch sensor high reference voltage, no change

enumerator TOUCH_HVOLT_2V4
    Touch sensor high reference voltage, 2.4V

enumerator TOUCH_HVOLT_2V5
    Touch sensor high reference voltage, 2.5V

enumerator TOUCH_HVOLT_2V6
    Touch sensor high reference voltage, 2.6V

enumerator TOUCH_HVOLT_2V7
    Touch sensor high reference voltage, 2.7V

enumerator TOUCH_HVOLT_MAX
enum `touch_low_volt_t`
Touch sensor low reference voltage

*Values:*

- enumerator `TOUCH_LVOLT_KEEP`
  Touch sensor low reference voltage, no change

- enumerator `TOUCH_LVOLT_0V5`
  Touch sensor low reference voltage, 0.5V

- enumerator `TOUCH_LVOLT_0V6`
  Touch sensor low reference voltage, 0.6V

- enumerator `TOUCH_LVOLT_0V7`
  Touch sensor low reference voltage, 0.7V

- enumerator `TOUCH_LVOLT_0V8`
  Touch sensor low reference voltage, 0.8V

- enumerator `TOUCH_LVOLT_MAX`

enum `touch_volt_atten_t`
Touch sensor high reference voltage attenuation

*Values:*

- enumerator `TOUCH_HVOLT_ATTEN_KEEP`
  Touch sensor high reference voltage attenuation, no change

- enumerator `TOUCH_HVOLT_ATTEN_1V5`
  Touch sensor high reference voltage attenuation, 1.5V attenuation

- enumerator `TOUCH_HVOLT_ATTEN_1V`
  Touch sensor high reference voltage attenuation, 1.0V attenuation

- enumerator `TOUCH_HVOLT_ATTEN_0V5`
  Touch sensor high reference voltage attenuation, 0.5V attenuation

- enumerator `TOUCH_HVOLT_ATTEN_0V`
  Touch sensor high reference voltage attenuation, 0V attenuation

- enumerator `TOUCH_HVOLT_ATTEN_MAX`

enum `touch_cnt_slope_t`
Touch sensor charge/discharge speed

*Values:*

- enumerator `TOUCH_PAD_SLOPE_0`
  Touch sensor charge / discharge speed, always zero
enumerator TOUCH_PAD_SLOPE_1
Touch sensor charge / discharge speed, slowest

enumerator TOUCH_PAD_SLOPE_2
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_3
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_4
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_5
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_6
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_7
Touch sensor charge / discharge speed, fast

enumerator TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
Touch sensor initial charge level
Values:

enumerator TOUCH_PAD_TIE_OPT_LOW
Initial level of charging voltage, low level

enumerator TOUCH_PAD_TIE_OPT_HIGH
Initial level of charging voltage, high level

enumerator TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t
Touch sensor FSM mode
Values:

enumerator TOUCH_FSM_MODE_TIMER
To start touch FSM by timer

enumerator TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

enumerator TOUCH_FSM_MODE_MAX
enum touch_trigger_mode_t

Values:

enumerator TOUCH_TRIGGER_BELOW
    Touch interrupt will happen if counter value is less than threshold.

enumerator TOUCH_TRIGGER_ABOVE
    Touch interrupt will happen if counter value is larger than threshold.

enumerator TOUCH_TRIGGER_MAX

enum touch_trigger_src_t

Values:

enumerator TOUCH_TRIGGER_SOURCE_BOTH
    wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator TOUCH_TRIGGER_SOURCE_SET1
    wakeup interrupt is generated if SET1 is “touched”

enumerator TOUCH_TRIGGER_SOURCE_MAX

2.6.24 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- Two-Wire Automotive Interface (TWAI)
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
  - Examples
  - API Reference
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages

TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

• 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
• Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
• Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters

The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

Error Active: A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

Error Passive: A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

Bus-Off: A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.
TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

Note: An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes  The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts  The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured...
during runtime by calling `twai_reconfigure_alerts()` . The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()` . The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the brp can be any even number from 2 to 128.

If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the CONFIG_ESP32_REV_MIN to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).
The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. $sjw$ can range from 1 to 4.

**Note:** Multiple combinations of $brp$, $tseg_1$, $tseg_2$, and $sjw$ can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver:

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_125KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()

Revision 2 or later of the ESP32 also supports the following bit rates:

- TWAI_TIMING_CONFIG_20KBITS()
- TWAI_TIMING_CONFIG_16KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()
Disabling TX Queue  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note:  When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

ESP32 Errata Workarounds  The ESP32’s TWAI controller contains multiple hardware errata (more details about the errata can be found in the ESP32’s ECO document). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:

- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
- If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.
Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Fig. 26: State transition diagram of the TWAI driver (see table below)**

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>

<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped**: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off**: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:
### Message Flag

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>

</tbody>
</table>

### Examples

#### Configuration & Installation

The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    // Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    // Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    // Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

#### Message Transmission

The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
```

(continues on next page)
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

Message Reception  The following code snippet demonstrates how to receive a message via the usage of the twai_message_t type and twai_receive() function.

#include "driver/twai.h"
...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"
...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}
//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the
\texttt{twai\_stop()} and \texttt{twai\_driver\_uninstall()} functions.

```c
#include "driver/twai.h"
...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in \texttt{twai\_filter\_config\_t} can be configured such
that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting
bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the
IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```plaintext
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples  

\textbf{Network Example:} The TWAINetwork example demonstrates communication between
two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer
of a data from another node acting as a network slave. The example can be found via \texttt{peripherals/twai/twai\_network}.

\textbf{Alert and Recovery Example:} This example demonstrates how to use the TWAI driver’s alert and bus-off recovery
API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via \texttt{peripherals/twai/twai\_alert\_and\_recovery}.

\textbf{Self Test Example:} This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI
controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections
between the TWAI controller and the external transceiver are working correctly. The example can be found via \texttt{peripherals/twai/twai\_self\_test}.

struct twai_timing_config_t

Structure for bit timing configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure
Chapter 2. API Reference

Public Members

**uint32_t brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported.

**uint8_t tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

**uint8_t tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

**uint8_t sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

**bool triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

**struct twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

**Note:** Macro initializers are available for this structure

---

Public Members

**uint32_t acceptance_code**

32-bit acceptance code

**uint32_t acceptance_mask**

32-bit acceptance mask

**bool single_filter**

Use Single Filter Mode (see documentation)

---

Macros

**TWAI_EXTD_ID_MASK**

TWAI Constants. Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**

Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**

EFF ID requires 4 bytes (29bit)
TWAI_FRAME_STD_ID_LEN_BYTES
SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH
Error counter threshold for error passive

Enumerations
enum twai_mode_t
TWAI Controller operating modes.

Values:

enumerator TWAI_MODE_NORMAL
Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator TWAI_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

enumerator TWAI_MODE_LISTEN_ONLY
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File
• components/driver/include/driver/twai.h

Functions
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
Install TWAI driver.
This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note: Macro initializers are available for the configuration structures (see documentation)

Note: To reinstall the TWAI driver, call twai_driver_uninstall() first

Parameters
• g_config [in] General configuration structure
• t_config [in] Timing configuration structure
• f_config [in] Filter configuration structure

Returns
• ESP_OK: Successfully installed TWAI driver
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_NO_MEM: Insufficient memory
• ESP_ERR_INVALID_STATE: Driver is already installed
**esp_err_t twai_driver_uninstall (void)**

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t twai_start (void)**

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

**esp_err_t twai_stop (void)**

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

**esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)**

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note:** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note:** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.
Chapter 2. API Reference

Parameters
- **message** – [in] Message to transmit
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block on the TX queue

Returns
- **ESP_OK**: Transmission successfully queued/initiated
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_TIMEOUT**: Timed out waiting for space on TX queue
- **ESP_FAIL**: TX queue is disabled and another message is currently transmitting
- **ESP_ERR_INVALID_STATE**: TWAI driver is not in running state, or is not installed
- **ESP_ERR_NOT_SUPPORTED**: Listen Only Mode does not support transmissions

```c
esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)
```
Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters
- **message** – [out] Received message
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block on RX queue

Returns
- **ESP_OK**: Messages successfully received from RX queue
- **ESP_ERR_TIMEOUT**: Timed out waiting for message
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)
```
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it times out.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Parameters
- **alerts** – [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block for alert

Returns
- **ESP_OK**: Alerts read
- **ESP_ERR_TIMEOUT**: Timed out waiting for alerts
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)
```
Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Parameters
- **alerts_enabled** – [in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** – [out] Bit field of currently raised alerts. Set to NULL if unused
Returns
• ESP_OK: Alerts reconfigured
• ESP.ERR.INVALID_STATE: TWAI driver is not installed

`esp_err_t twai_initiate_recovery(void)`
Start the bus recovery process.
This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Returns
• ESP_OK: Bus recovery started
• ESP.ERR.INVALID.STATE: TWAI driver is not in the bus-off state, or is not installed

`esp_err_t twai_get_status_info(twai_status_info_t *status_info)`
Get current status information of the TWAI driver.

Parameters
status_info - [out] Status information

Returns
• ESP_OK: Status information retrieved
• ESP.ERR.INVALID_ARG: Arguments are invalid
• ESP.ERR.INVALID_STATE: TWAI driver is not installed

`esp_err_t twai_clear_transmit_queue(void)`
Clear the transmit queue.
This function will clear the transmit queue of all messages.

Note: The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

Returns
• ESP_OK: Transmit queue cleared
• ESP.ERR.INVALID_STATE: TWAI driver is not installed or TX queue is disabled

`esp_err_t twai_clear_receive_queue(void)`
Clear the receive queue.
This function will clear the receive queue of all messages.

Note: The receive queue is automatically cleared when twai_start() is called.

Returns
• ESP_OK: Transmit queue cleared
• ESP.ERR.INVALID_STATE: TWAI driver is not installed

Structures

`struct twai_general_config_t)`
Structure for general configuration of the TWAI driver.
Note: Macro initializers are available for this structure

Public Members

`twai_mode_t mode`
Mode of TWAI controller

`gpio_num_t tx_io`
Transmit GPIO number

`gpio_num_t rx_io`
Receive GPIO number

`gpio_num_t clkout_io`
CLKOUT GPIO number (optional, set to -1 if unused)

`gpio_num_t bus_off_io`
Bus off indicator GPIO number (optional, set to -1 if unused)

`uint32_t tx_queue_len`
Number of messages TX queue can hold (set to 0 to disable TX Queue)

`uint32_t rx_queue_len`
Number of messages RX queue can hold

`uint32_t alerts_enabled`
Bit field of alerts to enable (see documentation)

`uint32_t clkout_divider`
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

`int intr_flags`
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

`struct twai_status_info_t`
Structure to store status information of TWAI driver.

Public Members

`twai_state_t state`
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`
Number of messages queued for transmission or awaiting transmission completion
uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred

**Macros**

**TWAI_IO_UNUSED**
    Marks GPIO as unused in TWAI configuration

**Enumerations**

enum twai_state_t
    TWAI driver states.

    *Values:*

    enumerator TWAI_STATE_STOPPED
        Stopped state. The TWAI controller will not participate in any TWAI bus activities

    enumerator TWAI_STATE_RUNNING
        Running state. The TWAI controller can transmit and receive messages

    enumerator TWAI_STATE_BUS_OFF
        Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

    enumerator TWAI_STATE_RECOVERING
        Recovering state. The TWAI controller is undergoing bus recovery
### 2.6.25 Universal Asynchronous Receiver/Transmitter (UART)

#### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

#### Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

#### Setting Communication Parameters

UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.
### Table 8: Functions for Configuring specific parameters individually

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

### Setting Communication Pins

After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

### Driver Installation

Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
                                    uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

### Running UART Communication

Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.
Transmitting  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.
";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

Receiving  Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts  There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in `ESP32 Technical Reference Manual > UART Controller`
(UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]*. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is
supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

---

**Note:**
- The schematics below do **not** necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

    | +---| GND |
```

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

```
VCC -----------------+  
    |                 |  
RXD <-------| R |  
   | B|-------<> B  
ESP |  |  |  
    |  |  |  
TXD ------->| D |  
    |   |  |  
    | ADM483 |  | RS485 bus side  
    | |  |  
    | RTS ------->| DE |  
    | |  |  
    |   |  |  
    | A|-------<> A  
    | |  |  
    |   |  |  
    | +---| /RE |  
    | |  |  
    |   |  |  
    | +---| GND |  
    | |  |  
    |   |  |  
    | +---| GND |
```

(continues on next page)
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

```
+-------x-------+
|              |
|       GND    |
```

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

Application Examples

The table below describes the code examples available in the directory peripherals/uart/.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peripherals/uart/uart_echo</td>
<td>Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.</td>
</tr>
<tr>
<td>peripherals/uart/uart_events</td>
<td>Reporting various communication events, using pattern detection interrupts.</td>
</tr>
<tr>
<td>peripherals/uart/uart_async_rxtxtasks</td>
<td>Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.</td>
</tr>
<tr>
<td>peripherals/uart/uart_select</td>
<td>Using synchronous I/O multiplexing for UART file descriptors.</td>
</tr>
<tr>
<td>peripherals/uart/uart_echo_rs485</td>
<td>Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to peripherals/uart/uart_echo but allows communication through an RS485 interface chip connected to ESP32 pins.</td>
</tr>
<tr>
<td>peripherals/uart/nmea0183_parser</td>
<td>Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.</td>

Components

- components/driver/include/driver/uart.h

Functions

**esp_err_t uart_driver_install**(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note:** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** - UART RX ring buffer size.
- **tx_buffer_size** - UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** - UART event queue size/depth.
- **uart_queue** - UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_**IRAM** here (the driver’s ISR handler is not located in IRAM)

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_driver_delete**(uart_port_t uart_num)

Uninstall UART driver.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

**bool uart_is_driver_installed**(uart_port_t uart_num)

Checks whether the driver is installed or not.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- true driver is installed
- false driver is not installed

**esp_err_t uart_set_word_length**(uart_port_t uart_num, uart_word_length_t data_bit)

Set UART data bits.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** - UART data bits

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_word_length**(uart_port_t uart_num, uart_word_length_t *data_bit)

Get the UART data bit configuration.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **data_bit** — Pointer to accept value of UART data bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

```c
esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)
```
Set UART stop bits.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** — UART stop bits

**Returns**
- ESP_OK Success
- ESP_FAIL Fail

```c
esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)
```
Get the UART stop bit configuration.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** — Pointer to accept value of UART stop bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)
```
Set UART parity mode.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** — the enum of uart parity configuration

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)
```
Get the UART parity mode configuration.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** — Pointer to accept value of UART parity mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_baudrate (uart_port_t uart_num, uint32_t baudrate)
```
Set UART baud rate.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** — UART baud rate.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_get_baudrate (uart_port_t uart_num, uint32_t *baudrate)
```
Get the UART baud rate configuration.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** — Pointer to accept value of UART baud rate

**Returns**
- ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*baudrate)

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```
Set UART line inverse mode.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `inverse_mask` – Choose the wires that need to be inverted. Using the ORred mask of
  `uart_signal_inv_t`

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```
Set hardware flow control.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl` – Hardware flow control mode
- `rx_thresh` – Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when
  UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```
Set software flow control.

**Parameters**
- `uart_num` – UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable` – switch on or off
- `rx_thresh_xon` – low water mark
- `rx_thresh_xoff` – high water mark

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```
Get the UART hardware flow control configuration.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl` – Option for different flow control mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```
Clear UART interrupt status.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `clr_mask` – Bit mask of the interrupt status to be cleared.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```
Set UART interrupt enable.

**Parameters**
• **uart_num** – UART port number, the max port number is (UART_NUM_MAX - 1).
• **enable_mask** – Bit mask of the enable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX - 1).
- **disable_mask** – Bit mask of the disable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
```

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
```

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number
- **enable** – 1: enable; 0: disable
- **thresh** – Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is
performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `tx_io_num` - UART TX pin GPIO number.
- `rx_io_num` - UART RX pin GPIO number.
- `rts_io_num` - UART RTS pin GPIO number.
- `cts_io_num` - UART CTS pin GPIO number.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```
Manually set the UART RTS pin level.

**Note:** UART must be configured with hardware flow control disabled.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` - 1: RTS output low (active); 0: RTS output high (block)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` - 1: DTR output low; 0: DTR output high

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```
Set UART idle interval after tx FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num` - idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```
Set UART configuration parameters.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `uart_config` - UART parameter settings

**Returns**
- ESP_OK Success
Chapter 2. API Reference

- ESP_FAIL Parameter error

`esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)`

Configure UART interrupts.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `intr_conf` - UART interrupt settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)`

Wait until UART TX FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `ticks_to_wait` - Timeout, count in RTOS ticks

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

`int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)`

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note:** This function should only be used when UART TX buffer is not enabled.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buffer` - data buffer address
- `len` - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

`int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)`

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

`int uart_write_bytes_with_break(uart_port_t uart_num, const void *src, size_t size, int brk_len)`

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.
Otherwise, if the `tx_buffer_size` > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send
- `brk_len` - break signal duration (unit: the time it takes to send one bit at current baudrate)

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes(uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buf` - pointer to the buffer.
- `length` - data length
- `ticks_to_wait` - s Timeout, count in RTOS ticks

**Returns**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

```c
esp_err_t uart_flush(uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

```c
esp_err_t uart_flush_input(uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `size` - Pointer of size_t to accept cached data length

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
**esp_err_t uart_get_tx_buffer_free_size** *(uart_port_t uart_num, size_t*size)*

UART get TX ring buffer free space size.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **size** - Pointer of size_t to accept the free space size

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_disable_pattern_det_intr** *(uart_port_t uart_num)*

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_pattern_det_baud_intr** *(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)*

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num** - UART port number.
- **pattern_chr** - character of the pattern.
- **chr_num** - number of the character, 8bit value.
- **chr_tout** - timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** - idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- **pre_idle** - idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**int uart_pattern_pop_pos** *(uart_port_t uart_num)*

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
int uart_pattern_get_pos (uart_port_t uart_num)

  Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue. This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters
  • uart_num – UART port number, the max port number is (UART_NUM_MAX - 1).

Returns
  • (-1) No pattern found for current index or parameter error
  • others the pattern position in rx buffer.

esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)

  Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters
  • uart_num – UART port number, the max port number is (UART_NUM_MAX - 1).
  • queue_length – Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns
  • ESP_ERR_NO_MEM No enough memory
  • ESP_ERR_INVALID_STATE Driver not installed
  • ESP_FAIL Parameter error
  • ESP_OK Success

esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)

  UART set communication mode.

Note: This function must be executed after uart_driver_install(), when the driver object is initialized.

Parameters
  • uart_num – Uart number to configure, the max port number is (UART_NUM_MAX - 1).
  • mode – UART UART mode to set

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)

  Set uart threshold value for RX fifo full.

Note: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Parameters
  • uart_num – UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • threshold – Threshold value above which RX fifo full interrupt is generated

Returns
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

`esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)`

Set uart threshold values for TX fifo empty.

**Parameters**
- `uart_num` – UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold` – Threshold value below which TX fifo empty interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

`esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)`

UART set threshold timeout for TOUT feature.

**Parameters**
- `uart_num` – Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `tout_thresh` – This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

`esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)`

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Parameters**
- `uart_num` – Uart number to configure the max port number is (UART_NUM_MAX -1).
- `collision_flag` – Pointer to variable of type bool to return collision flag.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)`

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select UART_SCLK_REF_TICK or UART_SCLK_XTAL as UART clock source in `uart_config_t::source_clk`.
Note: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1); UART2 does not support light sleep wakeup feature.

Parameters
- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **wakeup_threshold** - number of RX edges for light sleep wakeup, value is 3.. 0x3ff.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

```c
esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int*out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

Parameters
- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

```c
esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

Parameters **uart_num** - UART number

```c
esp_err_t uart_set_loop_back (uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

Parameters
- **uart_num** - UART number
- **loop_back_en** - Set true to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout (uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.
Parameters

• `uart_num` - UART number
• `always_rx_timeout_en` - Set to false to enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

`uint32_t intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

Public Members

`uart_event_type_t type`

UART event type

`size_t size`

UART data size for UART_DATA event

`bool timeout_flag`

UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

`UART_NUM_0`

UART port 0

`UART_NUM_1`

UART port 1
Chapter 2. API Reference

UART_NUM_2
UART port 2

UART_NUM_MAX
UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN
Length of the UART HW FIFO.

UART_BITRATE_MAX
Maximum configurable bitrate.

Type Definitions
typedef intr_handle_t uart_isr_handle_t

Enumerations
enum uart_event_type_t
UART event types used in the ring buffer.

Values:

enumerator UART_DATA
UART data event

enumerator UART_BREAK
UART break event

enumerator UART_BUFFER_FULL
UART RX buffer full event

enumerator UART_FIFO_OVF
UART FIFO overflow event

enumerator UART_FRAME_ERR
UART RX frame error event

enumerator UART_PARITY_ERR
UART RX parity event

enumerator UART_DATA_BREAK
UART TX data and break event

enumerator UART_PATTERN_DET
UART pattern detected

enumerator UART_EVENT_MAX
UART event max index
Chapter 2. API Reference

Header File

- components/hal/include/hal/uart_types.h

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

**Public Members**

```c
uint8_t cmd_char
    UART AT cmd char

uint8_t char_num
    AT cmd char repeat number

uint32_t gap_tout
    gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
    the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle
    the idle time(in baud-rate) between the last AT char and the none AT char
```

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

**Public Members**

```c
uint8_t xon_char
    Xon flow control char

uint8_t xoff_char
    Xoff flow control char

uint8_t xon_thrd
    If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
    If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent
```

struct **uart_config_t**

UART configuration parameters for uart_param_config function.
Public Members

int baud_rate
   UART baud rate

uart_word_length_t data_bits
   UART byte size

uart_parity_t parity
   UART parity mode

uart_stop_bits_t stop_bits
   UART stop bits

uart_hw_flowcontrol_t flow_ctrl
   UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
   UART HW RTS threshold

uart_sclk_t source_clk
   UART source clock selection

Type Definitions

typedef int uart_port_t
   UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX - 1).

typedef soc_periph_uart_clk_src_legacy_t uart_sclk_t
   UART source clock.

Enumerations

enum uart_mode_t
   UART mode selection.

   Values:

   enumerator UART_MODE_UART
      mode: regular UART mode

   enumerator UART_MODE_RS485_HALF_DUPLEX
      mode: half duplex RS485 UART mode control by RTS pin

   enumerator UART_MODE_IRDA
      mode: IRDA UART mode

   enumerator UART_MODE_RS485_COLLISION_DETECT
      mode: RS485 collision detection UART mode (used for test purposes)
enumerator UART_MODE_RS485_APP_CTRL
    mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
    UART word length constants.
    Values:
    
    enumerator UART_DATA_5_BITS
        word length: 5bits

    enumerator UART_DATA_6_BITS
        word length: 6bits

    enumerator UART_DATA_7_BITS
        word length: 7bits

    enumerator UART_DATA_8_BITS
        word length: 8bits

    enumerator UART_DATA_BITS_MAX

enum uart_stop_bits_t
    UART stop bits number.
    Values:
    
    enumerator UART_STOP_BITS_1
        stop bit: 1bit

    enumerator UART_STOP_BITS_1_5
        stop bit: 1.5bits

    enumerator UART_STOP_BITS_2
        stop bit: 2bits

    enumerator UART_STOP_BITS_MAX

enum uart_parity_t
    UART parity constants.
    Values:
    
    enumerator UART_PARITY_DISABLE
        Disable UART parity

    enumerator UART_PARITY_EVEN
        Enable UART even parity

    enumerator UART_PARITY_ODD
        Enable UART odd parity
enum uart_hw_flowcontrol_t
UART hardware flow control modes.

Values:

enumerator UART_HW_FLOWCTRL_DISABLE
disable hardware flow control
enumerator UART_HW_FLOWCTRL_RTS
enable RX hardware flow control (rts)
enumerator UART_HW_FLOWCTRL_CTS
enable TX hardware flow control (cts)
enumerator UART_HW_FLOWCTRL_CTS_RTS
enable hardware flow control
enumerator UART_HW_FLOWCTRL_MAX

enum uart_signal_inv_t
UART signal bit map.

Values:

enumerator UART_SIGNAL_INV_DISABLE
Disable UART signal inverse
enumerator UART_SIGNAL_IRDA_TX_INV
inversethe UART irda_tx signal
enumerator UART_SIGNAL_IRDA_RX_INV
inversethe UART irda_rx signal
enumerator UART_SIGNAL_RXD_INV
inversethe UART rxd signal
enumerator UART_SIGNAL_CTS_INV
inversethe UART cts signal
enumerator UART_SIGNAL_DSR_INV
inversethe UART dsr signal
enumerator UART_SIGNAL_TXD_INV
inversethe UART txd signal
enumerator UART_SIGNAL_RTS_INV
inversethe UART rts signal
enumerator UART_SIGNAL_DTR_INV
inversethe UART dtr signal
**GPIOLookupMacros** The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIOLookupMacros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- `components/soc/esp32/include/soc/uart_channel.h`

**Macros**

- `UART_GPIO1_DIRECT_CHANNEL`
- `UART_NUM_0_TXD_DIRECT_GPIO_NUM`
- `UART_GPIO3_DIRECT_CHANNEL`
- `UART_NUM_0_RXD_DIRECT_GPIO_NUM`
- `UART_GPIO19_DIRECT_CHANNEL`
- `UART_NUM_0_CTS_DIRECT_GPIO_NUM`
- `UART_GPIO22_DIRECT_CHANNEL`
- `UART_NUM_0_RTS_DIRECT_GPIO_NUM`
- `UART_TXD_GPIO1_DIRECT_CHANNEL`
- `UART_RXD_GPIO3_DIRECT_CHANNEL`
- `UART_CTS_GPIO19_DIRECT_CHANNEL`
- `UART_RTS_GPIO22_DIRECT_CHANNEL`
- `UART_GPIO10_DIRECT_CHANNEL`
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7.Direct_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.
2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extensions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.

After being updated, this configuration is saved inside sdkconfig file in the project root directory. Based on sdkconfig, application build targets will generate sdkconfig.h file in the build directory, and will make sdkconfig options available to the project build system and source files.

2.7.3 Using sdkconfig.defaults

In some cases, such as when sdkconfig file is under revision control, the fact that sdkconfig file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of sdkconfig.defaults file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the sdkconfig file. sdkconfig.defaults can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the idf.py save-defconfig command.

Once sdkconfig.defaults is created, sdkconfig can be deleted and added to the ignore list of the revision control system (e.g. .gitignore file for git). Project build targets will automatically create sdkconfig file, populated with the settings from sdkconfig.defaults file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in sdkconfig by ones from sdkconfig.defaults. For more information, see Custom sdkconfig defaults.

2.7.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

• Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
• The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
• No trailing spaces are allowed at the end of the lines.
• The maximum length of options is set to 40 characters.
• The maximum length of lines is set to 120 characters.

Format checker
tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix .new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For
example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

### 2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in \texttt{sdkconfig}. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. \texttt{confgen.py} is used by the tool chain to pre-process \texttt{sdkconfig} files before anything else, for example \texttt{menuconfig}, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. \texttt{confgen.py} recursively finds all \texttt{sdkconfig.rename} files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the \texttt{sdkconfig} file. Renames that should only appear for a single target can be placed in a target specific rename file: \texttt{sdkconfig.rename.TARGET}, where \texttt{TARGET} is the target name, e.g. \texttt{sdkconfig.rename.esp32s2}.
3. \texttt{confgen.py} post-processes \texttt{sdkconfig} files and generates all build outputs (\texttt{sdkconfig.h}, \texttt{sdkconfig.cmake}, \texttt{auto.conf}) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. \textit{Deprecated options and their replacements} are automatically generated by \texttt{confgen.py}.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of \texttt{menuconfig}.

By convention, all option names are upper case with underscores. When Kconfig generates \texttt{sdkconfig} and \texttt{sdkconfig.h} files, option names are prefixed with \texttt{CONFIG_}. So if an option \texttt{ENABLE_FOO} is defined in a Kconfig file and selected in \texttt{menuconfig}, then \texttt{sdkconfig} and \texttt{sdkconfig.h} files will have \texttt{CONFIG_ENABLE_FOO} defined. In this reference, option names are also prefixed with \texttt{CONFIG_}, same as in the source code.

#### Build type

Contains:

- \texttt{CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS}
- \texttt{CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS}
- \texttt{CONFIG_APP_BUILD_TYPE}
- \texttt{CONFIG_APP_REPRODUCIBLE_BUILD}
- \texttt{CONFIG_APP_NO_BLOBS}

**\texttt{CONFIG_APP_BUILD_TYPE}**

Application build type

\textit{Found in: Build type}

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required...
to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```plaintext
# Connect to a running instance of OpenOCD target remote :3333
# Reset and halt the target
mon reset halt
# Run to a specific point in ROM code, # where most of initialization is complete.
thb *0x40007d54
# Load the application into RAM
load
# Run till app_main
app_main
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

```plaintext
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=y CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
```

**Available options:**

- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL)) (APP_BUILD_TYPE_ELF_RAM)

**CONFIG_APP_REPRODUCIBLE_BUILD**

Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

*Default value:*

- No (disabled)

**CONFIG_APP_NO_BLOBS**

No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

*Default value:*

- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Build type*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.
Default value:
  • No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Build type*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

Default value:
  • No (disabled)

**Application manager**

Contains:

  • `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
  • `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
  • `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
  • `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
  • `CONFIG_APP_COMPILE_TIME_DATE`

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

Default value:
  • Yes (enabled)

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:
  • No (disabled)
Chapter 2. API Reference

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*
  - No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

*Default value:*
  - No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

*Default value:*
  - 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

*Range:*
  - from 8 to 64

*Default value:*
  - 16

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
• `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
• `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
• `CONFIG_BOOTLOADER_WDT_ENABLE`
• `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

### `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

*Available options:*
- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

### `CONFIG_BOOTLOADER_LOG_LEVEL`

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

*Available options:*
- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

### `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: Bootloader config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

*Default value:*

1283
Chapter 2. API Reference

- No (disabled) if `ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT`

**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

*Range:*
  - from 0 to 33 if `ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT`

*Default value:*
  - 7 if `ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT`

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*
  - 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
  - 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

*Default value:*
  - No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

*Range:*
  - from 0 to 39 if `CONFIG_BOOTLOADER_FACTORY_RESET`

*Default value:*
  - 4 if `CONFIG_BOOTLOADER_FACTORY_RESET`
**CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER_OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

**CONFIG_BOOTLOADER_APP_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if CONFIG_BOOTLOADER_APP_TEST

**Default value:**
- 18 if CONFIG_BOOTLOADER_APP_TEST
CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**
- Yes (enabled)

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
- Yes (enabled)

CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for dis-abling rtc_wdt.
**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in:*  [Bootloader config] > [CONFIG_BOOTLOADER_WDT_ENABLE]

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

*Range:*
- from 0 to 120000

*Default value:*
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in:*  [Bootloader config]

After updating the app, the bootloader runs a new app with the “ESP_OOTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

*Default value:*
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in:*  [Bootloader config] > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE]

This option prevents rollback to previous firmware/application image with lower security version.

*Default value:*
- No (disabled) if [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE]

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in:*  [Bootloader config] > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE] > [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK]

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD] option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.
Your partition table should have a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version (only test)

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

*Found in:* Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_BOOT`
Skip image validation from power on reset (READ HELP FIRST)

*Found in:* Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in:* Bootloader config

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in:* Bootloader config

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in:* Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Range:**
- from 0 to 0x10 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
Chapter 2. API Reference

**Default value:**
- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

*Default value:*
- Yes (enabled)

**Security features**

Contains:
- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
- `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`
- `CONFIG_SECURE_FLASH_ENC_ENABLED`
- `CONFIG_SECURE_BOOT`
- `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING`
- Potentially insecure options
  - `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
  - `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
  - `CONFIG_SECURE_BOOTLOADER_MODE`
  - `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
  - `CONFIG_SECURE_UART_ROM_DL_MODE`
  - `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

**CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG_SECURE_SIGNED_APPS_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

**Available options:**
- **ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)**
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- **RSA (SECURE_SIGNED_APPS_RSA_SCHEME)**
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- **ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)**
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

**CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE**
ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported
- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be brute forced compared to 192 bit key. At present, both key sizes are practically implausible to brute force.

**Available options:**
- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**
Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**
- No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && SEC-URE_SIGNED_APPS_ECDSA_SCHEME

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
Default value:
  • Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
  • No (disabled)

**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

  • RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
  • ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

**Available options:**
  • Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
    Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
  • Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
    Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**
  • One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
    On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
  • Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
    Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows re-flashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

*Default value:*

- “secure_boot_signing_key.pem” if **CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader...
This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT` && `SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY` && `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING` Hardware Key Encoding

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with esefuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

**Default value:**
- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**

Size of generated AES-XTS key

**Default value:**
- No (disabled)
• AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
• AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
• AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:
• AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
• AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
• AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE
Enable usage mode

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

Available options:
• Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
• Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:
• CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
• CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
• CONFIG_SECURE_BOOT_ALLOW_JTAG
• CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
• CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
• CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC

Leave ROM BASIC Interpreter available on reset

Found in: Security features > Potentially insecure options

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

Default value:
• No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT
CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if \( CONFIG\_SECURE\_BOOT\_INSECURE \) || \( SEC\_CUR\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT \)

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is _NOT_ possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application.

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes sure that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.
Default value:
• No (disabled) if CONFIG_SECURE_BOOT_INSECURE && SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:
• No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC

Leave UART bootloader decryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

Default value:
• No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:
• No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

Found in: Security features > Potentially insecure options

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

Default value:
• No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT
**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

*Found in: Security features*

- If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.
- If not set, the app does not care if the flash encryption eFuse bit is set or not.

*Default value:*
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

*Available options:*
- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  - If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  - It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  - It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  - If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  - Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.
  - Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
  - Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
  - It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`
  - Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  - This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Serial flasher config**

Contains:
- `CONFIG_ESP_TOOLPY_AFTER`
- `CONFIG_ESP_TOOLPY_BEFORE`
Chapter 2. API Reference

- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

*Default value:*
  - No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

*Available options:*
  - QIO (ESPTOOLPY_FLASHMODE_QIO)
  - QOUT (ESPTOOLPY_FLASHMODE_QOUT)
  - DIO (ESPTOOLPY_FLASHMODE_DIO)
  - DOUT (ESPTOOLPY_FLASHMODE_DOUT)
  - OPI (ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

*Available options:*
  - STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
  - DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

*Available options:*
  - 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
  - 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
  - 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
  - 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
  - 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
  - 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
  - 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
  - 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
  - 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
  - 15 MHz (ESPTOOLPY_FLASHFREQ_15M)
**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

**Default value:**

- No (disabled)

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)
Partition Table

Contains:

- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`

**CONFIG_PARTITION_TABLE_TYPE**

**Partition Table**

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENCRYPTED_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

**Found in: Partition Table**

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

**Found in: Partition Table**

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

**Found in: Partition Table**

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled) if `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`
CONFIG_COMPILER_OPTIMIZATION

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting causes the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlate code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT- LOADER_COMPILER_OPTIMIZATION setting.

**Available options:**

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

**Available options:**

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

*Found in: Compiler options*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.
Available options:
  • libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
  • librvfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: Compiler options

If enabled, the error messages will be discarded in following check macros:
  - ESP_RETURN_ON_ERROR
  - ESP_EXIT_ON_ERROR
  - ESP_RETURN_ON_FALSE
  - ESP_EXIT_ON_FALSE

Default value:
  • No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS
Replace ESP-IDF and project paths in binaries

Found in: Compiler options

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

Default value:
  • Yes (enabled)

CONFIG_COMPILER_CXX_EXCEPTIONS
Enable C++ exceptions

Found in: Compiler options

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Default value:
  • No (disabled)

Contains:
  • CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE
Emergency Pool Size

Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.
Default value:
- 0 if `CONFIG_COMPILER_CXX_EXCEPTIONS`

**CONFIG_COMPILER_CXX_RTTI**
Enable C++ run-time type info (RTTI)
*Found in: Compiler options*
Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

Default value:
- No (disabled)

**CONFIG_COMPILER_STACK_CHECK_MODE**
Stack smashing protection mode
*Found in: Compiler options*
Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In **NORMAL** mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- **STRONG** mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected - those that have local array definitions, or have references to local frame addresses.
- In **OVERALL** mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:
- **performance**: NORMAL > STRONG > OVERALL
- **coverage**: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**
- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**
Enable -Wwrite-strings warning flag
*Found in: Compiler options*
Adds -Wwrite-strings flag for the C/C++ compilers.
For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.
For C++, this warns about the deprecated conversion from string literals to `char *`.

Default value:
- No (disabled)
Chapter 2. API Reference

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

Contains:

- ADC and ADC Calibration
- Application Level Tracing
- Bluetooth
- Common ESP-related
- Core dump
- Driver Configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH
- ESP HTTP client
- ESP HTTPS OTA
- ESP HTTPS server

**Application Level Tracing**

Contains:

- `CONFIG_APPTRACE_DESTINATION1`
- `CONFIG_APPTRACE_DESTINATION2`
- FreeRTOS SystemView Tracing
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_APPTRACE_UART_BAUDRATE`
- `CONFIG_APPTRACE_UART_RX_GPIO`
- `CONFIG_APPTRACE_UART_RX_BUFF_SIZE`
- `CONFIG_APPTRACE_UART_TASK_PRIO`
- `CONFIG_APPTRACE_UART_TX_MSG_SIZE`
- `CONFIG_APPTRACE_UART_TX_GPIO`
- `CONFIG_APPTRACE_UART_TX_BUFF_SIZE`

**CONFIG_APPTRACE_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (`APTRACE_DEST_JTAG`)
- None (`APTRACE_DEST_NONE`)

**CONFIG_APPTRACE_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

**Available options:**

- UART0 (`APTRACE_DEST_UART0`)
- UART1 (`APTRACE_DEST_UART1`)
- UART2 (`APTRACE_DEST_UART2`)
- USB_CDC (`APTRACE_DEST_USB_CDC`)
- None (`APTRACE_DEST_UART_NONE`)

**CONFIG_APPTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.
Chapter 2. API Reference

CONFIG_APPTRACE_UART_RX_GPIO

UART RX on GPIO#

*Found in:* Component config > Application Level Tracing

This GPIO is used for UART RX pin.

CONFIG_APPTRACE_UART_BAUDRATE

UART baud rate

*Found in:* Component config > Application Level Tracing

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

CONFIG_APPTRACE_UART_RX_BUFF_SIZE

UART RX ring buffer size

*Found in:* Component config > Application Level Tracing

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

CONFIG_APPTRACE_UART_TX_BUFF_SIZE

UART TX ring buffer size

*Found in:* Component config > Application Level Tracing

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

*Found in:* Component config > Application Level Tracing

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PRIO

UART Task Priority

*Found in:* Component config > Application Level Tracing

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

**Range:**
- from 1 to 32

**Default value:**
- 1
**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- `CONFIG_APPTRACE_SV_CPU`
- `CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE`
- `CONFIG_APPTRACE_SV_MAX_TASKS`
- `CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE`
- `CONFIG_APPTRACE_SV_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE`
- `CONFIG_APPTRACE_SV_BUF_WAIT_TMO`

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.
CONFIG_APPTRACE_SV_DEST
SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_DISABLE*

SystemView will transfer data through defined interface.

**Available options:**
- Data destination JTAG (APTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU
CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**
- CPU0 (APTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (APTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE
Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (APTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS
Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO
Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.
CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE
Trace Buffer Overflow Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
Task Start Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
Task Stop Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Stop Ready State” event.
CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE
Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE
Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE
System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE
Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE
Timer Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE
GCOV to Host Enable

Found in: Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

Bluetooth  Contains:
- Bluedroid Options
- CONFIG_BT_ENABLED
- Controller Options
- NimiBLE Options

CONFIG_BT_ENABLED
Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.
Chapter 2. API Reference

**CONFIG_BT_HOST**

Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
- Disabled (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**CONFIG_BT_CONTROLLER**

Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

**Available options:**

- Enabled (BT_CONTROLLER_ENABLED)
  This option is recommended for Bluetooth controller usecases
- Disabled (BT_CONTROLLER_DISABLED)
  This option is recommended for Bluetooth Host only usecases

**Bluedroid Options**

Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTC_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT_DEBUG_LOG_LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_CLASSIC_ENABLED`
- `CONFIG_BT_HID_ENABLED`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_MULTI_CONNECTION_ENABLE`
- `CONFIG_BT_MAX_DEVICE_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_SSP_ENABLED`
- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`

**CONFIG_BT_BTC_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size
**CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

*Available options:*

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

*Default value:*

- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

*Default value:*

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED
CONFIG_BT_SPP_ENABLED

SPP

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

This enables the Serial Port Profile

Default value:
  • No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_L2CAP_ENABLED

BT L2CAP

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

Default value:
  • No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

Default value:
  • No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_HFP_ROLE

Hands-free Profile Role configuration

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

Available options:
  • Hands Free Unit (BT_HFP_CLIENT_ENABLE)
  • Audio Gateway (BT_HFP_AG_ENABLE)

CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:
  • PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
  • HCI (BT_HFP_AUDIO_DATA_PATH_HCI)

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

Found in: Component config > Bluetooth > Bluedroid Options

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

Default value:
• Yes (enabled) if BT_HFP_AUDIO_DATA_PATH_HCI && BT_BLUE_DROID_ENABLED

**CONFIG_BT_HID_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

• No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_HID_ROLE**

Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

**Available options:**

• Classic BT HID Host (BT_HID_HOST_ENABLED)
  This enables the BT HID Host
• Classic BT HID Device (BT_HID_DEVICE_ENABLED)
  This enables the BT HID Device

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**

• Yes (enabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

• Yes (enabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

• Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUE_DROID_ENABLED
CONFIG_BT_GATTS_PPCP_CHAR_GAP
Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:
• No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE
Include blufi function

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:
• No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES
Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:
• from 1 to 32 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
• 8 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE
GATT Service Change Mode

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:
• GATTs manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API esp_ble_gatts_send_service_change_indication()• GATTs automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluechild handle the service change indication internally

CONFIG_BT_GATTC_ENABLE
Include GATT client module (GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_CACHE_NVS_FLASH**

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 3 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module (SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size
Default value:
  • No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**BT DEBUG LOG LEVEL**  Contains:

  • `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
  • `CONFIG_BT_LOG_APB_TRACE_LEVEL`
  • `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
  • `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
  • `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
  • `CONFIG_BT_LOG_BIF_TRACE_LEVEL`
  • `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
  • `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
  • `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
  • `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
  • `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
  • `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
  • `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
  • `CONFIG_BT_LOG_HID_TRACE_LEVEL`
  • `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
  • `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
  • `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
  • `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
  • `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
  • `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
  • `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

**Available options:**

  • NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
  • ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
  • WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
  • API (BT_LOG_HCI_TRACE_LEVEL_API)
  • EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
  • DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
  • VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

  • NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
  • ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
  • WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
  • API (BT_LOG_BTM_TRACE_LEVEL_API)
  • EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
  • DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
  • VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: Component config > Bluetooth > Bluez > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

Available options:
- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: Component config > Bluetooth > Bluez > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: Component config > Bluetooth > Bluez > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: Component config > Bluetooth > Bluez > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL
BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL
PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL
A2D layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:
• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL
AVDT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer
Available options:
- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL
AVCT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL
Define BT trace level for AVCT layer
Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL
AVRC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL
Define BT trace level for AVRC layer
Available options:
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL
MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL
Define BT trace level for MCA layer
Available options:
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

**Available options:**
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**
- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**
- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: Component config > Bluetooth > Bluehdroid Options > BT DEBUG LOG LEVEL
Define BT trace level for BTIF layer

Available options:
• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: Component config > Bluetooth > Bluehdroid Options > BT DEBUG LOG LEVEL
Define BT trace level for BTC layer

Available options:
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluehdroid Options > BT DEBUG LOG LEVEL
Define BT trace level for OSI layer

Available options:
• NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
• API (BT_LOG_OSI_TRACE_LEVEL_API)
• EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: Component config > Bluetooth > Bluehdroid Options > BT DEBUG LOG LEVEL
Define BT trace level for BLUFI layer
Available options:
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS
BT/BLE MAX ACL CONNECTIONS (1~7)

Found in: Component config > Bluetooth > Bluedroid Options

Maximum BT/BLE connection count

Range:
- from 1 to 7 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENABLE
Enable BLE multi-conections

Found in: Component config > Bluetooth > Bluedroid Options

Enable this option if there are multiple connections

Default value:
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
BT/BLE will first malloc the memory from the PSRAM

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the internal RAM if there have the PSRAM

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
Use dynamic memory allocation in BT/BLE stack

Found in: Component config > Bluetooth > Bluedroid Options

This select can make the allocation of memory will become more flexible

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
BLE queue congestion check

Found in: Component config > Bluetooth > Bluedroid Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.
Default value:
• No (disabled) if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

**CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluez Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

Default value:
• No (disabled) if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{(BTDM\_CTRL\_MODE_BTDM || BTDM\_CTRL\_MODE\_BLE\_ONLY)} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

**CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluez Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP\_GATTC\_OPEN\_EVT or ESP\_GATT\_S\_OPEN\_EVT is triggered.

Range:
• from 1 to 60 if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

Default value:
• 30 if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

**CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN**

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluez Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

Range:
• from 32 to 248 if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

Default value:
• 32 if \texttt{BT\_BLUEDROID\_ENABLED} \&\& \texttt{BT\_BLUEDROID\_ENABLED}

**CONFIG\_BT\_BLE\_RPA\_SUPPORTED**

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluez Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3, ESP32S3, ESP32H2 and ESP32C2, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.
Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_50_FEATURES_SUPPORTED**
Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

Default value:
- Yes (enabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_42_FEATURES_SUPPORTED**
Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

**NimBLE Options**
Contains:

- CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
- CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
- CONFIG_BT_NIMBLE_WHITELIST_SIZE
- CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM
- CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_MESH
- CONFIG_BT_NIMBLE_ROLE_OBSERVER
- CONFIG_BT_NIMBLE_ROLEPeripheral
- CONFIG_BT_NIMBLE_SECURITY_ENABLE
- CONFIG_BT_NIMBLE_BLUFI_ENABLE
- CONFIG_BT_NIMBLE.Enable_CONN_REATTEMPT
- CONFIG_BT_NIMBLE_USE_ESP_TIMER
- CONFIG_BT_NIMBLE_DEBUG
- CONFIG_BT_NIMBLE_HS_FLOW_CTRL
- CONFIG_BT_NIMBLE_SVC_GAP_APPERANCE
- CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
- CONFIG_BT_NIMBLE_MAX_BONDS
- CONFIG_BT_NIMBLE_MAX_CCCDS
- CONFIG_BT_NIMBLE_MAX_CONNECTIONS
- CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
- CONFIG_BT_NIMBLE_MEM_ALLOC_MODE
- Memory Settings
- CONFIG_BT_NIMBLE_LOG_LEVEL
- CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE
- CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
- CONFIG_BT_NIMBLE_NV_PERSIST
- CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
- CONFIG_BT_NIMBLE_RPA_TIMEOUT
Chapter 2. API Reference

- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

*Available options:*

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
  
  Allows to use IRAM memory region as 8bit accessible region.
  
  Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BT_NIMBLE_LOG_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity”.

*Available options:*

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

*Range:*

- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

*Default value:*
• 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

• 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

• from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**

• 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**

• Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
• Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

• 5120 if CONFIG_BLE_MESH && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
• 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**

• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*
Enable peripheral role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*
Enable broadcaster role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*
Enable observer role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*
Enable this flag to make bonding persistent across device reboots

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*
Enable BLE sm feature

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`
**CONFIG_BT_NIMBLE_SM_LEGACY**

Security manager legacy pairing

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SM_SC**

Security manager secure connections (4.2)

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS**

Use predefined public-private key pair

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION**

Enable LE encryption

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_DEBUG**

Enable extra runtime asserts and host debugging

*Found in:* Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

**Default value:**

- “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**Default value:**

- 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Memory Settings Contains:

- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
- CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE
CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 12 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**
- 256 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**
- 24 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**
- 320 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers.

**Default value:**
- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
• 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE**

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

*Default value:*

- 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT**

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

*Default value:*

- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

*Default value:*

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

*Default value:*

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

*Default value:*

- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_RPA_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**
- from 1 to 41400 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**Default value:**
- 900 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:
- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PROV**
Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PB_ADV**
Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PB_GATT**
Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_GATT_PROXY**
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_RELAY**
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This value defines Bluetooth Mesh device/node name

**Default value:**
- “nimble-mesh-node” if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Defines mesh node count.

**Default value:**
- 1 if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioner.

**Default value:**
- 0 if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in:* Component config > Bluetooth > NimBLE Options

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec
*Found in: Component config > Bluetooth > NimBLE Options*
BLE Host stop procedure timeout in milliseconds.
**Default value:**
- 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error
*Found in: Component config > Bluetooth > NimBLE Options*
Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.
**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts
*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*
Defines maximum number of connection reattempts.
**Range:**
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED
**Default value:**
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
Enable BLE 5 feature
*Found in: Component config > Bluetooth > NimBLE Options*
Enable BLE 5 feature
**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
Contains:
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
Enable 2M Phy
*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*
Enable 2M-PHY
**Default value:**
• Yes (enabled) if \texttt{CONFIG_BT_NIMBLE_50\_FEATURE\_SUPPORT} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY}

Enable coded Phy

\textit{Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT}

Enable coded-PHY

\textbf{Default value:}

• Yes (enabled) if \texttt{CONFIG_BT_NIMBLE_50\_FEATURE\_SUPPORT} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{CONFIG\_BT\_NIMBLE\_EXT\_ADV}

Enable extended advertising

\textit{Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT}

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG_BT_NIMBLE_50\_FEATURE\_SUPPORT} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES}

Maximum number of extended advertising instances.

\textit{Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT > CONFIG\_BT\_NIMBLE\_EXT\_ADV}

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

\textbf{Range:}

• from 0 to 4 if \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{Default value:}

• 1 if \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{BT\_NIMBLE\_ENABLED}
• 0 if \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE}

Maximum length of the advertising data.

\textit{Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT > CONFIG\_BT\_NIMBLE\_EXT\_ADV}

Defines the length of the extended adv data. The value should not exceed 1650.

\textbf{Range:}

• from 0 to 1650 if \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_EXTENSION\_ADV} \&\& \texttt{BT\_NIMBLE\_ENABLED}

\textbf{Default value:}
• 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED
• 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

Enable periodic advertisement.

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transfer Sync Events

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

Range:
• from 0 to 8 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

Default value:
• 1 if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED
• 0 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_COEX_PHYCODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Available options:
• Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
• Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

**CONFIG_BT_NIMBLE_WHITELIST_SIZE**

BLE white list size

*Found in: Component config > Bluetooth > NimBLE Options*

BLE list size

*Range:*  
  • from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*  
  • 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST**

Throughput Test Mode enable

*Found in: Component config > Bluetooth > NimBLE Options*

Enable the throughput test mode

*Default value:*  
  • No (disabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_BLUFI_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

*Default value:*  
  • No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_USE_ESP_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

*Default value:*  
  • Yes (enabled) if BT_NIMBLE_ENABLED

**Controller Options**

Contains:

- `CONFIG_BTDM_CTRL_AUTO_LATENCY`
- `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP`
- `CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED`
- `CONFIG_BTDM_CTRL_BLE_MAX_CONN`
- `CONFIG_BTDM_BLE_SCAN_DUPL`
- `CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY`
- `CONFIG_BTDM_CTRL_MODE`
- `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN`
- `CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH`
- `CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN`
- `CONFIG_BTDM_CTRL_HCI_MODE_CHOICE`
- `HCI UART(H4) Options`
Chapter 2. API Reference

- `CONFIG_BTDM_CTRL_HLI`
- `CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT`
- `MODEM_SLEEP` Options
- `CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG`
- `CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE`

### CONFIG_BTDM_CTRL_MODE

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Controller Options*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

### CONFIG_BTDM_CTRL_BLE_MAX_CONN

BLE Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum connections of bluetooth controller. Each connection uses 1 KB static DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 9 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 3 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

### CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 7 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 2 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

### CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED
Default value:
- 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

`CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH`

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Controller Options*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

**Available options:**
- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

`CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG`

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > Controller Options*

**Default value:**
Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && BT_CONTROLLER_ENABLED

**Contains:**
- `CONFIG_BTDM_CTRL_PCM_POLAR`
- `CONFIG_BTDM_CTRL_PCM_ROLE`

`CONFIG_BTDM_CTRL_PCM_ROLE`

PCM Role

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

**Available options:**
- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

`CONFIG_BTDM_CTRL_PCM_POLAR`

PCM Polar

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

**Available options:**
- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)
Chapter 2. API Reference

**CONFIG_BTDM_CTRL_AUTO_LATENCY**

Auto latency

*Found in: Component config > Bluetooth > Controller Options*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**Default value:**
- No (disabled) if BTDM_CTRL_MODE_BTDM && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT**

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Controller Options*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

**Available options:**
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options** Contains:

- **CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**
- **CONFIG_BTDM_CTRL_HCI_UART_NO**

**CONFIG_BTDM_CTRL_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.
Range:
• from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

Default value:
• 1 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE
UART Baudrate for HCI

Range:
• from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

Default value:
• 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

MODEM SLEEP Options  Contains:

• CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
• CONFIG_BTDM_CTRL_MODEM_SLEEP

CONFIG_BTDM_CTRL_MODEM_SLEEP
Bluetooth modem sleep

Default value:
• Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE
Bluetooth Modem sleep mode

Available options:
• ORIG Mode(sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode,
  bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is
  used to maintain bluetooth reference clock.
• EVED Mode(For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
  EVED mode is for BLE only and is only for internal test. Do not use it for production. this
  mode is not compatible with DFS nor light sleep

CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
Bluetooth low power clock

Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source

• “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
• “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

Available options:
- Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.
- External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

**CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Controller Options*

BLE Sleep Clock Accuracy(SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy(e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator(LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode.
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

Available options:
- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

**CONFIG_BTDM_BLE_SCAN_DUPL**

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

Default value:
- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_SCAN_DUPL_TYPE**

Scan Duplicate Type

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and
device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

**CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*

- from 10 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

*Default value:*

- 100 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

*Default value:*

- No (disabled) if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*

- from 10 to 1000 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN && BT_CONTROLLER_ENABLED

*Default value:*

- 100 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN && BT_CONTROLLER_ENABLED
CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED

BLE full scan feature supported

*Found in:* Component config > Bluetooth > Controller Options

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

*Found in:* Component config > Bluetooth > Controller Options

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

The number of unprocessed advertising report that Bluedroid can save. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
- from 50 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

**Default value:**
- 100 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD

BLE adv lost event threshold value

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
- from 1 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED
Default value:
- 20 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_CTRL_HLI**

High level interrupt

*Found in: Component config > Bluetooth > Controller Options*

Using Level 4 interrupt for Bluetooth.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLE` && `BT_CONTROLLER_ENABLED`

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:
- BLE Mesh and BLE coexistence support
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- BLE Mesh NET BUF DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- BLE Mesh specific test option
- BLE Mesh STACK DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- `CONFIG_BLE_MESH_NODE`
Chapter 2. API Reference

- CONFIG_BLE_MESH_PROVISIONER
- CONFIG_BLE_MESH_FRIEND
- CONFIG_BLE_MESH_LOW_POWER
- CONFIG_BLE_MESH_HCI_5_0
- CONFIG_BLE_MESH_IV_UPDATE_TEST
- CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

*Default value:*
  - Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

*Available options:*
  - Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
  - External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
  - Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
    Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
  - Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
    Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.
CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

*Default value:*

- No (disabled) if (CONFIG_SPIRAM || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

*Available options:*

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

*Default value:*

- Yes (enabled) if CONFIG_BLE_MESH

BLE Mesh and BLE coexistence support

Contains:

- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

*Default value:*

- No (disabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:
• from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

Default value:
• 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.
CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g., Device UUID, address).

*Range:*
  - from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  - 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically, a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

*Range:*
  - from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  - 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

*Range:*
  - from 1 to 10 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  - 2 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

*Range:*
  - from 1 to 5 if CONFIG_BLE_MESH_PB_GATT && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*

---

Espressif Systems 1353 Release v5.0-dev-4379-g36f49f361c
Submit Document Feedback
• 1 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**
• from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**
• from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
• 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**
• No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**
• from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` & `CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE`

**Default value:**
• 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE`
CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**
- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**
• Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

• Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

• from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

• 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

• from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && CONFIG_BLE_MESH

**Default value:**

• 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

• No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

Found in: Component config > CONFIG_BLE_MESH

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

Default value:
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:
• from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
• 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:
• No (disabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

Default value:
• No (disabled) if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:
• “ble_mesh” if CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner
moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

**Default value:**
- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`
Default value:
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

*Range:*
- from 0 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*

---
Chapter 2. API Reference

- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:
- from 1 to 255 if CONFIG_BLE_MESH

Default value:
- 1 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

Found in: Component config > CONFIG_BLE_MESH

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

Range:
- from 36 to 384 if CONFIG_BLE_MESH

Default value:
- 384 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

Range:
- from 2 to 32 if CONFIG_BLE_MESH

Default value:
- 32 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY

Relay support

Found in: Component config > CONFIG_BLE_MESH

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.
Default value:
  • Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:
  • No (disabled) if CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

*Range:*
  • from 6 to 256 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

Default value:
  • 60 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up a Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

Default value:
  • No (disabled) if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled, LPN mode needs to be manually enabled by calling bt_mesh_lpn_set(true). When an
unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger
the node starts to send Friend Request at a certain period until it finds a proper Friend node.

Default value:
• No (disabled) if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPNUUTO_TIMEOUTo
Time from last received message before going to LPN mode

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CON-
FIG_BLE_MESH_LPNUUTO

Time in seconds from the last received message, that the node waits out before starting to look for Friend
nodes.

Range:
• from 0 to 3600 if CONFIG_BLE_MESH_LPNUUTO && CONFIG_BLE_MESH_LOW_POWER &&
CONFIG_BLE_MESH

Default value:
• 15 if CONFIG_BLE_MESH_LPNUUTO && CONFIG_BLE_MESH_LOW_POWER &&
CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPNURETUETO_TIMEOUTo
Retry timeout for Friend requests

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable
Friend Offers.

Range:
• from 1 to 3600 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
• 6 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPNUSSIFACTUOTo
RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0
= 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low
Power node, which is used to calculate the Friend Offer Delay.

Range:
• from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
• 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPNURCUWINFACTUOTo
ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1
= 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by
Low Power node, which is used to calculate the Friend Offer Delay.

Range:
• from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH
Default value:
• 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

*Range:*
• from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

Default value:
• 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

*Range:*
• from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

Default value:
• 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

*Range:*
• from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

Default value:
• 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

*Range:*
• from 10 to if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

Default value:
• if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

CONFIG_BLE_MESH_FRIEND_RECV_WIN

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

*Range:*
  - from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

*Default value:*
  - 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

*Range:*
  - from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

*Default value:*
  - 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SEG_RX**

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

*Range:*
  - from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

*Default value:*
  - 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NO_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

*Default value:*
  - No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL** Contains:

* • CONFIG_BLE_MESH_STACK_TRACE_LEVEL*
CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:
- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

Contains:
- CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:
- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout(ms) for client message response

Found in: Component config > CONFIG_BLE_MESH

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

Range:
- from 100 to 1200000 if CONFIG_BLE_MESH

Default value:
- 4000 if CONFIG_BLE_MESH

Support for BLE Mesh Foundation models

Contains:
- CONFIG_BLE_MESH_CFG_CLI
- CONFIG_BLE_MESH_HEALTH_CLI
- CONFIG_BLE_MESH_HEALTH_SRV
**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG_BLE_MESH_HEALTH_SRV**

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

**Support for BLE Mesh Client/Server models**

Contains:

- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_ONOFF\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_GENERIC\_SERVER}
- \texttt{CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_LIGHTING\_SERVER}
- \texttt{CONFIG\_BLE\_MESH\_SCENE\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_SCHEDULER\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_SENSOR\_CLI}
- \texttt{CONFIG\_BLE\_MESH\_SENSOR\_SERVER}
- \texttt{CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER}
- \texttt{CONFIG\_BLE\_MESH\_TIME\_CLI}

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.
CONFIG_BLE_MESH_GENERICLEVEL_CLI
Generic Level Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERICDEF_TRANS_TIME_CLI
Generic Default Transition Time Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERICPOWER_ONOFF_CLI
Generic Power OnOff Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERICPOWER_LEVEL_CLI
Generic Power Level Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERICBATTERY_CLI
Generic Battery Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERICLOCATION_CLI
Generic Location Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERICPROPERTY_CLI
Generic Property Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSORMESH_CLI
Sensor Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Sensor Client model.
CONFIG_BLE_MESH_TIME_CLI

Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI

Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI

Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.
CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

**BLE Mesh specific test option**

Contains:
- CONFIG_BLE_MESH_DEBUG
- CONFIG_BLE_MESH_SHELL
- CONFIG_BLE_MESH_SELF_TEST
**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_USE_WHITE_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_DEBUG**

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_ADV
Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER
Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND
Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY
Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

**Driver Configurations**  Contains:

- GPIO Configuration
- GPTimer Configuration
- I2S Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- PCNT Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration

**Legacy ADC Configuration**  Contains:

- CONFIG_ADC_DISABLE_DAC
- Legacy ADC Calibration Configuration
- CONFIG_ADC_SUPPRESS_DEPRECATE_WARN
CONFIG_adc_disable_dac

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

CONFIG_adc_suppress_deprecate_warn

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

Legacy ADC Calibration Configuration

Contains:

- CONFIG_adc_cali_suppress_deprecate_warn
- CONFIG_adc_cal_efuse_vref_enable
- CONFIG_adc_cal_lut_enable
- CONFIG_adc_cal_efuse_tp_enable

CONFIG_adc_cal_efuse_tp_enable

Use Two Point Values

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

CONFIG_adc_cal_efuse_vref_enable

Use eFuse Vref

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)
CONFIG_ADC_CAL_LUT_ENABLE

Use Lookup Tables

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CAL_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

SPI Configuration

Contains:
- CONFIG_SPI_MASTER_ISR_IN_IRAM
- CONFIG_SPI_SLAVE_ISR_IN_IRAM
- CONFIG_SPI_MASTER_IN_IRAM
- CONFIG_SPI_SLAVE_IN_IRAM

CONFIG_SPI_MASTER_IN_IRAM

Place transmitting functions of SPI master into IRAM

*Found in:* Component config > Driver Configurations > SPI Configuration

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

CONFIG_SPI_MASTER_ISR_IN_IRAM

Place SPI master ISR function into IRAM

*Found in:* Component config > Driver Configurations > SPI Configuration

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)
CONFIG_SPI_SLAVE_IN_IRAM

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

CONFIG_SPI_SLAVE_ISR_IN_IRAM

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled)

TWAI Configuration  Contains:

- CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID
- CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC
- CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT
- CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST
- CONFIG_TWAI_ISR_IN_IRAM

CONFIG_TWAI_ISR_IN_IRAM

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the `ESP_INTR_FLAG_IRAM` in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)

CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver Configurations > TWAI Configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.
Chapter 2. API Reference

Default value:
  • Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**

Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

Default value:
  • Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**

Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

Default value:
  • Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**

Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

Default value:
  • Yes (enabled)

**Temperature sensor Configuration**  Contains:

• `CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG`
• `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN`

**CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (`driver/temp_sensor.h`). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
  • No (disabled) if SOC_TEMP_SENSOR_SUPPORTED
**CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**UART Configuration**

Contains:

- `CONFIG_UART_ISR_IN_IRAM`

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver Configurations > UART Configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled) if `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`

**GPIO Configuration**

Contains:

- `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`
- `CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL`

**CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**

Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: Component config > Driver Configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

**CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

Place GPIO control functions into IRAM

*Found in: Component config > Driver Configurations > GPIO Configuration*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)

**Sigma Delta Modulator Configuration**

Contains:

- `CONFIG_SDM_ENABLE_DEBUG_LOG`
- `CONFIG_SDM_CTRL_FUNC_IN_IRAM`
- `CONFIG_SDM_SUPPRESS_DEPRECATE_WARN`
CONFIG_SDM_CTRL_FUNC_IN_IRAM
Place SDM control functions into IRAM

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_SDM_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_SDM_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

GPTimer Configuration  Contains:
- CONFIG_GPTIMER_ENABLE_DEBUG_LOG
- CONFIG_GPTIMER_ISR_IRAM_SAFE
- CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM
- CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM
Place GPTimer control functions into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)
CONFIG_GPTIMER_ISR_IRAM_SAFE
GPTimer ISR IRAM-Safe

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_GPTIMER_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

PCNT Configuration
Contains:

- CONFIG_PCNT_ENABLE_DEBUG_LOG
- CONFIG_PCNT_ISR_IRAM_SAFE
- CONFIG_PCNT_CTRL_FUNC_IN_IRAM
- CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

CONFIG_PCNT_CTRL_FUNC_IN_IRAM
Place PCNT control functions into IRAM

*Found in: Component config > Driver Configurations > PCNT Configuration*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_PCNT_ISR_IRAM_SAFE
PCNT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > PCNT Configuration*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).
CONFIG_PCNT_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > PCNT Configuration*

Wether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
• No (disabled)

CONFIG_PCNT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > PCNT Configuration*

Wether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

**Default value:**
• No (disabled)

RMT Configuration  Contains:
• CONFIG_RMT_ENABLE_DEBUG_LOG
• CONFIG_RMT_ISR_IRAM_SAFE
• CONFIG_RMT_SUPPRESS_DEPRECATED_WARN

CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
• No (disabled)

CONFIG_RMT_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
• No (disabled)
CONFIG_RMT_ENABLE_DEBUG_LOG
Enable debug log

*Found in:* Component config > Driver Configurations > RMT Configuration

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

MCPWM Configuration  Contains:
- **CONFIG_MCPWM_ISR_IRAM_SAFE**

CONFIG_MCPWM_ISR_IRAM_SAFE
Place MCPWM ISR function into IRAM

*Found in:* Component config > Driver Configurations > MCPWM Configuration

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled)

I2S Configuration  Contains:
- **CONFIG_I2S_ENABLE_DEBUG_LOG**
- **CONFIG_I2S_ISR_IRAM_SAFE**
- **CONFIG_I2S_SUPPRESS_DEPRECATE_WARN**

CONFIG_I2S_ISR_IRAM_SAFE
I2S ISR IRAM-Safe

*Found in:* Component config > Driver Configurations > I2S Configuration

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_I2S_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

*Found in:* Component config > Driver Configurations > I2S Configuration

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**
- No (disabled)
CONFIG_I2S_ENABLE_DEBUG_LOG

Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**
- No (disabled)

**eFuse Bit Manager**

Contains:
- `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`
- `CONFIG_EFUSEVIRTUAL`
- `CONFIG_EFUSECUSTOM_TABLE`

CONFIG_EFUSE_CUSTOM_TABLE

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if `CONFIG_EFUSE_CUSTOM_TABLE`

CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “y”- No virtual mode. All eFuse operations are real and use eFuse registers. If “y”- The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the `efuse` partition.

partition.csv: “efuse_em, data, efuse, , 0x2000,”
During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**

- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS** Contains:

- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS (ESP_TLS_USINGMBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

**CONFIG_ESP_TLS_USE_SECURE_ELEMENT**

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

**CONFIG_ESP_TLS_USE_DS_PERIPHERAL**

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.
Default value:
  - Yes (enabled) if ESP_TLS_USING_MBEDTLS && SOC_DIG_SIGN_SUPPORTED

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

Found in: Component config > ESP-TLS
Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

Found in: Component config > ESP-TLS
Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER
Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS
Sets the session ticket timeout used in the tls server.

Default value:
  - 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER
When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

mbedtls_ssl_get_verify_result() can be called after the handshake is complete to retrieve status of verification.

CONFIG_ESP_TLS_PSK_VERIFICATION

Enable PSK verification

Found in: Component config > ESP-TLS
Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.
CONFIG_ESP_TLS_INSECURE

Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

CONFIG_ESP_DEBUG_WOLFSSL

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

ADC and ADC Calibration Contains:
- *ADC Calibration Configurations*
- CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE
- CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**
- No (disabled)
CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE

ADC continuous mode driver ISR IRAM-Safe

Found in: Component config > ADC and ADC Calibration

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:
• No (disabled)

ADC Calibration Configurations  Contains:

• CONFIG_ADC_CALI_EFUSE_VREF_ENABLE
• CONFIG_ADC_CALI_LUT_ENABLE
• CONFIG_ADC_CALI_EFUSE_TP_ENABLE

CONFIG_ADC_CALI_EFUSE_TP_ENABLE

Use Two Point Values

Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

Default value:
• Yes (enabled)

CONFIG_ADC_CALI_EFUSE_VREF_ENABLE

Use eFuse Vref

Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

Default value:
• Yes (enabled)

CONFIG_ADC_CALI_LUT_ENABLE

Use Lookup Tables

Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

Default value:
• Yes (enabled)

Common ESP-related  Contains:

• CONFIG_ESP_ERR_TO_NAME_LOOKUP
CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**Ethernet**  
Contains:
- CONFIG_ETH_TRANSMIT_MUTEX
- CONFIG_ETH_USE_ESP32_EMAC
- CONFIG_ETH_USE_OPENETH
- CONFIG_ETH_USE_SPI_ETHERNET

CONFIG_ETH_USE_ESP32_EMAC

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**
- Yes (enabled)

Contains:
- CONFIG_ETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_DMA_TX_BUFFER_NUM
- CONFIG_ETH_SOFT_FLOW_CONTROL
- CONFIG_ETH_DMA_BUFFER_SIZE
- CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0
- CONFIG_ETH_PHY_INTERFACE
- CONFIG_ETH_RMII_CLK_OUT_GPIO
- CONFIG_ETH_RMII_CLK_MODE

CONFIG_ETH_PHY_INTERFACE

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

**Available options:**
- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

CONFIG_ETH_RMII_CLK_MODE

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**
Chapter 2. API Reference

- **Input RMII clock from external (ETH_RMII_CLK_INPUT)**
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- **Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)**
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

**CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

**Default value:**

- No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_RMII_CLK_OUT_GPIO**

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

**Range:**

- from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**Default value:**

- 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_DMA_BUFFER_SIZE**

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

**Range:**

- from 256 to 1600

**Default value:**

- 512

**CONFIG_ETH_DMA_RX_BUFFER_NUM**

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**

- from 3 to 30

**Default value:**

- 10
**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

**CONFIG_ETH_SOFT_FLOW_CONTROL**

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**
- No (disabled) if CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_USE_SPI_ETHERNET**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

**Contains:**
- CONFIG_ETH_SPI_ETHERNET_DM9051
- CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
- CONFIG_ETH_SPI_ETHERNET_W5500

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG_ETH_SPI_ETHERNET_W5500**

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.
**CONFIG ETH_SPI ETHERNET KSZ8851SNL**

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

**CONFIG ETH USE OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- `CONFIG ETH OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG ETH OPENETH_DMA_TX_BUFFER_NUM`

**CONFIG ETH OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if `CONFIG ETH USE OPENETH`

**Default value:**

- 4 if `CONFIG ETH USE OPENETH`

**CONFIG ETH OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if `CONFIG ETH USE OPENETH`

**Default value:**

- 1 if `CONFIG ETH USE OPENETH`

**CONFIG ETH TRANSMIT_MUTEX**

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)
Event Loop Library Contains:

- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**
- No (disabled)

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

**Default value:**
- Yes (enabled)

GDB Stub Contains:

- CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

**CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**CONFIG_ESP_GDBSTUB_MAX_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**
- 32 if CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
ESP HTTP client  Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**
- Yes (enabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

HTTP Server  Contains:

- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**
- 512
CONFIG_HTTPD_MAX_URI_LEN
Max HTTP URI Length

*Found in:* Component config > HTTP Server

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**
- 512

CONFIG_HTTPD_ERR_RESP_NO_DELAY
Use TCP_NODELAY socket option when sending HTTP error responses

*Found in:* Component config > HTTP Server

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**
- Yes (enabled)

CONFIG_HTTPD_PURGE_BUF_LEN
Length of temporary buffer for purging data

*Found in:* Component config > HTTP Server

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**
- 32

CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

*Found in:* Component config > HTTP Server

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)

CONFIG_HTTPD_WS_SUPPORT
WebSocket server support

*Found in:* Component config > HTTP Server

This sets the WebSocket server support.

**Default value:**
- No (disabled)
**CONFIG_HTTPD_QUEUE_WORK_BLOCKING**

httpd_queue_work as blocking API

*Found in: Component config > HTTP Server*

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

**ESP HTTPS OTA**

Contains:

- `CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP`
- `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB`

**CONFIG_ESP_HTTPS_OTA_DECRYPT_CB**

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

**CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP**

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

**ESP HTTPS server**

Contains:

- `CONFIG_ESP_HTTPS_SERVER_ENABLE`

**CONFIG_ESP_HTTPS_SERVER_ENABLE**

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

**Hardware Settings**

Contains:

- `GDMA Configuration`
- `MAC Config`
- `CONFIG_ESP32_XTAL_FREQ_SEL`
- `CONFIG_ESP32_REV_MIN`
- `MMU Config`
- `Peripheral Control`
- `RTC Clock Config`
- `Sleep Config`
MAC Config Contains:

- `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES`

**CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES**

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**

- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

**Sleep Config** Contains:

- `CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU`
- `CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY`
- `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND`
- `CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND`
- `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH`
- `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

**Default value:**

- No (disabled) if `CONFIG_SPIRAM`

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c2, esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition
• GPIO needs to be configured as input-mode only
• The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

PSRAM leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**Default value:**
• Yes (enabled) if `CONFIG_SPIRAM`

CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND

Flash leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**Default value:**
• Yes (enabled)

CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU

All pins of mspi need pull up

*Found in: Component config > Hardware Settings > Sleep Config*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > Hardware Settings > Sleep Config*

When the chip exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**Range:**
• from 0 to 5000
Chapter 2. API Reference

Default value:
• 2000

RTC Clock Config  Contains:
• CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
• CONFIG_RTC_XTAL_CAL_RETRY
• CONFIG_RTC_CLK_CAL_CYCLES
• CONFIG_RTC_CLK_SRC

CONFIG_RTC_CLK_SRC

RTC clock source

Found in: Component config > Hardware Settings > RTC Clock Config

Choose which clock is used as RTC clock source.

• “Internal 150kHz oscillator” option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
• “External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
• “External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin cannot be used as a GPIO in this case.
• “Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

Available options:
• Internal 150kHz RC oscillator (RTC_CLK_SRC_INT_RC)
• External 32kHz crystal (RTC_CLK_SRC_EXT_CRYS)
• External 32kHz oscillator at 32K_XN pin (RTC_CLK_SRC_EXT_OSC)
• Internal 8.5MHz oscillator, divided by 256 (~33kHz) (RTC_CLK_SRC_INT_8MD256)

CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD

Additional current for external 32kHz crystal

Found in: Component config > Hardware Settings > RTC Clock Config

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option. allow all wakeup sources, and save some code size.

• “None” option will not provide additional current to external crystal
• “Method 1” option can’t ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
• “Method 2” option can solve the external 32k issue, but the touchpad can’t work in this method.

Available options:
• None (RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
Chapter 2. API Reference

- Method 1 (RTC_EXT_CRYS_T_ADDIT_CURRENT)
- Method 2 (RTC_EXT_CRYS_T_ADDIT_CURRENT_V2)

**CONFIG_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

*Range:*
- from 0 to 27000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

*Default value:*
- 3000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
- 1024

**CONFIG_RTC_XTAL_CAL_RETRY**

Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

*Default value:*
- 1 if RTC_CLK_SRC_EXT_CRYS

Peripheral Control Contains:

- **CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

**CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. periph_module_reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

*Default value:*
- No (disabled)

**MMU Config**
**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

Found in: Component config > Hardware Settings

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

Available options:
- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)

**CONFIG_ESP32_XTAL_FREQ_SEL**

Main XTAL frequency

Found in: Component config > Hardware Settings

ESP32 currently supports the following XTAL frequencies:
- 26 MHz
- 40 MHz

Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.

Available options:
- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
- Autodetect (ESP32_XTAL_FREQ_AUTO)

**GDMA Configuration**

Contains:

- **CONFIG_GDMA_ISR_IRAM_SAFE**
- **CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

Place GDMA control functions into IRAM

Found in: Component config > Hardware Settings > GDMA Configuration

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled) if SOC_GDMA_SUPPORTED

**CONFIG_GDMA_ISR_IRAM_SAFE**

GDMA ISR IRAM-Safe

Found in: Component config > Hardware Settings > GDMA Configuration

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:
- No (disabled) if SOC_GDMA_SUPPORTED
Chapter 2. API Reference

LCD and Touch Panel  Contains:
  • LCD Peripheral Configuration

LCD Peripheral Configuration  Contains:
  • CONFIG_LCD_ENABLE_DEBUG_LOG
  • CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE
  • CONFIG_LCD_RGB_RESTART_IN_VSYNC
  • CONFIG_LCD_RGB_ISR_IRAM_SAFE

CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE
  LCD panel io format buffer size
  Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration
  LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.
  Default value: • 32

CONFIG_LCD_ENABLE_DEBUG_LOG
  Enable debug log
  Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration
  Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.
  Default value: • No (disabled)

CONFIG_LCD_RGB_ISR_IRAM_SAFE
  RGB LCD ISR IRAM-Safe
  Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration
  Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.
  Default value: • No (disabled) if SOC_LCD_RGB_SUPPORTED

CONFIG_LCD_RGB_RESTART_IN_VSYNC
  Restart transmission in VSYNC
  Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration
  Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.
  Default value: • No (disabled) if SOC_LCD_RGB_SUPPORTED
ESP NETIF Adapter Contains:

- `CONFIG_ESP_NETIF_BRIIDGE_EN`
- `CONFIG_ESP_NETIF_L2_TAP`
- `CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`
- `CONFIG_ESP_NETIF_USE_TCPPIP_STACK_LIB`

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

**CONFIG_ESP_NETIF_USE_TCPPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**
- LwIP (ESP_NETIF_TCPIP_LWIP)
  - LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)
  - Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_L2_TAP**

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

**CONFIG_ESP_NETIF_L2_TAP_MAX_FDS**

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

**Range:**
- from 1 to 10 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**
- 5 if `CONFIG_ESP_NETIF_L2_TAP`
CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

Range:
- from 1 to 100 if CONFIG_ESP_NETIF_L2_TAP

Default value:
- 20 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

Found in: Component config > ESP NETIF Adapter

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge available!

Default value:
- No (disabled)

PHY Contains:
- CONFIG_ESP_PHY_MAX_WIFI_TX_POWER
- CONFIG_ESP_PHY_REDUCE_TX_POWER
- CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE
- CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

Found in: Component config > PHY

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

Default value:
- Yes (enabled)

CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

Found in: Component config > PHY

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.
If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID`
- `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

**CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is:
1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL.
2. Country notified by the connected AP.
3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` & `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` & `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*
If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in:* Component config > PHY

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in:* Component config > PHY

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled)

**Power Management**

Contains:
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PM_RTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

**CONFIG_PM_ENABLE**

Support for power management

*Found in:* Component config > Power Management

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in:* Component config > Power Management > CONFIG_PM_ENABLE

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`
CONFIG_PM_PROFILING

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200–300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.
### ESP PSRAM
Contains:
- `CONFIG_SPIRAM`

### CONFIG_SPIRAM
Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**
- No (disabled)

### SPI RAM config
Contains:
- `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_SPIWP_SD3_PIN`
- `CONFIG_SPIRAM_BANKSWITCH_ENABLE`
- `CONFIG_SPIRAM_2T_MODE`
- `CONFIG_SPIRAM_CACHE_WORKAROUND`
- `CONFIG_SPIRAM_BOOT_INIT`
- `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`
- `PSRAM clock and cs IO for ESP32-D2WD`
- `PSRAM clock and cs IO for ESP32-DOWD`

### CONFIG_SPIRAM_TYPE
Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

**Available options:**
- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

### CONFIG_SPIRAM_SPEED
Set RAM clock speed

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode(80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY_FLASHFREQ_80M is true)

Available options:
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

CONFIG_SPIRAM_BOOT_INIT

Initialize SPI RAM during startup

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

Default value:
- Yes (enabled) if CONFIG_SPIRAM

CONFIG_SPIRAM_IGNORE_NOTFOUND

Ignore PSRAM when not found

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

Default value:
- No (disabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY && CONFIG_SPIRAM

CONFIG_SPIRAM_USE

SPI RAM access method

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM) (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.
Default value:
• Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT & CONFIG_SPIRAM

CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

Range:
• from 0 to 131072 if SPIRAM_USE_MALLOC & CONFIG_SPIRAM

Default value:
• 16384 if SPIRAM_USE_MALLOC & CONFIG_SPIRAM

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

Default value:
• No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) & CONFIG_SPIRAM

CONFIG_SPIRAM_MALLOC_reserve_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

Range:
• from 0 to 262144 if SPIRAM_USE_MALLOC & CONFIG_SPIRAM

Default value:
• 32768 if SPIRAM_USE_MALLOC & CONFIG_SPIRAM

CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY

Allow .bss segment placed in external memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config
If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM` && `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`

**CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY**

Allow .noinit segment placed in external memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM` && `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**Default value:**
- Yes (enabled) if `(SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC)` && `CONFIG_SPIRAM`

**SPIRAM cache workaround debugging**

Contains:

- `CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY`

**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

Workaround strategy

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

**Available options:**
Chapter 2. API Reference

- Insert `memw` after vulnerable instructions (default) (SPI-RAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate `LD/ST` for 32-bit, `memw` for 8/16 bit (SPI-RAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert `nops` between vulnerable loads/stores (old strategy, obsolete) (SPI-RAM_CACHE_WORKAROUND_STRATEGY_NOPS)

SPIRAM workaround libraries placement  Contains:

- `CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`

- `CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`

**CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM**

Put libc’s jump related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: `longjmp` and `setjmp`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM**

Put libc’s math related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: `abs`, `div`, `labs`, `ldiv`, `quorem`, `fpclassify`, and `nan`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM**

Put libc’s number parsing related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: `utoa`, `itoa`, `atoi`, `atol`, `strtol`, and `strtoul`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
• Yes (enabled) if \textit{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \textit{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM}

Put libcs I/O related functions in IRAM

\textit{Found in: Component config \> ESP PSRAM \> CONFIG_SPIRAM \> SPI RAM config \> SPIRAM workaround libraries placement}

The functions affected by this option are: wctomb, fwrite, wbuf, wsetup, fputwc, wcputomb, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

• Yes (enabled) if \textit{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \textit{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM}

Put libcs time related functions in IRAM

\textit{Found in: Component config \> ESP PSRAM \> CONFIG_SPIRAM \> SPI RAM config \> SPIRAM workaround libraries placement}

The functions affected by this option are:asctime, asctime, ctime, ctime, localtime, localtime, gmtime, gmtime, strftime, mktime, tzset, tzset, time, gettzinfo, systimes, month_length, timelocal, tzvare, tzlock, tzcalc_limits, and strptime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

• Yes (enabled) if \textit{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \textit{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM}

Put libcs characters related functions in IRAM

\textit{Found in: Component config \> ESP PSRAM \> CONFIG_SPIRAM \> SPI RAM config \> SPIRAM workaround libraries placement}

The functions affected by this option are: cctype, toupper, tolower, toascii, strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

• Yes (enabled) if \textit{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \textit{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM}

Put libcs memory related functions in IRAM

\textit{Found in: Component config \> ESP PSRAM \> CONFIG_SPIRAM \> SPI RAM config \> SPIRAM workaround libraries placement}

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

• Yes (enabled) if \textit{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \textit{CONFIG_SPIRAM}
**CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM**

Put libc’s string related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpyp, strcsppn, strdup, strdup_r, strlcat, strlcpy, strlen, strlwr, strnasecmp, strncat, strncmp, strncpy, strndup, strndup_r, strncoll, strnchr, strsep, strspn, strstr, strtok_r, and strupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM**

Put libc’s random related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: srand, rand, and rand_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM**

Put libc’s environment related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: environ, envlock, and getenv_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**

Put libc’s file related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, sbrk, stdio, syssbrk, sysclose, sysopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**
Put libc’s miscellaneous functions in IRAM, see help

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: raise and system. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` & `CONFIG_SPIRAM`

**CONFIG_SPIRAM_BANKSWITCH_ENABLE**

Enable bank switching for >4MiB external RAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_psram_extram_writeback_cache needs some kind of mapping of #some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

**Default value:**

- Yes (enabled) if `(SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC)` & `CONFIG_SPIRAM`

**CONFIG_SPIRAM_BANKSWITCH_RESERVE**

Amount of 32K pages to reserve for bank switching

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

**Range:**

- from 1 to 62 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` & `CONFIG_SPIRAM`

**Default value:**

- 8 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` & `CONFIG_SPIRAM`

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.
Default value:
  • No (disabled) if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

CONFIG_SPIRAM_OCCUPY_SPI_HOST
SPI host to use for 32MBit PSRAM

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the
HSPI/VSPI host will be used to output the clock. Select which one to use here.

Available options:
  • HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
  • VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
  • Will not try to use any host, will abort if not able to use the PSRAM (SPI-RAM_OCCUPY_NO_HOST)

PSRAM clock and cs IO for ESP32-DOWD  
Contains:

  • CONFIG_D0WD_PSRAM_CLK_IO
  • CONFIG_D0WD_PSRAM_CS_IO

CONFIG_D0WD_PSRAM_CLK_IO
PSRAM CLK IO number

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and
 cs IO for ESP32-DOWD

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user
use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
  • from 0 to 33 if CONFIG_SPIRAM && CONFIG_SPIRAM

Default value:
  • 17 if CONFIG_SPIRAM && CONFIG_SPIRAM

CONFIG_D0WD_PSRAM_CS_IO
PSRAM CS IO number

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and
 cs IO for ESP32-DOWD

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use
1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
  • from 0 to 33 if CONFIG_SPIRAM && CONFIG_SPIRAM

Default value:
  • 16 if CONFIG_SPIRAM && CONFIG_SPIRAM

PSRAM clock and cs IO for ESP32-D2WD  
Contains:

  • CONFIG_D2WD_PSRAM_CLK_IO
  • CONFIG_D2WD_PSRAM_CS_IO
Chapter 2. API Reference

**CONFIG_D2WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**Default value:**
- 9 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**CONFIG_D2WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**Default value:**
- 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**PSRAM clock and cs IO for ESP32-PICO**

Contains:
- `CONFIG_PICO_PSRAM_CS_IO`

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**Default value:**
- 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.
If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif
chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify
the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash
WP pin configured in the bootloader.

**Default value:**
- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this
value to the GPIO number of the SPIRAM WP pin.

**Range:**
- from 0 to 33 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM

**Default value:**
- 7 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed
bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications
will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

**Default value:**
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM

**ESP Ringbuf**

Contains:

- CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH
- CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH

**CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**

Place non-ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up
IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**
- No (disabled)
**CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH**

Place ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which is configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**
- No (disabled)

**ESP System Settings**

Contains:

- `CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- Trace memory
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

**Available options:**
- 40 MHz (`ESP_DEFAULT_CPU_FREQ_MHZ_40`)
- 80 MHz (`ESP_DEFAULT_CPU_FREQ_MHZ_80`)
- 160 MHz (`ESP_DEFAULT_CPU_FREQ_MHZ_160`)
- 240 MHz (`ESP_DEFAULT_CPU_FREQ_MHZ_240`)

**Memory**

Contains:
- `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`
• CONFIG_ESP32_RTCDATA_IN_FAST_MEM
• CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_RTCDATA_IN_FAST_MEM

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

Found in: Component config > ESP System Settings > Memory

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

Default value:
• No (disabled) if CONFIG_FREERTOS_UNICORE

CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

Use fixed static RAM size

Found in: Component config > ESP System Settings > Memory

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

Default value:
• No (disabled)

CONFIG_ESP32_FIXED_STATIC_RAM_SIZE

Fixed Static RAM size

Found in: Component config > ESP System Settings > Memory > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_reserve_DRAM if Bluetooth controller is enabled.

Range:
• from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

Default value:
• “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

Enable IRAM as 8 bit accessible memory

Found in: Component config > ESP System Settings > Memory

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

Trace memory Contains:
• CONFIG_ESP32_TRAX
CONFIG_ESP32_TRAX

Use TRAX tracing feature

*Found in: Component config > ESP System Settings > Trace memory*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
- No (disabled)

CONFIG_ESP32_TRAX_TWOBANKS

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP System Settings > Trace memory > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reserve for trace, used in linker script

**Default value:**
- No (disabled) if CONFIG_ESP32_TRAX && CONFIG_FREERTOS_UNICORE

CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**
- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime.

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.
To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection** Contains:

- **CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT**
- **CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

**CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT**

Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC_MEMPROT_SUPPORTED

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**

Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled) if **CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**
CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE

System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE

Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

CONFIG_ESP_MAIN_TASK_STACK_SIZE

Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

CONFIG_ESP_MAIN_TASK_AFFINITY

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**
- 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).
• Default is to use UART0 on pre-defined GPIOs.
• If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
• If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
• On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
• On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:
• Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
• USB CDC (ESP_CONSOLE_USB_CDC)
• USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
• Custom UART (ESP_CONSOLE_UART_CUSTOM)
• None (ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_UART_NUM
UART peripheral to use for console output (0-1)

Found in: Component config > ESP System Settings

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

Available options:
• UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
• UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO
UART TX on GPIO#

Found in: Component config > ESP System Settings

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:
• from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

Default value:
• 1 if ESP_CONSOLE_UART_CUSTOM
• 43 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP-console_UART_RX_GPIO
UART RX on GPIO#

Found in: Component config > ESP System Settings

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.
Range:
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

Default value:
- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE

Default value:
- 74880 if ESP32C2_XTAL_FREQ_26
- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

Default value:
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

Range:
- from 10 to 10000

Default value:
- 300 if CONFIG_SPIRAM && CONFIG_ESP_INT_WDT
- 800 if CONFIG_SPIRAM && CONFIG_ESP_INT_WDT

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*
Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_INT_WDT` && `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_TASK_WDT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)

**CONFIG_ESP_TASK_WDT_TIMEOUT_S**

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0**

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.
Default value:
- Yes (enabled) if `CONFIG_ESP_TASK_WDT` && `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

Default value:
- No (disabled)

**CONFIG_ESP_DEBUG_STUBS_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

Default value:
- “`COMPILER_OPTIMIZATION_LEVEL_DEBUG`” if `CONFIG_ESP32_TRAX` && `ESP32S2_TRAX` && `ESP32S3_TRAX`

**CONFIG_ESP_DEBUG_OCD_AWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

Default value:
- Yes (enabled)

**CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**
- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog and other system checks.

**Brownout Detector**  Contains:
- `CONFIG_ESP_BROWNOUT_DET`
CONFIG_ESP_BROWNOUT_DET

Hardware brownout detect & reset

Found in: Component config > ESP System Settings > Brownout Detector

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

Default value:
- Yes (enabled)

CONFIG_ESP_BROWNOUT_DET_LVL_SEL

Brownout voltage level

Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages of the brownout threshold levels.

Available options:
- 2.43V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_7)

CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE

Permanently disable BASIC ROM Console

Found in: Component config > ESP System Settings

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

Default value:
- No (disabled)

IPC (Inter-Processor Call) Contains:
- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

Found in: Component config > IPC (Inter-Processor Call)

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be
enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_UNICORE

**High resolution timer (esp_timer)**  Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**
- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**
- from 2048 to 65536

**Default value:**
- 3584
**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
- from 1 to 3
- from 1 to 1

**Default value:**
- 1

**CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)

**Wi-Fi** Contains:

- CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA
- CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE
- CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN
- CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
- CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE
- CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE
- CONFIG_ESP32_WIFI_TX_BUFFER
- CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED
- CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED
- CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED
- CONFIG_ESP32_WIFI_CSI_ENABLED
- CONFIG_ESP_WIFI_FTM_ENABLE
- CONFIG_ESP_WIFI_GCMP_SUPPORT
- CONFIG_ESP_WIFI_GMAC_SUPPORT
- CONFIG_ESP32_WIFI_IRAM_OPT
- CONFIG_ESP32_WIFI_MGMT_SBUF_NUM
- CONFIG_ESP32_WIFI_NVS_ENABLED
- CONFIG_ESP32_WIFI_RX_IRAM_OPT
- CONFIG_ESP32_WIFI_SLP_BEACON_LOST_OPT
- CONFIG_ESP32_WIFI_SLP_IRAM_OPT
- CONFIG_ESP32_WIFI_SOFTAP_SUPPORT
- CONFIG_ESP32_WIFI_TASK_CORE_ID

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**
Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:
If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**
Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
- from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

*Default value:*
- 16 if ESP32_WIFI_STATIC_TX_BUFFER

**CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM**
Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

*Range:*
- from 16 to 128 if CONFIG_SPIRAM

*Default value:*
- 32 if CONFIG_SPIRAM

**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**
Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.
Chapter 2. API Reference

CONFIG_ESP32_WIFI_CSI_ENABLED

WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

*Default value:*
- No (disabled)

CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

*Default value:*
- Yes (enabled)

CONFIG_ESP32_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

*Range:*
- from 2 to 32

*Default value:*
- 6

CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

*Default value:*
- Yes (enabled)

CONFIG_ESP32_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless...
special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED`

---

**CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED**

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if `CONFIG_SPIRAM`

---

**CONFIG_ESP32_WIFI_NVS_ENABLED**

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

---

**CONFIG_ESP32_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

---

**CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added ontop of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).
Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
- 752

**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

**Range:**
- from 6 to 32

**Default value:**
- 32

**CONFIG_ESP32_WIFI_IRAM_OPT**

WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED && CONFIG_SPIRAM`
- Yes (enabled)

**CONFIG_ESP32_WIFI_RX_IRAM_OPT**

WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED && CONFIG_SPIRAM`
- Yes (enabled)

**CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE**

Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)
CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA

Enable OWE STA

Found in: Component config > Wi-Fi

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

Default value:
• Yes (enabled)

CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME

Minimum active time

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT

The minimum timeout for waiting to receive data, unit: milliseconds.

Range:
• from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

Default value:
• 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME

Maximum keep alive time

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT

The maximum time that wifi keep alive, unit: seconds.

Range:
• from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

Default value:
• 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_FTM_ENABLE

WiFi FTM

Found in: Component config > Wi-Fi

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).
CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

CONFIG_ESP_WIFI_GCMP_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

CONFIG_ESP_WIFI_GMAC_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_SOFTAP_SUPPORT

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

WiFi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.
CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**
- from 5 to 100 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 10 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**
- from 0 to 8 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 3 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**
- from 0 to 100 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**
- from 0 to 8 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Core dump** Contains:
- CONFIG_ESP_COREDUMP_CHECK_BOOT
- CONFIG_ESP_COREDUMP_DATA_FORMAT
- CONFIG_ESP_COREDUMP_CHECKSUM
- CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART
- CONFIG_ESP_COREDUMP_UART_DELAY
- CONFIG_ESP_COREDUMP_DECODE
- CONFIG_ESP_COREDUMP_MAX_TASKS_NUM
Chapter 2. API Reference

- **CONFIG_ESP_COREDUMP_STACK_SIZE**

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (ESP_COREDUMP_ENABLE_TO_UART)
- None (ESP_COREDUMP_ENABLE_TO_NONE)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

**Available options:**

- Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

**Available options:**

- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.
CONFIG_ESP_COREDUMP_UART_DELAY
Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

*Default value:*
  - 0 if ESP_COREDUMP_ENABLE_TO_UART

CONFIG_ESP_COREDUMP_STACK_SIZE
Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

CONFIG_ESP_COREDUMP_DECODE
Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

*Available options:*
  - Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
  - Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

FAT Filesystem support  Contains:

- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_USE_FASTSEEK
- CONFIG_FATFS_CHOOSE_TYPE
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_VOLUME_COUNT
- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFS_ALLOC_PREFER_EXTRAM
- CONFIG_FATFS_SECTOR_SIZE
- CONFIG_FATFS_SECTORS_PER_CLUSTER
- CONFIG_FATFS_TIMEOUT_MS
- CONFIG_FATFS_PER_FILE_CACHE

CONFIG_FATFS_VOLUME_COUNT
Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

*Range:*
  - from 1 to 10

*Default value:*
  - 2
CONFIG_FATFS_SECTOR_SIZE

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

**Available options:**
- 512 (FATFS_SECTOR_512)
- 1024 (FATFS_SECTOR_1024)
- 2048 (FATFS_SECTOR_2048)
- 4096 (FATFS_SECTOR_4096)

CONFIG_FATFS_SECTORS_PER_CLUSTER

Sectors per cluster

*Found in: Component config > FAT Filesystem support*

This value specifies how many sectors there are in one cluster.

**Available options:**
- 1 (FATFS_SECTORS_PER_CLUSTER_1)
- 2 (FATFS_SECTORS_PER_CLUSTER_2)
- 4 (FATFS_SECTORS_PER_CLUSTER_4)
- 8 (FATFS_SECTORS_PER_CLUSTER_8)
- 16 (FATFS_SECTORS_PER_CLUSTER_16)
- 32 (FATFS_SECTORS_PER_CLUSTER_32)
- 64 (FATFS_SECTORS_PER_CLUSTER_64)
- 128 (FATFS_SECTORS_PER_CLUSTER_128)

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**
- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portugese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
Chapter 2. API Reference

- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_CHOOSE_TYPE

FAT type

*Found in: 
Component config \> FAT Filesystem support*

If user specifies automatic detection of the FAT type, the FATFS generator will determine the type by the size.

Available options:
- Select a suitable FATFS type automatically. (FATFS_AUTO_TYPE)
- FAT12 (FATFS_FAT12)
- FAT16 (FATFS_FAT16)

CONFIG_FATFS_LONG_FILENAMES

Long filename support

*Found in: 
Component config \> FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap (Currently not supported by FATFS partition generator).

Available options:
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

CONFIG_FATFS_MAX_LFN

Max long filename length

*Found in: 
Component config \> FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

Range:
- from 12 to 255

Default value:
- 255

CONFIG_FATFS_API_ENCODING

API character encoding

*Found in: 
Component config \> FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)
**CONFIG_FATFS_FS_LOCK**

Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK_. The option _FS_LOCK_ switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**
- from 0 to 65535

**Default value:**
- 0

**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT_, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY_.

If this option is set, _FS_TINY_ is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY_ is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

• Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC` 

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using `lseek` function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
• No (disabled)

**CONFIG_FATFS_FASTSEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
• 64 if `CONFIG_FATFS_USE_FASTSEEK`

**FreeRTOS**  Contains:

• *Kernel*
• *Port*

**Kernel**  Contains:

• `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
• `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY`
• `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
• `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
• `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
• `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
• `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
• `CONFIG_FREERTOS_HZ`
• `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
• `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
• `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
• `CONFIG_FREERTOS_USE_IDLE_HOOK`
• `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
• `CONFIG_FREERTOS_USE_TICK_HOOK`
• `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
• `CONFIG_FREERTOS_USE_TRACE_FACILITY`
• `CONFIG_FREERTOS_UNICORE`
• `CONFIG_FREERTOS_SMP`
• `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`

**CONFIG_FREERTOS_SMP**
Run the SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

This will cause the FreeRTOS component to compile with the SMP FreeRTOS kernel instead. THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**CONFIG_FREERTOS_HZ**

configTICK_RATE_HZ

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK_RATE_HZ documentation for more details).

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

configUSE_PORT_OPTIMISED_TASK_SELECTION

*Found in: Component config > FreeRTOS > Kernel*

Enables port specific task selection method. This option can will speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

configCHECK_FOR_STACK_OVERFLOW

*Found in: Component config > FreeRTOS > Kernel*

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

**Note:** If users do not provide their own vApplicationStackOverflowHook() function, a default function will be provided by ESP-IDF.

**Available options:**
- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
- Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW = 0)

• Check by stack pointer value (Method 1) (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid
  range. Quick but does not detect stack overflows that happened between context switches
  (configCHECK_FOR_STACK_OVERFLOW = 1)

• Check using canary bytes (Method 2) (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these
  bytes are still intact. More thorough than just checking the pointer, but also slightly slower.
  (configCHECK_FOR_STACK_OVERFLOW = 2)

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

configNUM_THREADLOCAL_STORAGE_POINTERS

*Found in: Component config > FreeRTOS > Kernel*

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-
local-storage. Other indexes can be used for any desired purpose.

Range:
  • from 1 to 256

Default value:
  • 1

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

configMINIMAL_STACK_SIZE (Idle task stack size)

*Found in: Component config > FreeRTOS > Kernel*

Sets the idle task stack size in bytes (see configMINIMAL_STACK_SIZE documentation for more
details).

Note:
  • ESP-IDF specifies stack sizes in bytes instead of words.
  • The default size is enough for most use cases.
  • The stack size may need to be increased above the default if the app installs idle or thread local
    storage cleanup hooks that use a lot of stack memory.
  • Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

Range:
  • from 768 to 32768

Default value:
  • 1536

CONFIG_FREERTOS_USE_IDLE_HOOK

configUSE_IDLE_HOOK

*Found in: Component config > FreeRTOS > Kernel*

Enables the idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

Note:
  • The application must provide the hook function void vApplicationIdleHook( void
    );
  • vApplicationIdleHook() is called from FreeRTOS idle task(s)
  • The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled
    simultaneously.
**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

Use FreeRTOS minimal idle hook

*Found in: Component config > FreeRTOS > Kernel*

Enables the minimal idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

**Note:**
- The application must provide the hook function `void vApplicationMinimalIdleHook(
  void );`
- `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

`configUSE_TICK_HOOK`

*Found in: Component config > FreeRTOS > Kernel*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

**Note:**
- The application must provide the hook function `void vApplicationTickHook(
  void );`
- `vApplicationTickHook()` is called from FreeRTOS’s tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

`configMAX_TASK_NAME_LEN`

*Found in: Component config > FreeRTOS > Kernel*

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

**Note:** For most uses, the default of 16 characters is sufficient.

**Range:**
- from 1 to 256

**Default value:**
- 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

`configENABLE_BACKWARD_COMPATIBILITY`

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see `configENABLE_BACKWARD_COMPATIBILITY` documentation for more details).
**Default value:**
- No (disabled)

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

```c
configTIMER_TASK_PRIORITY
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see `configTIMER_TASK_PRIORITY` documentation for more details).

**Range:**
- from 1 to 25

**Default value:**
- 1

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

```c
configTIMER_TASK_STACK_DEPTH
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s stack size (see `configTIMER_TASK_STACK_DEPTH` documentation for more details).

**Range:**
- from 1536 to 32768

**Default value:**
- 2048

**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

```c
configTIMER_QUEUE_LENGTH
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s command queue length (see `configTIMER_QUEUE_LENGTH` documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10

**CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE**

```c
configQUEUE_REGISTRY_SIZE
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the size of the queue registry (see `configQUEUE_REGISTRY_SIZE` documentation for more details).

*Note: A value of 0 will disable queue registry functionality*

**Range:**
- from 0 to 20

**Default value:**
- 0
**CONFIG_FREERTOS_USE_TRACE_FACILITY**

```
configUSE_TRACE_FACILITY
```

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see `configUSE_TRACE_FACILITY` documentation for more details).

*Default value:*

- No (disabled)

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

```
configUSE_STATS_FORMATTING_FUNCTIONS
```

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*

Set `configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` to 1 to include the `vTaskList()` and `vTaskGetRunTimeStats()` functions in the build (see `configUSE_STATS_FORMATTING_FUNCTIONS` documentation for more details).

*Default value:*

- No (disabled) if `CONFIG_FREERTOS_USE_TRACE_FACILITY`

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in `vTaskList`

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when `vTaskList` is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

*Default value:*

- No (disabled) if `CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS`

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

```
configGENERATE_RUN_TIME_STATS
```

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see `configGENERATE_RUN_TIME_STATS` documentation for more details).

*Note:* The clock used for run time statistics can be configured in `FREERTOS_RUN_TIME_STATS_CLK`.

*Default value:*

- No (disabled)

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

```
configUSE_TICKLESS_IDLE
```

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using `FREERTOS_IDLE_TIME_BEFORE_SLEEP` option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

`configEXPECTED_IDLE_TIME_BEFORE_SLEEP`

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

*Range:*
- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

*Default value:*
- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Port**

Contains:

- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_FPU_IN_ISR`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

*Default value:*
- Yes (enabled)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for
more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**
- No (disabled)

### CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**
- Yes (enabled) if `CONFIG_FREERTOS_SMP && CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS > 0`

### CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task cleanup hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call the static task cleanup hook when a task is deleted.

*Note: Users will need to provide a `void vPortCleanUpTCB ( void \*pxTCB )` callback*

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP`

### CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS > Port*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

*Range:*
  - from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
  - from 1536 to 32768

*Default value:*
  - 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
  - 1536

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS > Port*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

*Default value:*
  - Yes (enabled)

**CONFIG_FREERTOS_FPU_IN_ISR**

Use float in Level 1 ISR

*Found in: Component config > FreeRTOS > Port*

When enabled, the usage of float type is allowed inside Level 1 ISRs. Note that usage of float types in higher level interrupts is still not permitted.

*Default value:*
  - No (disabled)

**CONFIG_FREERTOS_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: Component config > FreeRTOS > Port*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

*Available options:*
  - Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
    Select this to use timer 0
  - Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
    Select this to use timer 1
  - SYSTIMER0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
    Select this to use systimer with the 1 interrupt priority.
  - SYSTIMER0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
    Select this to use systimer with the 3 interrupt priority.
CONFIG_FREERTOS_RUN_TIME_STATS_CLK

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > Port*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**

- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH

Place FreeRTOS functions into Flash

*Found in: Component config > FreeRTOS > Port*

When enabled, the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH

Place task snapshot functions into flash

*Found in: Component config > FreeRTOS > Port*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**

- No (disabled) if CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT && CONFIG_ESP_PANIC_HANDLER_IRAM

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*.CRITICAL calls

*Found in: Component config > FreeRTOS > Port*

If enabled, context of port*.CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*.CRITICAL from ISR context would cause assert failure

**Default value:**

- No (disabled)
**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS > Port*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an `assert()`.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT**

Enable task snapshot functions

*Found in: Component config > FreeRTOS > Port*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked. Task snapshots are primarily used by GDB Stub and Core dump.

**Default value:**
- Yes (enabled)

**Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:**
- `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`
- `CONFIG_HAL_LOG_LEVEL`
- `CONFIG_HAL_SYSTIMER_USE_ROM_IMPL`
- `CONFIG_HAL_WDT_USE_ROM_IMPL`

**CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**

Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**
- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)

**CONFIG_HAL_LOG_LEVEL**

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

**Available options:**
- No output (HAL_LOG_LEVEL_NONE)
- Error (HAL_LOG_LEVEL_ERROR)
- Warning (HAL_LOG_LEVEL_WARN)
- Info (HAL_LOG_LEVEL_INFO)
- Debug (HAL_LOG_LEVEL_DEBUG)
- Verbose (HAL_LOG_LEVEL_VERBOSE)
**CONFIG_HAL_SYSTIMER_USE_ROM_IMPL**

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER && ESP32C2_XTAL_FREQ_26

**CONFIG_HAL_WDT_USE_ROM_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_WDT

**Heap memory debugging**

Contains:
- **CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**
- **CONFIG_HEAP_TASK_TRACKING**
- **CONFIG_HEAP_CORRUPTION_DETECTION**
- **CONFIG_HEAP_TRACING_DEST**
- **CONFIG_HEAP_TRACING_STACK_DEPTH**
- **CONFIG_HEAP_TLSF_USE_ROM_IMPL**

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**
- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.
This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**
- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)

**CONFIG_HEAP_TLSF_USE_ROM_IMPL**

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HEAP_TLSF

**Log output**

Contains:

- **CONFIG_LOG_DEFAULT_LEVEL**
- **CONFIG_LOG_TIMESTAMP_SOURCE**
- **CONFIG_LOG_MAXIMUM_LEVEL**
- **CONFIG_LOG_COLORS**
CONFIG_LOG_DEFAULT_LEVEL

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set()` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**
- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

CONFIG_LOG_MAXIMUM_LEVEL

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

CONFIG_LOG_COLORS

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

CONFIG_LOG_TIMESTAMP_SOURCE

Log Timestamps

*Found in: Component config > Log output*
Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:
- Checksums
- DHCP server
  - CONFIG_LWIP_DHCP_OPTIONS_LEN
  - CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID
  - CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID
  - CONFIG_LWIP_DHCP.Does_ARP_CHECK

  - CONFIG_LWIP_SO_REUSE
  - CONFIG_LWIP_NETIF_STATUS_CALLBACK
  - CONFIG_LWIP_TCP_IP_CORE_LOCKING
  - CONFIG_LWIP_NETIF_API
  - Hooks
  - ICMP
  - CONFIG_LWIP_LOCAL_HOSTNAME
  - LWIP RAW API
Chapter 2. API Reference

- `CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS`
- `CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE`
- `CONFIG_LWIP_MAX SOCKETS`
- `CONFIG_LWIP_BRIDGEIF_MAX_PORTS`
- `CONFIG_LWIP_NUM_NETIF_CLIENT_DATA`
- `CONFIG_LWIP_ESP Gratuitous ARP`
- `SNTP`
- `CONFIG_LWIP_USE_ONLY_LWIP_SELECT`
- `CONFIG_LWIP_NETIF LOOPBACK`
- `TCP`
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_RECVMBX_SIZE`
- `UDP`
- `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`

**CONFIG_LWIP_LOCAL_HOSTNAME**

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

*Default value:*

- “espressif”

**CONFIG_LWIP_NETIF_API**

Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific `esp_netif_get_netif_impl_name()`

*Default value:*

- No (disabled)

**CONFIG_LWIP_TCPIP_CORE_LOCKING**

Enable tcpip core locking

*Found in: Component config > LWIP*

If `enable tcpip core locking`, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See `LOCK_TCPIP_CORE()` and `UNLOCK_TCPIP_CORE()`.

If `disable tcpip core locking`, TCP IP will perform tasks through context switching.

*Default value:*

- No (disabled)

**CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES**

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*
If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_L2_TO_L3_COPY**
Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IRAM_OPTIMIZATION**
Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)

**CONFIG_LWIP_TIMERS_ONDEMAND**
Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MAX_SOCKETS**
Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**
- from 1 to 16

**Default value:**
- 10
**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_LINGER**

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1,l_linger can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_REUSE_RXTOALL**

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_RCVBUF**

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)
CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

*Default value:*
  * No (disabled)*

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

*Default value:*
  * Yes (enabled)*

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

*Default value:*
  * Yes (enabled)*

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

*Default value:*
  * No (disabled)*

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

*Default value:*
  * No (disabled)*

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

*Default value:*
  * No (disabled)*
**CONFIG_LWIP_IPV4_NAPT**
Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if `CONFIG_LWIP_IP_FORWARD` is enabled.

**CONFIG_LWIP_STATS**
Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

**CONFIG_LWIP_ESPเมตร GRATUITOUS ARP**
Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_GARP_TMR_INTERVAL**
GARP timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_meter GRATUITOUS ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**
- 60

**CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**
TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32
CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_OPTIONS_LEN

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

**Range:**
- from 68 to 255

**Default value:**
- 68
- 108
**CONFIG_LWIP_NUM_NETIF_CLIENT_DATA**

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

**DHCP server**

Contains:

- **CONFIG_LWIP_DHCPS**

**CONFIG_LWIP_DHCPS**

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

**CONFIG_LWIP_DHCPSLEASE_UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

**CONFIG_LWIP_DHCPS_MAX_STATION_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from its address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

**CONFIG_LWIP_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.
See RFC 3927.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_AUTOIP_TRIES`
- `CONFIG_LWIP_AUTOIP_MAX_CONFLICTS`
- `CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL`

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_IPV6**

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
• Yes (enabled)

**CONFIG_LWIP_IPV6_AUTOCONFIG**

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPv6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

• No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

• 3

**CONFIG_LWIP_IPV6_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

• No (disabled)

**CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

• 0 if **CONFIG_LWIP_IPV6_AUTOCONFIG**

**CONFIG_LWIP_IPV6_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

**Default value:**

• No (disabled) if **CONFIG_LWIP_IPV6_AUTOCONFIG**
**CONFIG_LWIP_NETIF_STATUS_CALLBACK**

Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
- No (disabled)

**CONFIG_LWIP_NETIF_LOOPBACK**

Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP.

**Default value:**
- Yes (enabled)

Contains:

- **CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

**CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**
- from 0 to 16

**Default value:**
- 8

**TCP**

Contains:

- **CONFIG_LWIP_TCP_WND_DEFAULT**
- **CONFIG_LWIP_TCP_SND_BUF_DEFAULT**
- **CONFIG_LWIP_TCP_RECVMBOX_SIZE**
- **CONFIG_LWIP_TCP_RTO_TIME**
- **CONFIG_LWIP_MAX_ACTIVE_TCP**
- **CONFIG_LWIP_MAX_LISTENING_TCP**
- **CONFIG_LWIP_TCP_MAXRTX**
- **CONFIG_LWIP_TCP_SYNMAXRTX**
- **CONFIG_LWIP_TCP_MSL**
- **CONFIG_LWIP_TCP_MSS**
- **CONFIG_LWIP_TCP_OVERSIZE**
- **CONFIG_LWIP_TCP_QUEUE_OOSEQ**
- **CONFIG_LWIP_TCP_WND_SCALE**
- **CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**
- **CONFIG_LWIP_TCP_TMR_INTERVAL**
CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

*Range:*
  * from 1 to 1024

*Default value:*
  * 16

CONFIG_LWIP_MAX_LISTENING_TCP

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

*Range:*
  * from 1 to 1024

*Default value:*
  * 16

CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

*Default value:*
  * Yes (enabled)

CONFIG_LWIP_TCP_MAXRTX

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

*Range:*
  * from 3 to 12

*Default value:*
  * 12

CONFIG_LWIP_TCP_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.
Chapter 2. API Reference

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval (ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
- 60000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 65535 if CONFIG_LWIP_WND_SCALE
- from 2440 to 1024000 if CONFIG_LWIP_WND_SCALE

**Default value:**
- 5744
**CONFIG_LWIP_TCP_WND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets. Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCP_RECVMBobox_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: `LWIP_TCP_WND_DEFAULT/TCP_MSS + 2`, e.g. if `LWIP_TCP_WND_DEFAULT`=14360, `TCP_MSS`=1436, then the recommended receive mail box size is `(14360/1436 + 2) = 12`.

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum `LWIP_TCP_RECVMBobox_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCP_RECVMBobox_SIZE` multiples the maximum TCP socket number. In other words, the bigger `LWIP_TCP_RECVMBobox_SIZE` means more memory. On the other hand, if the receiv mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_TCP_SACK_OUT

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)

CONFIG_LWIP_TCP_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

CONFIG_LWIP_WND_SCALE

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if \textit{CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP}

CONFIG_LWIP_TCP_RCV_SCALE

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if \textit{CONFIG_LWIP_WND_SCALE}

**Default value:**
- 0 if \textit{CONFIG_LWIP_WND_SCALE}

CONFIG_LWIP_TCP_RTO_TIME

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 3000
• 1500

UDP Contains:
  • `CONFIG_LWIP_UDP_RECVMBOX_SIZE`  
  • `CONFIG_LWIP_MAX_UDP_PCBS`  

`CONFIG_LWIP_MAX_UDP_PCBS`
Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
  • from 1 to 1024  
**Default value:**
  • 16

`CONFIG_LWIP_UDP_RECVMBOX_SIZE`
Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
  • from 6 to 64  
**Default value:**
  • 6

Checksums Contains:
  • `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`  
  • `CONFIG_LWIP_CHECKSUM_CHECK_IP`  
  • `CONFIG_LWIP_CHECKSUM_CHECK_UDP`  

`CONFIG_LWIP_CHECKSUM_CHECK_IP`
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
  • No (disabled)
Chapter 2. API Reference

**CONFIG_LWIP_CHECKSUM_CHECK_UDP**
Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received UDP messages

**Default value:**
*No (disabled)*

**CONFIG_LWIP_CHECKSUM_CHECK_ICMP**
Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received ICMP messages

**Default value:**
*Yes (enabled)*

**CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
TCP/IP Task Stack Size

*Found in: Component config > LWIP*
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
*from 2048 to 65536*

**Default value:**
*3072*

**CONFIG_LWIP_TCPIP_TASK_AFFINITY**
TCP/IP task affinity

*Found in: Component config > LWIP*
Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
*No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)*
*CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)*
*CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)*

**CONFIG_LWIP_PPP_SUPPORT**
Enable PPP support (new/experimental)

*Found in: Component config > LWIP*
Enable PPP stack. Now only PPP over serial is possible.
PPP over serial support is experimental and unsupported.

**Default value:**
*No (disabled)*

Contains:
*CONFIG_LWIP_PPP_ENABLE_IPV6*
CONFIG_LWIP_PPP_ENABLE_IPV6

Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**
- Yes (enabled) if $CONFIG_LWIP_PPP_SUPPORT$ & $CONFIG_LWIP_IPV6$

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**
- from 3 to 20

**Default value:**
- 3

CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**
- from 3 to 10

**Default value:**
- 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**
- No (disabled) if $CONFIG_LWIP_PPP_SUPPORT$

CONFIG_LWIP_PPP_PAP_SUPPORT

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support

**Default value:**
- No (disabled) if $CONFIG_LWIP_PPP_SUPPORT$
CONFIG_LWIP_PPP_CHAP_SUPPORT

Enable CHAP support

*Found in: Component config > LWIP*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MSCHAP_SUPPORT

Enable MSCHAP support

*Found in: Component config > LWIP*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MPPE_SUPPORT

Enable MPPE support

*Found in: Component config > LWIP*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_ENABLE_LCP_ECHO

Enable LCP ECHO

*Found in: Component config > LWIP*

Enable LCP echo keepalive requests

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_LCP_ECHOINTERVAL

Echo interval (s)

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**
- from 0 to 1000000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

CONFIG_LWIP_LCP_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`
Default value:
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**CONFIG_LWIP_PPP_DEBUG_ON**
Enable PPP debug log output

*Found in: Component config > LWIP*
Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_SLIP_SUPPORT**
Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*
Enable SLIP stack. Now only SLIP over serial is possible.
SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`

**CONFIG_LWIP_SLIP_DEBUG_ON**
Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*
Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

**ICMP** Contains:
- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

**CONFIG_LWIP_ICMP**
ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*
Enable ICMP module for check network stability

**Default value:**
- Yes (enabled)
CONFIG_LWIP_MULTICAST_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

CONFIG_LWIP_BROADCAST_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

LWIP RAW API  
Contains:
- `CONFIG_LWIP_MAX_RAW_PCBS`

CONFIG_LWIP_MAX_RAW_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

SNTP  
Contains:
- `CONFIG_LWIP_SNTP_MAX_SERVERS`
- `CONFIG_LWIP_SNTP_UPDATE_DELAY`
- `CONFIG_LWIP_DHCP_GET_NTP_SRV`

CONFIG_LWIP_SNTP_MAX_SERVERS

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

**Range:**
- from 1 to 16

**Default value:**
- 1

CONFIG_LWIP_DHCP_GET_NTP_SRV

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*
If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see snip_servermode_dhcp() func.)

**Default value:**
- No (disabled)

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**Default value:**
- 1 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**CONFIG_LWIP_SNTP_UPDATE_DELAY**

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**
- from 15000 to 4294967295

**Default value:**
- 3600000

**CONFIG_LWIP_BRIDGEIF_MAX_PORTS**

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consist of.

**Range:**
- from 1 to 63

**Default value:**
- 7

**CONFIG_LWIP_ESP_LWIP_ASSERT**

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE
Hooks Contains:

- `CONFIG_LWIP_HOOK_ND6_GET_GW`
- `CONFIG_LWIP_HOOK_IP6_INPUT`
- `CONFIG_LWIP_HOOK_IP6_ROUTE`
- `CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE`
- `CONFIG_LWIP_HOOK_TCP_ISN`

**CONFIG_LWIP_HOOK_TCP_ISN**

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:
- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

**CONFIG_LWIP_HOOK_IP6_ROUTE**

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:
- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

**CONFIG_LWIP_HOOK_ND6_GET_GW**

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:
- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*
Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_INPUT**

IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_INPUT_CUSTOM)

**CONFIG_LWIP_DEBUG**

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output. All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:
- CONFIG_LWIP_API_LIB_DEBUG
- CONFIG_LWIP_BINDER_FINISH_DEBUG
- CONFIG_LWIP_BRIDGE_INTERFACE_DEBUG
- CONFIG_LWIP_BRIDGEIF_FW_DEBUG
- CONFIG_LWIP_BRIDGEIF_DEBUG
- CONFIG_LWIP_DHCP_DEBUG
- CONFIG_LWIP_DHCP_STATE_DEBUG
- CONFIG_LWIP_DNS_DEBUG
- CONFIG_LWIP_ETHARP_DEBUG
- CONFIG_LWIP_ICMP_DEBUG
- CONFIG_LWIP_ICMP6_DEBUG
- CONFIG_LWIP_IP_DEBUG
- CONFIG_LWIP_IP6_DEBUG
- CONFIG_LWIP_NETIF_DEBUG
- CONFIG_LWIP_PBUF_DEBUG
- CONFIG_LWIP_SOCKETS_DEBUG
- CONFIG_LWIP_TCP_DEBUG
- CONFIG_LWIP_DEBUG_ESP_LOG

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*
Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_NETIF_DEBUG**
Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_PBUF_DEBUG**
Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ETHARP_DEBUG**
Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_API_LIB_DEBUG**
Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_SOCKETS_DEBUG**
Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_IP_DEBUG**
Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG &amp; CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG

Enable DHCP state tracking

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_DHCP_DEBUG

Enable DHCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP6_DEBUG

Enable IP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP6_DEBUG

Enable ICMP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_TCP_DEBUG

Enable TCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SNTP_DEBUG

Enable SNTP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG
CONFIG_LWIP_DNS_DEBUG
Enable DNS debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_BRIDGEIF_DEBUG
Enable bridge generic debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_BRIDGEIF_FDB_DEBUG
Enable bridge FDB debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_BRIDGEIF_FW_DEBUG
Enable bridge forwarding debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

**mbedTLS** Contains:

- CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN
- Certificate Bundle
- Certificates
- CONFIG_MBEDTLS_CHACHA20_C
- CONFIG_MBEDTLS_DH_C
- CONFIG_MBEDTLS_ECP_C
- CONFIG_MBEDTLS_ECDH_C
- CONFIG_MBEDTLS_ECPJPAKE_C
- CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
- CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED
- CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED
- CONFIG_MBEDTLS_CMAC_C
- CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
- CONFIG_MBEDTLS_ECDSA_DETERMINISTIC
- CONFIG_MBEDTLS_HARDWARE_AES
- CONFIG_MBEDTLS_HARDWARE_ECC
- CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN
- CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
- CONFIG_MBEDTLS_HARDWARE_MPI
- CONFIG_MBEDTLS_HARDWARE_SHA
- CONFIG_MBEDTLS_DEBUG
- CONFIG_MBEDTLS_ECP_RESTARTABLE
- CONFIG_MBEDTLS_HAVE_TIME
- CONFIG_MBEDTLS_RIPEMD160_C
**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

*Available options:*

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
• Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)
  Allows to use IRAM memory region as 8bit accessible region.
  TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN
  TLS maximum message content length
  Found in: Component config > mbedTLS

  Maximum TLS message length (in bytes) supported by mbedTLS.
  16384 is the default and this value is required to comply fully with TLS standards.
  However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.
  If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

  Range:
  • from 512 to 16384
  Default value:
  • 16384

CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN
  Asymmetric in/out fragment length
  Found in: Component config > mbedTLS

  If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

  Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN
  TLS maximum incoming fragment length
  Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN

  This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

  Range:
  • from 512 to 16384
  Default value:
  • 16384

CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN
  TLS maximum outgoing fragment length
  Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN

  This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

  Range:
  • from 512 to 16384
Default value:
  • 4096

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

**Default value:**
  • No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS` && `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

**CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA**

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**
  • No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT**

Free SSL CA certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**
  • Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

**CONFIG_MBEDTLS_DEBUG**

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call `mbedtls.esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**
  • No (disabled)
**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

*Available options:*

- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

**mbedTLS v3.x related**

Contains:

- DTLS-based configurations
- CONFIG_MBEDTLS_SSL_CONTEXT.Serialization
- CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
- CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
- CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
- CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_3**

Support TLS 1.3 protocol

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

*Default value:*

- No (disabled) if CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE && CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE**

Enable TLS 1.3 middlebox compatibility mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

*Default value:*

- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

**CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH**

Variable SSL buffer length

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

*Default value:*

- No (disabled)

**CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS_ECP_RESTARTABLE or if you want to access ECDH context fields directly.
CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK

Enable trusted certificate callbacks

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_CONTEXT.Serialization

Enable serialization of the TLS context structures

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE

Keep peer certificate after handshake completion

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

**Default value:**
- Yes (enabled) if MBEDTLS_DYNAMIC_FREE_PEER_CERT

DTLS-based configurations

Contains:
- CONFIG_MBEDTLS_SSL_DTLS_SRTP
- CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS
CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for incoming DTLS messages

Range:
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Default value:
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

Range:
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Default value:
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding (for DTLS 1.2)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

Notes: A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

Range:
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Default value:
- 16 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

Certificate Bundle Contains:
- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE
CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

*Available options:*
  - Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
  - Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
    Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
  - Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE*

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

*Default value:*
  - 200
**CONFIG_MBEDTLS_ECP_RESTARTABLE**
Enable mbedTLS ecp restartable

*Found in: Component config > mbedTLS*
Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CMAC_C**
Enable CMAC mode for block ciphers

*Found in: Component config > mbedTLS*
Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_HARDWARE_AES**
Enable hardware AES acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated AES encryption & decryption.
Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_GCM**
Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*
Enable partially hardware accelerated GCM. GHASH calculation is still done in software.
If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM & & CONFIG_MBEDTLS_HARDWARE_AES

**CONFIG_MBEDTLS_HARDWARE_MPI**
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated multiple precision integer operations.
Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.
These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST
CONFIG_MBEDTLS_HARDWARE_SHA

Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_ECC

Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED

CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK

Fallback to software implementation for curves not supported in hardware

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

CONFIG_MBEDTLS_ROM_MD5

Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME
Enable mbed TLS time support

*Found in: Component config > mbedTLS*

Enable use of time.h functions (time() and gmtime()) by mbedTLS.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT
Enable mbed TLS time support: platform-specific

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function `mbedtls_platform_set_time()` that allows to set an alternative time function pointer.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE
Enable mbed TLS certificate expiry check

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**
**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedTLS*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MbedTLS_SHA512_C adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**

Contains:

- **CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**
- **CONFIG_MBEDTLS_PSK_MODES**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-
Default value:
- Yes (enabled) if \textit{CONFIG\_MBEDTLS\_DHM\_C}

\textbf{CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE}

Support Elliptic Curve based ciphersuites

\emph{Found in: Component config > mbedTLS > TLS Key Exchange Methods}

Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

Default value:
- Yes (enabled)

\textbf{CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDSHE\_RSA}

Enable ECDH-RSA based ciphersuite modes

\emph{Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE}

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
- Yes (enabled)

\textbf{CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDSHE\_ECDSA}

Enable ECDHE-ECDSA based ciphersuite modes

\emph{Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE}

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
- Yes (enabled)

\textbf{CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA}

Enable ECDH-ECDSA based ciphersuite modes

\emph{Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE}

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
- Yes (enabled)

\textbf{CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA}

Enable ECDH-RSA based ciphersuite modes

\emph{Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE}

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
- Yes (enabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_ECJPAKE_C` & `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1

Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS

Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)
CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in:* Component config > mbedtls

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in:* Component config > mbedtls

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**

Contains:
- CONFIG_MBEDTLS_AES_C
- CONFIG_MBEDTLS_BLOWFISH_C
- CONFIG_MBEDTLS_CAMELLIA_C
- CONFIG_MBEDTLS_CCM_C
- CONFIG_MBEDTLS_DES_C
- CONFIG_MBEDTLS_GCM_C
- CONFIG_MBEDTLS_NIST_KW_C
- CONFIG_MBEDTLS_XTEA_C

CONFIG_MBEDTLS_AES_C

AES block cipher

*Found in:* Component config > mbedtls > Symmetric Ciphers

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

*Found in:* Component config > mbedtls > Symmetric Ciphers

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

*Found in:* Component config > mbedtls > Symmetric Ciphers

Enables the DES block cipher to support 3DES-based TLS ciphersuites. 3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)
Chapter 2. API Reference

**CONFIG_MBEDTLS_BLOWFISH_C**
Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_XTEA_C**
XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CCM_C**
CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_GCM_C**
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_NIST_KW_C**
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*
Enable the RIPEMD-160 hash algorithm.

**Default value:**
- No (disabled)

**Certificates**
Contains:
- CONFIG_MBEDTLS_PEM_PARSE_C
- CONFIG_MBEDTLS_PEM_WRITE_C
- CONFIG_MBEDTLS_X509_CRL_PARSE_C
- CONFIG_MBEDTLS_X509_CSR_PARSE_C

CONFIG_MBEDTLS_PEM_PARSE_C
Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*
Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C
Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*
Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C
X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C
X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*
Support for parsing X.509 Certificate Signing Requests

**Default value:**
- Yes (enabled)
CONFIG_MBEDTLS_ECP_C
Elliptic Curve Ciphers

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_DHM_C
Diffie-Hellman-Merkle key exchange (DHM)

*Found in: Component config > mbedTLS*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file `mbedtls/dhm.h` file.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_ECDH_C
Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C
Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C
Elliptic curve J-PAKE

*Found in: Component config > mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED
Enable SECP192R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`
Chapter 2. API Reference

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
Enable SECP224R1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP224R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (\text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN} \mid\mid \text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY}) \&\& \text{CONFIG_MBEDTLS_ECP_C} \)

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP384R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (\text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN} \mid\mid \text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY}) \&\& \text{CONFIG_MBEDTLS_ECP_C} \)

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP521R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (\text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN} \mid\mid \text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY}) \&\& \text{CONFIG_MBEDTLS_ECP_C} \)

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP192K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (\text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN} \mid\mid \text{CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY}) \&\& \text{CONFIG_MBEDTLS_ECP_C} \)

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP224K1 Elliptic Curve.
Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256K1 Elliptic Curve.

Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: Component config > mbedTLS*

Enable support for CURVE25519 Elliptic Curve.

Default value:
• Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\)
CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations

Found in: Component config > mbedTLS
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.
# end of Elliptic Curve options

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C
Poly1305 MAC algorithm

Found in: Component config > mbedTLS
Enable support for Poly1305 MAC algorithm.

Default value:
  • No (disabled)

CONFIG_MBEDTLS_CHACHA20_C
Chacha20 stream cipher

Found in: Component config > mbedTLS
Enable support for Chacha20 stream cipher.

Default value:
  • No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C
ChaCha20-Poly1305 AEAD algorithm

Found in: Component config > mbedTLS
Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:
  • No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C

CONFIG_MBEDTLS_HKDF_C
HKDF algorithm (RFC 5869)

Found in: Component config > mbedTLS
Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:
  • No (disabled)
CONFIG_MBEDTLS_THREADING_C
Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT
Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD
Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI
Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS
Show configurations with potential security risks

*Found in: Component config > mbedTLS*

**Default value:**
- No (disabled)

Contains:
- CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT
X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions
Default value:
- No (disabled) if `CONFIG_MBEDTLS_SECURITY_RISKS`

**ESP-MQTT Configurations**
Contains:
- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**
Enable MQTT protocol 3.1.1
*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_SSL**
Enable MQTT over SSL
*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbdtls

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**
Enable MQTT over Websocket
*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE**
Enable MQTT over Websocket Secure
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*

Enable MQTT transport over Websocket Secure.

**Default value:**
- Yes (enabled)
CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**
- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later). The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.

**Default value:**
- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

**Default value:**
- 1883 if CONFIG_MQTT_USE_CUSTOM_CONFIG
**CONFIG_MQTT_SSL_DEFAULT_PORT**

Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over SSL port

*Default value:*

- 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_SSL`

**CONFIG_MQTT_WS_DEFAULT_PORT**

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket port

*Default value:*

- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

**CONFIG_MQTT_WSS_DEFAULT_PORT**

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

*Default value:*

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

**CONFIG_MQTT_BUFFER_SIZE**

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

*Default value:*

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_STACK_SIZE**

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

*Default value:*

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_DISABLE_API_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

*Default value:*

• No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

• 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**CONFIG_MQTT_TASK_CORE_SELECTION**

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**

• Core 0 (MQTT_USE_CORE_0)
• Core 1 (MQTT_USE_CORE_1)

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqtt mqttCOMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

**Default value:**

• No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

• 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

• `CONFIG_NEWLIB_NANO_FORMAT`
• `CONFIG_NEWLIB_STDIN_LINE_ENDING`
• `CONFIG_NEWLIBSTDOUT_LINE_ENDING`
• `CONFIG_NEWLIB_TIME_SYSCALL`
**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘n’, LF) appears on stdout. Three options are possible:

- **CRLF**: whenever LF is encountered, prepend it with CR
- **LF**: no modification is applied, stdout is sent as is
- **CR**: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘n’, LF) on stdin. Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘—enable-newlib-nano-formatted-io’ : [https://sourceware.org/newlib/README](https://sourceware.org/newlib/README)

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.
CONFIG_NEWLIB_TIME_SYSCALL

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.**
- **If only high-resolution timer (systimer) is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.**
- **If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.**
- **If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.**
- **When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.**

**Available options:**

- RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
- None (NEWLIB_TIME_SYSCALL_USE_NONE)

NVS Contains:

- **CONFIG_NVS_ENCRYPTION**
- **CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**
- **CONFIG_NVS_ASSERT_ERROR_CHECK**

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if **CONFIG_SECURE_FLASH_ENC_ENABLED**

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK

Use assertions for error checking

*Found in: Component config > NVS*
This option switches error checking type between assertions (y) or return codes (n).

**Default value:**
- No (disabled)

**OpenThread**
Contains:
- `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_ENABLED**
OpenThread

*Found in: Component config > OpenThread*
Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

**CONFIG_OPENTHREAD_RADIO_TYPE**

Config the Thread radio type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*
Configure how OpenThread connects to the 15.4 radio

**Available options:**
- Native 15.4 radio (`OPENTHREAD_RADIO_NATIVE`)
  Select this to use the native 15.4 radio.
- Connect via UART (`OPENTHREAD_RADIO_SPINEL_UART`)
  Select this to connect to a Radio Co-Processor via UART.

**CONFIG_OPENTHREAD_DEVICE_TYPE**

Config the Thread device type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*
OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**
- Full Thread Device (`OPENTHREAD_FTD`)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (`OPENTHREAD_MTD`)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (`OPENTHREAD_RADIO`)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

**CONFIG_OPENTHREAD_DIAG**

Enable diag

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*
Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.
Default value:
  • Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_COMMISSIONER**

Enable Commissioner

*Found in: Component config > OpenThread* > `CONFIG_OPENTHREAD_ENABLED`

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

Default value:
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_JOINER**

Enable Joiner

*Found in: Component config > OpenThread* > `CONFIG_OPENTHREAD_ENABLED`

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

Default value:
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_SR_P_CLIENT**

Enable SRP Client

*Found in: Component config > OpenThread* > `CONFIG_OPENTHREAD_ENABLED`

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

Default value:
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_BORDER_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread* > `CONFIG_OPENTHREAD_ENABLED`

Select this option to enable border router features in OpenThread.

Default value:
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS**

The number of openthread message buffers

*Found in: Component config > OpenThread* > `CONFIG_OPENTHREAD_ENABLED`

**Range:**
  • from 50 to 100 if `CONFIG_OPENTHREAD_ENABLED`

Default value:
  • 65 if `CONFIG_OPENTHREAD_ENABLED`
Protocomm  Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

`CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
Support protocomm security version 0 (no security)

*Found in: Component config > Protocomm*

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
- Yes (enabled)

`CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
- Yes (enabled)

`CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`
Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
- No (disabled)

PThreads  Contains:

- `CONFIG_PTHREAD_TASK_NAME_DEFAULT`
- `CONFIG_PTHREAD_TASK_CORE_DEFAULT`
- `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
- `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`
- `CONFIG_PTHREAD_STACK_MIN`

`CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

*Range:*
- from 0 to 255
Default value:
- 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**
- 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
- 768

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**
- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
- “pthread”

**SPI Flash driver**

Contains:

- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- SPI Flash behavior when brownout
- CONFIG_SPI_FLASH_SHARE_SPI1_BUS
Chapter 2. API Reference

- `CONFIG_SPI_FLASH_VERIFY_WRITE`
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`

`CONFIG_SPI_FLASH_VERIFY_WRITE`
Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**
- No (disabled)

`CONFIG_SPI_FLASH_LOG_FAILED_WRITE`
Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

`CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`
Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

`CONFIG_SPI_FLASH_ENABLE_COUNTERS`
Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:
- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**
- 0
CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**
- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_SHARE_SPI1_BUS

Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**
- No (disabled)
CONFIG_SPI_FLASH_YIELD_DURING_ERASE
Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS and SPI\_FLASH\_ERASE\_YIELD\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS
Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**
- 20

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS
CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

 Defines how many ticks will be before returning to continue a erasing.

**Default value:**
- 1

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**
- from 256 to 8192

**Default value:**
- 8192

CONFIG_SPI_FLASH_SIZE_OVERRIDE
Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**Default value:**
- No (disabled)
**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**
Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**
Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the `default_registered_chips` structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

**Default value:**
- No (disabled)

**SPI Flash behavior when brownout**
Contains:
- **CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

**CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**
Enable sending reset when brownout for XMC flash chips

*Found in: Component config > SPI Flash driver > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

**DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.**

**Default value:**
- Yes (enabled)

**Auto-detect flash chips**
Contains:
- **CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_TH_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**

**CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**
ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by *chip_drv* member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by *chip_drv* member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**

- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by *chip_drv* member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP**

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by *chip_drv* member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- No (disabled)
- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_TH_CHIP**

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by *chip_drv* member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)
**CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE**

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)

**SPIFFS Configuration**  Contains:

- **Debug Configuration**
- `CONFIG_SPIFFS_USE_MAGIC`
- `CONFIG_SPIFFS_GC_STATS`
- `CONFIG_SPIFFS_PAGE_CHECK`
- `CONFIG_SPIFFS_FOLLOW_SYMLINKS`
- `CONFIG_SPIFFS_MAX_PARTITIONS`
- `CONFIG_SPIFFS_USE_MTIME`
- `CONFIG_SPIFFS_GC_MAX_RUNS`
- `CONFIG_SPIFFS_OBJ_NAME_LEN`
- `CONFIG_SPIFFS_META_LENGTH`
- **SPIFFS Cache Configuration**
- `CONFIG_SPIFFS_CACHE`
- `CONFIG_SPIFFS_PAGE_SIZE`
- `CONFIG_SPIFFS_MTIME_WIDE_64_BITS`

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**
- from 1 to 10

**Default value:**
- 3

**SPIFFS Cache Configuration**  Contains:

- `CONFIG_SPIFFS_CACHE`

**CONFIG_SPIFFS_CACHE**

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)
CONFIG_SPIFFS_CACHE_WR
Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS
Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_PAGE_CHECK
Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS
Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**
- from 1 to 10000

**Default value:**
- 10

CONFIG_SPIFFS_GC_STATS
Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
- No (disabled)
**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- from 256 to 1024

**Default value:**
- 256

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- from 1 to 256

**Default value:**
- 32

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
• Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**

• 4

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

• Yes (enabled)

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**

• No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

**Debug Configuration** Contains:

• CONFIG_SPIFFS_DBG
• CONFIG_SPIFFS_API_DBG
• CONFIG_SPIFFS_CACHE_DBG
• CONFIG_SPIFFS_CHECK_DBG
• CONFIG_SPIFFS_TEST_VISUALISATION
• CONFIG_SPIFFS_GC_DBG

**CONFIG_SPIFFS_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**

• No (disabled)
CONFIG_SPIFFS_API_DBG
Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_GC_DBG
Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_CACHE_DBG
Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_CHECK_DBG
Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION
Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

**Default value:**
- No (disabled)

TCP Transport  Contains:
- Websocket

Websocket  Contains:
- **CONFIG_WS_TRANSPORT**
CONFIG_WS_TRANSPORT
Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*
Enable support for creating websocket transport.

**Default value:**
- Yes (enabled)

CONFIG_WS_BUFFER_SIZE
Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*
Size of the buffer used for constructing the HTTP Upgrade request during connect.

**Default value:**
- 1024

CONFIG_WS_DYNAMIC_BUFFER
Using dynamic websocket transport buffer

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*
If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**
- No (disabled)

Ultra Low Power (ULP) Co-processor Contains:

- CONFIG_ULP_COPROC_ENABLED

CONFIG_ULP_COPROC_ENABLED
Enable Ultra Low Power (ULP) Co-processor

*Found in: Component config > Ultra Low Power (ULP) Co-processor*
Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**
- No (disabled)

CONFIG_ULP_COPROC_TYPE
ULP Co-processor type

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*
Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V. Please note that ESP32 only supports ULP FSM.

**Available options:**
- ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
- ULP RISC-V (ULP_COPROC_TYPE_RISCV)
CONFIG_ULP_COPROC_reserve_MEM

RTC slow memory reserved for coprocessor

*Found in:* Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

*Range:*
  - from 32 to 8176 if CONFIG_ULP_COPROC_ENABLED

*Default value:*
  - 512 if CONFIG_ULP_COPROC_ENABLED

Unity unit testing library

Contains:

- CONFIGUNITY_ENABLE_COLOR
- CONFIGUNITY_ENABLE_IDF_TEST_RUNNER
- CONFIGUNITY_ENABLE_FIXTURE
- CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL
- CONFIGUNITY_ENABLE_64BIT
- CONFIGUNITY_ENABLE_DOUBLE
- CONFIGUNITY_ENABLE_FLOAT

CONFIGUNITY_ENABLE_FLOAT

Support for float type

*Found in:* Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

*Default value:*
  - Yes (enabled)

CONFIGUNITY_ENABLE_DOUBLE

Support for double type

*Found in:* Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

*Default value:*
  - Yes (enabled)

CONFIGUNITY_ENABLE_64BIT

Support for 64-bit integer types

*Found in:* Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

*Default value:*
  - No (disabled)
CONFIG_UNITY_ENABLE_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

**Virtual file system**

Contains:

- CONFIG_VFS_SUPPORT_IO

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.
open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.
Disabling this option can save memory when the support for these functions is not required.
Note that the following functions can still be used with socket file descriptors when this option is disabled:
close, read, write, ioctl, fcntl.

**Default value:**
• Yes (enabled)

**CONFIG_VFS_SUPPORT_DIR**

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component.
stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.
Disabling this option can save memory when the support for these functions is not required.

**Default value:**
• Yes (enabled)

**CONFIG_VFS_SUPPORT_SELECT**

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.
If disabled, the default select implementation will be provided by LWIP for sockets only.
Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**Default value:**
• Yes (enabled) if CONFIG_VFS_SUPPORT_IO && CONFIG_LWIP_USE_ONLY_LWIP_SELECT

**CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT**

Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconventionally lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
• Yes (enabled)
CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

Host File System I/O (Semihosting)  Contains:

- `CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS`

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**
- 1

Wear Levelling  Contains:

- `CONFIG_WL_SECTOR_MODE`
- `CONFIG_WL_SECTOR_SIZE`

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**
- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
Chapter 2. API Reference

• In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:
• Performance (WL_SECTOR_MODE_PERF)
• Safety (WL_SECTOR_MODE_SAFE)

Wi-Fi Provisioning Manager Contains:
• CONFIG_WIFI_PROV_BLE_BONDING
• CONFIG_WIFI_PROV_BLE_SEC_CONN
• CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION
• CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
• CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT

CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
Max Wi-Fi Scan Result Entries

Found in: Component config > Wi-Fi Provisioning Manager
This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

Range:
• from 1 to 255

Default value:
• 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT
Provisioning auto-stop timeout

Found in: Component config > Wi-Fi Provisioning Manager
Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Range:
• from 5 to 600

Default value:
• 30

CONFIG_WIFI_PROV_BLE_BONDING
Enable BLE bonding

Found in: Component config > Wi-Fi Provisioning Manager
This option is applicable only when provisioning transport is BLE.

Default value:
• Yes (enabled) if CONFIG_BT_ENABLED

CONFIG_WIFI_PROV_BLE_SEC_CONN
Enable BLE Secure connection flag

Found in: Component config > Wi-Fi Provisioning Manager
Used to enable Secure connection support when provisioning transport is BLE.

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

**Default value:**

• Yes (enabled)

**Supplicant** Contains:

• `CONFIG_WPA_TESTING_OPTIONS`
• `CONFIG_WPA_WPS_SOFTAP_REGISTRAR`
• `CONFIG_WPA_11KV_SUPPORT`
• `CONFIG_WPA_11R_SUPPORT`
• `CONFIG_WPA_DPP_SUPPORT`
• `CONFIG_WPA_MBO_SUPPORT`
• `CONFIG_WPA_SUITE_B_192`
• `CONFIG_WPA_WAPI_PSK`
• `CONFIG_WPA_DEBUG_PRINT`
• `CONFIG_WPA_WPS STRICT`
• `CONFIG_WPA_MBEDTLS_CRYPTO`

**CONFIG_WPA_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**

• Yes (enabled)

**CONFIG_WPA_MBEDTLS_TLS_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Supplicant > CONFIG_WPA_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

• Yes (enabled)

**CONFIG_WPA_WAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

• No (disabled)
CONFIG_WPA_SUITE_B_192
Enable NSA suite B support with 192 bit key

Found in: Component config > Supplicant

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

Default value:
• No (disabled)

CONFIG_WPA_DEBUG_PRINT
Print debug messages from WPA Supplicant

Found in: Component config > Supplicant

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

Default value:
• No (disabled)

CONFIG_WPA_TESTING_OPTIONS
Add DPP testing code

Found in: Component config > Supplicant

Select this to enable unity test for DPP.

Default value:
• No (disabled)

CONFIG_WPA_WPS_STRICT
Strictly validate all WPS attributes

Found in: Component config > Supplicant

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

Default value:
• No (disabled)

CONFIG_WPA_11KV_SUPPORT
Enable 802.11k, 802.11v APIs Support

Found in: Component config > Supplicant

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

Default value:
• No (disabled)
CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if `CONFIG_WPA_11KV_SUPPORT`

CONFIG_WPA_MBO_SUPPORT

Enable Multi Band Operation Certification Support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)

CONFIG_WPA_DPP_SUPPORT

Enable DPP support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

CONFIG_WPA_11R_SUPPORT

Enable 802.11R (Fast Transition) Support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Fast Transition Support.

**Default value:**
- No (disabled)

CONFIG_WPA_WPS_SOFTAP_REGISTRAR

Add WPS Registrar support in SoftAP mode

*Found in: Component config > Supplicant*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**
- No (disabled)

Deprecated options and their replacements

- `CONFIG_A2DP_ENABLE (CONFIG_BT_A2DP_ENABLE)`

Chapter 2. API Reference

2.8 Provisioning API

2.8.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
Chapter 2. API Reference

• protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
  • Proof-of-possession (support with protocomm_security1 only)
  • Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (for protocomm_security1 and protocomm_security2) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Enabling protocomm security version

Protocomm component provides project configuration menu to enable/disable support of respective security versions. The respective configuration options can be found as follows:

• Support protocomm security version 0 (no security): CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0 (this option is enabled by default)
• Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption): CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1 (this option is enabled by default)
• Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption): CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2

Note: Enabling multiple security versions allow to control them dynamically but also increases firmware size.

Transport Example (SoftAP + HTTP) with Security 2

For sample usage, see wifi_provisioning/src/scheme_softap.c

```c
/* Endpoint handler to be registered with protocomm. */
* This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
  const uint8_t *inbuf, ssize_t inlen,
  uint8_t *outbuf, ssize_t *outlen,
  void *priv_data)
{
  /* Session ID may be used for persistence */
  printf("Session ID : %d", session_id);

  /* Echo back the received data */
  *outlen = inlen;            /* Output data length updated */
  *outbuf = malloc(inlen);    /* This will be deallocated outside */
  memcpy(*outbuf, inbuf, inlen);

  /* Private data that was passed at the time of endpoint creation */
  uint32_t *priv = (uint32_t *) priv_data;
  if (priv) {
    printf("Private data : %d", *priv);
  }

  return ESP_OK;
}

static const char sec2_salt[] = {0xf7, 0x5f, 0xe2, 0xbe, 0xa9, 0x81, 0xcd};

  protocomm_unset_security(pc, "security_endpoint");

  /* Stop BLE protocomm service */
  protocomm_ble_stop(pc);
  protocomm_delete(pc);
}

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new(void)
Create a new protocomm instance.
This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t
structure initialized to NULL.

Returns
- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)
Delete a protocomm instance.
This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters pc –[in] Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h,
   void *priv_data)
Add endpoint request handler for a protocomm instance.
This API will bind an endpoint handler function to the specified endpoint name, along with any private data
that needs to be pass to the handler at the time of call.

Note:
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- This function internally calls the registered add_endpoint() function of the selected transport which
  is a member of the protocomm_t instance structure.
Parameters

- **pc** [in] Pointer to the protocomm instance
- **ep_name** [in] Endpoint identifier (name) string
- **h** [in] Endpoint handler function
- **priv_data** [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

Returns

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

Note:

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

### protocomm_open_session

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```

Allocates internal resources for new transport session.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

### protocomm_close_session

```c
esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)
```

Frees internal resources used by a transport session.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
Returns

- ESP_OK: Request handled successfully
- ESP_ERR_INVALID_ARG: Null instance/name arguments

```c
esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Parameters**

- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **session_id** - [in] Unique ID for a communication session
- **inbuf** - [in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** - [in] Length of the input buffer
- **outbuf** - [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** - [out] Buffer length of the allocated output buffer

**Returns**

- ESP_OK: Request handled successfully
- ESP_FAIL: Internal error in execution of registered handler
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

```c
esp_err_t protocomm_set_security (protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const void *sec_params)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

**Parameters**

- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **sec** - [in] Pointer to endpoint security instance
- **sec_params** - [in] Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 sec_params should contain pointer to struct of type `protocomm_security1_params_t` and `protocomm_security2_params_t` respectively.

**Returns**

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Security endpoint already set
Chapter 2. API Reference

- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

```c
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)
```
Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier (name) string

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

```c
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```
Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier (name) string
- `version` [in] Version identifier (name) string

**Returns**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint/Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Version endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

```c
esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)
```
Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier (name) string

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Type Definitions**

typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t* inbuf, ssize_t inlen,
uint8_t** outbuf, ssize_t* outlen, void* priv_data)
Function prototype for protocomm endpoint handler.

typedef struct protocomm_t
This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.
Note: Structure of the protocomm object is kept private

Header File

- components/protocomm/include/security/protocomm_security.h

Structures

struct protocomm_security1_params
Protocomm Security 1 parameters: Proof Of Possession.

Public Members

const uint8_t *data
Pointer to buffer containing the proof of possession data

uint16_t len
Length (in bytes) of the proof of possession data

struct protocomm_security2_params
Protocomm Security 2 parameters: Salt and Verifier.

Public Members

const char *salt
Pointer to the buffer containing the salt

uint16_t salt_len
Length (in bytes) of the salt

const char *verifier
Pointer to the buffer containing the verifier

uint16_t verifier_len
Length (in bytes) of the verifier

struct protocomm_security
Protocomm security object structure.
The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members
int ver

Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)

Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)

Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t

Protocomm Security 1 parameters: Proof Of Possession.

typedef protocomm_security1_params_t protocomm_security_pop_t

typedef struct protocomm_security2_params protocomm_security2_params_t

Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Header File

- components/protocomm/include/security/protocomm_security0.h
**Header File**

- components/protocomm/include/security/protocomm_security1.h

**Header File**

- components/protocomm/include/transports/protocomm_httpd.h

**Functions**

```c
esp_err_t protocomm_httpd_start(protocomm_t *pc, const protocomm_httpd_config_t *config)
```

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Parameters**

- `pc` - [in] Protocomm instance pointer obtained from protocomm_new()
- `config` - [in] Pointer to config structure for initializing HTTP server

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

```c
esp_err_t protocomm_httpd_stop(protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters**

- `pc` - [in] Same protocomm instance that was passed to protocomm_httpd_start()

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

**Unions**

```c
union protocomm_httpd_config_data_t
```

`#include <protocomm_httpd.h>` Protocomm HTTPD Configuration Data

**Public Members**

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active
Chapter 2. API Reference

Structures

struct protocomm_http_server_config_t

Config parameters for protocomm HTTP server.

Public Members

uint16_t port

Port on which the HTTP server will listen

size_t stack_size

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned task_priority

Priority of server task

struct protocomm_httpd_config_t

Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided

Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data

Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

• components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Parameters

• pc [in] Protocomm instance pointer obtained from protocomm_new()
• config [in] Pointer to config structure for initializing BLE

Returns

• ESP_OK : Success
• ESP_FAIL : Simple BLE start error
• ESP_ERR_NO_MEM : Error allocating memory for internal resources
• ESP_ERR_INVALID_STATE : Error in ble config
• ESP_ERR_INVALID_ARG : Null arguments
### esp_err_t protocomm_ble_stop (protocomm_t *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

**Note:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp bt mem release in that case.

**Parameters**

- `pc` –in Same protocomm instance that was passed to protocomm_ble_start()

**Returns**

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

### Structures

**struct name_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

- `const char *name`
  
  Name of the handler, which is passed to protocomm layer

- `uint16_t uuid`
  
  UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm_ble_config**

Config parameters for protocomm BLE service.

**Public Members**

- `char device_name[MAX_BLE_DEVNAME_LEN]`
  
  BLE device name being broadcast at the time of provisioning

- `uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]`
  
  128 bit UUID of the provisioning service

- `uint8_t *manufacturer_data`
  
  BLE device manufacturer data pointer in advertisement

- `ssize_t manufacturer_data_len`
  
  BLE device manufacturer data length in advertisement

- `ssize_t nu_lookup_count`
  
  Number of entries in the Name-UUID lookup table
protocomm_ble_name_uuid_t *nu_lookup
    Pointer to the Name-UUID lookup table

unsigned ble_bonding
    BLE bonding

unsigned ble_sm_sc
    BLE security flag

Macros

MAX_BLE_DEVNAME_LEN
    BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

MAX_BLE_MANUFACTURER_DATA_LEN
    Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
    This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
    Config parameters for protocomm BLE service.

2.8.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. Extensible Protocol: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. Transport Flexibility: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. Security Scheme Flexibility: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. **Compact Data Representation:** The protocol uses Google Protocol Buffers as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

**Typical Provisioning Process**

**Deciding on Transport**

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases.
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

**Deciding on Security**

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. **Transport Security:** SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. **Application Security:** The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

**Device Discovery**

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.
Chapter 2. API Reference

Fig. 27: Typical Provisioning Process

1. Transport specific discovery and connection
   - Some form of beaonning
   - Client connects

2. Session Establishment =
   - Get Version Request
   - Get Version Response

   - Set Config Response (optional)
   - Wi-Fi SetConfig(SSID, Passphrase...)
   - Wi-Fi SetConfig response
   - Wi-Fi ApplyConfig cmd
   - Wi-Fi ApplyConfig resp
   - Wi-Fi GetStatus cmd (repeated)
   - Wi-Fi GetStatus resp (repeated)

4. Close connection
   - Close Connection
Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called Protocol Communication which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present, unified provisioning supports the following security schemes:

1. Security0 - No security (No encryption)
2. Security1 - Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
   a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
   b. No Auth (Null PoP) - Shared key derived through key exchange only
3. Security2 - SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

Note: The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in Protocol Communication for more
Chapter 2. API Reference

Security1 Scheme

Security1 scheme details are shown in the below sequence diagram -

**Note:** We shall soon migrate to Security2 scheme as the default scheme in our examples as it provides enhanced security. This change shall be done once we have our phone apps (Android/iOS) upgraded to handle Security2 scheme.

Security2 Scheme

Security2 scheme is based on the Secure Remote Password (SRP6a) protocol - [RFC 5054](https://tools.ietf.org/html/rfc5054). The protocol requires the Salt and Verifier to be generated beforehand with help of the identifying username \( I \) and the plaintext password \( p \). The Salt and Verifier are then stored on ESP32. - The password \( p \) and username \( I \) are to be provided to the Phone App (Provisioning entity) by suitable means for example QR code sticker.

Security2 scheme details are shown in the below sequence diagram -

Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.8.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Verify Device 

Client calculates device proof M2 as M2 = H(A, M, K) 
client verifies this M2 with M2 obtained from device
Initialization  `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_APIs`. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **`scheme`**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **`scheme_event_handler`**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`: Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`: Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`: Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE`: Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **`app_event_handler`** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`'s that are emitted to the default event loop handler. See definition of ``wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
        case WIFI_PROV_START:
            ESP_LOGI(TAG, "Provisioning started");
            break;
        case WIFI_PROV_CRED_RECV: {
            wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t*)
            (*event_data);
            /*
```
ESP_LOGI(TAG, "Received Wi-Fi credentials"
  "\n\tSSID : %s\n\tPassword : %s",
  (const char *) wifi_sta_cfg->ssid,
  (const char *) wifi_sta_cfg->password);
  break;
} case WIFI_PROV_CRED_FAIL: {
  wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
  →reason_t *)event_data;
  ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
  "\n\tPlease reset to factory and retry_
  →provisioning",
  (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi_
  →access-point not found");
  break;
} case WIFI_PROV_CRED_SUCCESS: 
  ESP_LOGI(TAG, "Provisioning successful");
  break;
 case WIFI_PROV_END: 
  /* De-initialize manager once provisioning is finished */
  wifi_prov_mgr_deinit();
  break;
 default:
  break;
}
}

The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().

Check Provisioning State Whether device is provisioned or not can be checked at runtime by calling wifi_prov_mgr_is_provisioned(). This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the esp_wifi_ APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call esp_wifi_ APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start Provisioning Service At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is wifi_prov_scheme_softap
- BLE Device name (service key is ignored) when scheme is wifi_prov_scheme_ble

Also, since internally the manager uses protocolcomm, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
• Security 0 is simply plain text communication. In this case the pop is simply ignored

See Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";
wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK(wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key));
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check Provisioning State.

### Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK(wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key));

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT’s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to _esp_wifi_prov.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement.
and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic will be assigned a UUID like 55cc____-fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the proto-ver endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like:  

```
```

Here label `prov` provides provisioning service version (ver) and capabilities (cap). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version/capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding .proto files can be found under `wifi_provisioning/proto`):

- `get_status` - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- `set_config` - For setting the Wi-Fi connection credentials
- `apply_config` - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- `scan_start` - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished
  - `passive` (input) - If true scan is started in passive mode (this may be slower) instead of active mode
– group_channels (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g., BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

– period_ms (input) - Scan parameter specifying how long to wait on each channel

- scan_status - Gives the status of scanning process:
  - scan_finished (output) - When scan has finished this returns true
  - result_count (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating

- scan_result - For fetching scan results. This can be called even if scan is still on going
  - start_index (input) - Starting index from where to fetch the entries from the results list
  - count (input) - Number of entries to fetch from the starting index
  - entries (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_,
    →key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
    →custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the apply_config command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some
time after the Wi-Fi connection is successfully established. For example, if the application requires the de-
vice to connect to some cloud service and obtain another set of credentials, and exchange this credentials
over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling
\texttt{wifi_prov_mgr\_stop\_provisioning()} inside the protocomm handler itself. The right amount of de-
lay ensures that the transport resources are freed only after the response from the protocomm handler reaches the
client side application.

\textbf{Application Examples}

For complete example implementation see \texttt{provisioning/wifi\_prov\_mgr}

\textbf{Provisioning Tools}

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: \texttt{esp-idf-provisioning-android}.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: \texttt{esp-idf-provisioning-ios}.

- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as
a debugging tool for developers.

\textbf{API Reference}

\textbf{Header File}

- components/wifi\_provisioning/include/wifi\_provisioning/manager.h

\textbf{Functions}

\begin{verbatim}
\texttt{esp\_err\_t \texttt{wifi\_prov\_mgr\_init}(wifi\_prov\_mgr\_config\_t config)}
\end{verbatim}

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

\begin{verbatim}
\texttt{Parameters config -[in] Configuration structure}
\texttt{Returns}
  • ESP\_OK : Success
  • ESP\_FAIL : Fail}
\end{verbatim}

\begin{verbatim}
\texttt{void \texttt{wifi\_prov\_mgr\_deinit} (void)}
\end{verbatim}

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting
WIFI\_PROV\_END, and then performs the de-initialization
esp_err_t wifi_prov_mgr_is_provisioned(bool *provisioned)
Checks if device is provisioned.
This checks if Wi-Fi credentials are present on the NVS
The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component
If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note:** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Parameters**

**provisioned** - [out] True if provisioned, else false

**Returns**

- ESP_OK: Retrieved provision state successfully
- ESP_FAIL: Wi-Fi not initialized
- ESP_ERR_INVALID_ARG: Null arguments supplied
- ESP_ERR_INVALID_STATE: Manager not initialized

esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)

Start provisioning service.
This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi_prov_scheme_ble: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

**Note:** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

**Parameters**

- **security** - [in] Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** - [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively.
- **service_name** - [in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service_key** - [in] Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

**Returns**
void wifi_prov_mgr_stop_provisioning (void)
Stop provisioning service.
If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.
If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.
This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.
Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.
Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.
For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)
Wait for provisioning service to finish.
Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted. This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
Disable auto stopping of provisioning service upon completion.
By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.
This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Parameters cleanup_delay [in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns
• ESP_OK : Success
• ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char **capabilities, size_t total_capabilities)
Set application version and capabilities in the JSON data returned by proto-ver endpoint.
This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.
The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Parameters**
- `label` [in] String indicating the application name.
- `version` [in] String indicating the application version. There is no constraint on format.
- `capabilities` [in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- `total_capabilities` [in] Size of capabilities array

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM`: Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG`: Null argument

`esp_err_t wifi_prov_mgr_endpoint_create(const char* ep_name)`
Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note:** This API can only be called BEFORE provisioning is started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Parameters** `ep_name` [in] unique name of the endpoint

**Returns**
- `ESP_OK`: Success
- `ESP_FAIL`: Failure

`esp_err_t wifi_prov_mgr_endpoint_register(const char* ep_name, protocomm_req_handler_t handler, void *user_ctx)`
Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note:** This API can only be called AFTER provisioning has started
Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application.

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered.

Parameters
- **ep_name** - [in] Name of the endpoint
- **handler** - [in] Endpoint handler function
- **user_ctx** - [in] User data

Returns
- ESP_OK : Success
- ESP_FAIL : Failure

```c
void wifi_prov_mgr_endpoint_unregister (const char *ep_name)
```
Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters **ep_name** - [in] Name of the endpoint

```c
esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
```
Get state of Wi-Fi Station during provisioning.

Parameters **state** - [out] Pointer to wifi_prov_sta_state_t variable to be filled

Returns
- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

```c
esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
```
Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters **reason** - [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

Returns
- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

```c
esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
```
Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started.

Parameters **wifi_cfg** - [in] Pointer to Wi-Fi configuration structure

Returns
- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration
**Chapter 2. API Reference**

**esp_err_t wifi_prov_mgr_reset_provisioning (void)**

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Returns**

- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

**esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)**

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Returns**

- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**Structures**

`struct wifi_prov_event_handler_t`

Event handler that is used by the manager while provisioning service is active.

**Public Members**

`wifi_prov_cb_func_t event_cb`

Callback function to be executed on provisioning events

`void *user_data`

User context data to pass as parameter to callback function

`struct wifi_prov_scheme`

Structure for specifying the provisioning scheme to be followed by the manager.

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

`esp_err_t (*prov_start)(protocomm_t *pc, void *config)`

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

`esp_err_t (*prov_stop)(protocomm_t *pc)`

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
Chapter 2. API Reference

void *(*new_config)(void)
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start().

void (*delete_config)(void *config)
Function which is to be called by the manager to delete a configuration generated using new_config().

esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure.

esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure.

wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning. This is set to:

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme
Provisioning scheme to use. Following schemes are already available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

wifi_prov_event_handler_t app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE
Event handler can be set to none if not used.
Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t
    Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
    Security modes supported by the Provisioning Manager.
    These are same as the security modes provided by protocomm

typedef protocomm_security1_params_t wifi_prov_security1_params_t

typedef protocomm_security2_params_t wifi_prov_security2_params_t

Enumerations

denum wifi_prov_cb_event_t
    Events generated by manager.
    These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

typedef enum

enumerator WIFI_PROV_INIT
    Emited when the manager is initialized

denumerator WIFI_PROV_START
    Indicates that provisioning has started

denumerator WIFI_PROV_CRED_RECV
    Emited when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

denumerator WIFI_PROV_CRED_FAIL
    Emited when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

denumerator WIFI_PROV_CRED_SUCCESS
    Emited when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

denumerator WIFI_PROV_END
    Signals that provisioning service has stopped
Chapter 2. API Reference

enumerator WIFI_PROV_DEINIT
    Signals that manager has been de-initialized

enum wifi_prov_security
    Security modes supported by the Provisioning Manager.
    These are same as the security modes provided by protocomm

Values:

enumerator WIFI_PROV_SECURITY_0
    No security (plain-text communication)

enumerator WIFI_PROV_SECURITY_1
    This secure communication mode consists of X25519 key exchange
    • proof of possession (pop) based authentication
    • AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
    This secure communication mode consists of SRP6a based authentication and key exchange
    • AES-GCM encryption/decryption

Header File
    • components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
    Set the 128 bit GATT service UUID used for provisioning.
    This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.
    This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

Note: The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

Parameters uuid128  [in] A custom 128 bit UUID
Returns
    • ESP_OK : Success
    • ESP_ERR_INVALID_ARG : Null argument
**Esp_err_t wifi_prov_scheme_ble_set_mfg_data**

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. \((\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\). If the mfg_data length exceeds this limit, the length will be truncated.

**Parameters**

- **mfg_data**  
  - [in] Custom manufacturer data
- **mfg_data_len**  
  - [in] Manufacturer data length

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Macros**

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

**Functions**

**void wifi_prov_scheme_softap_set_httpd_handle**

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note:** This API should be called before wifi_prov_mgr_start_provisioning()

**Parameters**

- **handle**  
  - [in] Handle to HTTPD server instance

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/wifi_config.h
Chapter 2. API Reference

Functions

```c
esp_err_t wifi_prov_config_data_handler(uint32_t session_id, const uint8_t* inbuf, ssize_t inlen, uint8_t** outbuf, ssize_t* outlen, void* priv_data)
```

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (`protocomm proto-comm_req_handler_t`) using `protocomm_add_endpoint()`.

Structures

```c
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.

**Public Members**

- `char ip_addr[IP4ADDR_STRLEN_MAX]`
  - IP Address received by station
- `char bssid[6]`
  - BSSID of the AP to which connection was established
- `char ssid[33]`
  - SSID of the to which connection was established
- `uint8_t channel`
  - Channel of the AP
- `uint8_t auth_mode`
  - Authorization mode of the AP

```c
struct wifi_prov_config_get_data_t
```

WiFi status data to be sent in response to `get_status` request from master.

**Public Members**

- `wifi_prov_sta_state_t wifi_state`
  - WiFi state of the station
- `wifi_prov_sta_fail_reason_t fail_reason`
  - Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)
- `wifi_prov_sta_conn_info_t conn_info`
  - Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

```c
struct wifi_prov_config_set_data_t
```

WiFi config data received by slave during `set_config` request from master.
Public Members

char ssid[33]
SSID of the AP to which the slave is to be connected

cchar password[64]
Password of the AP

cchar bssid[6]
BSSID of the AP

uint8_t channel
Channel of the AP

struct wifi_prov_config_handlers
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to
wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave
(in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)
Handler function for applying the configuration that was set in set_config_handler. After apply-
ing the station may get connected to the AP or may fail to connect. The slave must be ready to convey the
updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx
Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t
Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers
structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to
wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().
Enumerations

enum wifi_prov_sta_state_t
  WiFi STA status for conveying back to the provisioning master.
  
  Values:

  enumerator WIFI_PROV_STA_CONNECTING

  enumerator WIFI_PROV_STA_CONNECTED

  enumerator WIFI_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t
  WiFi STA connection fail reason.
  
  Values:

  enumerator WIFI_PROV_STA_AUTH_ERROR

  enumerator WIFI_PROV_STA_AP_NOT_FOUND

Code examples for above API are provided in the provisioning directory of ESP-IDF examples.
Code example for above API is provided in wifi/smart_config.
Code example for above API is provided in wifi/wifi_easy_connect/dpp-enrollee.

2.9 Storage API

2.9.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.

The function esp_vfs_fat_unregister_path() deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with esp_vfs_fat_ functions:

1. Call esp_vfs_fat_register() to specify:
   • Path prefix where to mount the filesystem (e.g., "/sdcard", "/spiflash")
   • FatFs drive number
Chapter 2. API Reference

• A variable which will receive the pointer to the FATFS structure

2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.

3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see FatFs documentation.

4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available here.

5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX lseek function to perform it faster. The fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.

6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").

7. Close all open files.

8. Call the FatFs function `f_mount` for the same drive number with NULL FATFS* argument to unmount the filesystem.

9. Call the FatFs function `ff_diskio_register()` with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.

10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount`, `esp_vfs_fat_sdspi_mount`, and `esp_vfs_fat_sdcardUnmount` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

```c
esp_err_t esp_vfs_fat_register(const char*base_path,const char*fat_drive,size_tmax_files,FATFS**out_fs)
```

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

**Note:** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

**Parameters**

- `base_path` — path prefix where FATFS should be registered
- `fat_drive` — FATFS drive specification; if only one drive is used, can be an empty string
- `max_files` — maximum number of files which can be open at the same time
- `out_fs` — [out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_register` was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

```c
esp_err_t esp_vfs_fat_unregister_path(const char *base_path)
```

Un-register FATFS from VFS.

**Note:** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.
Chapter 2. API Reference

Parameters **base_path** – path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

Using FatFs with VFS and SD Cards

The header file fatfs/vfs/esp_vfs_fat.h defines convenience functions esp_vfs_fat_sdmmc_mount(), esp_vfs_fat_sdspi_mount(), and esp_vfs_fat_sdcardUnmount(). These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function esp_vfs_fat_sdmmcUnmount() unmounts the filesystem and releases the resources acquired by esp_vfs_fat_sdmmc_mount().

```
 esp_err_t esp_vfs_fat_sdmmc_mount (const char* base_path, const sdmmc_host_t* host_config, const void* slot_config, const esp_vfs_fat_mount_config_t* mount_config, sdmmc_card_t** out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real-world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

Parameters

- **base_path** – path where partition should be registered (e.g. “/sdcard”)
- **host_config** – Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD-SPI_HOST_DEFAULT() macro.
- **slot_config** – Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config** – Pointer to structure with extra parameters for mounting FATFS
- **out_card** – [out] if not NULL, pointer to the card information structure will be returned via this argument

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```
 esp_err_t esp_vfs_fat_sdmmc_unmount (void)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.
Chapter 2. API Reference

Deprecated:
Use `esp_vfs_fat_sdcard_unmount()` instead.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn’t been called

```c
esp_err_t esp_vfs_fat_sdspi_mount(const char* base_path, const sdmmc_host_t *host_config_input,
    const sdspi_device_config_t *slot_config, const esp_vfs_fat_mount_config_t *mount_config,
    sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- Initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- Initializes SD card with configuration in `host_config_input`
- Mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- Registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

Parameters

- `base_path` - path where partition should be registered (e.g. `"/sdcard"`)
- `host_config_input` - Pointer to structure describing SDMMC host. This structure can be initialized using `SDMMC_HOST_DEFAULT()` macro.
- `slot_config` - Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- `mount_config` - pointer to structure with extra parameters for mounting FATFS
- `out_card` - [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
struct esp_vfs_fat_mount_config_t
```
Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

Public Members

```c
bool format_if_mount_failed
```
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.
int max_files
    Max number of open files.

size_t allocation_unit_size
    If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.
    Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.
    Setting this field to 0 will result in allocation unit set to the sector size.

bool disk_status_check_enable
    Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.
    Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.
    Doesn’t do anything for other memory storage media.

esp_err_t esp_vfs_fat_sdcardUnmount (const char*base_path, sdmmc_card_t*card)
    Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_sdspi_mount().
    Returns
    • ESP_OK on success
    • ESP_ERR_INVALID_ARG if the card argument is unregistered
    • ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

Using FatFs with VFS in Read-Only Mode

The header file fatfs/vfs/esp_vfs_fat.h also defines the convenience functions esp_vfs_fat_spiflash_mount_ro() and esp_vfs_fat_spiflash_unmount_ro(). These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

esp_err_t esp_vfs_fat_spiflash_mount_ro (const char*base_path, const char*partition_label, const esp_vfs_fat_mount_config_t*mount_config)
    Convenience function to initialize read-only FAT filesystem and register it in VFS.
    This is an all-in-one function which does the following:
    • finds the partition with defined partition_label. Partition label should be configured in the partition table.
    • mounts FAT partition using FATFS library
    • registers FATFS library with VFS, with prefix given by base_prefix variable

Note:  Wear levelling is not used when FAT is mounted in read-only mode using this function.

Parameters
    • base_path – path where FATFS partition should be mounted (e.g. “/spiflash”)
    • partition_label – label of the partition which should be used
    • mount_config – pointer to structure with extra parameters for mounting FATFS

Returns
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
• ESP_ERR_NO_MEM if memory cannot be allocated
• ESP_FAIL if partition cannot be mounted
• other error codes from SPI flash driver, or FATFS drivers

```c
esp_err_t esp_vfs_fat_spiflash_unmount_ro (const char* base_path, const char* partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

**Parameters**
- `base_path` – path where partition should be registered (e.g. “/spiflash”)
- `partition_label` – label of partition to be unmounted

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

### FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

**Parameters**
- `pdrv` – drive number
- `discio_impl` – pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```c
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

### Public Members

DSTATUS (*init)(unsigned char pdrv)

- disk initialization function

DSTATUS (*status)(unsigned char pdrv)

- disk status check function

DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

- sector read function

DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

- sector write function
DRESULT(*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
function to get info about disk and do some misc operations

void ff_diskio_register_sdmmc (unsigned char pdrv, sdmmc_card_t *card)
Register SD/MMC diskio driver

Parameters
• pdrv - drive number
• card - pointer to sdmmc_card_t structure describing a card; card should be initialized
  before calling f_mount.

esp_err_t ff_diskio_register_wl_partition (unsigned char pdrv, wl_handle_t flash_handle)
Register spi flash partition

Parameters
• pdrv - drive number
• flash_handle - handle of the wear levelling partition.

esp_err_t ff_diskio_register_raw_partition (unsigned char pdrv, const esp_partition_t *part_handle)
Register spi flash partition

Parameters
• pdrv - drive number
• part_handle - pointer to raw flash partition.

FatFs Partition Generator

We provide a partition generator for FatFs (wl_fatfsgen.py) which is integrated into the build system and could be
easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.
The script is based on the partition generator (fatfsgen.py). Apart from generating partition, it can also initialize wear
levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to
255 characters and can contain multiple periods (.) characters within the filename and additional characters +, , ; ,
=, [ and ].

Build System Integration with FatFs Partition Generator
It is possible to invoke FatFs generator directly from
the CMake build system by calling fatfs_create_spiflash_image:

fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])

If you prefer generating partition without wear levelling support, you can use
fatfs_create_rawflash_image:

fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])

fatfs_create_spiflash_image respectively fatfs_create_rawflash_image must be called from project’s CMakeLists.txt.

If you decide for any reason to use fatfs_create_rawflash_image (without wear levelling support), beware
that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. partition - the name of the partition as defined in the partition table (e.g. storage/fatfsgen/partitions_example.csv).
2. base_dir - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. flag FLASH_IN_PROJECT - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash -p <PORT> by specifying FLASH_IN_PROJECT.

For example:

```python
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py or a custom build system target.

For an example, see storage/fatfsgen.

**FatFs Partition Analyzer**

(fatfsparse.py) is a partition analyzing tool for FatFs.

It is a reverse tool of (fatfsgen.py), i.e. it can generate the folder structure on the host based on the FatFs image.

Usage:

```bash
./fatfsparse.py [-h] [-L] [-l] [-n] [-s] [fatfs_image.img]
```

### 2.9.2 Manufacturing Utility

**Introduction**

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only). Just download it, unzip, and follow the instructions inside the doc folder.
- Direct flash programming using custom production tools.

**Prerequisites**

This utility is dependent on esp-idf’s NVS partition utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python

**Note:**

**Before using this utility, please make sure that:**

- The path to Python is added to the PATH environment variable.
- You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.
Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```plaintext
name1,namespace,  <-- First entry should be of type "namespace"
key1,type1,encoding1  
key2,type2,encoding2,REPEAT  
name2,namespace,  
key3,type3,encoding3  
key4,type4,encoding4
```

**Note:** The first line in this file should always be the `namespace` entry.

Each line should have three parameters: `key, type, encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```plaintext
app,namespace,  
firmware_key,data,hex2bin  
serial_no,data,string,REPEAT  
device_no,data,i32
```

**Note:**

Make sure there are no spaces:
- before and after `,`.
- at the end of each line in a CSV file

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```plaintext
key1,key2,key3,......  
value1,value2,value3,.....
```

**Note:** The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.
Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

- **value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccddd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace,,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, -help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**

Run `mfg_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

To generate factory images for each device (Default):  

**Usage:**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR] conf values prefix size
```
Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>-fileid, FILEID</td>
<td>Unique file identifier (any key in values file) for each filename suffix (Default: numeric value (1, 2, 3…))</td>
</tr>
<tr>
<td>-keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>-inputkey, INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>-outdir, OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_\ rightarrow singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrpyt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_\ rightarrow singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format \(<outdir>/keys/keys-<prefix>-<fileid>.bin\) is created. This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to NVS Key Partition for more details.

- Encrtypy by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_\ rightarrow singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

**To generate only encryption keys:**

**Usage::** python mfg_gen.py generate-key [-h] [-keyfile KEYFILE] [-outdir OUTDIR]

**Optional Arguments:**
You can run the utility to generate only encryption keys using the command below:

```bash
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`. To provide custom target filename use the `--keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- **bin/** for storing the generated binary files
- **csv/** for storing the generated intermediate CSV files
- **keys/** for storing encryption keys (when generating encrypted factory images)

## 2.9.3 Non-volatile Storage Library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying Storage** Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backendsto keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

**Keys and Values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
• variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS Iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators. `nvs_entry_find()` and `nvs_entry_next()` will set the given iterator to NULL or a valid iterator in all cases except a parameter error occurred (i.e., return `ESP_ERR_NVS_NOT_FOUND`). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

**Security, Tampering, and Robustness** NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to `NVS Encryption` for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

**NVS Encryption**

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one `sector` and relative...
address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as sector-number. The NVS Encryption can be enabled by enabling CONFIG_NVS_ENCRYPTION. The keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when Flash Encryption is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the NVS Key Partition. Two partition tables containing the NVS Key Partition are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (idf.py menuconfig). Please refer to the example security/flash_encryption for how to configure and use NVS encryption feature.

**NVS Key Partition**

An application requiring NVS encryption support needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted and its size should be the minimum partition size (4KB). Refer to Partition Tables for more details. Two additional partition tables which contain the NVS Key Partition are provided under the partition table option (menuconfig->Partition Table). They can be directly used for NVS Encryption. The structure of these partitions is depicted below.

| +---------------------------------------------+ |
| XTS encryption key (32) | |
| +---------------------------------------------+ |
| XTS tweak key (32) | |
| +---------------------------------------------+ |
| CRC32 (4) | |
| +---------------------------------------------+ |

The XTS encryption keys in the NVS Key Partition can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:

   When NVS encryption is enabled the nvs_flash_init() API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first NVS Key Partition. Then the API function automatically generates and stores the NVS keys in that partition by making use of the nvs_flash_generate_keys() API function provided by nvs_flash/include/nvs_flash.h. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of nvs_flash_secure_init_partition(). The API functions nvs_flash_secure_init() and nvs_flash_secure_init_partition() do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the nvs_flash_generate_keys() API function provided by nvs_flash.h. The API function will then write those keys onto the key-partition in encrypted form.

2. Use pre-generated key partition:

   This option will be required by the user when keys in the NVS Key Partition are not generated by the application. The NVS Key Partition containing the XTS encryption keys can be generated with the help of NVS Partition Generator Utility. Then the user can store the pre generated key partition on the flash with help of the following two commands:

   i) Build and flash the partition table

   ```
   idf.py partition-table partition-table-flash
   ```

   ii) Store the keys in the NVS Key Partition (on the flash) with the help of parttool.py (see Partition Tool section in partition-tables for more details)

   ```
   parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of nvs_key partition" --input NVS_KEY_PARTITION_FILE
   ```
Note: If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell parttool.py to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (build/partition_table) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of nvs_key partition" -i-NVS_KEY_PARTITION_FILE
```

Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

Encrypted Read/Write  The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

Encrypt the default NVS partition: To enable encryption for the default NVS partition no additional steps are necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first NVS Key Partition found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

Encrypt a custom NVS partition: To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to `NVS Partition Generator Utility`.

Application Example

You can find code examples in the `storage` directory of ESP-IDF examples:

`storage/nvs_rw_value`

Demonstrates how to read a single integer value from, and write it to NVS.
The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

**storage/nvs_rw_blob**

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- value - tracks the number of the ESP32 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

**storage/nvs_rw_value_cxx**

This example does exactly the same as **storage/nvs_rw_value**, except that it uses the C++ NVS handle class.

**Internals**

**Log of Key-Value Pairs**  NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and Entries**  NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

- **Empty/uninitialized**  Flash storage for the page is empty (all bytes are \(0xff\)). Page is not used to store any data at this point and does not have a sequence number.
- **Active**  Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.
- **Full**  Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.
- **Erasing**  Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.
- **Corrupted**  Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

```
+--------+ +--------+ +--------+ +--------+
| Page 1 | | Page 2 | | Page 3 | | Page 4 |
| Full +---> | Full +---> | Active | | Empty | <- states
| #11 | | #12 | | #14 | | | <- sequence numbers
+--------+ +--------+ +--------+ +--------+
```

(continues on next page)
Structure of a Page  
For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

| State (4) | Seq. no. (4) | version (1) | Unused (19) | CRC32 (4) | Header (32) |
|-----------+--------------+-------------+-------------------------+-----------+------------|
|           |              |             |                           | Entry state bitmap (32) |
|           |              |             |                           | Entry 0 (32) |
|           |              |             |                           | Entry 1 (32) |
|           |              |             |                            | /           |
|           |              |             |                            | /           |
|           |              |             |                            | Entry 125 (32) |

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

Entry and Entry State Bitmap  
Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

Empty (2’b11) Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

Written (2’b10) A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

Erased (2’b00) A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

Structure of Entry  
For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.
Individual fields in entry structure have the following meanings:

**NS**  Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type**  One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span**  Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex**  Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32**  Checksum calculated overall the bytes in this entry, except for the CRC32 field itself.

**Key**  Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data**  For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size**  (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount**  (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart**  (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size**  (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32**  (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The **Span** field of the first entry indicates how many entries are used.

**Namespaces**  As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.
Chapter 2. API Reference

(continued from previous page)

Item Hash List  To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, Page::findItem first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- components/nvs_flash/include/nvs_flash.h

Functions

`esp_err_t nvs_flash_init (void)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVSD_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NVSD_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NVSD_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).
esp_err_t nvs_flash_init_partition (const char *partition_label)
Initialize NVS flash storage for the specified partition.

Parameters

partition_label [in] Label of the partition. Must be no longer than 16 characters.

Returns

• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t *partition)
Initialize NVS flash storage for the partition specified by partition pointer.

Parameters

partition [in] pointer to a partition obtained by the ESP partition API.

Returns

• ESP_OK if storage was successfully initialized
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_INVALID_ARG in case partition is NULL
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

esp_err_t nvs_flash_deinit (void)
Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Returns

• ESP_OK on success (storage was deinitialized)
• ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t nvs_flash_deinit_partition (const char *partition_label)
Deinitialize NVS storage for the given NVS partition.

Parameters

partition_label [in] Label of the partition

Returns

• ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t nvs_flash_erase (void)
Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Returns

• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
• different error in case de-initialization fails (shouldn’t happen)

esp_err_t nvs_flash_erase_partition (const char *part_name)
Erase specified NVS partition.

Erase all content of a specified NVS partition
Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**

**part_name** [in] Name (label) of the partition which should be erased

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

```c
esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)
```

Erase custom partition.

Erase all content of specified custom partition.

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**

**partition** [in] pointer to a partition obtained by the ESP partition API.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)
```

Initialize the default NVS partition.

This API initializes the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters**

**cfg** [in] Security configuration (keys) to be used for NVS encryption/decryption.

If cfg is NULL, no encryption is used.

**Returns**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_secure_init_partition (const char *partition_label, nvs_sec_cfg_t *cfg)
```

Initialize NVS flash storage for the specified partition.

**Parameters**

- **partition_label** [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**Returns**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Generate and store NVS keys in the provided esp partition.

**Parameters**

- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns**
- ESP_OK, if cfg was read successfully;
- ESP_INVALID_ARG, if partition or cfg;
- or error codes from esp_partition_write/erase APIs.

```c
esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Read NVS security configuration from a partition.

**Note:** Provided partition is assumed to be marked ‘encrypted’.

**Structures**

```c
struct nvs_sec_cfg_t
```

Key for encryption and decryption.

**Public Members**

```c
uint8_t eky[NVS_KEY_SIZE]
```

XTS encryption and decryption key

```c
uint8_t tky[NVS_KEY_SIZE]
```

XTS tweak key

**Macros**

```c
NVS_KEY_SIZE
```

**Header File**

```c
components/nvs_flash/include/nvs.h
```

**Functions**

```c
esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)
```

Set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called.
Parameters

- **handle** - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** - [in] The value to set.

Returns

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

```c
esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)
```

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)
```

Set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
Chapter 2. API Reference

- **value** - [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**Returns**

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

```c
esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)
```

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

* out_value has to be a pointer to an already allocated variable of the given type.

```c
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

**Parameters**

- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

**Returns**

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
```

get uint8_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
```

get int16_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
```

get uint16_t value for given key

This function is the same as nvs_get_i8 except for the data type.
esp_err_t nvs_get_i32(nvs_handle_t handle, const char* key, int32_t*out_value)
get int32_t value for given key

This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u32(nvs_handle_t handle, const char* key, uint32_t*out_value)
get uint32_t value for given key

This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i64(nvs_handle_t handle, const char* key, int64_t*out_value)
get int64_t value for given key

This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u64(nvs_handle_t handle, const char* key, uint64_t*out_value)
get uint64_t value for given key

This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_str(nvs_handle_t handle, const char* key, char*out_value, size_t*length)
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Parameters
- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - [out] Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** - [inout] A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

Returns
- ESP_OK if the value was retrieved successfully
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char* key, void*out_value, size_t*length)
```

get blob value for given key

This function behaves the same as nvs_get_str, except for the data type.

```c
esp_err_t nvs_open(const char* namespace_name, nvs_open_mode_t open_mode, nvs_handle_t*out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

**Parameters**

- `namespace_name` - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `open_mode` - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `out_handle` - [out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS INVALID NAME if key name doesn’t satisfy constraints
- ESP_ERR NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

```c
esp_err_t nvs_open_from_partition(const char* part_name, const char* namespace_name, nvs_open_mode_t open_mode, nvs_handle_t*out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

**Parameters**

- `part_name` - [in] Label (name) of the partition of interest for object read/write/erase
- `namespace_name` - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `open_mode` - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `out_handle` - [out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS PART_NOT_FOUND if the partition with specified name is not found
• ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
• ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
• ESP_ERR_NVS_NO_MEM in case memory could not be allocated for the internal structures
• other error codes from the underlying storage driver

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char* key, const void *value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

Parameters

• `handle` – [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
• `key` – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
• `value` – [in] The value to set.
• `length` – [in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

Returns

• ESP_OK if value was set successfully
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
• ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

Parameters

• `handle` – [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
• `key` – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

Returns

• ESP_OK if erase operation was successful
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if handle was opened as read only
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• other error codes from the underlying storage driver

`esp_err_t nvs_erase_all(nvs_handle_t handle)`

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

Parameters `handle` – [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

Returns

• ESP_OK if erase operation was successful
Chapter 2. API Reference

- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

`esp_err_t nvs_commit(nvs_handle_t handle)`

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Parameters**
- handle – [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**Returns**
- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

`void nvs_close(nvs_handle_t handle)`

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**
- handle – [in] Storage handle to close

`esp_err_t nvs_get_stats(const char *part_name, nvs_stats_t *nvs_stats)`

Fill structure nvs_stats_t. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free-entries:

nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n"
       "n",
       nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
```

**Parameters**
- part_name – [in] Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ( "nvs" ).
- nvs_stats – [out] Returns filled structure nvs_stats_t. It provides info about used memory the partition.

**Returns**
- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.
**esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t *used_entries)**

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs in one namespace:

nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if (nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

**Parameters**
- **handle** - [in] Handle obtained from nvs_open function.
- **used_entries** - [out] Returns amount of used entries from a namespace.

**Returns**
- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_ARG if used_entries equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

**esp_err_t nvs_entry_find (const char *part_name, const char *namespace_name, nvs_type_t type, nvs_iterator_t *output_iterator)**

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified partition and namespace

nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
```

**Parameters**
- **part_name** - [in] Partition name
- **namespace_name** - [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** - [in] One of nvs_type_t values.
**output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, `output_iterator` is NULL too. If ESP_ERR_INVALID_ARG occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**Returns**
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release `output_iterator` in case ESP_ERR_INVALID_ARG has been returned.

```c
esp_err_t nvs_entry_next (nvs_iterator_t *iterator)
```

Advances the iterator to next item matching the iterator criteria. Note that any copies of the iterator will be invalid after this call.

**Parameters**
- `iterator` - [inout] Iterator obtained from `nvs_entry_find` function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, `iterator` is set to NULL. If ESP_ERR_INVALID_ARG occurs, `iterator` is not changed.

**Returns**
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if `iterator` is NULL.
- Possibly other errors in the future for internal programming or flash errors.

```c
esp_err_t nvs_entry_info (const nvs_iterator_t iterator, nvs_entry_info_t *out_info)
```

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

**Parameters**
- `iterator` - [in] Iterator obtained from `nvs_entry_find` function. Must be non-NULL.
- `out_info` - [out] Structure to which entry information is copied.

**Returns**
- ESP_OK if all parameters are valid; current iterator data has been written to `out_info`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

```c
void nvs_release_iterator (nvs_iterator_t iterator)
```

Release iterator.

**Parameters**
- `iterator` - [in] Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

### Structures

- **nvs_entry_info_t**

  information about entry obtained from `nvs_entry_info` function

### Public Members

- **namespace_name** [16]

  Namespace to which key-value belong

- **key** [NV_S_KEY_NAME_MAX_SIZE]

  Key of stored key-value pair
Chapter 2. API Reference

*nvs_type_t* _type_
Type of stored key-value pair

```c
class nvs_stats_t
```

*Note:* Info about storage space NVS.

**Public Members**

```c
size_t used_entries
Amount of used entries.
```

```c
size_t free_entries
Amount of free entries.
```

```c
size_t total_entries
Amount all available entries.
```

```c
size_t namespace_count
Amount name space.
```

**Macros**

*ESP_ERR_NVS_BASE*
Starting number of error codes

*ESP_ERR_NVS_NOT_INITIALIZED*
The storage driver is not initialized

*ESP_ERR_NVS_NOT_FOUND*
A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

*ESP_ERR_NVS_TYPE_MISMATCH*
The type of set or get operation doesn’t match the type of value stored in NVS

*ESP_ERR_NVS_READ_ONLY*
Storage handle was opened as read only

*ESP_ERR_NVS_NOT_ENOUGH_SPACE*
There is not enough space in the underlying storage to save the value

*ESP_ERR_NVS_INVALID_NAME*
Namespace name doesn’t satisfy constraints

*ESP_ERR_NVS_INVALID_HANDLE*
Handle has been closed or is NULL

Submit Document Feedback
ESP_ERR_NVS_REMOVE_FAILED
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
Key name is too long

ESP_ERR_NVS_PAGE_FULL
Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt
**Chapter 2. API Reference**

**ESP_ERR_NVS_WRONG_ENCRYPTION**
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_NVS_CONTENT_DIFFERS**
Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS_DEFAULT_PART_NAME**
Default partition name of the NVS partition in the partition table

**NVS_PART_NAME_MAX_SIZE**
maximum length of partition name (excluding null terminator)

**NVS_KEY_NAME_MAX_SIZE**
Maximum length of NVS key name (including null terminator)

**Type Definitions**

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t * nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

**Enumerations**

enum nvs_open_mode_t
Mode of opening the non-volatile storage.
Values:

enumerator NVS_READONLY
Read only

enumerator NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.
Values:

enumerator NVS_TYPE_U8
Type uint8_t

enumerator NVS_TYPE_I8
Type int8_t
Chapter 2. API Reference

enumerator NVS_TYPE_U16
Type uint16_t
enumerator NVS_TYPE_I16
Type int16_t
enumerator NVS_TYPE_U32
Type uint32_t
enumerator NVS_TYPE_I32
Type int32_t
enumerator NVS_TYPE_U64
Type uint64_t
enumerator NVS_TYPE_I64
Type int64_t
enumerator NVS_TYPE_STR
Type string
enumerator NVS_TYPE_BLOB
Type blob
enumerator NVS_TYPE_ANY
Must be last

2.9.4 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in `requirements.txt` in the root of the esp-idf directory.
CSV File Format

Each line of a CSV file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data, and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64, and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace are fixed and are not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value       <-- column header
namespace_name,namespace,,    <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

Note:
Make sure there are no spaces:
* before and after ', '
* at the end of each line in a CSV file

NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.
Chapter 2. API Reference

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of Entry. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the Utility

Usage:

```
python nvs_partition_gen.py [-h] (generate,generate-key,encrypt,decrypt) ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
</tbody>
</table>

Commands:

Run `nvs_partition_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>

<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

To Generate NVS Partition (Default):

Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

**To Generate Only Encryption Key Partition:**

**Usage:**

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption key partition file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only the encryption key partition using the command below:

```
python nvs_partition_gen.py generate-key
```

**To Generate Encrypted NVS Partition:**

**Usage:**

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR] input output size
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version Version 1 - Multipage blob support disabled Version 2 - Multipage blob support enabled Default: Version 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>
You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen --keyfile sample_keys.bin
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

- Encrypt by providing the encryption keys as input binary file:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --inputkey sample_keys.bin
  ```

To Decrypt Encrypted NVS Partition:  Usage:

```python
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to decrypt encrypted NVS partition using the command below:

```python
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:
## Multipage Blob Support Enabled (Version 2):
You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** *Minimum NVS Partition Size needed is 0x3000 bytes.*

**Note:** *When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.*

### Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

### 2.9.5 SD/SDIO/MMC Driver

#### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc_host.h](#) and [driver/include/driver/sdspi_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](#)
- SD SPI host, see [SD SPI Host API](#)

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.
Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the `storage/sd_card` directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (memory + IO) cards** The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread safety** Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

Protocol layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

Using API with eMMC chips

From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards

Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the field is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See [ESP Serial Slave Link](#) and example `peripherals/sdio/host`.

### API Reference

#### Header File

- `components/sdmmc/include/sdmmc_cmd.h`

#### Functions

- **esp_err_t sdmmc_card_init**(const `sdmmc_host_t` *host, `sdmmc_card_t` *out_card)
  
  Probe and initialize SD/MMC card using given host

  **Parameters**
  - host – pointer to structure defining host controller
  - out_card – pointer to structure which will receive information about the card when the function completes

  **Returns**
  - ESP_OK on success
  - One of the error codes from SDMMC host controller

- **void sdmmc_card_print_info**(FILE *stream, const `sdmmc_card_t` *card)
  
  Print information about the card to a stream.

  **Parameters**
  - stream – stream obtained using fopen or fdopen
  - card – card information structure initialized using sdmmc_card_init

- **esp_err_t sdmmc_get_status**(`sdmmc_card_t` *card)
  
  Get status of SD/MMC card

  **Parameters**
  - card – pointer to card information structure previously initialized using sdmmc_card_init

  **Returns**
  - ESP_OK on success
  - One of the error codes from SDMMC host controller

- **esp_err_t sdmmc_write_sectors**(`sdmmc_card_t` *card, const void *src, size_t start_sector, size_t sector_count)

  Write given number of sectors to SD/MMC card

  **Parameters**
• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **src** – pointer to data buffer to read data from; data size must be equal to `sector_count` * `card->csd.sector_size`
• **start_sector** – sector where to start writing
• **sector_count** – number of sectors to write

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```

Read given number of sectors from the SD/MMC card

**Parameters**
• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **dst** – pointer to data buffer to write into; buffer size must be at least `sector_count` * `card->csd.sector_size`
• **start_sector** – sector where to start reading
• **sector_count** – number of sectors to read

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_erase_sectors (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
```

Erase given number of sectors from the SD/MMC card

**Note:** When `sdmmc_erase_sectors` used with cards in SDSPi mode, it was observed that card requires re-init after erase operation.

**Parameters**
• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **start_sector** – sector where to erase
• **sector_count** – number of sectors to erase
• **arg** – erase command (CMD38) argument

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_can_discard (sdmmc_card_t *card)
```

Check if SD/MMC card supports discard

**Parameters**
• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
• ESP_OK if supported by the card/device
• ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_can_trim (sdmmc_card_t *card)
```

Check if SD/MMC card supports trim

**Parameters**
• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
• ESP_OK if supported by the card/device
• ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_mmc_can_sanitize (sdmmc_card_t *card)
```

Check if SD/MMC card supports sanitize
Chapter 2. **API Reference**

### Parameters card
- Pointer to card information structure previously initialized using `sdmmc_card_init`.

### Returns
- ESP_OK if supported by the card/device.
- ESP_FAIL if not supported by the card/device.

#### `esp_err_t sdmmc_mmc_sanitize(sdmmc_card_t *card, uint32_t timeout_ms)`
Sanitize the data that was unmapped by a Discard command.

**Note:** Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with `sdmmc_erase_sectors` argument.

### Parameters
- `card` - Pointer to card information structure previously initialized using `sdmmc_card_init`.
- `timeout_ms` - Timeout value in milliseconds required to sanitize the selected range of sectors.

### Returns
- ESP_OK on success.
- One of the error codes from SDMMC host controller.

#### `esp_err_t sdmmc_full_erase(sdmmc_card_t *card)`
Erase complete SD/MMC card.

### Parameters
- `card` - Pointer to card information structure previously initialized using `sdmmc_card_init`.

### Returns
- ESP_OK on success.
- One of the error codes from SDMMC host controller.

#### `esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)`
Read one byte from an SDIO card using IO_RW_DIRECT (CMD52).

### Parameters
- `card` - Pointer to card information structure previously initialized using `sdmmc_card_init`.
- `function` - IO function number.
- `reg` - Byte address within IO function.
- `out_byte` - [out] output, receives the value read from the card.

### Returns
- ESP_OK on success.
- One of the error codes from SDMMC host controller.

#### `esp_err_t sdmmc_io_write_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)`
Write one byte to an SDIO card using IO_RW_DIRECT (CMD52).

### Parameters
- `card` - Pointer to card information structure previously initialized using `sdmmc_card_init`.
- `function` - IO function number.
- `reg` - Byte address within IO function.
- `in_byte` - Value to be written.
- `out_byte` - [out] if not NULL, receives new byte value read from the card (read-after-write).

### Returns
- ESP_OK on success.
- One of the error codes from SDMMC host controller.

#### `esp_err_t sdmmc_io_read_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)`
Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53).
This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

Parameters
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where reading starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

Parameters
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written
- `size` - number of bytes to write

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

Parameters
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read, must be divisible by the card block size.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_blocks.

Parameters
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written

```
esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```
Chapter 2. API Reference

- **size** - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```
Enable SDIO interrupt in the SDMMC host

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```
Block until an SDIO interrupt is received

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ticks** - time to wait for the interrupt, in RTOS ticks

**Returns**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

```c
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t*out_buffer, size_t buffer_size, size_t *inout_cis_size)
```
Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer** - Output buffer of the CIS data
- **buffer_size** - Size of the buffer.
- **inout_cis_size** - Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc io_read_bytes

```c
esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
```
Parse and print the CIS information of an SDIO card.

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.
using sdmmc_card_init

**Parameters**
- `buffer` - Buffer to parse
- `buffer_size` - Size of the buffer.
- `fp` - File pointer to print to, set to NULL to print to stdout.

**Returns**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

**Header File**
- components/driver/include/driver/sdmmc_types.h

**Structures**

`struct sdmmc_csd_t`
Decoded values from SD card Card Specific Data register

**Public Members**

- `int csd_ver`
  CSD structure format

- `int mmc_ver`
  MMC version (for CID format)

- `int capacity`
  total number of sectors

- `int sector_size`
  sector size in bytes

- `int read_block_len`
  block length for reads

- `int card_command_class`
  Card Command Class for SD

- `int tr_speed`
  Max transfer speed

`struct sdmmc_cid_t`
Decoded values from SD card Card IDentification register

**Public Members**
Chapter 2. API Reference

int mfg_id
    manufacturer identification number

int oem_id
    OEM/product identification number

char name[8]
    product name (MMC v1 has the longest)

int revision
    product revision

int serial
    product serial number

int date
    manufacturing date

struct sdmmc_scr_t
    Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

    Public Members

    uint32_t sd_spec
        SD Physical layer specification version, reported by card

    uint32_t erase_mem_state
        data state on card after erase whether 0 or 1 (card vendor dependent)

    uint32_t bus_width
        bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

    uint32_t reserved
        reserved for future expansion

    uint32_t rsvd_mnf
        reserved for manufacturer usage

struct sdmmc_ssr_t
    Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

    Public Members

    uint32_t alloc_unit_kb
        Allocation unit of the card, in multiples of kB (1024 bytes)
Chapter 2. API Reference

uint32_t erase_size_au
   Erase size for the purpose of timeout calculation, in multiples of allocation unit

uint32_t cur_bus_width
   SD current bus width

uint32_t discard_support
   SD discard feature support

uint32_t fule_support
   SD FULE (Full User Area Logical Erase) feature support

uint32_t erase_timeout
   Timeout (in seconds) for erase of a single allocation unit

uint32_t erase_offset
   Constant timeout offset (in seconds) for any erase operation

uint32_t reserved
   reserved for future expansion

struct sdmmc_ext_csd_t
   Decoded values of Extended Card Specific Data

Public Members

uint8_t rev
   Extended CSD Revision

uint8_t power_class
   Power class used by the card

uint8_t erase_mem_state
   data state on card after erase whether 0 or 1 (card vendor dependent)

uint8_t sec_feature
   secure data management features supported by the card

struct sdmmc_switch_func_rsp_t
   SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
   response data

struct sdmmc_command_t
   SD/MMC command information
Public Members

uint32_t **opcode**
SD or MMC command index

uint32_t **arg**
SD/MMC command argument

`sdmmc_response_t` **response**
response buffer

void *data
buffer to send or read into

size_t **datalen**
length of data buffer

size_t **blklen**
block length

int **flags**
see below

`esp_err_t` **error**
error returned from transfer

uint32_t **timeout_ms**
response timeout, in milliseconds

struct **sdmmc_host_t**
SD/MMC Host description
This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t **flags**
flags defining host properties

int **slot**
slot number, to be passed to host functions

int **max_freq_khz**
max frequency supported by the host

float **io_voltage**
I/O voltage used by the controller (voltage switching is not supported)
\textbf{Chapter 2. API Reference}

\texttt{esp\_err\_t (*init)(void)}

Host function to initialize the driver

\texttt{esp\_err\_t (*set\_bus\_width)(int slot, size\_t width)}

host function to set bus width

\texttt{size\_t (*get\_bus\_width)(int slot)}

host function to get bus width

\texttt{esp\_err\_t (*set\_bus\_ddr\_mode)(int slot, bool ddr\_enable)}

host function to set DDR mode

\texttt{esp\_err\_t (*set\_card\_clk)(int slot, uint32\_t freq\_khz)}

host function to set card clock frequency

\texttt{esp\_err\_t (*do\_transaction)(int slot, sdmmc\_command\_t *cmdinfo)}

host function to do a transaction

\texttt{esp\_err\_t (*deinit)(void)}

host function to deinitialize the driver

\texttt{esp\_err\_t (*deinit\_p)(int slot)}

host function to deinitialize the driver, called with the \texttt{slot}

\texttt{esp\_err\_t (*io\_int\_enable)(int slot)}

Host function to enable SDIO interrupt line

\texttt{esp\_err\_t (*io\_int\_wait)(int slot, TickType\_t timeout\_ticks)}

Host function to wait for SDIO interrupt line to be active

\texttt{int command\_timeout\_ms}

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

\texttt{struct sdmmc\_card\_t}

SD/MMC card information structure

\textbf{Public Members}

\texttt{sdmmc\_host\_t host}

Host with which the card is associated

\texttt{uint32\_t ocr}

OCR (Operation Conditions Register) value

\texttt{sdmmc\_cid\_t cid}

decoded CID (Card IDentification) register value
sdmmc_response_t raw_cid
    raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
    decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
    decoded SCR (SD card Configuration Register) value

sdmmc_ssr_t ssr
    decoded SSR (SD Status Register) value

sdmmc_ext_csd_t ext_csd
    decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
    RCA (Relative Card Address)

uint16_t max_freq_khz
    Maximum frequency, in kHz, supported by the card

uint32_t is_mem
    Bit indicates if the card is a memory card

uint32_t is_sdio
    Bit indicates if the card is an IO card

uint32_t is_mmc
    Bit indicates if the card is MMC

uint32_t num_io_functions
    If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width
    log2(bus width supported by card)

uint32_t is_ddr
    Card supports DDR mode

uint32_t reserved
    Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
    host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
    host supports 4-line SD and MMC protocol
**Chapter 2. API Reference**

**SDMMC_HOST_FLAG_8BIT**
host supports 8-line MMC protocol

**SDMMC_HOST_FLAG_SPI**
host supports SPI protocol

**SDMMC_HOST_FLAG_DDR**
host supports DDR mode for SD/MMC

**SDMMC_HOST_FLAG_DEINIT_ARG**
host deinit function called with the slot argument

**SDMMC_FREQ_DEFAULT**
SD/MMC Default speed (limited by clock divider)

**SDMMC_FREQ_HIGHSPEED**
SD High speed (limited by clock divider)

**SDMMC_FREQ_PROBING**
SD/MMC probing speed

**SDMMC_FREQ_52M**
MMC 52MHz speed

**SDMMC_FREQ_26M**
MMC 26MHz speed

**Type Definitions**

typedef uint32_t sdmmc_response_t[4]
SD/MMC command response buffer

**Enumerations**

enum sdmmc_erase_arg_t

SD/MMC erase command (38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

*Values:*

- enumerator **SDMMC_ERASE_ARG**
  Erase operation on SD, Trim operation on MMC
2.9.6 SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The spi_flash component also has higher-level API functions which work with partitions defined in the partition table.

Different from the API before IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of going through the cache connected to the SPI0 peripheral, most esp_flash_* APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external flash.

However, due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after ESP-IDF v4.0 are no longer atomic. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

Note: Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

Quad/Dual Mode Chips Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don’t need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Optional Features
Optional features for flash  Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- Auto Suspend & Resume
- Flash unique ID
- High performance mode
- OPI flash support
- 32-bit Address Flash Chips

Note:

- The features listed above needs to be supported by both esp chips and flash chips.
- If you are using an official Espressif modules/SiP, Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention:  This document only shows that IDF code has supported the features of those flash chips. It’s not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own bought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume  ESP Chips List:
1. ESP32C3

Flash Chips List:
1. XM25QxxC series

Flash unique ID  Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:
ALL

Flash Chips List:
1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

Note:  This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as
we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:
1. ESP32S3

Flash Chips (name & ID) List:
1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

Attention: It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support  OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:
1. ESP32S3

Flash Chips List:
1. MX25UM25645G

32-bit Address Flash Chips  Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:
ALL ESP Chips support this.

Flash Chips List:
1. W25Q256
2. GD25Q256

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bits ID.

If you want to use these features, please ensure both ESP32 and ALL flash chips in your product support these features. For more details, refer to Optional features for flash.

You may also customise your own flash chip driver. See Overriding Default Chip Drivers for more details.

Warning: Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)
Overriding Default Chip Drivers  During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
   - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files
   Modify the files above properly.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***(_vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```c
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the
following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
set_property(TARGET ${spi_flash_lib} APPEND PROPERTY INTERFACE_LINK_LIBRARIES ${COMPONENT_LIB})
```

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See `Linker Script Generation` for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

**Example** See also `storage/custom_flash_driver`.

### Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now.

### SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of `partition-specific functions`.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

### Concurrency Constraints for Flash on SPI1

**Concurrency Constraints for flash on SPI1** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI...
Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

**When the caches are disabled**  Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches will suspend all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also *OS Functions* and *SPI Bus Lock*.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g. IRAM, DRAM) and flash cache, please refer to the *application memory layout* documentation.

**IRAM-Safe Interrupt Handlers**  For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See *How to place code in IRAM*.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Note:**  When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and `format string` are placed into DRAM in that case.

**Non-IRAM-Safe Interrupt Handlers**  If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users won’t see the corresponding hardware event happening.

**Attention:**  The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See *Concurrency Constraints for flash on SPI1* for more details.

**Partition Table API**

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in *Partition Tables*.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find`.

---

**Partition Table API**

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in *Partition Tables*.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
• `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_` API functions instead of lower level `esp_flash_` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

---

**SPI Flash Encryption**

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware. Refer to the [Flash Encryption documentation](#) for more details.

---

**Memory Mapping API**

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

**Note:** mmap is supported by cache, so it can only be used on main flash.

---

**SPI Flash Implementation**

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).
Host driver  The host driver relies on an interface (spi_flash_host_driver_t) defined in the spi_flash_types.h (in the hal/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However, due to the speed limitations of ESP32, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (memspi_host_driver.h and .c) implement the high-speed version of these commands with the common_command function provided in the HAL, and wrap these functions as spi_flash_host_driver_t for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the spi_flash_host_driver_t are implemented, the esp_flash API can access the flash regardless of the low-level hardware.

Chip Driver  The chip driver, defined in spi_flash_chip_driver.h, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS Functions  Currently the OS function layer provides entries of a lock and delay.

The lock (see SPI Bus Lock) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device doesn’t have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option CONFIG_ESP_TASK_WDT_PANIC is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It’s pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the CONFIG_SPI_FLASH_YIELD_DURING_ERASE option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.

   • Increase CONFIG_SPI_FLASH_ERASE_YIELD_TICKS or decrease CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS in menuconfig.
   • You can also increase CONFIG_ESP_TASK_WDT_TIMEOUT_MS in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the CONFIG_ESP_TASK_WDT_PANIC option when doing long-running SPI flash operations which will trigger the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based
on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation. - In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

Functions

```
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

**Parameters**

- `out_chip` - Pointer to hold the initialized chip.
- `config` - Configuration of the chips to initialize.

**Returns**

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

```
esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)
```

Remove a SPI Flash device from the SPI bus.

**Parameters**

- `chip` - The flash device to remove.
## Returns

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

## Structures

**struct esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

### Public Members

- `spi_host_device_t host_id`
  
  Bus to use.

- `int cs_io_num`
  
  GPIO pin to output the CS signal.

- `esp_flash_io_mode_t io_mode`
  
  IO mode to read from the Flash.

- `enum esp_flash_speed_s speed`
  
  Speed of the Flash clock. Replaced by freq_mhz.

- `int input_delay_ns`
  
  Input delay of the data pins, in ns. Set to 0 if unknown.

- `int cs_id`
  
  CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

- `int freq_mhz`
  
  The frequency of flash chip(MHZ)

## Header File

- `components/spi_flash/include/esp_flash.h`

## Functions

**esp_err_t esp_flash_init(esp_flash_t *chip)**

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

---

**Note:** If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.
Parameters `chip` – Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns ESP_OK on success, or a flash error code if initialisation fails.

bool `esp_flash_chip_driver_initialized(const esp_flash_t *chip)`

Check if appropriate chip driver is set.

Parameters `chip` – Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns true if set, otherwise false.

`esp_err_t esp_flash_read_id(esp_flash_t *chip, uint32_t*out_id)`

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

• `chip` – Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• `out_id` – [out] Pointer to receive ID value.

Returns ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t*out_size)`

Detect flash size based on flash ID.

Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Parameters

• `chip` – Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• `out_size` – [out] Detected size in bytes.

Returns ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_read_unique_chip_id(esp_flash_t *chip, uint64_t*out_id)`

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters

• `chip` – Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
• `out_id` – [out] Pointer to receive unique ID value.

Returns

• ESP_OK on success, or a flash error code if operation failed.
• ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

`esp_err_t esp_flash_erase_chip(esp_flash_t *chip)`

Erase flash chip contents.

Parameters `chip` – Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

Returns

• ESP_OK on success,
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• Other flash error code if operation failed.
Chapter 2. API Reference

esp_err_t esp_flash_erase_region (esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- `chip` - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init().
- `start` - Address to start erasing flash. Must be sector aligned.
- `len` - Length of region to erase. Must also be sector aligned.

**Returns**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t esp_flash_get_chip_write_protect (esp_flash_t *chip, bool *write_protected)

Read if the entire chip is write protected.

**Note:** A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Parameters**

- `chip` - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init().
- `write_protected` - [out] Pointer to boolean, set to the value of the write protect flag.

**Returns**

- ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_set_chip_write_protect (esp_flash_t *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Parameters**

- `chip` - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init().
- `write_protect` - Boolean value for the write protect flag

**Returns**

- ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_protectable_regions (const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.
Chapter 2. API Reference

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_regions – [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- out_num_regions – [out] Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

Note: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region – Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- out_protected – [out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

Note: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region – Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- protect – Write protection flag to set.

Returns ESP_OK on success, or a flash error code if operation failed.
**esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)**

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Parameters**
- **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().
- **buffer** - Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** - Address on flash to read from. Must be less than chip->size field.
- **length** - Length (in bytes) of data to read.

**Returns**
- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

**esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)**

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().
- **address** - Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** - Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** - Length (in bytes) of data to write.

**Returns**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

**esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)**

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

**Parameters**
- **chip** - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** - Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** - Pointer to a buffer with the data to write.
- **length** - Length (in bytes) of data to write. 16 byte aligned.
Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

```
esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Parameters

- `chip` - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- `address` - Address on flash to read from.
- `out_buffer` - Pointer to a buffer for the data to read to.
- `length` - Length (in bytes) of data to read.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

```
static inline bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Parameters `chip` - Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns true if flash works in quad mode, otherwise false

Structures

```
struct esp_flash_region_t
```

Structure for describing a region of flash.

Public Members

```
uint32_t offset
```

Start address of this region.

```
uint32_t size
```

Size of the region.

```
struct esp_flash_os_functions_t
```

OS-level integration hooks for accessing flash chips inside a running OS.

- It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.
- For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

```
esp_err_t (*start)(void *arg)
```

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).
**esp_err_t** (*end*) (void *arg)

Called after completing any flash operation.

**esp_err_t** (*region_protected*) (void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS.

**esp_err_t** (*delay_us*) (void *arg, uint32_t us)

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void (*)(*get_temp_buffer*) (void *arg, size_t request_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (*)(*release_temp_buffer*) (void *arg, void *temp_buf)

Called for release temp buffer.

**esp_err_t** (*check_yield*) (void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

**esp_err_t** (*yield*) (void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

int64_t (*)(*get_system_time*) (void *arg)

Called for get system time.

void (*)(*set_flash_op_status*) (uint32_t op_status)

Call to set flash operation status

---

**Public Members**

**spi_flash_host_inst_t** *host

Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

**const spi_flash_chip_t** *chip_drv

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

**const esp_flash_os_functions_t** *os_func

Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.
void *os_func_data
Point to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
Size of SPI flash in bytes. If 0, size will be detected during initialization.

uint32_t chip_id
Detected chip id.

uint32_t busy
This flag is used to verify chip’s status.

uint32_t reserved_flags
reserved.

Macros
SPI_FLASH_YIELD_REQ_YIELD
SPI_FLASH_YIELD_REQ_SUSPEND
SPI_FLASH_YIELD_STA_RESUME
SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions
typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t

Header File
• components/spi_flash/include/spi_flash_mmap.h

Functions
esp_err_t spi_flash_mmap (size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
Map region of flash memory into data or instruction address space.
This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.
As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.
Parameters
• src_addr - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
**size**  
Size of region to be mapped. This size will be rounded up to a 64kB boundary

**memory**  
Address space where the region should be mapped (data or instruction)

**out_ptr [out]**  
Output, pointer to the mapped memory region

**out_handle [out]**  
Output, handle which should be used for spi_flash_munmap call

**Returns**  
ESP_OK on success, ESP_ERR_NO_MEM if pages cannot be allocated

```c
esp_err_t spi_flash_mmap_pages (const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

**Parameters**

- **pages**  
An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.

- **page_count**  
Number of entries in the pages array

- **memory**  
Address space where the region should be mapped (instruction or data)

- **out_ptr [out]**  
Output, pointer to the mapped memory region

- **out_handle [out]**  
Output, handle which should be used for spi_flash_munmap call

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

```c
void spi_flash_munmap (spi_flash_mmap_handle_t handle)
```

Release region previously obtained using `spi_flash_mmap`.

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**

- **handle**  
Handle obtained from `spi_flash_mmap`

```c
void spi_flash_mmap_dump (void)
```

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

```c
uint32_t spi_flash_mmap_get_free_pages (spi_flash_mmap_memory_t memory)
```

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters**

- **memory**  
memory type of MMU table free page

**Returns**  
number of free pages which can be mmaped

```c
size_t spi_flash_cache2phys (const void *cached)
```

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have been assigned via `spi_flash_mmap()`, any address in memory mapped flash space can be looked up.

**Parameters**

- **cached**  
Pointer to flashed cached memory.

**Returns**
• SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
• Otherwise, returns physical offset in flash

const void *spi_flash_phys2cache(size_t phys_offs, spi_flash_mmap_memory_t memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

Note: Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

Note: This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

Parameters
• phys_offs – Physical offset in flash memory to look up.
• memory – Address space type to look up a flash cache address mapping for (instruction or data)

Returns
• NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
• Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions

typedef uint32_t spi_flash_mmap_handle_t

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations
enum spi_flash_mmap_memory_t
    Enumeration which specifies memory space requested in an mmap call.
    Values:
        enumerator SPI_FLASH_MMAP_DATA
            map to data memory (Vaddr0), allows byte-aligned access, 4 MB total
        enumerator SPI_FLASH_MMAP_INST
            map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

Header File
    • components/hal/include/hal/spi_flash_types.h

Structures
struct spi_flash_trans_t
    Definition of a common transaction. Also holds the return value.

Public Members
    uint8_t reserved
        Reserved, must be 0.
    uint8_t mosi_len
        Output data length, in bytes.
    uint8_t miso_len
        Input data length, in bytes.
    uint8_t address_bitlen
        Length of address in bits, set to 0 if command does not need an address.
    uint32_t address
        Address to perform operation on.
    const uint8_t *mosi_data
        Output data to salve.
    uint8_t *miso_data
        [out] Input data from slave, little endian
    uint32_t flags
        Flags for this transaction. Set to 0 for now.
    uint16_t command
        Command to send.
Chapter 2. API Reference

uint8_t dummy_bitlen
    Basic dummy bits to use.

uint32_t io_mode
    Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
    Configuration structure for the flash chip suspend feature.

    **Public Members**

    uint32_t sus_mask
        SUS/SUS1/SUS2 bit in flash register.

    uint32_t cmd_rdsr
        Read flash status register(2) command.

    uint32_t sus_cmd
        Flash suspend command.

    uint32_t res_cmd
        Flash resume command.

    uint32_t reserved
        Reserved, set to 0.

struct spi_flash_encryption_t
    Structure for flash encryption operations.

    **Public Members**

    void (*flash_encryption_enable)(void)
        Enable the flash encryption.

    void (*flash_encryption_disable)(void)
        Disable the flash encryption.

    void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t*buffer, uint32_t size)
        Prepare flash encryption before operation.

    **Note:** address and buffer must be 8-word aligned.

    **Param address**  The destination address in flash for the write operation.
    **Param buffer**  Data for programming
    **Param size**  Size to program.
void (*flash_encryption_done)(void)
flash data encryption operation is done.

void (*flash_encryption_destroy)(void)
Destroy encrypted result

bool (*flash_encryption_check)(uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer
  Param address the address of written flash partition.
  Param length Buffer size.

struct spi_flash_host_inst_t
SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
  Pointer to the implementation function table.

struct spi_flash_host_driver_s
Host driver configuration and context structure.

Public Members

esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.
**esp_err_t** (*set_write_protect*)(*spi_flash_host_inst_t* host, bool wp)

Disable write protection.

**void** (*program_page*)(*spi_flash_host_inst_t* host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check **max_write_bytes** for the maximum allowed writing length.

**bool** (*supports_direct_write*)(*spi_flash_host_inst_t* host, const void *p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

**int** (*write_data_slicer*)(*spi_flash_host_inst_t* host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The **program_page** should be called iteratively with the return value of this function.

- **Param address**  Beginning flash address to write
- **Param len**  Length request to write
- **Param align_addr**  Output of the aligned address to write to
- **Param page_size**  Physical page size of the flash chip
- **Return**  Length that can be actually written in one **program_page** call

**esp_err_t** (*read*)(*spi_flash_host_inst_t* host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check **max_read_bytes** for the maximum allowed reading length.

**bool** (*supports_direct_read*)(*spi_flash_host_inst_t* host, const void *p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.

**int** (*read_data_slicer*)(*spi_flash_host_inst_t* host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The **read** should be called iteratively with the return value of this function.

- **Param address**  Beginning flash address to read
- **Param len**  Length request to read
- **Param align_addr**  Output of the aligned address to read
- **Param page_size**  Physical page size of the flash chip
- **Return**  Length that can be actually read in one **read** call

**uint32_t** (*host_status*)(*spi_flash_host_inst_t* host)

Check the host status, 0:busy, 1:idle, 2:suspended.

**esp_err_t** (*configure_host_io_mode*)(*spi_flash_host_inst_t* host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, **esp_flash_io_mode_t** io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

**void** (*poll_cmd_done*)(*spi_flash_host_inst_t* host)

Internal use, poll the HW until the last operation is done.

**esp_err_t** (*flush_cache*)(*spi_flash_host_inst_t* host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.
void (*check_suspend)(spi_flash_host_inst_t *host)
    Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*resume)(spi_flash_host_inst_t *host)
    Resume flash from suspend manually

void (*suspend)(spi_flash_host_inst_t *host)
    Set flash in suspend status manually

esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
    Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16
    Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
    Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
    Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_CONFIG_CONF_BITS
    OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG
    A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN
    Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum esp_flash_speed_s esp_flash_speed_t
    SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

    A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations

enum esp_flash_speed_s
    SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

    A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.
Values:

enumerator ESP_FLASH_5MHZ
    The flash runs under 5MHz.

enumerator ESP_FLASH_10MHZ
    The flash runs under 10MHz.

enumerator ESP_FLASH_20MHZ
    The flash runs under 20MHz.

enumerator ESP_FLASH_26MHZ
    The flash runs under 26MHz.

enumerator ESP_FLASH_40MHZ
    The flash runs under 40MHz.

enumerator ESP_FLASH_80MHZ
    The flash runs under 80MHz.

enumerator ESP_FLASH_120MHZ
    The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator ESP_FLASH_SPEED_MAX
    The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t
    Mode used for reading from SPI flash.
    Values:

enumerator SPI_FLASH_SLOWRD
    Data read using single I/O, some limits on speed.

enumerator SPI_FLASH_FASTRD
    Data read using single I/O, no limit on speed.

enumerator SPI_FLASH_DOUT
    Data read using dual I/O.

enumerator SPI_FLASH_DIO
    Both address & data transferred using dual I/O.

enumerator SPI_FLASH_QOUT
    Data read using quad I/O.

enumerator SPI_FLASH_QIO
    Both address & data transferred using quad I/O.
Chapter 2. API Reference

enumerator **SPI_FLASH_OPI_STR**
Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**
Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**
The fastest io mode supported by the host is **ESP_FLASH_READ_MODE_MAX-1**.

Header File
- components/hal/include/hal/esp_flash_err.h

Macros

**ESP_ERR_FLASH_NOTInicialised**

esp flash_chip_t structure not correctly initialised by esp flash init().

**ESP_ERR_FLASH_UNSUPPORTED_HOST**
Requested operation isn’t supported via this host SPI bus (chip->spi field).

**ESP_ERR_FLASH_UNSUPPORTED_CHIP**
Requested operation isn’t supported by this model of SPI flash chip.

**ESP_ERR_FLASH_PROTECTED**
Write operation failed due to chip’s write protection being enabled.

Enumerations

enum [anonymous]
Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**
The chip doesn’t have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**
Chip did not respond to the command, or timed out.

API Reference - Partition Table

Header File
- components/spi_flash/include/esp_partition.h

Functions

**esp_partition_iterator_t esp_partition_find**(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find partition based on one or more parameters.

Parameters
Chapter 2. API Reference

- **type** – Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer.
  To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** – Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer.
  To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

```c
const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find first partition based on one or more parameters.

**Parameters**

- **type** – Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer.
  To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** – Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer.
  To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)
```

Get `esp_partition_t` structure for given partition.

**Parameters**

- **iterator** – Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

```c
esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)
```

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Parameters**

- **iterator** – Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

```c
void esp_partition_iterator_release (esp_partition_iterator_t iterator)
```

Release partition iterator.

**Parameters**

- **iterator** – Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

```c
const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)
```

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**Parameters**

- **partition** – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns

- If partition not found, returns NULL.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.
esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

**Parameters**

- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst` – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `src_offset` – Address of the data to be read, relative to the beginning of the partition.
- `size` – Size of data to be read, in bytes.

**Returns**

ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t esp_partition_write (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the esp_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the esp_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

**Note:** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Parameters**

- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst_offset` – Address where the data should be written, relative to the beginning of the partition.
- `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `size` – Size of data to be written, in bytes.

**Returns**

ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t esp_partition_read_raw (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

**Note:** This function is essentially the same as esp_partition_read() above. It just never decrypts data but returns it as is.

**Parameters**

- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst` – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `src_offset` – Address of the data to be read, relative to the beginning of the partition.
- `size` – Size of data to be read, in bytes.
**Returns**  ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write_raw(
    const esp_partition_t *partition, size_t dst_offset, const void *src,
    size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note:** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Parameters**
- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst_offset` – Address where the data should be written, relative to the beginning of the partition.
- `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `size` – Size of data to be written, in bytes.

**Returns**  ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_erase_range(
    const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.

**Parameters**
- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `offset` – Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- `size` – Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

**Returns**  ESP_OK, if range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_mmap(
    const esp_partition_t *partition, size_t offset, size_t size,
    spi_flash_mmap_memory_t memory, const void **out_ptr,
    spi_flash_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

**Parameters**
• `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
• `offset` – Offset from the beginning of partition where mapping should start.
• `size` – Size of the area to be mapped.
• `memory` – Memory space where the region should be mapped
• `out_ptr` – Output, pointer to the mapped memory region
• `out_handle` – Output, handle which should be used for `spi_flash_munmap` call

**Returns**
ESP_OK, if successful

```c
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Parameters**

- `partition` – [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- `sha_256` – [out] Returned SHA-256 digest for a given partition.

**Returns**
- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the `sha_256` was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

```c
bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)
```

Check for the identity of two partitions by SHA-256 digest.

**Parameters**

- `partition_1` – [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- `partition_2` – [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

**Returns**
- True: In case of the two firmware are equal.
- False: Otherwise

```c
esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the `esp_flash_t` structure) as partitions. This allows using them with components which access SPI flash through the `esp_partition` API.

**Parameters**

- `flash_chip` – Pointer to the structure identifying the flash chip
- `offset` – Address in bytes, where the partition starts
- `size` – Size of the partition in bytes
- `label` – Partition name
- `type` – One of the partition types (ESP_PARTITION_TYPE_ *), or an integer. Note that applications cannot be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- `subtype` – One of the partition subtypes (ESP_PARTITION_SUBTYPE_ *), or an integer.
• **out_partition**  \([\text{out}]\)  Output, if non-NULL, receives the pointer to the resulting \textit{esp_partition_t} structure

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

```c
esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)
```

Deregister the partition previously registered using \textit{esp_partition_register_external}.

**Parameters**
- \texttt{partition} — pointer topartition structure obtained from \textit{esp_partition_register_external},

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using \textit{esp_partition_register_external} function.

**Structures**

```c
struct esp_partition_t
```

partition information structure

This is not the format in flash, that format is \textit{esp_partition_info_t}.
However, this is the format used by this API.

**Public Members**

```c
typedef esp_flash_t *flash_chip
```

SPI flash chip on which the partition resides

```c
typedef esp_partition_type_t type
```

partition type (app/data)

```c
typedef esp_partition_subtype_t subtype
```

partition subtype

```c
uint32_t address
```

starting address of the partition in flash

```c
uint32_t size
```

size of the partition, in bytes

```c
char label[17]
```

partition label, zero-terminated ASCII string

```c
bool encrypted
```

flag is set to true if partition is encrypted
## Macros

**ESP_PARTITION_SUBTYPE_OTA**

Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

## Type Definitions

typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t

Opaque partition iterator type.

## Enumerations

enum esp_partition_type_t

Partition type.

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

**Values:**

- **enumerator ESP_PARTITION_TYPE_APP**
  Application partition type.

- **enumerator ESP_PARTITION_TYPE_DATA**
  Data partition type.

- **enumerator ESP_PARTITION_TYPE_ANY**
  Used to search for partitions with any type.

enum esp_partition_subtype_t

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

**Values:**

- **enumerator ESP_PARTITION_SUBTYPE_APP_FACTORY**
  Factory application partition.

- **enumerator ESP_PARTITION_SUBTYPE_APP_OTA_MIN**
  Base for OTA partition subtypes.

- **enumerator ESP_PARTITION_SUBTYPE_APP_OTA_0**
  OTA partition 0.

- **enumerator ESP_PARTITION_SUBTYPE_APP_OTA_1**
  OTA partition 1.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_2
    OTA partition 2.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_3
    OTA partition 3.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_4
    OTA partition 4.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_5
    OTA partition 5.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_6
    OTA partition 6.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_7
    OTA partition 7.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_8
    OTA partition 8.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_9
    OTA partition 9.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_10
    OTA partition 10.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_11
    OTA partition 11.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_12
    OTA partition 12.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_13
    OTA partition 13.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_14
    OTA partition 14.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_15
    OTA partition 15.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_MAX
    Max subtype of OTA partition.
enumerator ESP_PARTITION_SUBTYPE_APP_TEST
    Test application partition.
enumerator ESP_PARTITION_SUBTYPE_DATA_OTA
OTA selection partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_PHY
PHY init data partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_NVS
NVS partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_COREDUMP
COREDUMP partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS
Partition for NVS keys.

enumerator ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM
Partition for emulate eFuse bits.

enumerator ESP_PARTITION_SUBTYPE_DATA_UNDEFINED
Undefined (or unspecified) data partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD
ESPHTTPD partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_FAT
FAT partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_SPIFFS
SPIFFS partition.

enumerator ESP_PARTITION_SUBTYPE_ANY
Used to search for partitions with any subtype.

## API Reference - Flash Encrypt

### Header File

- components/bootloader_support/include/esp_flash_encrypt.h

### Functions

```c
bool esp_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.
```

```c
esp_err_t esp_flash_encrypt_check_and_update (void)
bool esp_flash_encrypt_state (void)
Returns the Flash Encryption state and prints it.

Returns True - Flash Encryption is enabled False - Flash Encryption is not enabled
```
bool `esp_flash_encrypt_initialized_once()`

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

**Returns**
true - the first initialization was done
false - the first initialization was NOT done

`esp_err_t esp_flash_encrypt_init()`
The first initialization of Flash Encryption key and related eFuses.

**Returns**
ESP_OK if all operations succeeded

`esp_err_t esp_flash_encrypt_contents()`
Encrypts flash content.

**Returns**
ESP_OK if all operations succeeded

`esp_err_t esp_flash_encrypt_enable()`
Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

**Returns**
ESP_OK if all operations succeeded

bool `esp_flash_encrypt_is_write_protected()`

Returns True if the write protection of FLASH_CRYPT_CNT is set.

**Parameters**
- `print_error` - Print error if it is write protected

**Returns**
true - if FLASH_CRYPT_CNT is write protected

`esp_err_t esp_flash_encrypt_region()`
Encrypt-in-place a block of flash sectors.

**Note:** This function resets RTC_WDT between operations with sectors.

**Parameters**
- `src_addr` - Source offset in flash. Should be multiple of 4096 bytes.
- `data_length` - Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns**
ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void `esp_flash_write_protect_crypt_cnt()`

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note:** On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

`esp_flash_enc_mode_t esp_get_flash_encryption_mode()`

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Returns**
void esp_flash_encryption_init_checks (void)
Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

**Note:** This function is called automatically during app startup, it doesn’t need to be called from the app.

*esp_err_t* esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.

**Returns**
- ESP_OK - Successfully

void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from “Development” to “Release”.
If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:
- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

**Enumerations**

denum esp_flash_enc_mode_t
**Values:**

enumerator ESP_FLASH_ENC_MODE_DISABLED

enumerator ESP_FLASH_ENC_MODE_DEVELOPMENT

enumerator ESP_FLASH_ENC_MODE_RELEASE

**2.9.7 SPIFFS Filesystem**

**Overview**

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

**Notes**

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
• SPIFFS is able to reliably utilize only around 75% of assigned partition space.
• When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. here) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
• Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
• When ESP32 experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via esp_spiffs_check function. More details in the official SPIFFS FAQ <https://github.com/pellepl/spiffs/wiki/FAQ>.

Tools

**spiffsgen.py**  
spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling spiffs_create_partition_image:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the **image_size** is required for the standalone invocation, only the **partition** name is required when using spiffs_create_partition_image – the image size is automatically obtained from the project’s partition table.

**spiffs_create_partition_image** must be called from one of the component CMakeLists.txt files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash by specifying **FLASH_IN_PROJECT**. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If **FLASH_IN_PROJECT**/SPIFFS_IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py, parttool.py, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DEPENDS/_SPIFFS_IMAGE_DEPENDS to specify targets that should be executed before generating the image:
add_custom_target(dep COMMAND ...)  
spiffs_create_partition_image{my_spiffs_partition my_folder DEPENDS dep}

For an example, see storage/spiffs.

**mkspiffs**  Another tool for creating SPIFFS partition images is **mkspiffs**. Similar to **spiffsgen.py**, it can be used to create an image from a given folder and then flash that image using **esptool.py**

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000... --spiffs.bin
```

**Notes on which SPIFFS tool to use**  The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use **spiffsgen.py** in the following cases:

1. If you want to simply generate a SPIFFS image during the build. **spiffsgen.py** makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because **spiffsgen.py** does not require compilation.

Use **mkspiffs** in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with **spiffsgen.py**.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled **mkspiffs** binary can do the job. However, there is no build system integration for **mkspiffs** and the user has to do the corresponding work: compiling **mkspiffs** during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

**See also**

- **Partition Table documentation**

**Application Example**

An example of using SPIFFS is provided in the storage/spiffs directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.
High-level API Reference

Header File

- components/spiffs/include/esp_spiffs.h

Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```

Register and mount SPIFFS to VFS with given path prefix.

- **Parameters**
  - `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

- **Returns**
  - `ESP_OK` if success
  - `ESP_ERR_NO_MEM` if objects could not be allocated
  - `ESP_ERR_INVALID_STATE` if already mounted or partition is encrypted
  - `ESP_ERR_NOT_FOUND` if partition for SPIFFS was not found
  - `ESP_FAIL` if mount or format fails

```c
esp_err_t esp_vfs_spiffs_unregister(const char* partition_label)
```

Unregister and unmount SPIFFS from VFS

- **Parameters**
  - `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

- **Returns**
  - `ESP_OK` if successful
  - `ESP_ERR_INVALID_STATE` already unregistered

```c
bool esp_spiffs_mounted(const char* partition_label)
```

Check if SPIFFS is mounted

- **Parameters**
  - `partition_label`: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

- **Returns**
  - `true` if mounted
  - `false` if not mounted

```c
esp_err_t esp_spiffs_format(const char* partition_label)
```

Format the SPIFFS partition

- **Parameters**
  - `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

- **Returns**
  - `ESP_OK` if successful
  - `ESP_FAIL` on error

```c
esp_err_t esp_spiffs_info(const char* partition_label, size_t* total_bytes, size_t* used_bytes)
```

Get information for SPIFFS

- **Parameters**
  - `partition_label`: Same label as passed to `esp_vfs_spiffs_register`
  - `total_bytes` - [out] Size of the file system
  - `used_bytes` - [out] Current used bytes in the file system

- **Returns**
  - `ESP_OK` if success
  - `ESP_ERR_INVALID_STATE` if not mounted

```c
esp_err_t esp_spiffs_check(const char* partition_label)
```

Check integrity of SPIFFS

- **Parameters**
  - `partition_label`: Same label as passed to `esp_vfs_spiffs_register`

- **Returns**
  - `ESP_OK` if successful
  - `ESP_ERR_INVALID_STATE` if not mounted
  - `ESP_FAIL` on error
**esp_err_t esp_spiffs_gc** (const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

**Parameters**

- **partition_label** – Label of the partition to be garbage-collected. The partition must be already mounted.
- **size_to_gc** – The number of bytes that the GC process should attempt to make available.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

**Structures**

```c
struct esp_vfs_spiffs_conf_t
```

Configuration structure for esp_vfs_spiffs_register.

### Public Members

- **const char *base_path**
  File path prefix associated with the filesystem.

- **const char *partition_label**
  Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

- **size_t max_files**
  Maximum files that could be open at the same time.

- **bool format_if_mount_failed**
  If true, it will format the file system if it fails to mount.

## 2.9.8 Virtual filesystem component

### Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.
This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

**FS registration**

To register an FS driver, an application needs to define an instance of the *esp_vfs_t* structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
```

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t * fs, int fd, const void * data, size_t size);
```

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));

**Synchronous input/output multiplexing**  Synchronous input/output multiplexing by select() is supported in the VFS component. The implementation works in the following way.
1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

**Non-socket VFS drivers** If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
  .start_select = &uart_start_select,
  .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver. `end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- ` peripherals/uart/uart_select`
- ` system/select`

**Socket VFS drivers** A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
  .socket_select = &lwip_select,
  .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
  .stop_socket_select = &lwip_stop_socket_select,
  .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.
stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

**Note:** If you use select() for socket file descriptors only then you can disable the CONFIG_VFS_SUPPORT_SELECT option to reduce the code size and improve performance. You should not change the socket driver during an active select() call or you might experience some undefined behavior.

**Paths**

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../../../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

**File descriptors**

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib’s sys/types.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

**Standard IO streams (stdin, stdout, stderr)**

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.
Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `scanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘n’) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

**Standard streams and FreeRTOS tasks**

FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r");`.
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin(_stdout,_stderr) before creating the task.

**Event fds**

The `eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
- Option EFD_SUPPORT_ISR has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with EFD_SUPPORT_ISR will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

Chapter 2. API Reference

Functions

ssize_t esp_vfs_write (struct_reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t esp_vfs_lseek (struct_reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct_reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct_reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct_reent *r, int fd)

int esp_vfs_fstat (struct_reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct_reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct_reent *r, const char *n1, const char *n2)

int esp_vfs_unlink (struct_reent *r, const char *path)

int esp_vfs_rename (struct_reent *r, const char *src, const char *dst)

int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

- **base_path** — file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** — Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
- **ctx** — If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

- **vfs** — Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- **ctx** — Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **min_fd** — The smallest file descriptor this VFS will use.
- **max_fd** — Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Parameters

- **vfs** — Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().

Espressif Systems 1679 Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
• **ctx** – Pointer to context structure. Meaning is the same as for esp_vfs_register().
• **vfs_id** – Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

```c
esp_err_t esp_vfs_unregister(const char *base_path)
```

Unregister a virtual filesystem for given path prefix

**Parameters**
base_path – file prefix previously used in esp_vfs_register call

**Returns**
ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

```c
esp_err_t esp_vfs_unregister_with_id(esp_vfs_id_t vfs_id)
```

Unregister a virtual filesystem with the given index

**Parameters**
vfs_id – The VFS ID returned by esp_vfs_register_with_id

**Returns**
ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

```c
esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)
```

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

**Parameters**
• vfs_id – VFS identificator returned by esp_vfs_register_with_id.
• fd – The registered file descriptor will be written to this address.

**Returns**
ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
esp_err_t esp_vfs_register_fd_with_local_fd(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)
```

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

**Parameters**
• vfs_id – VFS identificator returned by esp_vfs_register_with_id.
• local_fd – The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
• permanent – Whether the fd should be treated as permanet (not removed after close())
• fd – The registered file descriptor will be written to this address.

**Returns**
ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)
```

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

**Parameters**
• vfs_id – VFS identificator returned by esp_vfs_register_with_id.
• fd – File descriptor which should be unregistered.

**Returns**
ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
```

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

**Parameters**
• nfds – Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
• readfds – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
• writefds – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** – If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**Returns** The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**

- `sem` – semaphore structure which was passed to the driver by the start_select call

```c
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**

- `sem` – semaphore structure which was passed to the driver by the start_select call
- `woken` – is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pread()`

**Parameters**

- `fd` – File descriptor used for read
- `dst` – Pointer to the buffer where the output will be written
- `size` – Number of bytes to be read
- `offset` – Starting offset of the read

**Returns** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pwrite()`

**Parameters**

- `fd` – File descriptor used for write
- `src` – Pointer to the buffer from where the output will be read
- `size` – Number of bytes to write
- `offset` – Starting offset of the write

**Returns** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for `select()`

**Public Members**

```c
bool is_sem_local
```

type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise
void *sem

semaphore instance

struct esp_vfs_t

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The
caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument.
For these implementations, populate the members of this structure which have _p suffix, set flags member
to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the
implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member
to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

int flags

ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)

Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer
ssize_t (*_pwrite)(int fd, const void *src, size_t size, off_t offset)
  pwrite without context pointer

int (*_open_p)(void *ctx, const char *path, int flags, int mode)
  open with context pointer

int (*_open)(const char *path, int flags, int mode)
  open without context pointer

int (*_close_p)(void *ctx, int fd)
  close with context pointer

int (*_close)(int fd)
  close without context pointer

int (*_fstat_p)(void *ctx, int fd, struct stat *st)
  fstat with context pointer

int (*_fstat)(int fd, struct stat *st)
  fstat without context pointer

int (*_stat_p)(void *ctx, const char *path, struct stat *st)
  stat with context pointer

int (*_stat)(const char *path, struct stat *st)
  stat without context pointer

int (*_link_p)(void *ctx, const char *n1, const char *n2)
  link with context pointer

int (*_link)(const char *n1, const char *n2)
  link without context pointer

int (*_unlink_p)(void *ctx, const char *path)
  unlink with context pointer

int (*_unlink)(const char *path)
  unlink without context pointer

int (*_rename_p)(void *ctx, const char *src, const char *dst)
  rename with context pointer

int (*_rename)(const char *src, const char *dst)
  rename without context pointer

DIR *(*_opendir_p)(void *ctx, const char *name)
  opendir with context pointer
DIR *(*open_dir)(const char *name)
    opendir without context pointer

struct dirent *(*read_dir_p)(void *ctx, DIR *pdir)
    readdir with context pointer

struct dirent *(*read_dir)(DIR *pdir)
    readdir without context pointer

int (*read_dir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r with context pointer

int (*read_dir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r without context pointer

long (*tell_dir_p)(void *ctx, DIR *pdir)
    telldir with context pointer

long (*tell_dir)(DIR *pdir)
    telldir without context pointer

void (*seek_dir_p)(void *ctx, DIR *pdir, long offset)
    seekdir with context pointer

void (*seek_dir)(DIR *pdir, long offset)
    seekdir without context pointer

int (*close_dir_p)(void *ctx, DIR *pdir)
    closedir with context pointer

int (*close_dir)(DIR *pdir)
    closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
    mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
    mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
    rmdir with context pointer

int (*rmdir)(const char *name)
    rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
    fcntl with context pointer

int (*fcntl)(const char *name, mode_t mode)
    fcntl without context pointer
int (*fcntl)(int fd, int cmd, int arg)
    fcntl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
    ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
    ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
    fsync with context pointer

int (*fsync)(int fd)
    fsync without context pointer

int (*access_p)(void *ctx, const char *path, int amode)
    access with context pointer

int (*access)(const char *path, int amode)
    access without context pointer

int (*truncate_p)(void *ctx, const char *path, off_t length)
    truncate with context pointer

int (*truncate)(const char *path, off_t length)
    truncate without context pointer

int (*ftruncate_p)(void *ctx, int fd, off_t length)
    ftruncate with context pointer

int (*ftruncate)(int fd, off_t length)
    ftruncate without context pointer

int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)
    utime with context pointer

int (*utime)(const char *path, const struct utimbuf *times)
    utime without context pointer

int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)
    tcsetattr with context pointer

int (*tcsetattr)(int fd, int optional_actions, const struct termios *p)
    tcsetattr without context pointer

int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)
    tcgetattr with context pointer
Chapter 2. API Reference

int (*tcgetattr)(int fd, struct termios *p)
tcgetattr without context pointer

int (*tcdrain_p)(void *ctx, int fd)
tcdrain with context pointer

int (*tcdrain)(int fd)
tcdrain without context pointer

int (*tcflush_p)(void *ctx, int fd, int select)
tcflush with context pointer

int (*tcflush)(int fd, int select)
tcflush without context pointer

int (*tcflow_p)(void *ctx, int fd, int action)
tcflow with context pointer

int (*tcflow)(int fd, int action)
tcflow without context pointer

pid_t (*tcgetsid_p)(void *ctx, int fd)
tcgetsid with context pointer

pid_t (*tcgetsid)(int fd)
tcgetsid without context pointer

int (*tcsendbreak_p)(void *ctx, int fd, int duration)
tcsendbreak with context pointer

int (*tcsendbreak)(int fd, int duration)
tcsendbreak without context pointer

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
                         esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the
given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval
                     *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for
the socket VFS

void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver
void *(*get_socket_select_semaphore)(void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t *(*end_select)(void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS
Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions
typedef int esp_vfs_id_t

Header File
• components/vfs/include/esp_vfs_dev.h

Functions
void esp_vfs_dev_uart_register (void)
add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (‘
’, LF) passed into stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters mode –line endings expected on UART
void **esp_vfs_dev_uart_set_tx_line_endings**(esp_line_endings_t mode)

Set the line endings to sent to UART.

This specifies the conversion between newlines (‘
’, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. writing to UART

**Parameters**

- **mode** – line endings to send to UART

int **esp_vfs_dev_uart_port_set_rx_line_endings**(int uart_num, esp_line_endings_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (‘
’, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. reading from UART

**Parameters**

- **uart_num** – the UART number
- **mode** – line endings to send to UART

**Returns**

0 if succeeded, or -1 when an error (specified by errno) have occurred.

int **esp_vfs_dev_uart_port_set_tx_line_endings**(int uart_num, esp_line_endings_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (‘
’, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. writing to UART

**Parameters**

- **uart_num** – the UART number
Chapter 2. API Reference

- **mode** - line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_dev_uart_use_nonblocking(int uart_num)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters  
uart_num - UART peripheral number
```

```c
void esp_vfs_dev_uart_use_driver(int uart_num)
set VFS to use UART driver for reading and writing
```

**Note:** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

```c
Parameters  
uart_num - UART peripheral number
```

```c
void esp_vfs_usb_serial_jtag_use_driver(void)
set VFS to use USB-SERIAL-JTAG driver for reading and writing
```

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking(void)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.
```

**Header File**

- components/vfs/include/esp_vfs_eventfd.h

**Functions**

```c
esp_err_t esp_vfs_eventfd_register(const esp_vfs_eventfd_config_t *config)
Registers the event vfs.

Returns  
ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.
```

```c
esp_err_t esp_vfs_eventfd_unregister(void)
Unregisters the event vfs.

Returns  
ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered.
```

```c
int eventfd(unsigned int initval, int flags)
```

**Structures**

**Public Members**

```c
size_t max_fds
The maximum number of eventfds supported
```
2.9.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wlUnmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wlSector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.
See also

- FAT Filesystem
- Partition Table documentation

Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the storage/wear_levelling/README.md file for more information.

High level API Reference

Header Files

- fatfs/vfs/esp_vfs_fat.h

Functions

```c
esp_err_t esp_vfs_fat_spiflash_mount_rw_wl(const char *base_path, const char *partition_label,
                                           const esp_vfs_fat_mount_config_t *mount_config,
                                           wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Parameters

- `base_path` – path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label` – label of the partition which should be used
- `mount_config` – pointer to structure with extra parameters for mounting FATFS
- `wl_handle` – [out] wear levelling driver handle

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

```c
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

Public Members

```c
bool format_if_mount_failed
```

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.
\textbf{max\_files}

Max number of open files.

\textbf{allocation\_unit\_size}

If format_if\_mount\_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear\_levelling, sector size is determined by \texttt{CONFIG\_WL\_SECTOR\_SIZE} option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

\textbf{disk\_status\_check\_enable}

Enables \texttt{ff\_disk\_status} function implementation for SD cards (\texttt{ff\_sdmmc\_status}). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

\texttt{esp\_err\_t esp\_vfs\_fat\_spiflash\_unmount\_rw\_wl (const char* base\_path, wl\_handle\_t \texttt{wl\_handle})}

Unmount FAT filesystem and release resources acquired using \texttt{esp\_vfs\_fat\_spiflash\_mount\_rw\_wl}.

\begin{itemize}
\item \texttt{base\_path} -- path where partition should be registered (e.g. “/spiflash”)
\item \texttt{wl\_handle} -- wear levelling driver handle returned by \texttt{esp\_vfs\_fat\_spiflash\_mount\_rw\_wl}
\end{itemize}

\textbf{Returns}

\begin{itemize}
\item ESP\_OK on success
\item ESP\_ERR\_INVALID\_STATE if \texttt{esp\_vfs\_fat\_spiflash\_mount\_rw\_wl} hasn’t been called
\end{itemize}

\textbf{Mid level API Reference}

\textbf{Header File}

\begin{itemize}
\item components/wear\_levelling/include/wear\_levelling.h
\end{itemize}

\textbf{Functions}

\texttt{esp\_err\_t \texttt{wl\_mount} (const esp\_partition\_t* partition, wl\_handle\_t* out\_handle)}

Mount WL for defined partition.

\begin{itemize}
\item \texttt{partition} -- that will be used for access
\item \texttt{out\_handle} -- handle of the WL instance
\end{itemize}

\textbf{Returns}

\begin{itemize}
\item ESP\_OK, if the allocation was successfully;
\item ESP\_ERR\_INVALID\_ARG, if WL allocation was unsuccessful;
\item ESP\_ERR\_NO\_MEM, if there was no memory to allocate WL components;
\end{itemize}

\texttt{esp\_err\_t \texttt{wl\_unmount} (wl\_handle\_t handle)}

Unmount WL for defined partition.

\begin{itemize}
\item \texttt{handle} -- WL partition handle
\end{itemize}

\textbf{Returns}

\begin{itemize}
\item ESP\_OK, if the operation completed successfully;
\item or one of error codes from lower-level flash driver.
\end{itemize}
Chapter 2. API Reference

.esp_err_t wl_erase_range (wl_handle_t handle, size_t start_addr, size_t size)
Erase part of the WL storage.

Parameters
- handle - WL handle that are related to the partition
- start_addr - Address where erase operation should start. Must be aligned to the result
  of function wl_sector_size( … ).
- size - Size of the range which should be erased, in bytes. Must be divisible by result of
  function wl_sector_size( … ).

Returns
- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

.esp_err_t wl_write (wl_handle_t handle, size_t dest_addr, const void* src, size_t size)
Write data to the WL storage.
Before writing data to flash, corresponding region of flash needs to be erased. This can be done using
wl_erase_range function.

Note: Prior to writing to WL storage, make sure it has been erased with wl_erase_range call.

Parameters
- handle - WL handle that are related to the partition
- dest_addr - Address where the data should be written, relative to the beginning of the
  partition.
- src - Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least
  ‘size’ bytes long.
- size - Size of data to be written, in bytes.

Returns
- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

.esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void* dest, size_t size)
Read data from the WL storage.

Parameters
- handle - WL module instance that was initialized before
- dest - Pointer to the buffer where data should be stored. Pointer must be non-NULL and
  buffer must be at least ‘size’ bytes long.
- src_addr - Address of the data to be read, relative to the beginning of the partition.
- size - Size of data to be read, in bytes.

Returns
- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

size_t wl_size (wl_handle_t handle)
Get size of the WL storage.

Parameters handle - WL module handle that was initialized before

Returns usable size, in bytes

size_t wl_sector_size (wl_handle_t handle)
Get sector size of the WL instance.
**Parameters** handle – WL module handle that was initialized before

**Returns** sector size, in bytes

**Macros**

WL_INVALID_HANDLE

**Type Definitions**

typedef int32_t wl_handle_t

wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.

### 2.10 System API

#### 2.10.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
   - offset for 0 Segment = \text{sizeof}(esp_image_header_t) + \text{sizeof}(esp_image_segment_header_t).
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + \text{sizeof}(esp_image_segment_header_t).
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + \text{sizeof}(esp_image_segment_header_t).
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than ESP_IMAGE_MAX_SEGMENTS.

To get the list of your image segments, please run the following command:

```
$ esptool.py --chip esp32 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: len 0x00000 load 0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
Segment 3: len 0x00000 load 0x3ff80000 file_offs 0x00013d08 SOC_RTC_DRAM
Segment 4: len 0x028e0 load 0x3ff80000 file_offs 0x00013d10 DRAM
Segment 5: len 0x00000 load 0x3ff80000 file_offs 0x000165f8 DRAM
Segment 6: len 0x00400 load 0x40080000 file_offs 0x00016600 SOC_IRAM
Segment 7: len 0x09600 load 0x40080400 file_offs 0x00016a00 SOC_IRAM
Segment 8: len 0x62e4c load 0x400d0018 file_offs 0x00020010 SOC_IROM
Segment 9: len 0x06ec8 load 0x40089a00 file_offs 0x00082e64 SOC_IRAM
Segment 10: len 0x00000 load 0x40000000 file_offs 0x00089b58 SOC_RTC_IRAM
Segment 11: len 0x00000 load 0x50000000 file_offs 0x00089b60 SOC_RTC_DATA
Segment 12: len 0x00000 load 0x50000004 file_offs 0x00089b6c SOC_RTC_DATA
```

(continues on next page)
You can also see the information on segments in the ESP-IDF logs while your application is booting:

```plaintext
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 (...)
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 size=0x000000 (...)
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 size=0x000000 (...)
I (571) esp_image: segment 3: paddr=0x00033d18 vaddr=0x3ffb0000 size=0x028e0 (...)
I (612) esp_image: segment 4: paddr=0x00036600 vaddr=0x3ffb28e0 size=0x000000 (...)
I (654) esp_image: segment 5: paddr=0x00036608 vaddr=0x40080000 size=0x004000 (...)
I (695) esp_image: segment 6: paddr=0x00036610 vaddr=0x40080400 size=0x096000 (...)
I (737) esp_image: segment 7: paddr=0x00040018 vaddr=0x400d0018 size=0x62e4c (...)
I (779) esp_image: segment 8: paddr=0x000a2e6c vaddr=0x40089a00 size=0x06ecc (...)
I (821) esp_image: segment 9: paddr=0x000a9b60 vaddr=0x40089900 size=0x000000 (...)
I (862) esp_image: segment 10: paddr=0x000a9b68 vaddr=0x50000000 size=0x000004 (...)
I (903) esp_image: segment 11: paddr=0x000a9b74 vaddr=0x50000004 size=0x000000 (...)
I (944) esp_image: segment 12: paddr=0x000a9b7c vaddr=0x50000004 size=0x000000 (...)
```

For more details on the type of memory segments and their address ranges, see ESP32 Technical Reference Manual > System and Memory > Embedded Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

**Application Description**

The DROM segment starts with the esp_app_desc_t structure which carries specific fields describing the application:

- **magic_word** - the magic word for the esp_app_desc structure.
- **secure_version** - see Anti-rollback.
- **version** - see App version.
- **project_name** is filled from PROJECT_NAME.
- **time and date** - compile time and date.
- **idf_ver** - version of ESP-IDF.
- **app_elf_sha256** - contains sha256 for the elf application file.
* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

**Adding a Custom Structure to an Application**

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t).

To guarantee that the custom structure is located in the image even if it is not used, you need to add target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc") into CMakeLists.txt.

**API Reference**

**Header File**

- components/bootloader_support/include/esp_app_format.h

**Structures**

struct esp_image_header_t

Main header of binary image.

**Public Members**

```c
uint8_t magic
    Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t segment_count
    Count of memory segments

uint8_t spi_mode
    flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t spi_speed
    flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t spi_size
    flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
    Entry address
```
uint8_t wp_pin
    WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pinDrv[3]
    Drive settings for the SPI flash pins (read by ROM bootloader)

\textit{esp\_chip\_id\_t} chip_id
    Chip identification number

uint8_t min_chip_rev
    Minimum chip revision supported by image

uint8_t reserved[8]
    Reserved bytes in additional header space, currently unused

uint8_t hash_appende\_d
    If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

\textbf{struct} esp\_image\_segment\_header\_t
    Header of binary image segment.

\textbf{Public Members}

uint32_t load_addr
    Address of segment

uint32_t data_len
    Length of data

\textbf{struct} esp\_app\_desc\_t
    Description about application.

\textbf{Public Members}

uint32_t magic_word
    Magic word ESP\_APP\_DESC\_MAGIC\_WORD

uint32_t secure_version
    Secure version

uint32_t reserved[2]
    reserved
char \texttt{version}[32] \\
Application version

char \texttt{project\_name}[32] \\
Project name

char \texttt{time}[16] \\
Compile time

char \texttt{date}[16] \\
Compile date

char \texttt{idf\_ver}[32] \\
Version IDF

uint8_t \texttt{app\_elf\_sha256}[32] \\
sha256 of elf file

uint32_t \texttt{reserv2}[20] \\
reserv2

\textbf{Macros}

\texttt{ESP\_IMAGE\_HEADER\_MAGIC} \\
The magic word for the \texttt{esp\_image\_header\_t} structure.

\texttt{ESP\_IMAGE\_MAX\_SEGMENTS} \\
Max count of segments in the image.

\texttt{ESP\_APP\_DESC\_MAGIC\_WORD} \\
The magic word for the \texttt{esp\_app\_desc} structure that is in DROM.

\textbf{Enumerations}

\texttt{enum \texttt{esp\_chip\_id\_t}} \\
ESP chip ID.

\textit{Values:}

enumerator \texttt{ESP\_CHIP\_ID\_ESP32} \\
chip ID: ESP32

enumerator \texttt{ESP\_CHIP\_ID\_ESP32S2} \\
chip ID: ESP32-S2

enumerator \texttt{ESP\_CHIP\_ID\_ESP32C3} \\
chip ID: ESP32-C3

enumerator \texttt{ESP\_CHIP\_ID\_ESP32S3} \\
chip ID: ESP32-S3
Chapter 2. API Reference

enumerator ESP_CHIP_ID_ESP32C2
    chip ID: ESP32-C2

enumerator ESP_CHIP_ID_INVALID
    Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
    SPI flash mode, used in esp_image_header_t.
    Values:
        enumerator ESP_IMAGE_SPI_MODE_QIO
            SPI mode QIO
        enumerator ESP_IMAGE_SPI_MODE_QOUT
            SPI mode QOUT
        enumerator ESP_IMAGE_SPI_MODE_DIO
            SPI mode DIO
        enumerator ESP_IMAGE_SPI_MODE_DOUT
            SPI mode DOUT
        enumerator ESP_IMAGE_SPI_MODE_FAST_READ
            SPI mode FAST_READ
        enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
            SPI mode SLOW_READ

enum esp_image_spi_freq_t
    SPI flash clock division factor.
    Values:
        enumerator ESP_IMAGE_SPI_SPEED_DIV_2
            The SPI flash clock frequency is divided by 2 of the clock source
        enumerator ESP_IMAGE_SPI_SPEED_DIV_3
            The SPI flash clock frequency is divided by 3 of the clock source
        enumerator ESP_IMAGE_SPI_SPEED_DIV_4
            The SPI flash clock frequency is divided by 4 of the clock source
        enumerator ESP_IMAGE_SPI_SPEED_DIV_1
            The SPI flash clock frequency equals to the clock source

enum esp_image_flash_size_t
    Supported SPI flash sizes.
    Values:
2.10.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with minimal overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- components/app_trace/include/esp_app_trace.h

Functions
Chapter 2. API Reference

**esp_err_t esp_apptrace_init (void)**

Initializes application tracing module.

**Note:** Should be called before any esp_apptrace_xxx call.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)
```

Configures down buffer.

**Note:** Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

**Parameters**

- **buf** – Address of buffer to use for down channel (host to target) data.
- **size** – Size of the buffer.

```c
uint8_t *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)
```

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

**Parameters**

- **dest** – Indicates HW interface to send data.
- **size** – Size of data to write to trace buffer.
- **tmo** – Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

```c
esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

**Parameters**

- **dest** – Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- **ptr** – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- **tmo** – Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)
```

Writes data to trace buffer.

**Parameters**

- **dest** – Indicates HW interface to send data.
- **data** – Address of data to write to trace buffer.
- **size** – Size of data to write to trace buffer.
- **tmo** – Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
int esp_apptrace_vprintf_to (esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
```

vprintf-like function to send log messages to host via specified HW interface.

**Parameters**

- **dest** – Indicates HW interface to send data.
• `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
• `fmt` – Address of format string.
• `ap` – List of arguments.

Returns Number of bytes written.

int `esp_apptrace_vprintf` (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

Parameters
• `fmt` – Address of format string.
• `ap` – List of arguments.

Returns Number of bytes written.

`esp_err_t esp_apptrace_flush` (`esp_apptrace_dest_t` dest, uint32_t tmo)
Flushes remaining data in trace buffer to host.

Parameters
• `dest` – Indicates HW interface to flush data on.
• `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

`esp_err_t esp_apptrace_flush_nolock` (`esp_apptrace_dest_t` dest, uint32_t min_sz, uint32_t tmo)
Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

Parameters
• `dest` – Indicates HW interface to flush data on.
• `min_sz` – Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
• `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

`esp_err_t esp_apptrace_read` (`esp_apptrace_dest_t` dest, void *data, uint32_t *size, uint32_t tmo)
Reads host data from trace buffer.

Parameters
• `dest` – Indicates HW interface to read the data on.
• `data` – Address of buffer to put data from trace buffer.
• `size` – Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
• `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

uint8_t *`esp_apptrace_down_buffer_get` (`esp_apptrace_dest_t` dest, uint32_t *size, uint32_t tmo)
Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

Parameters
• `dest` – Indicates HW interface to receive data.
• `size` – Address to store size of available data in down buffer. Must be initialized with requested value.
• `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

`esp_err_t esp_apptrace_down_buffer_put` (`esp_apptrace_dest_t` dest, uint8_t *ptr, uint32_t tmo)
Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.
Chapter 2. API Reference

Parameters
- **dest** – Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apprace_down_buffer_get.
- **ptr** – Address of trace buffer to release. Should be the value returned by call to esp_apprace_down_buffer_get.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

bool **esp_apprace_host_is_connected**(esp_apprace_dest_t dest)
Checks whether host is connected.

Parameters **dest** – Indicates HW interface to use.

Returns true if host is connected, otherwise false

void **esp_apprace_fopen**(esp_apprace_dest_t dest, const char* path, const char* mode)
Opens file on host. This function has the same semantic as `fopen` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **path** – Path to file.
- **mode** – Mode string. See fopen for details.

Returns non zero file handle on success, otherwise 0

int **esp_apprace_fclose**(esp_apprace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as `fclose` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by esp_apprace_fopen.

Returns Zero on success, otherwise non-zero. See fclose for details.

size_t **esp_apprace_fwrite**(esp_apprace_dest_t dest, const void* ptr, size_t size, size_t nmemb, void *stream)
Writes to file on host. This function has the same semantic as `fwrite` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **ptr** – Address of data to write.
- **size** – Size of an item.
- **nmemb** – Number of items to write.
- **stream** – File handle returned by esp_apprace_fopen.

Returns Number of written items. See fwrite for details.

size_t **esp_apprace_fread**(esp_apprace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
Read file on host. This function has the same semantic as `fread` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **ptr** – Address to store read data.
- **size** – Size of an item.
- **nmemb** – Number of items to read.
- **stream** – File handle returned by esp_apprace_fopen.

Returns Number of read items. See fread for details.

int **esp_apprace_fseek**(esp_apprace_dest_t dest, void *stream, long offset, int whence)
Set position indicator in file on host. This function has the same semantic as `fseek` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by esp_apprace_fopen.
- **offset** – Offset. See fseek for details.
• whence - Position in file. See fseek for details.

Returns Zero on success, otherwise non-zero. See fseek for details.

int esp_apptrace_ftell (esp_aptrace_dest_t dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

Parameters
• dest - Indicates HW interface to use.
• stream - File handle returned by esp_aptrace_fopen.

Returns Current position in file. See ftell for details.

int esp_apptrace_fstop (esp_aptrace_dest_t dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Parameters dest - Indicates HW interface to use.

Returns ESP_OK on success, otherwise see esp_err_t

void esp_gcov_dump (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

denum esp_aptrace_dest_t

Application trace data destinations bits.

Values:

enumerator ESP_APPTRACE_DEST_JTAG

JTAG destination.

enumerator ESP_APPTRACE_DEST_TRAX

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator ESP_APPTRACE_DEST_UART

UART destination.

enumerator ESP_APPTRACE_DEST_MAX

enumerator ESP_APPTRACE_DEST_NUM

Header File

• components/app_trace/include/esp_sysview_trace.h

Functions

static inline esp_err_t esp_sysview_flush (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

Parameters tmo - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK.
int esp_sysview_vprintf (const char *format, va_list args)

vprintf-like function to send log messages to the host.

Parameters
  • format - Address of format string.
  • args - List of arguments.

Returns
  Number of bytes written.

esp_err_t esp_sysview_heap_trace_start (uint32_t tmo)

Starts SystemView heap tracing.

Parameters
  • tmo - Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

Returns
  ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

esp_err_t esp_sysview_heap_trace_stop (void)

Stops SystemView heap tracing.

Returns
  ESP_OK.

void esp_sysview_heap_trace_alloc (void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

Parameters
  • addr - Address of allocated block.
  • size - Size of allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void esp_sysview_heap_trace_free (void *addr, const void *callers)

Sends heap de-allocation event to the host.

Parameters
  • addr - Address of de-allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.10.3 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as printf. The given function can be called inside the shared stack space which is a callback function deferred by calling esp_execute_shared_stack_function(), passing that function as parameter

Usage

esp_execute_shared_stack_function() takes four arguments:
  • a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
  • a pointer to the top of stack used for that function
  • the size of stack in bytes
  • a pointer to the shared stack function

The user defined function will be deferred as a callback and can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

// Let's suppose we want to call printf using a separated stack space
// allowing the app to reduce its stack size.
void app_main()
{
    // Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    // Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    // Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
            shared_stack,
            8192,
            external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}

API Reference

Header File

- components/esp_system/include/esp_expression_with_stack.h

Functions

void esp_execute_shared_stack_function(SemaphoreHandle_t lock, void *stack, size_t stack_size,
    shared_stack_function function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters

- lock - Mutex object to protect in case of shared stack
- stack - Pointer to user allocated stack
- stack_size - Size of current stack in bytes
- function - Pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)

Type Definitions

typedef void (*shared_stack_function)(void)
Chapter 2. API Reference

2.10.4 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by linenoise library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by argtable3 library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

Note: These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use getopt or custom code for argument parsing, instead of argtable3. Likewise, it is possible to use simpler means of command input (such as fgets) together with the rest of the means for command splitting and argument parsing.

Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see [6n or similar escape sequence when running system/console example instead of a command prompt (e.g. esp>), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and idf_monitor.py (which can be invoked using idf.py monitor from project directory).

Here is an overview of functions provided by linenoise library.

Configuration  Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

linenoiseClearScreen()

Clear terminal screen using an escape sequence and position the cursor at the top left corner.

linenoiseSetMultiLine()

Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

linenoiseAllowEmpty()

Set whether linenoise library will return a zero-length string (if true) or NULL (if false) for empty lines. By default, zero-length strings are returned.

linenoiseSetMaxLineLen()

Set maximum length of the line for linenoise library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4 KB.
Main loop  `linenoise()`

In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns completed line once ‘enter’ key is pressed. As such, it handles the ‘read’ part of the loop.

`linenoiseFree()`

This function must be called to release the command line buffer obtained from `linenoise()` function.

Hints and completions  `linenoiseSetCompletionCallback()`

When user presses ‘tab’ key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.

`console` component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

`linenoiseAddCompletion()`

Function to be called by completion callback to inform the library about possible completions of the currently typed command.

`linenoiseSetHintsCallback()`

Whenever user input changes, linenoise invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

`linenoiseSetFreeHintsCallback()`

If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

History  `linenoiseHistorySetMaxLen()`

This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

`linenoiseHistoryAdd()`

Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

`linenoiseHistorySave()`

Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

`linenoiseHistoryLoad()`

Counterpart to `linenoiseHistorySave()`, loads history from a file.

`linenoiseHistoryFree()`

Releases memory used to store command history. Call this function when done working with linenoise library.
Splitting of command line into arguments

The `console` component provides the `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using \ (backslash) character.
- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123 456, def]`
- `\`a\ b\c\"` → `[a b\c"]`

Argument parsing

For argument parsing, the `console` component includes the `argtable3` library. Please see the tutorial for an introduction to `argtable3`. Github repository also includes examples.

Command registration and dispatching

The `console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

- `esp_console_run()`
  This function takes the command line string, splits it into `argc/argv` argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.

- `esp_console_register_help_command()`
  Adds `help` command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

- `esp_console_get_completion()`
  Callback function to be used with `linenoiseSetCompletionCallback()` from linenoise library. Provides completions to linenoise based on the list of registered commands.

- `esp_console_get_hint()`
Callback function to be used with `linenoiseSetHintsCallback()` from linenoise library. Provides argument hints for registered commands to linenoise.

**Initialize console REPL environment**

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

**Application Example**

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/iperf`.

**API Reference**

**Header File**

- `components/console/esp_console.h`

**Functions**

`esp_err_t esp_console_init (const esp_console_config_t *config)`

initialize console module

**Parameters**

`config` – console configuration

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

`esp_err_t esp_console_deinit (void)`

de-initialize console module

**Note:** Call this once when done using console module functions

**Parameters**

- `config` – console configuration

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet
`esp_err_t esp_console_cmd_register(const esp_console_cmd_t *cmd)`

Register console command.

**Parameters**
- `cmd` - pointer to the command description; can point to a temporary value

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

`esp_err_t esp_console_run(const char *cmdline, int *cmd_ret)`

Run command line.

**Parameters**
- `cmdline` - command line (command name followed by a number of arguments)
- `cmd_ret` - [out] return code from the command (set if command was run)

**Returns**
- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

`size_t esp_console_split_argv(char *line, char **argv, size_t argv_size)`

Split command line into arguments in place.

```
 /* - This function finds whitespace-separated arguments in the given input line.
 * - 'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
 * - Argument which include spaces may be surrounded with quotes. In this case
 *   spaces are preserved and quotes are stripped.
 * - 'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
 * - Escape sequences may be used to produce backslash, double quote, and space:
 *   'a\b\c"' -> [ 'a b\c"' ]
 */
```

**Note:** Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

**Parameters**
- `line` - pointer to buffer to parse; it is modified in place
- `argv` - array where the pointers to arguments are written
- `argv_size` - number of elements in argv_array (max. number of arguments)

**Returns**
- number of arguments found (argc)

`void esp_console_get_completion(const char *buf, linenoiseCompletions *lc)`

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

**Parameters**
- `buf` - the string typed by the user
- `lc` - linenoiseCompletions to be filled in
const char *esp_console_get_hint (const char *buf, int *color, int *bold)
Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:
linenoiseSetHintsCallback((linenoiseHintsCallback *)&esp_console_get_hint);
The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

Parameters
- **buf** – line typed by the user
- **color** –[out] ANSI color code to be used when displaying the hint
- **bold** –[out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

esp_err_t esp_console_register_help_command (void)
Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

esp_err_t esp_console_new_repl_uart (const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters
- **dev_config** –[in] UART device configuration
- **repl_config** –[in] REPL configuration
- **ret_repl** –[out] return REPL handle after initialization succeed, return NULL otherwise

Returns
- ESP_OK on success
- ESP_FAIL Parameter error

esp_err_t esp_console_new_repl_usb_cdc (const esp_console_dev_usb_cdc_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
Establish a console REPL environment over USB CDC.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is a all-in-one function to establish the environment needed for REPL, includes:
Chapter 2. API Reference

- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters

- `dev_config` - [in] USB CDC configuration
- `repl_config` - [in] REPL configuration
- `ret_repl` - [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

```c
esp_err_t esp_console_start_repl (esp_console_repl_t *repl)
```

Start REPL environment.

Note: Once the REPL gets started, it won’t be stopped until the user calls `repl->del(repl)` to destroy the REPL environment.

Parameters `repl` - [in] REPL handle returned from `esp_console_new_repl_xxx`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if `repl` has started already

Structures

```c
struct esp_console_config_t
```

Parameters for console initialization.

Public Members

```c
size_t max_cmdline_length
```

length of command line buffer, in bytes

```c
size_t max_cmdline_args
```

maximum number of command line arguments to parse

```c
int hint_color
```

ASCII color code of hint text.

```c
int hint_bold
```

Set to 1 to print hint text in bold.

```c
struct esp_console_repl_config_t
```

Parameters for console REPL (Read Eval Print Loop)

Public Members

```c
uint32_t max_history_len
```

maximum length for the history
const char *history_save_path
  file path used to save history commands, set to NULL won’t save to file system

uint32_t task_stack_size
  repl task stack size

uint32_t task_priority
  repl task priority

const char *prompt
  prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
  maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
  Parameters for console device: UART.

  **Public Members**

  int channel
    UART channel number (count from zero)

  int baud_rate
    Comunication baud rate.

  int tx_gpio_num
    GPIO number for TX path, -1 means using default one.

  int rx_gpio_num
    GPIO number for RX path, -1 means using default one.

struct esp_console_dev_usb_cdc_config_t
  Parameters for console device: USB CDC.

  **Note:** It’s an empty structure for now, reserved for future

struct esp_console_cmd_t
  Console command description.

  **Public Members**

  const char *command
    Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.
const char *help
Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *hint
Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t func
Pointer to a function which implements the command.

void *argtable
Array or structure of pointers to arg_xxx structures, maybe NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct esp_console_repl_s
Console REPL base structure.

Public Members

esp_err_t (*del)(esp_console_repl_t *repl)
Delete console REPL environment.
Param repl [in] REPL handler returned from esp_console_new_repl_xxx
Return
• ESP_OK on success
• ESP_FAIL on errors

Macros
ESP_CONSOLE_CONFIG_DEFAULT ()
Default console configuration value.
ESP_CONSOLE_REPL_CONFIG_DEFAULT ()
Default console repl configuration value.
ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT ()
ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT ()

Type Definitions
typedef struct linenoiseCompletions linenoiseCompletions
typedef int (*esp_console_cmd_func_t)(int argc, char **argv)
Console command main function.
Param argc number of arguments
Param argv array with arg entries, each pointing to a zero-terminated string argument
Return console command return code, 0 indicates “success”
typedef struct esp_console_repl_s esp_console_repl_t
Type defined for console REPL.
2.10.5 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This section introduces some concepts used by eFuse Manager.

Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool efuse_table_gen.py. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:

- common (esp_efuse_table.csv) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command idf.py efuse-common-table). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by CONFIG_EFUSE_CUSTOM_TABLE) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running idf.py efuse-custom-table.

Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

field_name Name of field. The prefix ESP_EFUSE_ will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of
bits in the field, and expand the field as well (see MAC_FACTORY field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see WR_DIS and RD_DIS in the common table).

efuse_block  Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0.EFUSE_BLK3.

bit_start  Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

bit_count  The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on CONFIG_EFUSE_CODE_SCHEME_SELECTOR, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

comment  This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

<table>
<thead>
<tr>
<th># Factory MAC address #</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 64, 8, Factory MAC addr [1]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 56, 8, Factory MAC addr [2]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 48, 8, Factory MAC addr [3]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 40, 8, Factory MAC addr [4]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 32, 8, Factory MAC addr [5]</td>
</tr>
<tr>
<td>MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address</td>
</tr>
</tbody>
</table>

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

Structured efuse fields

| WR_DIS, EFUSE_BLK0, 0, 32, Write protection |
| WR_DIS.RD_DIS, EFUSE_BLK0, 0, 1, Write protection for.. |
| WR_DIS.FIELD_1, EFUSE_BLK0, 1, 1, Write protection for.. |
| WR_DIS.FIELD_2, EFUSE_BLK0, 2, 4, Write protection for.. |
| WR_DIS.FIELD_2.B1, EFUSE_BLK0, 2, 2, Write protection for.. |
| WR_DIS.FIELD_2.B2, EFUSE_BLK0, 4, 2, Write protection for.. |
| WR_DIS.FIELD_3, EFUSE_BLK0, 5, 1, Write protection for.. |
| WR_DIS.FIELD_3.ALIAS, EFUSE_BLK0, 5, 1, Write protection for.. |
| WR_DIS.FIELD_3 (just a alias for WR_DIS.FIELD_3) |
| WR_DIS.FIELD_4, EFUSE_BLK0, 7, 1, Write protection for.. |

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.
The IDF names for structured efuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by _. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.

The efuse_table_gen tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, 0, 32
```

Solution: Describe SERIAL_NUMBER to be included in USER_DATA. (USER_DATA.SERIAL_NUMBER).

```
Field at FIELD, EFUSE_BLK3, 0, 50 out of range FIELD.MAJOR_NUMBER, EFUSE_BLK3, 0, 60, 32
```

Solution: Change bit_start for FIELD.MAJOR_NUMBER from 60 to 0, so MAJOR_NUMBER is in the FIELD range.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:

```
cd $IDF_PATH/components/efuse/.
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv
```

After generation in the folder $IDF_PATH/components/efuse/esp32 create:

- esp_efuse_table.c file.
- In include folder esp Efuse_table.h file.

To generate a custom files, use the following command idf.py efuse-custom-table or:

```
cd $IDF_PATH/components/efuse/.
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- esp_efuse_custom_table.c file.
- In include folder esp_efuse_custom_table.h file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

**Supported coding scheme**

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.
When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espfuse.py -p PORT summary` command.
- from esptool utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `CONFIG_EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks `esp_efuse_read...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**Note:** If there is already pre-written data in the eFuse block using the 3/4 or Repeat encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
**Chapter 2. API Reference**

- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

**How to add a new field**

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv.

```
Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv.
...
Verifying efuse table...
Max number of bits in BLK 192
```

Sorted efuse table:

```
#  field_name   efuse_block  bit_start  bit_count
 1  WR_DIS_EFUSE_RD_DISABLE  EFUSE_BLK0  0     1
 2  WR_DIS_FLASH_CRYPT_CNT   EFUSE_BLK0  2     1
 3  WR_DIS_BLK1              EFUSE_BLK0  7     1
 4  WR_DIS_BLK2              EFUSE_BLK0  8     1
 5  WR_DIS_BLK3              EFUSE_BLK0  9     1
 6  RD_DIS_BLK1              EFUSE_BLK0  16    1
 7  RD_DIS_BLK2              EFUSE_BLK0  17    1
 8  RD_DIS_BLK3              EFUSE_BLK0  18    1
 9  FLASH_CRYPT_CNT          EFUSE_BLK0  20    7
10  UART_DOWNLOAD_DIS        EFUSE_BLK0  27    1
11  MAC_FACTORY             EFUSE_BLK0  32    8
12  MAC_FACTORY             EFUSE_BLK0  40    8
13  MAC_FACTORY             EFUSE_BLK0  48    8
14  MAC_FACTORY             EFUSE_BLK0  56    8
15  MAC_FACTORY             EFUSE_BLK0  64    8
16  MAC_FACTORY             EFUSE_BLK0  72    8
17  MAC_FACTORY_CRC         EFUSE_BLK0  80    8
18  CHIP_VER_DIS_APP_CPU    EFUSE_BLK0  96    1
19  CHIP_VER_DIS_BT         EFUSE_BLK0  97    1
20  CHIP_VER_PKG            EFUSE_BLK0  98    1
21  CHIP_VER_PKG            EFUSE_BLK0 105    3
22  CHIP_CPU_FREQ_LOW       EFUSE_BLK0 108    1
23  CHIP_CPU_FREQ_RATED     EFUSE_BLK0 109    1
24  CHIP_VER_REV1           EFUSE_BLK0 111    1
25  ADC_VREF_AND_SDIO_DREF  EFUSE_BLK0 136    6
```

**Used bits in efuse table:**

- **EFUSE_BLK0**
  - [0 0] [2 2] [7 9] [16 18] [20 27] [32 87] [96 98] [105 109] [111 111] [136 144]
  - [180 180] [188 191] [194 194] [196 201]

- **EFUSE_BLK1**
  - [0 191]

- **EFUSE_BLK2**
  - [0 191]

- **EFUSE_BLK3**
  - [0 55] [96 159] [184 191]

**Note:** Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif)

### The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the **Structured efuse fields** technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE REV to an existing USER_DATA field. Use . (dot) to show an attachment in a field.

```markdown
- USER_DATA.SERIAL_NUMBER, EFUSE_BLK3, 0, 32,
- USER_DATA.MODEL_NUMBER, EFUSE_BLK3, 32, 10,
- USER_DATA.HARDWARE_REV, EFUSE_BLK3, 42, 10,
```

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check efuse table. To generate source files run efuse_common_table or efuse_custom_table command.

You may get errors such as intersects with or out of range. Please see how to solve them in the **Structured efuse fields** article.
Chapter 2. API Reference

Bit Order

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump
USER_DATA (BLOCK3 ) [3 ] read_regs: 03020100 07060504 0B0A0908...
   --0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4 (BLOCK4 ) [4 ] read_regs: 03020100 07060504 0B0A0908...
   --0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
```

where is the register representation:

- `EFUSE_RD_USR_DATA0_REG = 0x03020100`
- `EFUSE_RD_USR_DATA1_REG = 0x07060504`
- `EFUSE_RD_USR_DATA2_REG = 0x0B0A0908`
- `EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C`
- `EFUSE_RD_USR_DATA4_REG = 0x13121111`
- `EFUSE_RD_USR_DATA5_REG = 0x17161514`
- `EFUSE_RD_USR_DATA6_REG = 0x1B1A1918`
- `EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C`

where is the byte representation:

- `byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] = 0x1F`

For example, csv file describes the `USER_DATA` field, which occupies all 256 bits (a whole block).

```
USER_DATA,        EFUSE_BLK3,  0, 256,  User data
USER_DATA.FIELD1, EFUSE_BLK3, 16, 16,  Field1
ID,               EFUSE_BLK4,  8,  3,   ID bit[0..2]
,                 EFUSE_BLK4, 16,  2,   ID bit[3..4]
,                 EFUSE_BLK4, 32,  3,   ID bit[5..7]
```

Thus, reading the eFuse `USER_DATA` block written as above gives the following results:

```
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first 2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can NOT be used because it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
// [3] [2] [3]
```

(continues on next page)
**uint8_t** id_1 = 0;
```
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

### Debug eFuse & Unit tests

**Virtual eFuses**  The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse` partition. `partition.csv: "efuse_em, data, efuse, , 0x2000,"`. During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

**espefuse.py**  esptool includes a useful tool for reading/writing ESP32 eFuse bits - `espefuse.py`.

Enumerations

```c
enum esp_efuse_block_t
    Type of eFuse blocks for ESP32.

    Values:

    enumerator EFUSE_BLK0
        Number of eFuse block. Reserved.

    enumerator EFUSE_BLK1
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK_KEY0
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK_ENCRYPT_FLASH
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK2
        Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

    enumerator EFUSE_BLK_KEY1
        Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.
```
enumerator **EFUSE_BLK_SECURE_BOOT**
    Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

enumerator **EFUSE_BLK3**
    Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY2**
    Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**
    Type of coding scheme.
    **Values:**

    enumerator **EFUSE_CODING_SCHEME_NONE**
        None

    enumerator **EFUSE_CODING_SCHEME_3_4**
        3/4 coding

    enumerator **EFUSE_CODING_SCHEME_REPEAT**
        Repeat coding

enum **esp_efuse_purpose_t**
    Type of key purpose (virtual because ESP32 has only fixed purposes for blocks)
    **Values:**

    enumerator **ESP_EFUSE_KEY_PURPOSE_USER**
        BLOCK3

    enumerator **ESP_EFUSE_KEY_PURPOSE_SYSTEM**
        BLOCK0

    enumerator **ESP_EFUSE_KEY_PURPOSE_FLASH_ENCRYPTION**
        BLOCK1

    enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_V2**
        BLOCK2

    enumerator **ESP_EFUSE_KEY_PURPOSE_MAX**
        MAX PURPOSE

**Header File**

- components/efuse/include/esp_efuse.h
Functions

`esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)`

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `dst` – [out] A pointer to array that will contain the result of reading.
- `dst_size_bits` – [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])`

Read a single bit eFuse field as a boolean value.

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

**Note:** If assertions are enabled and the parameter is invalid, execution will abort.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

**Returns**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

`esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t *out_cnt)`

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `out_cnt` – [out] A pointer that will contain the number of programmed as “1” bits.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)`
Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in the field structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Parameters
- **field** - [in] A pointer to the structure describing the fields of efuse.
- **src** - [in] A pointer to array that contains the data for writing.
- **src_size_bits** - [in] The number of bits required to write.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

```c
esp_err_t esp_efuse_write_field_cnt (const esp_efuse_desc_t *field[], size_t cnt)
```

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Parameters
- **field** - [in] A pointer to the structure describing the fields of efuse.
- **cnt** - [in] Required number of programmed as “1” bits.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

```c
esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])
```

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Parameters **field** - [in] Pointer to the structure describing the efuse field.

Returns
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

```c
esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)
```

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Parameters **blk** - [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

```c
esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)
```

Sets a read protection for the whole block.
After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**

- **blk** – [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

```c
int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])
```

Returns the number of bits used by field.

**Parameters**

- **field** – [in] A pointer to the structure describing the fields of eFuse.

**Returns**

Returns the number of bits used by field.

```c
uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)
```

Returns value of eFuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- **blk** – [in] Block number of eFuse.
- **num_reg** – [in] The register number in the block.

**Returns**

Value of register

```c
esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
```

Write value to eFuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Parameters**

- **blk** – [in] Block number of eFuse.
- **num_reg** – [in] The register number in the block.
- **val** – [in] Value to write.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

```c
esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme (esp_efuse_block_t blk)
```

Return eFuse coding scheme for blocks.

**Note:** The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Parameters**

- **blk** – [in] Block number of eFuse.

**Returns**

Return eFuse coding scheme for blocks

```c
esp_err_t esp_efuse_read_block (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
```

Read key to eFuse block starting at the offset and the required size.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**
• **blk** –[in] Block number of eFuse.
• **dst_key** –[in] A pointer to array that will contain the result of reading.
• **offset_in_bits** –[in] Start bit in block.
• **size_bits** –[in] The number of bits required to read.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to eFuse block starting at the offset and the required size.

**Parameters**

- **blk** –[in] Block number of eFuse.
- **src_key** –[in] A pointer to array that contains the key for writing.
- **offset_in_bits** –[in] Start bit in block.
- **size_bits** –[in] The number of bits required to write.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits.

```c
uint32_t esp_efuse_get_pkg_ver (void)
```

Returns chip package from eFuse.

**Returns** chip package

```c
void esp_efuse_reset (void)
```

Reset eFuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note:** This function is not threadsafe, if calling code updates eFuse values from multiple tasks then this is caller’s responsibility to serialise.

```c
void esp_efuse_disable_basic_rom_console (void)
```

Disable BASIC ROM Console via eFuse.

By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

Call this function (from bootloader or app) to permanently disable the console on this chip.

```c
esp_err_t esp_efuse_disable_rom_download_mode (void)
```

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Returns**
**Chapter 2. API Reference**

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode.
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written.

```c
esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)
```

Set boot ROM log scheme via eFuse.

**Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

**Parameters**
- `log_scheme` – Supported ROM log scheme

**Returns**
- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme.
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already.

```c
uint32_t esp_efuse_read_secure_version (void)
```

Return secure version from efuse field.

**Returns**
- Secure version from efuse field

```c
bool esp_efuse_check_secure_version (uint32_t secure_version)
```

Check secure version from app and secure_version and from efuse field.

**Parameters**
- `secure_version` – Secure version from app.

**Returns**
- True: If version of app is equal or more then secure_version from efuse.

```c
esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
```

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Parameters**

**Returns**
- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

```c
esp_err_t esp_efuse_batch_write_begin (void)
```

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several eFuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written eFuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

**Note:** If batch mode is enabled by the first task, at this time the second task cannot write/read eFuses. The second task will wait for the first task to complete the batch operation.
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3);  // ESP_EFUSE_1 == 1, here we write a new...
value = 3. The changes will be burn by the commit() function.

... // esp_efuse_batch_write APIs can be called recursively.
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit();  // the burn will be skipped here, it will be...
--- done in the last commit().

...  // Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();

Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns

• ESP_OK: Successful.

esp_err_t esp_efuse_batch_write_cancel (void)
Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Returns

• ESP_OK: Successful.
• ESP_ERR_INVALID_STATE: Tha batch mode was not set.

esp_err_t esp_efuse_batch_write_commit (void)
Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns

• ESP_OK: Successful.
• ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

bool esp_efuse_block_is_empty (esp_efuse_block_t block)
Checks that the given block is empty.

Returns

• True: The block is empty.
• False: The block is not empty or was an error.
bool esp_efuse_get_key_dis_read(esp_efuse_block_t block)
    Returns a read protection for the key block.
    Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
    Returns True: The key block is read protected False: The key block is readable.

esp_err_t esp_efuse_set_key_dis_read(esp_efuse_block_t block)
    Sets a read protection for the key block.
    Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
    Returns
    • ESP_OK: Successful.
    • ESP_ERR_INVALID_ARG: Error in the passed arguments.
    • ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
    • ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_get_key_dis_write(esp_efuse_block_t block)
    Returns a write protection for the key block.
    Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
    Returns True: The key block is write protected False: The key block is writeable.

esp_err_t esp_efuse_set_key_dis_write(esp_efuse_block_t block)
    Sets a write protection for the key block.
    Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
    Returns
    • ESP_OK: Successful.
    • ESP_ERR_INVALID_ARG: Error in the passed arguments.
    • ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
    • ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_key_block_unused(esp_efuse_block_t block)
    Returns true if the key block is unused, false otherwise.
    An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)
    Parameters block [in] key block to check.
    Returns
    • True if key block is unused,
    • False if key block is used or the specified block index is not a key block.

bool esp_efuse_find_purpose(esp_efuse_purpose_t purpose, esp_efuse_block_t *block)
    Find a key block with the particular purpose set.
    Parameters
    • purpose [in] Purpose to search for.
    • block [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.
    Returns
    • True: If found,
    • False: If not found (value at block pointer is unchanged).

bool esp_efuse_get_keypurpose_dis_write(esp_efuse_block_t block)
    Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.
**Parameters**

- **block** - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**

- True: The key purpose is write protected.
- False: The key purpose is writeable.

**esp_efuse_get_key_purpose** *(esp_efuse_block_t block)*

Returns the current purpose set for an efuse key block.

**Parameters**

- **block** - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

**esp_efuse_write_key** *(esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key, size_t key_size_bytes)*

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

**Parameters**

- **block** - [in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- **purpose** - [in] Purpose to set for this key. Purpose must be already unset.
- **key** - [in] Pointer to data to write.
- **key_size_bytes** - [in] Bytes length of data to write.

**Returns**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**esp_efuse_write_keys** *(const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)*

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

**Parameters**

- **purposes** - [in] Array of purposes (purpose[number_of_keys]).
- **keys** - [in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- **number_of_keys** - [in] The number of keys to write (up to 6 keys).

**Returns**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**esp_efuse_check_errors** *(void)*

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

**Note:** Refers to ESP32-C3 only.
Chapter 2. API Reference

Returns

- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

Structures

struct esp_efuse_desc_t

Type definition for an eFuse field.

Public Members

esp_efuse_block_t efuse_block
Block of eFuse

uint8_t bit_start
Start bit [0..255]

uint16_t bit_count
Length of bit field [1-]

Macros

ESP_ERR_EFUSE
Base error code for efuse api.

ESP_OK_EFUSE_CNT
OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL
Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG
Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING
Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

Enumerations

enum esp_efuse_rom_log_scheme_t
Type definition for ROM log scheme.

Values:
enumerator ESP_EFUSE_ROM_LOG_ALWAYS_ON
   Always enable ROM logging

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
   ROM logging is enabled when specific GPIO level is low during startup

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
   ROM logging is enabled when specific GPIO level is high during startup

enumerator ESP_EFUSE_ROM_LOG_ALWAYS_OFF
   Disable ROM logging permanently

### 2.10.6 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see *Error Handling*.

For the full list of error codes defined in ESP-IDF, see *Error Code Reference*.

**API Reference**

**Header File**

- components/esp_common/include/esp_check.h

**Macros**

**ESP_RETURN_ON_ERROR**(x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension \#__VA_ARGS___. The second one is using the C++20 feature VA_OPT(.). This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using \#__VA_ARGS___. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

**ESP_RETURN_ON_ERROR_ISR**(x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

**ESP_GOTO_ON_ERROR**(x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

**ESP_GOTO_ON_ERROR_ISR**(x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

**ESP_RETURN_ON_FALSE**(a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

**ESP_RETURN_ON_FALSE_ISR**(a, err_code, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

**ESP_GOTO_ON_FALSE**(a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.
ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File
- components/esp_common/include/esp_err.h

Functions
const char *esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.
This function finds the error code in a pre-generated lookup-table and returns its string representation.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time
an esp_err_t error is modified, created or removed from the IDF project.

Parameters code – esp_err_t error code

Returns string error message

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)
Returns string for esp_err_t and system error codes.
This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string
representation. If the error code is not found then it is attempted to be found among system errors.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time
an esp_err_t error is modified, created or removed from the IDF project.

Parameters
- code – esp_err_t error code
- buf – [out] buffer where the error message should be written
- buflen – Size of buffer buf. At most buflen bytes are written into the buf buffer (including
the terminating null byte).

Returns buf containing the string error message

Macros
ESP_OK
esp_err_t value indicating success (no error)

ESP_FAIL
Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM
Out of memory

ESP_ERR_INVALID_ARG
Invalid argument

ESP_ERR_INVALID_STATE
Invalid state

ESP_ERR_INVALID_SIZE
Invalid size

ESP_ERR_NOT_FOUND
Requested resource not found
Chapter 2. API Reference

ESP_ERR_NOT_SUPPORTED
    Operation or feature not supported

ESP_ERR_TIMEOUT
    Operation timed out

ESP_ERR_INVALID_RESPONSE
    Received response was invalid

ESP_ERR_INVALID_CRC
    CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
    Version was invalid

ESP_ERR_INVALID_MAC
    MAC address was invalid

ESP_ERR_NOT_FINISHED
    There are items remained to retrieve

ESP_ERR_WIFI_BASE
    Starting number of WiFi error codes

ESP_ERR_MESH_BASE
    Starting number of MESH error codes

ESP_ERR_FLASH_BASE
    Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
    Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
    Starting number of Memory Protection API error codes

ESP_ERROR_CHECK (x)
    Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK.
    Prints the error code, error location, and the failed statement to serial output.
    Disabled if assertions are disabled.

ESP_ERROR_CHECK WITHOUT_ABORT (x)
    Macro which can be used to check the error code. Prints the error code, error location, and the failed statement
to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t
terminating the program.

Type Definitions

typedef int esp_err_t
2.10.7 ESP HTTPS OTA

Overview

`esp_https_ota` provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Server Verification

Please refer to `ESP-TLS: TLS Server Verification` for more information on server verification. The root certificate (in PEM format) needs to be provided to the `esp_http_client_config_t::cert_pem` member.

**Note:** The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason being that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the ESP x509 Certificate Bundle feature for verification, which covers most of the trusted root certificates (using the `esp_http_client_config_t::crt_bundle_attach` member).

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIGMBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using `partial_http_download` with `max_http_request_size` of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.
Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure boot

Advanced APIs

esp_https_ota also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS OTA APIs: system/ota/advanced_https_ota.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable CONFIG_ESP_HTTPS_OTA_DECRYPT_CB in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: system/ota/pre_encrypted_ota.

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

esp_err_t esp_https_ota (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation.

This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of ota_config->http_config.

Note: This API handles the entire OTA operation, so if this API is being used then no other APIs from esp_https_ota component should be called. If more information and control is needed during the HTTPS OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

Parameters

ota_config – [in] pointer to esp_https_ota_config_t structure.

Returns

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

esp_err_t esp_https_ota_begin (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then esp_https_ota_perform should be called to continue with the OTA process and there should be a call to esp_https_ota_finish on completion.
Chapter 2. API Reference

of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of http_config, which is a part of ota_config. In case of error, this API explicitly sets handle to NULL.

Note: This API is blocking, so setting is_async member of http_config structure will result in an error.

Parameters
- ota_config - [in] pointer to esp_https_ota_config_t structure
- handle - [out] pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

Returns
- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

```c
esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)
```

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Parameters https_ota_handle - [in] pointer to esp_https_ota_handle_t structure

Returns
- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_HTTPS_OTA_VALIDATE_FAILED: Invalid chip revision in image header
- ESP_ERR_HTTPS_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

```c
bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)
```

Checks if complete data was received or not.

Note: This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

Parameters https_ota_handle - [in] pointer to esp_https_ota_handle_t structure

Returns
- false
- true

```c
esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.
**Note:** If this API returns successfully, esp_restart() must be called to boot from the new firmware image. esp_https_ota_finish should not be called after calling esp_https_ota_abort.

### Parameters
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

### Returns
- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

### esp_err_t esp_https_ota_abort (esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note:** esp_https_ota_abort should not be called after calling esp_https_ota_finish.

### Parameters
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

### Returns
- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

### esp_err_t esp_https_ota_get_img_desc (esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note:** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

### Parameters
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure
- **new_app_info** - [out] pointer to an allocated esp_app_desc_t structure

### Returns
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

### int esp_https_ota_get_image_len_read (esp_https_ota_handle_t https_ota_handle)

This function returns OTA image data read so far.

**Note:** This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

### Parameters
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

### Returns
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor
Chapter 2. API Reference

• -1 On failure
• total bytes read so far

int **esp_https_ota_get_image_size** *(esp_https_ota_handle_t https_ota_handle)*

This function returns OTA image total size.

**Note:** This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

**Parameters**

https_ota_handle  -[in] pointer to esp_https_ota_handle_t structure

**Returns**

• -1 On failure or chunked encoding
• total bytes of image

**Structures**

struct *esp_https_ota_config_t*

ESP HTTPS OTA configuration.

**Public Members**

const *esp_http_client_config_t* **http_config**

ESP HTTP client configuration

*http_client_init_cb_t** **http_client_init_cb**

Callback after ESP HTTP client is initialised

bool **bulk_flash_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial_http_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max_http_request_size**

Maximum request size for partial HTTP download

**Macros**

ESP_ERR_HTTPS_OTA_BASE

ESP_ERR_HTTPS_OTA_IN_PROGRESS

**Type Definitions**

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)
2.10.8 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers—code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that here.
4. Event sources post an event to the loop using `esp_event_post_to()`. 
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data) {
    // Event handler logic
}

void app_main() {
    // 2. A configuration structure of type esp_event_loop_args_t is needed to specify the properties of the loop to be created. A handle of type esp_event_loop_handle_t is obtained, which is needed by the other APIs to reference the loop // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ..., ...
    };
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
    ...
}
```

(continues on next page)
Declaring and defining events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```c
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```c
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:
**Chapter 2. API Reference**

```c
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

### Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

### Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. `ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```
If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.

**Handler Registration and Handler Dispatch Order**  
The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the esp_event library can be found in system/esp_event. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt esp_event library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- components/esp_event/include/esp_event.h

**Functions**

```c
esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args,
                                esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

**Parameters**

- `event_loop_args` - [in] configuration structure for the event loop to create
- `event_loop` - [out] handle to the created event loop

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail
**esp_err_t esp_event_loop_delete** *(esp_event_loop_handle_t event_loop)*

Delete an existing event loop.

**Parameters**
- `event_loop` - [in] event loop to delete, must not be NULL

**Returns**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_create_default** *(void)*

Create default event loop.

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete_default** *(void)*

Delete the default event loop.

**Returns**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_run** *(esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)*

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Parameters**
- `event_loop` - [in] event loop to dispatch posted events from, must not be NULL
- `ticks_to_run` - [in] number of ticks to run the loop

**Returns**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_handler_register** *(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)*

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.
Chapter 2. API Reference

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note:** This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_register() instead.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### Parameters

- **event_base** - [in] the base ID of the event to register the handler for
- **event_id** - [in] the ID of the event to register the handler for
- **event_handler** - [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** - [in] data, aside from event data, that is passed to the handler when it is called

### Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

**Note:** This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_register_with() instead.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### Parameters

- **event_loop** - [in] the event loop to register this handler function to, must not be NULL
- **event_base** - [in] the base ID of the event to register the handler for
- **event_id** - [in] the ID of the event to register the handler for
- **event_handler** - [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** - [in] data, aside from event data, that is passed to the handler when it is called

### Returns
Chapter 2. API Reference

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
    esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler,
    void *event_handler_arg, esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Parameters**
- `event_loop` - [in] the event loop to register this handler function to, must not be NULL
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called
- `instance` - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,
    esp_event_handler_t event_handler, void *event_handler_arg,
    esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.
This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### Parameters
- **event_base** [in] the base ID of the event to register the handler for
- **event_id** [in] the ID of the event to register the handler for
- **event_handler** [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** [in] data, aside from event data, that is passed to the handler when it is called
- **instance** [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

### Returns
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```c
esp_err_t esp_event_handler_unregister (esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_register() when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

**Note:** This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister() instead.

**Note:** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

### Parameters
- **event_base** [in] the base of the event with which to unregister the handler
- **event_id** [in] the ID of the event with which to unregister the handler
- **event_handler** [in] the handler to unregister

### Returns
- ESP_OK success
- ESP_ERR_INVALID_ARG invalid combination of event base and event ID
- Others fail
\texttt{esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)}

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as \texttt{esp_event_handler_unregister}, except the additional specification of the event loop to unregister the handler with.

**Note:** This function is obsolete and will be deprecated soon, please use \texttt{esp_event_handler_instance_unregister_with()} instead.

**Parameters**

- \texttt{event_loop} \hspace{1em} \texttt{[in]} the event loop with which to unregister this handler function, must not be NULL
- \texttt{event_base} \hspace{1em} \texttt{[in]} the base of the event with which to unregister the handler
- \texttt{event_id} \hspace{1em} \texttt{[in]} the ID of the event with which to unregister the handler
- \texttt{event_handler} \hspace{1em} \texttt{[in]} the handler to unregister

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

\texttt{esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)}

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to \texttt{esp_event_handler_instance_register()} when that handler instance was registered. Passing ESP\_EVENT\_ANY\_BASE and/or ESP\_EVENT\_ANY\_ID will only unregister handler instances that were registered with the same wildcard arguments.

**Note:** When using ESP\_EVENT\_ANY\_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP\_EVENT\_ANY\_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Parameters**

- \texttt{event_loop} \hspace{1em} \texttt{[in]} the event loop with which to unregister this handler function, must not be NULL
- \texttt{event_base} \hspace{1em} \texttt{[in]} the base of the event with which to unregister the handler
- \texttt{event_id} \hspace{1em} \texttt{[in]} the ID of the event with which to unregister the handler
- \texttt{instance} \hspace{1em} \texttt{[in]} the instance object of the registration to be unregistered

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

\texttt{esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)}

Unregister a handler from the system event loop.
This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

**Parameters**
- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `instance` [in] the instance object of the registration to be unregistered

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**Parameters**
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `ticks_to_wait` [in] number of ticks to block on a full event queue

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of `event_data` and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Parameters**
- `event_loop` [in] the event loop to post to, must not be NULL
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `ticks_to_wait` [in] number of ticks to block on a full event queue

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post for posting events from interrupt handlers.
Note: this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Parameters
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
- **event_data** [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** [in] the size of the event data; max is 4 bytes
- **task_unblocked** [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns
- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_isr_post_to (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post_to for posting events from interrupt handlers.

Note: this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Parameters
- **event_loop** [in] the event loop to post to, must not be NULL
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
- **event_data** [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** [in] the size of the event data
- **task_unblocked** [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns
- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_dump (FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:
event loop
    handler
    handler
    ...

where:

    event loop
    format: address, name rx:total_received dr:total_dropped
    where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue...
    - being full

handler
    format: address ev:base, id inv:total_invoked run:total_runtime
    where:
    address - address of the handler function
    base, id - the event specified by event base and ID this handler...
    - executes
    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Parameters file [in] the file stream to output to
Returns
  • ESP_OK: Success
  • ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
  • Others: Fail

Structures

struct esp_event_loop_args_t
    Configuration for creating event loops.

Public Members

int32_t queue_size
    size of the event loop queue

const char *task_name
    name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
    priority of the event loop task, ignored if task name is NULL
uint32_t task_stack_size
    stack size of the event loop task, ignored if task name is NULL

BaseType_t task_core_id
    core to which the event loop task is pinned to, ignored if task name is NULL

Header File

- components/esp_event/include/esp_event_base.h

Macros

ESP_EVENT_DECLARE_BASE (id)
ESP_EVENT_DEFINE_BASE (id)

ESP_EVENT_ANY_BASE
    register handler for any event base

ESP_EVENT_ANY_ID
    register handler for any event id

Type Definitions

typedef void *esp_event_loop_handle_t
    a number that identifies an event with respect to a base

typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
    function called when an event is posted to the queue

typedef void *esp_event_handler_instance_t
    context identifying an instance of a registered event handler

Related Documents

2.10.9 FreeRTOS

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Note: ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

- For more information about the SMP changes of ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS (SMP)
- For more information about the features added to ESP-IDF FreeRTOS, see FreeRTOS Supplemental Features.
Configuration

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various `#define config...` macros to `FreeRTOSConfig.h`. Through these macros, the kernel’s scheduling behavior and various kernel features can be enabled or disabled. However, in ESP-IDF FreeRTOS, the `FreeRTOSConfig.h` file is considered a private and must not be modified by users. Any FreeRTOS configuration that is exposed to the user will be done so via menuconfig.

ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see Project Configuration.

- `CONFIG_FREERTOS_UNICORE` will run ESP-IDF FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Futhermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core. Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION` will trigger a halt in functions in ESP-IDF FreeRTOS that have not been fully tested in an SMP context.
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER` will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e., does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

ESP-IDF FreeRTOS Applications

Unlike Vanilla FreeRTOS, users must not call `vTaskStartScheduler()`. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined `void app_main(void)` function.

- Typically, users would spawn the rest of their applications task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

The `main` task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Affinity</th>
<th>Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Task (main)</td>
<td>CPU0</td>
<td>1</td>
<td>Task that simply calls <code>app_main</code>. This task will self delete when <code>app_main</code> returns</td>
</tr>
<tr>
<td>Idle Tasks (IDLEX)</td>
<td>CPU0 and CPU1</td>
<td>0</td>
<td>Idle tasks created for (and pinned to) each CPU</td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>CPU0 and CPU1</td>
<td>24</td>
<td>IPC tasks created for (and pinned to) each CPU. IPC tasks are used to implement the IPC feature. See Inter-Processor Call for more details.</td>
</tr>
</tbody>
</table>

Task API

Header File

```
- components/freertos/FreeRTOS-Kernel/include/freertos/task.h
```

Functions
BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pvCreatedTask** - Used to pass back a handle by which the created task can be referenced.
- **xCoreID** - If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline BaseType_t xTaskCreate(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
```

(continues on next page)
static uint8_t ucParameterToPass;
TaskHandle_t xHandle = NULL;

// Create the task, storing the handle. Note that the passed parameter...
// ucParameterToPass
// must exist for the lifetime of the task, so in this case is declared...
// static. If it was just an
// an automatic stack variable it might no longer exist, or at least have...
// been corrupted, by the time
// the new task attempts to access it.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
// PRIORITY, &xHandle );
configASSERT( xHandle );

// Use the handle to delete the task.
if( xHandle != NULL )
{
    vTaskDelete( xHandle );
}

Note: If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**TaskHandle_t xTaskCreateStaticPinnedToCore** (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
• **ulStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
• **pvParameters** - Pointer that will be used as the parameter for the task being created.
• **uxPriority** - The priority at which the task will run.
• **pxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
• **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
• **xCoreID** - If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

**Returns** If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

```c
static inline TaskHandle_t xTaskCreateStatic( TaskFunction_t pvTaskCode, const char* const pcName, const uint32_t ulStackDepth, void* const pvParameters, UBaseType_t uxPriority, StackType_t* const puxStackBuffer, StaticTask_t* const pxTaskBuffer )
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

**Example usage:**

```c
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}
```

(continues on next page)
// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( 
        vTaskCode, // Function that implements the task.
        "NAME",   // Text name for the task.
        STACK_SIZE, // Stack size in bytes, not words.
        &xTaskBuffer // Variable to hold the task's data
    ); // Function that creates a task.

    vTaskSuspend( xHandle );
}

Note: If program uses thread local variables (ones specified with ”__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters
- pvTaskCode – Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName – A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth – The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters – Pointer that will be used as the parameter for the task being created.
- uxPriority – The priority at which the task will run.
- puxStackBuffer – Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer – Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

Returns
If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

BaseType_t xTaskCreateRestricted(const TaskParameters_t *const pxTaskDefinition, TaskHandle_t *pxCreatedTask)

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.
return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.

static const TaskParameters_t xCheckTaskParameters =
{
    vATask,  // pvTaskCode - the function that implements the task.
    "ATask",  // pcName - just a text name for the task to assist debugging.
    100,  // usStackDepth - the stack size DEFINED IN WORDS.
    NULL,  // pvParameters - passed into the task function as the function parameters.
    1UL | portPRIVILEGE_BIT,  // uxPriority - task priority, set the portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer,  // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by the task, with appropriate access permissions. Different processors have different memory alignment requirements - refer to the FreeRTOS documentation for full information.
    [
        { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
        { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_WRITE }
    ]
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle is requested (the second parameter is not NULL) but in this case just for demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle and/or timer task.
    for( ;; );
}
```

**Parameters**

- `pxTaskDefinition` - Pointer to a structure that contains a member for each of the normal `xTaskCreate()` parameters (see the `xTaskCreate()` API documentation) plus an optional stack buffer and the memory region definitions.
- `pxCreatedTask` - Used to pass back a handle by which the created task can be referenced.

**Return values**

- pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the projdefs.h file.

---

**void vTaskAllocateMPURegions** *(TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)*

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

`xTaskCreateRestrictedStatic()` should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreateRestricted()` then the stack is provided by the application writer, and the memory used to hold the
task’s data structure is automatically dynamically allocated inside the `xTaskCreateRestricted()` function. If a task is created using `xTaskCreateRestrictedStatic()` then the application writer must provide the memory used to hold the task’s data structures too. `xTaskCreateRestrictedStatic()` therefore allows a memory protected task to be created without using any dynamic memory allocation.

return `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`.

Example usage:

```c
// Create an `TaskParameters_t` structure that defines the task to be created. // The `StaticTask_t` variable is only included in the structure when // `configSUPPORT_STATIC_ALLOCATION` is set to 1. The `PRIVILEGED_DATA` macro can // be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,  // `pvTaskCode` - the function that implements the task.
    "ATask", // `pcName` - just a text name for the task to assist debugging.
    100, // `usStackDepth` - the stack size DEFINED IN BYTES.
    NULL, // `pvParameters` - passed into the task function as the function parameters.
    1UL | portPRIVILEGE_BIT, // `uxPriority` - task priority, set the portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // `puxStackBuffer` - the buffer to be used as the task stack.
    { // `xRegions` - Allocate up to three separate memory regions for access by // the task, with appropriate access permissions. Different processors have // different memory alignment requirements - refer to the FreeRTOS documentation // for full information.
        { // Base address Length Parameters
            cReadWriteArray, 32, portMPU_REGION_READ_WRITE ,
            cReadOnlyArray, 32, portMPU_REGION_READ_ONLY ,
            cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_WRITE
        }
    }
};

// Holds the task's data structure.

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle is requested (the second parameter is not NULL) but in this case just for demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle and/or timer task.
    for( ;; );
}
```

Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.
Example usage:

```c
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[portNUM_CONFIGURABLE_REGIONS] = {
    // Base address Length Parameters
    { ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
    { 0, 0, 0 },
    { 0, 0, 0 }
};

void vATask(void *pvParameters) {

    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}
```

Parameters

- **pxTaskDefinition** — Pointer to a structure that contains a member for each of
  the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus
  an optional stack buffer and the memory region definitions. If configSUP-
  PORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member,
  which is used to point to a variable of type StaticTask_t - which is then used to hold the
  task’s data structure.

- **pxCreatedTask** — Used to pass back a handle by which the created task can be refer-
  enced.

- **xTask** — The handle of the task being updated.

- **pxRegions** — A pointer to an MemoryRegion_t structure that contains the new memory
  region definitions.

```c
void vTaskDelete(TaskHandle_t xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section
for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from
all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted.
It is therefore important that the idle task is not starved of microcontroller processing time if your application
makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should
be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:
# Chapter 2. API Reference

```c
void vOtherFunction( void )
{
  TaskHandle_t xHandle;

  // Create the task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

  // Use the handle to delete the task.
  vTaskDelete( xHandle );
}
```

**Parameters**

- **xTaskToDelete** — The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

```c
void vTaskDelay( const TickType_t xTicksToDelay )
```

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

**INCLUDE_vTaskDelay** must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

**Example usage:**

```c
void vTaskFunction( void * pvParameters )
{
  // Block for 500ms.
  const TickType_t xDelay = 500 / portTICK_PERIOD_MS;
  for( ;; )
  {
    // Simply toggle the LED every 500ms, blocking between each toggle.
    vToggleLED();
    vTaskDelay( xDelay );
  }
}
```

**Parameters**

- **xTicksToDelay** — The amount of time, in tick periods, that the calling task should block.

```c
BaseType_t xTaskDelayUntil( TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement )
```

**INCLUDE_xTaskDelayUntil** must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay () in one important aspect: vTaskDelay () will cause a task to block for the specified number of ticks from the time vTaskDelay () is called. It is therefore difficult to use vTaskDelay
Chapter 2. API Reference

() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay () may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay () specifies a wake time relative to the time at which the function is called, xTaskDelayUntil () specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
  TickType_t xLastWakeTime;
  const TickType_t xFrequency = 10;
  BaseType_t xWasDelayed;

  // Initialise the xLastWakeTime variable with the current time.
  xLastWakeTime = xTaskGetTickCount();
  for( ;; )
  {
    // Wait for the next cycle.
    xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

    // Perform action here. xWasDelayed value can be used to determine 
    // whether a deadline was missed if the code here took too long.
  }
}
```

Parameters

- **pxPreviousWakeTime** – Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil ()
- **xTimeIncrement** – The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task way delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

BaseType_t xTaskAbortDelay( TaskHandle_t xTask )

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

Parameters **xTask** – The handle of the task to remove from the Blocked state.

Returns If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.
Chapter 2. API Reference

UBaseType_t uxTaskPriorityGet (const TaskHandle_t xTask)

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed // it itself.
    if ( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed its priority.
    }

    // ...

    // Is our priority higher than the created task?
    if ( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Parameters**

**xTask** – Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Returns**

The priority of xTask.

UBaseType_t uxTaskPriorityGetFromISR (const TaskHandle_t xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState eTaskGetState (TaskHandle_t xTask)

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**Parameters**

**xTask** – Handle of the task to be queried.

**Returns**

The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void vTaskGetInfo (TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.
Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE,  // Include the high water mark in xTaskDetails.
                  eInvalid); // Include the task state in xTaskDetails.
}
```

**Parameters**

- **xTask** – Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** – A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** – The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** – The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

**void vTaskPrioritySet (TaskHandle_t xTask, UBaseType_t uxNewPriority)**

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_~);

    // ...

    // Use the handle to raise the priority of the created task.
}
```
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

// ...

// Use a NULL handle to raise our priority to the same value.
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}

Parameters

- **xTask** – Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** – The priority to which the task will be set.

```c
void vTaskSuspend( TaskHandle_t xTaskToSuspend )

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:
```n
```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).
    // ...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

Parameters **xTaskToSuspend** – Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

```c
void vTaskResume( TaskHandle_t xTaskToResume )

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.
```
Resumes a suspended task.
A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ()

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle-->
    
    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //....

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

**Parameters**

**xTaskToResume** – Handle to the task being readied.

**BaseType_t xTaskResumeFromISR ( TaskHandle_t xTaskToResume )**

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ()

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Parameters**

**xTaskToResume** – Handle to the task being readied.

**Returns**

pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

**void vTaskStartScheduler ( void )**

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

NOTE: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.
Example usage:

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();

    // Will not get here unless a task calls vTaskEndScheduler()
}
```

```c
void vTaskEndScheduler( void )

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements
this function.

 Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either pre-
emptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was
called, as if vTaskStartScheduler () had just returned.

 See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler
().

 vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler
() in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

 vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free
resources allocated by application tasks.

 Example usage:

```c
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler();
    }
}
```

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();

    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}
```

```c
void vTaskSuspendAll( void )

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is
suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out
until a call to xTaskResumeAll () has been made.
API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for(;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}
```

BaseType_t xTaskResumeAll (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    for(;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
```

(continues on next page)
// During this time interrupts will still operate and the real
// time kernel tick count will be maintained.

// ...

// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if ( !xTaskResumeAll () )
{
    taskYIELD ();
}

Returns: If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise
pdFALSE is returned.

TickType_t xTaskGetTickCount (void)

Returns: The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Returns: The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

Returns: The number of tasks that the real time kernel is currently managing. This includes all
ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle
task will also be included in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)

Returns: The text (human readable) name of the task referenced by the handle xTaskToQuery. A
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Returns: The handle of the task that has the human readable name pcNameToQuery. NULL
is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in
FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.
Parameters **xTask** – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

```c
configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2(TaskHandle_t xTask)
```

Returns the start of the stack associated with xTask.

INCLUDE _uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters **xTask** – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

```c
uint8_t* pxTaskGetStackStart(TaskHandle_t xTask)
```

Returns the start of the stack associated with xTask.

INCLUDE _pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

Parameters **xTask** – Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

Returns A pointer to the start of the stack.

```c
void vTaskSetApplicationTaskTag(TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)
```

Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters
- **xTask** – Handle of the task to set the hook function for. Passing xTask as NULL has the effect of setting the calling tasks hook function.
- **pxHookFunction** – Pointer to the hook function.

```c
TaskHookFunction_t xTaskGetApplicationTaskTag(TaskHandle_t xTask)
```

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

```c
TaskHookFunction_t xTaskGetApplicationTaskTagFromISR(TaskHandle_t xTask)
```

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

```c
void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
```

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters
- **xTaskToSet** – Task to set thread local storage pointer for
- **xIndex** – The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** – Pointer value to set.
void *pvTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)
Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters
• xTaskToQuery - Task to get thread local storage pointer for
• xIndex - The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

Returns Pointer value

void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet,
BaseType_t xIndex, void *pvValue,
TlsDeleteCallbackFunction_t pvDelCallback)
Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters
• xTaskToSet - Task to set thread local storage pointer for
• xIndex - The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue - Pointer value to set.
• pvDelCallback - Function to call to dispose of the local storage pointer when the task is deleted.

void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)
This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters
• ppxIdleTaskTCBBuffer - A handle to a statically allocated TCB buffer
• ppxIdleTaskStackBuffer - A handle to a statically allocated Stack buffer for the idle task
• pulIdleTaskStackSize - A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)
Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters
• xTask - Handle of the task to call the hook for.
• pvParameter - Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle (void)
xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.
Simply returns the handle of the idle task. It is not valid to call \texttt{xTaskGetIdleTaskHandle()} before the scheduler has been started.

\begin{verbatim}
UBaseType_t uxTaskGetSystemState(TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for \texttt{uxTaskGetSystemState()} to be available.

\texttt{uxTaskGetSystemState()} populates a \texttt{TaskStatus_t} structure for each task in the system. \texttt{TaskStatus_t} structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the \texttt{TaskStatus_t} structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.
\end{verbatim}

Example usage:

\begin{verbatim}
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by \texttt{uxTaskGetSystemState()}.  
// The human readable table is written to \texttt{pcWriteBuffer}

void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a \texttt{TaskStatus_t} structure for each task.  An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the \texttt{pxTaskStatusArray} array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // \texttt{ulTotalRunTimeDiv100} has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter / ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
            }
        }
    }
}\end{verbatim}
vTaskList( char *pcWriteBuffer )

List all the current tasks.

cfgUSE_TRACE_FACILITY and cfgUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

Parameters

• **pxTaskStatusArray** - A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.

• **uxArraySize** - The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.

• **pulTotalRunTime** - If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see [https://www.FreeRTOS.org/RTOS-run-time-stats.html](https://www.FreeRTOS.org/RTOS-run-time-stats.html)) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

Returns

The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberofTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.
Chapter 2. API Reference

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file `printf-stdarg.c` (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters**

`pcWriteBuffer` – A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)
```

Get the state of running tasks as a string

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**NOTE 2:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file `printf-stdarg.c` (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**Parameters**

`pcWriteBuffer` – A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
uint32_t ulTaskGetIdleRunTimeCounter (void)
```

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.
Returns The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

cfgUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

Parameters
• **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle.

• **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.

• **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.

• **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - **eSetBits** - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.
  - **eIncrement** - The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
Chapter 2. API Reference

eSetValueWithOverwrite - The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Parameters

- uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- ulValue – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- eAction – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - pulPreviousNotificationValue -- Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.
  - pxHigherPriorityTaskWoked – xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoked to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

Returns

Dependent on the value of eAction. See the description of the eAction parameter.

BaseType_t xTaskGenericNotifyWait (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct task notification to be pending at a given index within an array of direct task notifications.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The
task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyWait()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyWait()` is equivalent to calling `xTaskNotifyWaitIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

**Parameters**

- **`uxIndexToWaitOn`** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyWait()` does not have this parameter and always waits for notifications on index 0.
- **`ulBitsToClearOnEntry`** – Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `U_LONG_MAX` (if `limits.h` is included) or `0xffffffff` (if `limits.h` is not included) will have the effect of resetting the task’s notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task’s notification value unchanged.
- **`ulBitsToClearOnExit`** – If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task’s notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task’s notification value (note `pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `U_LONG_MAX` (if `limits.h` is included) or `0xffffffff` (if `limits.h` is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task’s notification value).
- **`pulNotificationValue`** – Used to pass the task’s notification value out of the function. Note the value passed out will not be affected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **`xTicksToWait`** – The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns**

If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

```c
void vTaskGenericNotifyGiveFromISR(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken);
```

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.
A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

**Parameters**

- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** - vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskGenericNotifyTake ( UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().
When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTake Indexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWait Indexed() will return when a notification is pending, ulTaskNotifyTake Indexed() will return when the task’s notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTake Indexed() with the uxIndexToWaitOn parameter set to 0.

Parameters

• uxIndexToWaitOn – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.

•xClearCountOnExit – If xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

• xTicksToWait – The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

BaseType_t xTaskGenericNotifyStateClear (TaskHandle_t xTask, UBaseType_t uxIndexToClear)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClear Indexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible.
by always operating on the notification value at index 0 within the array. Calling \texttt{xTaskNotifyStateClear()} is equivalent to calling \texttt{xTaskNotifyStateClearIndexed()} with the \texttt{uxIndexToNotify} parameter set to 0.

**Parameters**

- **\texttt{xTask}** – The handle of the RTOS task that will have a notification state cleared. Set \texttt{xTask} to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using \texttt{xTaskCreate()} and make use of the \texttt{pxCreatedTask} parameter, or create the task using \texttt{xTaskCreateStatic()} and store the returned value, or use the task’s name in a call to \texttt{xTaskGetHandle}().

- **\texttt{uxIndexToClear}** – The index within the target task’s array of notification values to act upon. For example, setting \texttt{uxIndexToClear} to 1 will clear the state of the notification at index 1 within the array. \texttt{uxIndexToClear} must be less than \texttt{configTASK_NOTIFICATION_ARRAY_ENTRIES}. \texttt{ulTaskNotifyStateClear()} does not have this parameter and always acts on the notification at index 0.

**Returns** pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

\begin{verbatim}
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

\end{verbatim}

\texttt{configUSE_TASK_NOTIFICATIONS} must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (\texttt{uint32_t}). The constant \texttt{configTASK_NOTIFICATION_ARRAY_ENTRIES} sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

\texttt{ulTaskNotifyValueClearIndexed()} clears the bits specified by the \texttt{ulBitsToClear} bit mask in the notification value at array index \texttt{uxIndexToClear} of the task referenced by \texttt{xTask}.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. \texttt{ulTaskNotifyValueClear()} is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling \texttt{ulTaskNotifyValueClear()} is equivalent to calling \texttt{ulTaskNotifyValueClearIndexed()} with the \texttt{uxIndexToClear} parameter set to 0.

**Parameters**

- **\texttt{xTask}** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set \texttt{xTask} to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using \texttt{xTaskCreate()} and make use of the \texttt{pxCreatedTask} parameter, or create the task using \texttt{xTaskCreateStatic()} and store the returned value, or use the task’s name in a call to \texttt{xTaskGetHandle}().

- **\texttt{uxIndexToClear}** – The index within the target task’s array of notification values in which to clear the bits. \texttt{uxIndexToClear} must be less than \texttt{configTASK_NOTIFICATION_ARRAY_ENTRIES}. \texttt{ulTaskNotifyValueClear()} does not have this parameter and always clears bits in the notification value at index 0.

- **\texttt{ulBitsToClear}** – Bit mask of the bits to clear in the notification value of \texttt{xTask}. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set \texttt{ulBitsToClear} to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set \texttt{ulBitsToClear} to 0 to query the task’s notification value without clearing any bits.

**Returns** The value of the target task’s notification value before the bits specified by \texttt{ulBitsToClear} were cleared.

\begin{verbatim}
void vTaskSetTimeOutState(TimeOut_t *const pxTimeOut)

BaseType_t xTaskCheckForTimeOut (TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)

\end{verbatim}

Determines if \texttt{pxTicksToWait} ticks has passed since a time was captured using a call to \texttt{vTaskSetTimeOutState}(). The captured time includes the tick count and the number of times the tick count has overflowed.
Example Usage:

```c
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            // Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                                pucBuffer,
                                                uxWantedBytes );

    return uxReceived;
}
```

See also:

https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters

- `pxTimeOut` – The time status as captured previously using vTaskSetTimeOutState. If the timeout has not yet occurred, it is updated to reflect the current time status.
- `pxTicksToWait` – The number of ticks to check for timeout i.e. if pxTicksToWait
ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

**Returns** If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

```c
BaseType_t xTaskCatchUpTicks (TickType_t xTicksToCatchUp)
```

**Macros**

- tskKERNEL_VERSION_NUMBER
- tskKERNEL_VERSION_MAJOR
- tskKERNEL_VERSION_MINOR
- tskKERNEL_VERSION_BUILD
- tskMPU_REGION_READ_ONLY
- tskMPU_REGION_READ_WRITE
- tskMPU_REGION_EXECUTE_NEVER
- tskMPU_REGION_NORMAL_MEMORY
- tskMPU_REGION_DEVICE_MEMORY
- tskDEFAULT_INDEX_TO_NOTIFY
- tskNO_AFFINITY
- tskIDLE_PRIORITY

  Defines the priority used by the idle task. This must not be modified.

```c
taskYIELD ()
```

Macro for forcing a context switch.

```c
taskENTER_CRITICAL ()
```

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

**Note:** This may alter the stack (depending on the portable implementation) so must be used with care!

```c
taskENTER_CRITICAL_FROM_ISR ()
```

```c
taskENTER_CRITICAL_ISR ()
```
taskEXIT_CRITICAL()
Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note: This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR(x)
taskEXIT_CRITICAL_ISR()
taskDISABLE_INTERRUPTS()
Macro to disable all maskable interrupts.
taskENABLE_INTERRUPTS()
Macro to enable microcontroller interrupts.
taskSCHEDULER_SUSPENDED
taskSCHEDULER_NOT_STARTED
taskSCHEDULER_RUNNING

vTaskDelayUntil(pxPreviousWakeTime, xTimeIncrement)
xTaskNotify(xTaskToNotify, ulValue, eAction)
xTaskNotifyIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction)
xTaskNotifyAndQuery(xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)
xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.
xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.
xTaskNotifyAndQueryIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)
xTaskNotifyFromISR(xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)
xTaskNotifyIndexedFromISR(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)
xTaskNotifyAndQueryIndexedFromISR(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)
xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.
xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.
Chapter 2. API Reference

xTaskNotifyAndQueryFromISR (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGiveIndexed().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.

Parameters

• xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

• uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

Returns xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

xTaskNotifyGive (xTaskToNotify)

**Type Definitions**

typedef struct tskTaskControlBlock *TaskHandle_t

typedef BaseType_t(*TaskHookFunction_t)(void*)

typedef void (*TlsDeleteCallbackFunction_t)(int, void*)

Prototype of local storage pointer deletion callback.

**Enumerations**

enum eTaskState

Task states returned by eTaskGetState.

Values:

enumerator eRunning

enumerator eReady

enumerator eBlocked

enumerator eSuspended

enumerator eDeleted

enumerator eInvalid

enum eNotifyAction

Values:

enumerator eNoAction

enumerator eSetValueWithOverwrite
enumerator **eSetValueWithoutOverwrite**

**enum** **eSleepModeStatus**

Possible return values for **eTaskConfirmSleepModeStatus()**.

*Values:*

enumerator **eAbortSleep**

enumerator **eStandardSleep**

enumerator **eNoTasksWaitingTimeout**

**Queue API**

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h

**Functions**

**BaseType_t xQueueGenericSend(QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)**

It is preferred that the macros **xQueueSend()**, **xQueueSendToFront()** and **xQueueSendToBack()** are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See **xQueueSendFromISR()** for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures. // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become

(continues on next page)
// available if necessary.
if( xQueueGenericSend( xQueue1, (void *) &ulVar, (TickType_t) 10,...
   queueSEND_TO_BACK ) != pdPASS )
{
   // Failed to post the message, even after 10 ticks.
}

if( xQueue2 != 0 )
{
   // Send a pointer to a struct AMessage object. Don't block if the
   // queue is already full.
   pxMessage = & xMessage;
   xQueueGenericSend( xQueue2, (void *) &pxMessage, (TickType_t) 0,...
   queueSEND_TO_BACK );
// ... Rest of task code.
}

Parameters
• xQueue – The handle to the queue on which the item is to be posted.
• pvItemToQueue – A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
• xTicksToWait – The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.
• xCopyPosition – Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t xQueuePeek (QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)
Receive an item from a queue without removing the item from the queue. The item is received by copy so a
buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the
queue was created.
Successfully received items remain on the queue so will be returned again by the next call, or a call to
xQueueReceive().
This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that
can be called from an interrupt service routine.

Example usage:

struct AMessage
{
   char ucMessageID;
   char ucData[ 20 ];
} xMessage;
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
   struct AMessage *pxMessage;

(continues on next page)
// Create a queue capable of containing 10 pointers to AMessage structures. // These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// Send a pointer to a struct AMessage object. Don't block if the // queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

// Task to peek the data from the queue.
void vADifferentTask( void * pvParameters )
{
    struct AMessage * pxRxedMessage;
    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a // message is not immediately available.
        if( xQueuePeek( xQueue, & pxRxedMessage ), ( TickType_t ) 10 )
        {
            // pcRxedMessage now points to the struct AMessage variable posted // by vATask, but the item still remains on the queue.
        }
    }

    // ... Rest of task code.
}

**Parameters**

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

**Returns** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueuePeekFromISR ( QueueHandle_t xQueue, void * const pvBuffer )

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

**Parameters**

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueueReceive (QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask (void *pvParameters)
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate(10, sizeof(struct AMessage *));
    if (xQueue == 0)
    {
        // Failed to create the queue.
    }

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend(xQueue, (void *)&pxMessage, (TickType_t)0);

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask (void *pvParameters)
{
    struct AMessage *pxRxedMessage;

    if (xQueue != 0)
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if (xQueueReceive(xQueue, &pxRxedMessage, (TickType_t)10))
        {
            // pxRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }

    // ... Rest of task code.
}
```
Chapter 2. API Reference

Parameters

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

**Returns**

- **pdTRUE** if an item was successfully received from the queue, otherwise **pdFALSE**.

```c
UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
```

Return the number of messages stored in a queue.

**Parameters**

- **xQueue** - A handle to the queue being queried.

**Returns**

The number of messages available in the queue.

```c
UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )
```

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**Parameters**

- **xQueue** - A handle to the queue being queried.

**Returns**

The number of spaces available in the queue.

```c
void vQueueDelete( QueueHandle_t xQueue )
```

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters**

- **xQueue** - A handle to the queue to be deleted.

```c
BaseType_t xQueueGenericSendFromISR( QueueHandle_t xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition )
```

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, (queueSEND_TO_BACK ) );
    } while( portINPUT_BYTE( BUFFER_COUNT ) == 1 );
}
```

(continues on next page)
// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
    taskYIELD_YIELD_FROM_ISR();
}
}

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueGenericSendFromISR() will set
  *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to un-
  block, and the unblocked task has a priority higher than the currently running task. If
  xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should
  be requested before the interrupt is exited.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

```c
BaseType_t xQueueGiveFromISR ( QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken )

BaseType_t xQueueReceiveFromISR ( QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const
                         pxHigherPriorityTaskWoken )
```

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.
```
cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;
    
    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, %
       &xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );
        
        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }
    
    if( cTaskWokenByPost != ( char ) pdFALSE; {
        taskYIELD ();
    }
}

Parameters

• xQueue - The handle to the queue from which the item is to be received.
• pvBuffer - Pointer to the buffer into which the received item will be copied.
• pxHigherPriorityTaskWoken - [out] A task may be blocked waiting for space to
  become available on the queue. If xQueueReceiveFromISR causes such a task to unblock
  *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueueIsQueueEmptyFromISR( const QueueHandle_t xQueue )
BaseType_t xQueueIsQueueFullFromISR( const QueueHandle_t xQueue )
UBaseType_t uxQueueMessagesWaitingFromISR( const QueueHandle_t xQueue )
void vQueueAddToRegistry ( QueueHandle_t xQueue, const char *pcQueueName )

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call
vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be
available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be
ignored.

cfgQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. cfg-
QUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be avail-
able. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the
number that the registry can hold.

Parameters

• xQueue - The handle of the queue being added to the registry. This is the handle returned
  by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
• pcQueueName - The name to be associated with the handle. This is the name that the
  kernel aware debugger will display. The queue registry only stores a pointer to the string
  - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.
void vQueueUnregisterQueue(QueueHandle_t xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the registry. If you are not using a kernel aware debugger then this function can be ignored.

Parameters xQueue – The handle of the queue being removed from the registry.

const char* pcQueueGetName(QueueHandle_t xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

Parameters xQueue – The handle of the queue the name of which will be returned.

Returns If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t* pucQueueStorage, StaticQueue_t* pxStaticQueue, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Parameters uxEventQueueLength – Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

• If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
• If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 + 1), or 3.
If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to \((5 + 3)\), or 8.

**Returns** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

```c
BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**
- **xQueueOrSemaphore** – The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet** – The handle of the queue set to which the queue or semaphore is being added.

**Returns** If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

```c
BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Parameters**
- **xQueueOrSemaphore** – The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet** – The handle of the queue set in which the queue or semaphore is included.

**Returns** If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

```c
QueueSetMemberHandle_t xQueueSelectFromSet (QueueSetHandle_t xQueueSet, const TickType_t xTicksToWait)
```

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**
- **xQueueSet** – The queue set on which the task will (potentially) block.
- **xTicksToWait** – The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.
## Chapter 2. API Reference

**Returns**  
xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

QueueSetMemberHandle_t xQueueSelectFromSetFromISR(QueueSetHandle_t xQueueSet)

A version of xQueueSelectFromSet() that can be used from an ISR.

### Macros

**xQueueCreate**(uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.  

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );  
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}
```

**Parameters**

- **uxQueueLength** – The maximum number of items that the queue can contain.
- **uxItemSize** – The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**Returns**  
If the queue is successfully create then a handle to the newly created queue is returned.  
If the queue cannot be created then 0 is returned.
**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue.

xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// ((queue length) * ( queue item size)) bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
                          ITEM_SIZE,       // The size of each item in the queue
                          & ucQueueStorage[ 0 ], // The buffer that will...
                          & xQueueBuffer );     // The buffer that will hold the...

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}
```

**Parameters**

- **uxQueueLength** – The maximum number of items that the queue can contain.
- **uxItemSize** – The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** – If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- **pxQueueBuffer** – Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.
Returns If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

`xQueueSendToFront(xQueue, pvItemToQueue, xTicksToWait)` Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
  char ucMessageID;
  char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask(void *pvParameters)
{
  QueueHandle_t xQueue1, xQueue2;
  struct AMessage *pxMessage;

  // Create a queue capable of containing 10 uint32_t values.
  xQueue1 = xQueueCreate(10, sizeof(uint32_t));

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));

  // ...

  if( xQueue1 != 0 )
  {
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if( xQueueSendToFront(xQueue1, (void *)&ulVar, (TickType_t)10) != pdPASS )
      // Failed to post the message, even after 10 ticks.
  }

  if( xQueue2 != 0 )
  {
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSendToFront(xQueue2, (void *)&pxMessage, (TickType_t)0);
  }

  // ... Rest of task code.
}
```

Parameters
- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `xTicksToWait` - The maximum amount of time the task should block waiting for space
to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant \texttt{portTICK\_PERIOD\_MS} should be used to convert to real time if this is required.

**Returns** pd\texttt{TRUE} if the item was successfully posted, otherwise err\texttt{QUEUE\_FULL}.

\texttt{xQueueSendToBack} (\texttt{xQueue}, \texttt{pvItemToQueue}, \texttt{xTicksToWait})

This is a macro that calls \texttt{xQueueGenericSend}(). Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See \texttt{xQueueSendFromISR}() for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ... 
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}
```

**Parameters**

- \texttt{xQueue} - The handle to the queue on which the item is to be posted.
• **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

• **xTicksToWait** – The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

**Returns**  
`pdTRUE` if the item was successfully posted, otherwise `errQUEUE_FULL`.

### xQueueSend(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls `xQueueGenericSend()`. It is included for backward compatibility with versions of FreeRTOS.org that did not include the `xQueueSendToFront()` and `xQueueSendToBack()` macros. It is equivalent to `xQueueSendToBack()`.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
    }
}(continues on next page)
Parameters

- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the item the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `xTicksToWait` - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

Returns

- `pdTRUE` if the item was successfully posted, otherwise `errQUEUE_FULL`.

**xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
  QueueHandle_t xQueue;
  uint32_t ulVarToSend, ulValReceived;

  // Create a queue to hold one uint32_t value. It is strongly
  // recommended *not* to use xQueueOverwrite() on queues that can
  // contain more than one value, and doing so will trigger an assertion
  // if configASSERT() is defined.
  xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

  // Write the value 10 to the queue using xQueueOverwrite().
  ulVarToSend = 10;
  xQueueOverwrite( xQueue, &ulVarToSend );

  // Peeking the queue should now return 10, but leave the value 10 in
  // the queue. A block time of zero is used as it is known that the
  // queue holds a value.
  ulValReceived = 0;
  xQueuePeek( xQueue, &ulValReceived, 0 );

  if( ulValReceived != 10 )
  {
    // Error unless the item was removed by a different task.
  }

  // The queue is still full. Use xQueueOverwrite() to overwrite the
  // value held in the queue with 100.
  ulVarToSend = 100;
  xQueueOverwrite( xQueue, &ulVarToSend );

  // This time read from the queue, leaving the queue empty once more.
  // A block time of 0 is used again.
}```
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

// ...

Parameters

• xQueue - The handle of the queue to which the data is being sent.
• pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.

Returns xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the
same return values as xQueueSendToFront(). However, pdPASS is the only value that can be
returned because xQueueOverwrite() will write to the queue even when the queue is already
full.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
 This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```

Parameters
• **xQueue** - The handle to the queue on which the item is to be posted.
• **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• **pxHigherPriorityTaskWoken [out]** xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns**  
pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

### xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do{
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
}while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
    portYIELD_FROM_ISR ( );
}
}
```

**Parameters**

• **xQueue** - The handle to the queue on which the item is to be posted.
• **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• **pxHigherPriorityTaskWoken [out]** xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns**  
pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.
xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction ( void *pvParameters)
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler ( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    // ...
    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a-
        // context
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}
```

**Parameters**
- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be
requested before the interrupt is exited.

**Returns**  
xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**xQueueSendFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine. Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR();
    }
}
```

**Parameters**
- **xQueue** — The handle to the queue on which the item is to be posted.
- **pvItemToQueue** — A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** — [out] xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns**  
(pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

**xQueueReset** (xQueue)
Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.
Type Definitions

typedef struct QueueDefinition *QueueHandle_t

typedef struct QueueDefinition *QueueSetHandle_t

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

typedef struct QueueDefinition *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH

semSEMAPHORE_QUEUE_ITEM_LENGTH

semGIVE_BLOCK_TIME

vSemaphoreCreateBinary (xSemaphore)

xSemaphoreCreateBinary ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();
    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}

Returns Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

xSemaphoreCreateBinaryStatic(pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
    // xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}

Parameters

* pxStaticSemaphore – Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.
Returns If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

**xSemaphoreTake**( xSemaphore, xBlockTime )

*Macro* to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

**param** xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

**param** xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...
            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**xSemaphoreTakeRecursive**( xMutex, xBlockTime )

*Macro* to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex():

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.
This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.
            ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure. This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Parameters
Chapter 2. API Reference

- **xMutex** - A handle to the mutex being obtained. This is the handle returned by `xSemaphoreCreateRecursiveMutex()`;

- **xBlockTime** - The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then `xSemaphoreTakeRecursive()` will return immediately no matter what the value of `xBlockTime`.

**Returns** pdTRUE if the semaphore was obtained. pdFALSE if `xBlockTime` expired without the semaphore becoming available.

### xSemaphoreGive(xSemaphore)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`, and obtained using `xSemaphoreTake()`.

This macro must not be used from an ISR. See `xSemaphoreGiveFromISR()` for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using `xSemaphoreCreateRecursiveMutex()`.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

**Parameters**

- **xSemaphore** - A handle to the semaphore being released. This is the handle returned when the semaphore was created.
Returns pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

\textbf{xSemaphoreGiveRecursive} (xMutex)

\textit{Macro} to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

\textit{configUSE_RECURSIVE_MUTEXES} must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
        }
    }
```

(continues on next page)
// Now the mutex can be taken by other tasks.

}  
else  
{
    // We could not obtain the mutex and can therefore not access
    // the shared resource safely.

}  

Parameters

• **xMutex** - A handle to the mutex being released, or ‘given’. This is the handle returned
  by xSemaphoreCreateMutex();

Returns  pdTRUE if the semaphore was given.

**xSemaphoreGiveFromISR**( xSemaphore, pxHigherPriorityTaskWoken )

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro.

This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.

            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t uclLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    (continues on next page)
// A timer tick has occurred.
// ... Do other time functions.

// Is it time for vATask () to run?
xCHigherPriorityTaskWoken = pdFALSE;
ucLocalTickCount++;
if( ucLocalTickCount >= TICKS_TO_WAIT )
{
  // Unblock the task by releasing the semaphore.
xSemaphoreGiveFromISR( xSemaphore, &xCHigherPriorityTaskWoken );
  // Reset the count so we release the semaphore again in 10 ticks time.
  ucLocalTickCount = 0;
}
if( xHigherPriorityTaskWoken != pdFALSE )
{
  // We can force a context switch here. Context switching from an
  // ISR uses port specific syntax. Check the demo task for your port
  // to find the syntax required.
}

Parameters
• **xCSemaphore** - A handle to the semaphore being released. This is the handle returned when the semaphore was created.
• **pxHigherPriorityTaskWoken** - xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

Parameters
• **xCSemaphore** - A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
• **pxHigherPriorityTaskWoken** - [out] xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex()**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required
memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

 Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreGiveRecursive() and xSemaphoreTakeRecursive() macros must not be used.

 This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

 Mutex type semaphores cannot be used from within interrupt service routines.

 See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

 Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

**xSemaphoreCreateMutexStatic** (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

 Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreGiveRecursive() and xSemaphoreTakeRecursive() macros must not be used.

 This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

 Mutex type semaphores cannot be used from within interrupt service routines.

 See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

 Example usage:
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

Parameters
• pxMutexBuffer – Must point to a variable of type StaticSemaphore_t, which will be
  used to hold the mutex’s data structure, removing the need for the memory to be allocated
dynamically.

Returns If the mutex was successfully created then a handle to the created mutex is returned. If
pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateCounting(uxMaxCount, uxInitialCount)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex
can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex
structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the
required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see http://www.freertos.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex.

xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any
dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex does not become available
again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task
until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS
‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation
(where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and
from within interrupt service routines.

Example usage:

SemaphoreHandle_t xSemaphore;
void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();
}

(continues on next page)
if ( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold the mutexes data structures - so no dynamic memory allocation will be attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL, so there is no need to check it.
}
```

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreate-
Counting() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**Parameters**

- `pxStaticSemaphore` - Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.
- `uxMaxCount` - The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount` - The count value assigned to the semaphore when it is created.

**Returns** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Returns** Handle to the created semaphore. Null if the semaphore could not be created.

**xSemaphoreCreateCountingStatic** (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.
In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}
```

Parameters

- `uxMaxCount` - The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount` - The count value assigned to the semaphore when it is created.
- `pxSemaphoreBuffer` - Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

Returns If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If `pxSemaphoreBuffer` was NULL then NULL is returned.
vSemaphoreDelete(xSemaphore)
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters
• xSemaphore – A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder(xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR(xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount(xSemaphore)
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

Timer API

Header File
• components/freertos/FreeRTOS-Kernel/include/freertos/timers.h

Functions
TimerHandle_t xTimerCreate(const char * const pcTimerName,TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
Chapter 2. API Reference

* #define NUM_TIMERS 5
* 
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
* 
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
* 
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
*   int32_t lArrayIndex;
*   const int32_t xMaxExpiryCountBeforeStopping = 10;
*   
*   // Optionally do something if the pxTimer parameter is NULL.
*   configASSERT( pxTimer );
*   
*   // Which timer expired?
*   lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*   
*   // Increment the number of times that pxTimer has expired.
*   lExpireCounters[ lArrayIndex ] += 1;
*   
*   // If the timer has expired 10 times then stop it from running.
*   if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
*   {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
*   }
*   
* } // End of vTimerCallback

* void main( void )
* {
*   int32_t x;
*   
*   // Create then start some timers. Starting the timers before the...
*   
*   // has been started means the timers will start running immediately that
*   // the scheduler starts.
*   for( x = 0; x < NUM_TIMERS; x++ )
*   {
*     xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,...
*                                  ( 100 * x ), // The timer period...
*                                  ( void * ) x, // Assign each timer...
*                                  vTimerCallback // Each timer calls...
*                                    );
*     
*   }
*   
*   if( xTimers[ x ] == NULL )
*   {
*     // The timer was not created.
*   }
*   else
*   { (continues on next page)
* 
* { 
*   // Start the timer. No block time is specified, and even if one...
*   if( xTimerStart( xTimers[ x ], 0 ) != pdPASS ) 
*     { 
*       // The timer could not be set into the Active state. 
*     } 
*     
*   } 
* 
*   // ... 
*   // Create tasks here. 
*   // ... 
* 
*   // Starting the scheduler will start the timers running as they have...
*   // already 
*   vTaskStartScheduler(); 
* 
*   // Should not reach here. 
*   for( ;; ); 
* } 
* 

Parameters

- **pcTimerName** – A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** – The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.

- **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

- **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);”.

Returns

If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

```
TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer);
```

Creates a new software timer instance, and returns a handle by which the created software timer can be refer-
Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
/*
 * // The buffer used to hold the software timer's data structure.
 * static StaticTimer_t xTimerBuffer;
 *
 * // A variable that will be incremented by the software timer's callback
 * // function.
 * UBaseType_t uxVariableToIncrement = 0;
 *
 * // A software timer callback function that increments a variable passed to
 * // it when the software timer was created. After the 5th increment the
 * // callback function stops the software timer.
 * static void prvTimerCallback( TimerHandle_t xExpiredTimer )
 * {
 *   UBaseType_t *puxVariableToIncrement;
 *   BaseType_t xReturned;
 *
 *   // Obtain the address of the variable to increment from the timer ID.
 *   puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(...
 *     xExpiredTimer );
 *
 *   // Increment the variable to show the timer callback has executed.
 *   ( *puxVariableToIncrement )++;
 *
 *   // If this callback has executed the required number of times, stop the
 *   // timer.
 *   if( *puxVariableToIncrement == 5 )
 *   {
 *     // This is called from a timer callback so must not block.
 *     xTimerStop( xExpiredTimer, staticDONT_BLOCK );
 *   }
 * }
 *
 * void main( void )
 * {
 *   // Create the software time. xTimerCreateStatic() has an extra parameter
 *   // than the normal xTimerCreate() API function. The parameter is a...
 *   // pointer
 *   // to the StaticTimer_t structure that will hold the software timer
 *   // structure. If the parameter is passed as NULL then the structure...
 *   // will be
 *   // allocated dynamically, just as if xTimerCreate() had been called.
 *   xTimer = xTimerCreateStatic( "T1", // Text name for the task.
 *     0, // Helps debugging only. Not used by FreeRTOS.
 *     10000, // The period of the...
 *     xTimer in ticks.
 *
 *   // Start the timer.
 *   xTimerStart( xTimer, staticDONT_BLOCK );
 * }
 */
```

(continues on next page)
parameters

\- \textbf{pcTimerName} \textemdash A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

\- \textbf{xTimerPeriodInTicks} \textemdash The timer period. The time is defined in tick periods so the constant \texttt{portTICK\_PERIOD\_MS} can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500/portTICK\_PERIOD\_MS) provided \texttt{configTICK\_RATE\_HZ} is less than or equal to 1000. The timer period must be greater than 0.

\- \textbf{uxAutoReload} \textemdash If uxAutoReload is set to \texttt{pdTRUE} then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to \texttt{pdFALSE} then the timer will be a one-shot timer and enter the dormant state after it expires.

\- \textbf{pvTimerID} \textemdash An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

\- \textbf{pxCallbackFunction} \textemdash The function to call when the timer expires. Callback functions must have the prototype defined by \texttt{TimerCallbackFunction\_t}, which is \texttt{void vCallbackFunction(TimerHandle\_t xTimer);}.

\- \textbf{pxTimerBuffer} \textemdash Must point to a variable of type StaticTimer\_t, which will be then be used to hold the software timer’ s data structures, removing the need for the memory to be allocated dynamically.

returns If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

\begin{verbatim}
void *pvTimerGetTimerID (const TimerHandle\_t xTimer)
void *pvTimerGetTimerID( TimerHandle\_t xTimer );
\end{verbatim}

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to \texttt{xTimerCreated()} that was used to create the timer, and by calling the \texttt{vTimerSetTimerID()} API function.
If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** – The timer being queried.
- **pvNewID** – The ID assigned to the timer being queried.

**Returns**

The ID assigned to the timer being queried.

void vTimerSetTimerID(TimerHandle_t xTimer, void* pvNewID);

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** – The timer being updated.
- **pvNewID** – The ID to assign to the timer.

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

* // This function assumes xTimer has already been created.
* void vAFunction(TimerHandle_t xTimer)
* {
*   if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*       equivalently "if( xTimerIsTimerActive( xTimer ) )"
*   
*     // xTimer is active, do something.
*   
*   else
*   
*     // xTimer is not active, do something else.
*   
* }

**Parameters**

- **xTimer** – The timer being queried.

**Returns**

pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.
**TaskHandle_t xTimerGetTimerDaemonTaskHandle (void)**

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

**BaseType_t xTimerPendFunctionCallFromISR (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)**

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt just as if the callback had executed in the interrupt itself.

Example usage:

```c
/* // The callback function that will execute in the context of the daemon task. */
/* // Note callback functions must all use this same prototype. */
/* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 ) */
/* { */
/*   BaseType_t xInterfaceToService; */
/*   */
/*   // The interface that requires servicing is passed in the second */
/*   // parameter. The first parameter is not used in this case. */
/*   xInterfaceToService = ( BaseType_t ) ulParameter2; */
/*   */
/*   // ...Perform the processing here... */
/* } */

/* // An ISR that receives data packets from multiple interfaces */
/* void vAnISR( void ) */
/* { */
/*   BaseType_t xInterfaceToService, xHigherPriorityTaskWoken; */
/*   */
/*   // Query the hardware to determine which interface needs processing. */
/*   xInterfaceToService = prvCheckInterfaces(); */
/*   */
/*   // The actual processing is to be deferred to a task. Request the */
/*   // vProcessInterface() callback function is executed, passing in the */
/*   // number of the interface that needs processing. The interface to */
/*   // service is passed in the second parameter. The first parameter is */
/*   // not used in this case. */
/*   xHigherPriorityTaskWoken = pdFALSE; */
/*   xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t ) xInterfaceToService, &xHigherPriorityTaskWoken ); */
/*   */
/*   // If xHigherPriorityTaskWoken is now set to pdTRUE then a context */
/*   // switch should be requested. The macro used is port specific and will */
/*   // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to */
/*   // the documentation page for the port being used. */
/*   portYIELD_FROM_ISR( xHigherPriorityTaskWoken ); */
```

(continues on next page)
Parameters

• xFunctionToPend - The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
• pvParameter1 - The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
• ulParameter2 - The value of the callback function’s second parameter.
• pxHigherPriorityTaskWoken - As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialsed to pdFALSE. See the example code below.

Returns pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait )

Used to defer the execution of a function to theRTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Parameters

• xFunctionToPend - The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
• pvParameter1 - The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
• ulParameter2 - The value of the callback function’s second parameter.
• xTicksToWait - Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

Returns pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

const char * pcTimerGetName( TimerHandle_t xTimer )

Returns the name that was assigned to a timer when the timer was created.

Parameters xTimer - The handle of the timer being queried.

Returns The name assigned to the timer specified by the xTimer parameter.

void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload )

void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters

• xTimer - The handle of the timer being updated.
• **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

**UBaseType_t uxTimerGetReloadMode(TimerHandle_t xTimer)**

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

- **Parameters**
  - xTimer – The handle of the timer being queried.
- **Returns**
  - If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

**TickType_t xTimerGetPeriod(TimerHandle_t xTimer)**

Returns the period of a timer.

- **Parameters**
  - xTimer – The handle of the timer being queried.
- **Returns**
  - The period of the timer in ticks.

**TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer)**

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

- **Parameters**
  - xTimer – The handle of the timer being queried.
- **Returns**
  - If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

**void vApplicationGetTimerTaskMemory(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)**

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

- **Parameters**
  - ppxTimerTaskTCBBuffer – A handle to a statically allocated TCB buffer
  - ppxTimerTaskStackBuffer – A handle to a statically allocated Stack buffer for the idle task
  - pulTimerTaskStackSize – A pointer to the number of elements that will fit in the allocated stack buffer

**Macros**

- `tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR`
- `tmrCOMMAND_EXECUTE_CALLBACK`
- `tmrCOMMAND_START_DONT_TRACE`
- `tmrCOMMAND_START`
- `tmrCOMMAND_RESET`
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:
See the xTimerCreate() API function example usage scenario.

**Parameters**

- xTimer - The handle of the timer being started/restarted.
- xTicksToWait - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

**Returns**
pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
**xTimerStop** `(xTimer, xTicksToWait)`

```c
BaseType_t xTimerStop( TimerHandle_t xTimer, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

**Example usage:**

See the `xTimerCreate()` API function example usage scenario.

**Parameters**

- **xTimer** – The handle of the timer being stopped.
- **xTicksToWait** – Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStop()` was called. `xTicksToWait` is ignored if `xTimerStop()` is called before the scheduler is started.

**Returns**

`pdFAIL` will be returned if the stop command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerChangePeriod** `(xTimer, xNewPeriod, xTicksToWait)`

```c
BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerChangePeriod()` changes the period of a timer that was previously created using the `xTimerCreate()` API function.

`xTimerChangePeriod()` can be called to change the period of an active or dormant state timer.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerChangePeriod()` to be available.

**Example usage:**

```c
* // This function assumes xTimer has already been created. If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted. If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*  if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and equivalently
*       "if( xTimerIsTimerActive( xTimer ) )"
*  {
```

(continues on next page)
// xTimer is already active - delete it.
  xTimerDelete( xTimer );
} 
else 
{
  // xTimer is not active, change its period to 500ms. This will also
  // cause the timer to start. Block for a maximum of 100 ticks if the
  // change period command cannot immediately be sent to the timer
  // command queue.
  if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS ) 
  {
  // The command was successfully sent.
  } 
  else 
  { 
  // The command could not be sent, even after waiting for 100...
  } 
  } 
} 

Parameters

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

Returns

pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerDelete** (xTimer, xTicksToWait)

BaseType_t xTimerDelete( TimerHandle_t xTimer, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function. The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.
Parameters

- `xTimer` - The handle of the timer being deleted.
- `xTicksToWait` - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

Returns

`pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

`xTimerReset` (xTimer, xTicksToWait)

BaseType_t xTimerReset(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after `xTimerReset()` was called, where ‘n’ is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerReset()` to be available.

Example usage:

```c
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer.
* TimerHandle_t xBacklightTimer = NULL;
* // The callback function assigned to the one-shot timer. In this case the parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*   // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
*   vSetBacklightState( BACKLIGHT_OFF );
* }
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*   // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. Wait 10 ticks for the command to be successfully sent if it cannot be sent immediately.
*(continues on next page)
```
vSetBacklightState( BACKLIGHT_ON );
if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
{
    // The reset command was not executed successfully. Take appropriate
    // action here.
}

// Perform the rest of the key processing here.

void main( void )
{
    int32_t x;

    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a_
        ( 5000 / portTICK_PERIOD_MS), // The_
        (5000 / portTICK_PERIOD_MS), // The timer period in ticks.
        pdFALSE, // The timer_
        0, // The id is_
        vBacklightTimerCallback // The_
    );

    if( xBacklightTimer == NULL )
    {
        // The timer was not created.
    }
    else
    {
        // Start the timer. No block time is specified, and even if one was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
        {
            // The timer could not be set into the Active state.
        }
    }

    // ...*
    // Create tasks here.
    // ...

    // Starting the scheduler will start the timer running as it has already
    // been set into the active state.
    vTaskStartScheduler();
    // Should not reach here.
    for( ;; );
}

Parameters

- **xTimer** - The handle of the timer being reset/started/restarted.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is
ignored if xTimerReset() is called before the scheduler is started.

**Returns**

pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

### xTimerStartFromISR

BaseType_t xTimerStartFromISR( TimerHandle_t xTimer, BaseType_t* pxHigherPriorityTaskWoken );

A version of xTimerStart() that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then restart the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. This is an interrupt service routine so can only
    // call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here
    // as both cause the timer to re-calculate its expiry time.
    // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
    // declared in this function).
    if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
    // The start command was not executed successfully. Take appropriate
    // action here.
}

// Perform the rest of the key processing here.

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
```
(continues on next page)
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).

    ...
}

Parameters

- **xTimer** - The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

```
xTimerStopFromISR( xTimer, pxHigherPriorityTaskWoken )
```

** BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken ); **

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```
// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the timer should be simply stopped.

void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - simply stop the timer.
    if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The stop command was not executed successfully. Take appropriate
        // action here.
        ...
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
```

(continues on next page)
Call the interrupt safe `yield` function here (actual function depends on the FreeRTOS port being used).

Parameters

- `xTimer` - The handle of the timer being stopped.
- `pxHigherPriorityTaskWoken` - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStopFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStopFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerStopFromISR()` function. If `xTimerStopFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns `pdFAIL` will be returned if the stop command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

`xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)`

BaseType_t xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t *pxHigherPriorityTaskWoken );

A version of `xTimerChangePeriod()` that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xTimer has already been created and started. When
  * // an interrupt occurs, the period of xTimer should be changed to 500ms.
  * 
  * // The interrupt service routine that changes the period of xTimer.
  * void vAnExampleInterruptServiceRoutine( void )
  * {
  *   BaseType_t xHigherPriorityTaskWoken = pdFALSE;
  *   
  *   // The interrupt has occurred - change the period of xTimer to 500ms.
  *   // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
  *   // (within this function). As this is an interrupt service routine, only
  *   // FreeRTOS API functions that end in "FromISR" can be used.
  *   if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
  *     pdPASS )
  *     {
  *       // The command to change the timers period was not executed
  *       // successfully. Take appropriate action here.
  *       }
  *   }
  * 
  *   // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
  *   // should be performed. The syntax required to perform a context switch
  *   // from inside an ISR varies from port to port, and from compiler to
  *   // compiler. Inspect the demos for the port you are using to find the
  *   // actual syntax required.
  *   if( xHigherPriorityTaskWoken != pdFALSE )
  */
```

(continues on next page)
*{ /* Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used). */ }

Parameters

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerResetFromISR** (xTimer, pxHigherPriorityTaskWoken)

    BaseType_t xTimerResetFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```c
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
* *
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*    // The timer expired, therefore 5 seconds must have passed since a key
*    // was pressed. Switch off the LCD back-light.
*    vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
```
BaseType_t xHigherPriorityTaskWoken = pdFALSE;

Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".

vSetBacklightState( BACKLIGHT_ON );

// xTimerStartFromISR() or xTimerResetFromISR() could be called here
// as both cause the timer to re-calculate its expiry time.
// xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
{
    // The reset command was not executed successfully. Take appropriate action here.
}

// Perform the rest of the key processing here.

if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}

Parameters

- **xTimer** - The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

typedef void (*PendedFunction_t)(void*, uint32_t)

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h

Functions

EventGroupHandle_t xEventGroupCreate(void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Returns  If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See https://www.FreeRTOS.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic(StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.
Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

Parameters `pxEventGroupBuffer` - `pxEventGroupBuffer` must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

Returns If the event group was created then a handle to the event group is returned. If `pxEventGroupBuffer` was NULL then NULL is returned.

```c
EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_txClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )
```

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits( xEventGroup, // The event group being tested.
                                  BIT_0 | BIT_4, // The bits within the event group to wait...
                                  pdTRUE, // BIT_0 and BIT_4 should be cleared before...
                                  pdFALSE, // Don't wait for both bits, either bit will...
                                  xTicksToWait ); // Wait a maximum of 100ms for either bit to...

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) != ( BIT_0 | BIT_4 ) )
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
{ 
    // xEventGroupWaitBits() returned because both bits were set.
} else if ( (uxBits & BIT_0 ) != 0 ) 
{ 
    // xEventGroupWaitBits() returned because just BIT_0 was set.
} else if ( (uxBits & BIT_4 ) != 0 ) 
{ 
    // xEventGroupWaitBits() returned because just BIT_4 was set.
} else 
{
    // xEventGroupWaitBits() returned because xTicksToWait ticks passed 
     // without either BIT_0 or BIT_4 becoming set.
}
```

Parameters

- `xEventGroup` – The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- `uxBitsToWaitFor` – A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to 0x07. Etc.
- `xClearOnExit` – If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- `xWaitForAllBits` – If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- `xTicksToWait` – The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set.

Returns

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

```c
EventBits_t xEventGroupClearBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear) 
```

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits; 
    // Clear bit 0 and bit 4 in xEventGroup.
}
```

(continues on next page)
uxBits = xEventGroupClearBits(
    xEventGroup,  // The event group being updated.
    BIT_0 | BIT_4 ); // The bits being cleared.

if( (uxBits & (BIT_0 | BIT_4)) == (BIT_0 | BIT_4))
{
    // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
}
else if( (uxBits & BIT_0) != 0)
{
    // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
}
else if( (uxBits & BIT_4) != 0)
{
    // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.
}
else
{
    // Neither bit 0 nor bit 4 were set in the first place.
}

Parameters
- **xEventGroup** – The event group in which the bits are to be cleared.
- **uxBitsToClear** – A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns The value of the event group before the specified bits were cleared.

### EventBits_t xEventGroupSetBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( (uxBits & (BIT_0 | BIT_4)) == (BIT_0 | BIT_4))
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( (uxBits & BIT_0) != 0)
    {
        // Bit 0 remained set when the function returned, but bit 4 was
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
```
// cleared. It might be that bit 4 was cleared automatically as a
// task that was waiting for bit 4 was removed from the Blocked
// state.
}
else if( (uxBits & BIT_4) != 0 )
{
    // Bit 4 remained set when the function returned, but bit 0 was
    // cleared. It might be that bit 0 was cleared automatically as a
    // task that was waiting for bit 0 was removed from the Blocked
    // state.
}
else
{
    // Neither bit 0 nor bit 4 remained set. It might be that a task
    // was waiting for both of the bits to be set, and the bits were
    // cleared as the task left the Blocked state.
}

Parameters

- **xEventGroup** – The event group in which the bits are to be set.
- **uxBitsToSet** – A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

Returns

The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

Example usage:

```c
#define TASK_0_BIT  ( 1 << 0 )
#define TASK_1_BIT  ( 1 << 1 )
#define TASK_2_BIT  ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{ (continues on next page)```
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for( ;; )
{
    // Perform task functionality here.

    // Set bit 0 in the event flag to note this task has reached the
    // sync point. The other two tasks will set the other two bits defined
    // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
    // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
    // for this to happen.
    uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
                                xTicksToWait );

    if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
    {
        // All three tasks reached the synchronisation point before the call
        // to xEventGroupSync() timed out.
    }
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
Chapter 2. API Reference

Parameters

- `xEventGroup` - The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- `uxBitsToSet` - The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWaitFor` parameter are set.
- `uxBitsToWaitFor` - A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to 0x05. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to 0x07. Etc.
- `xTicksToWait` - The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

Returns

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

```c
EventBits_t xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)
```

A version of `xEventGroupGetBits()` that can be called from an ISR.

Parameters

- `xEventGroup` - The event group being queried.

Returns

The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

```c
void vEventGroupDelete (EventGroupHandle_t xEventGroup)
```

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

Parameters

- `xEventGroup` - The event group being deleted.

Macros

```c
xEventGroupClearBitsFromISR (EventGroupHandle_t xEventGroup, uxBitsToClear)
```

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler ( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup,          // The event group being updated.
        BIT_0 | BIT_4 );      // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
```

(continues on next page)
Parameters

- **xEventGroup** - The event group in which the bits are to be cleared.
- **uxBitsToClear** - A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to 0x08. To clear bit 3 and bit 0 set `uxBitsToClear` to 0x09.

Returns

If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

**xEventGroupSetBitsFromISR** (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken,
    xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4, // The bits being set.
        &xHigherPriorityTaskWoken
    );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}
```

Parameters

- **xEventGroup** - The event group in which the bits are to be set.
- **uxBitsToSet** - A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to 0x08. To set bit 3 and bit 0 set `uxBitsToSet` to 0x09.
Chapter 2. API Reference

• pxHigherPriorityTaskWoken – As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

Returns If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Parameters
• xEventGroup – The event group being queried.

Returns The event group bits at the time xEventGroupGetBits() was called.

Type Definitions
typedef struct EventGroupDef_t *EventGroupHandle_t
typedef TickType_t EventBits_t

Stream Buffer API

Header File
• components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h

Functions
size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFuncion( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS(100);
    // More code...
}
```

(continues on next page)
// Send an array to the stream buffer, blocking for a maximum of 100ms to // wait for enough space to be available in the stream buffer.
int xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, sizeof( ucArrayToSend ), x100ms );

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xStreamBufferSend() times out before there was enough // space in the buffer for the data to be written, but it did // successfully write xBytesSent bytes.
}

// Send the string to the stream buffer. Return immediately if there is not // enough space in the buffer.
int xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The entire string could not be added to the stream buffer because // there was not enough free space in the buffer, but xBytesSent bytes // were sent. Could try again to send the remaining bytes.
}

Parameters

- **xStreamBuffer** – The handle of the stream buffer to which a stream is being sent.
- **pvTxData** – A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** – The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** – The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the other xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

Returns The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write
to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**

- `xStreamBuffer` – The handle of the stream buffer to which a stream is being sent.
- `pvTxData` – A pointer to the data that is to be copied into the stream buffer.
- `xDataLengthBytes` – The maximum number of bytes to copy from `pvTxData` into the stream buffer.
- `pxHigherPriorityTaskWoken` – It is possible that a stream buffer will have a task blocked on it waiting for data. Calling `xStreamBufferSendFromISR()` can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling `xStreamBufferSendFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xStreamBufferSendFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE`. If `xStreamBufferSendFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the example code below for an example.

**Returns** The number of bytes actually written to the stream buffer, which will be less than `xDataLengthBytes` if the stream buffer didn’t have enough free space for all the bytes to be written.

```c
size_t xStreamBufferReceive( StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait )
```

Receives bytes from a stream buffer.
Kept: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
  uint8_t ucRxData[ 20 ];
  size_t xReceivedBytes;
  const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

  // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
  // Wait in the Blocked state (so not using any CPU processing time) for a
  // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
  // available.
  xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
    ( void * ) ucRxData,
    sizeof( ucRxData ),
    xBlockTime );

  if( xReceivedBytes > 0 )
  {
    // A ucRxData contains another xRecievedBytes bytes of data, which can
    // be processed here....
  }
}
```

Parameters

- **xStreamBuffer** - The handle of the stream buffer from which bytes are to be received.
- **pvRxData** - A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** - The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

Returns

The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

```c
size_t xStreamBufferReceiveFromISR( StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken )
```

An interrupt safe version of the API function that receives bytes from a stream buffer.
Use \texttt{xStreamBufferReceive()} to read bytes from a stream buffer from a task. Use \texttt{xStreamBufferReceiveFromISR()} to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Initialisation of the ISR.
    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                                ( void * ) ucRxData,
                                                sizeof( ucRxData ),
                                                &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- \texttt{xStreamBuffer} – The handle of the stream buffer from which a stream is being received.
- \texttt{pvRxData} – A pointer to the buffer into which the received bytes are copied.
- \texttt{xBufferSizeBytes} – The length of the buffer pointed to by the \texttt{pvRxData} parameter. This sets the maximum number of bytes to receive in one call. \texttt{xStreamBufferReceive} will return as many bytes as possible up to a maximum set by \texttt{xBufferSizeBytes}.
- \texttt{pxHigherPriorityTaskWoken} – It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling \texttt{xStreamBufferReceiveFromISR()} can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling \texttt{xStreamBufferReceiveFromISR()} causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, \texttt{xStreamBufferReceiveFromISR()} will set \texttt{pxHigherPriorityTaskWoken} to pdTRUE. If \texttt{xStreamBufferReceiveFromISR()} sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. \texttt{pxHigherPriorityTaskWoken} should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns

The number of bytes read from the stream buffer, if any.

```c
void vStreamBufferDelete ( StreamBufferHandle_t xStreamBuffer )
```

Deletes a stream buffer that was previously created using a call to \texttt{xStreamBufferCreate()} or \texttt{xStreamBuffer-}
CreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

Parameters xStreamBuffer – The handle of the stream buffer to be deleted.

BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

Parameters xStreamBuffer – The handle of the stream buffer being queried.
Returns If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

Parameters xStreamBuffer – The handle of the stream buffer being queried.
Returns If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)
Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

Parameters xStreamBuffer – The handle of the stream buffer being reset.
Returns If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

Parameters xStreamBuffer – The handle of the stream buffer being queried.
Returns The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

Parameters xStreamBuffer – The handle of the stream buffer being queried.
Returns The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)
A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

Parameters
• xStreamBuffer – The handle of the stream buffer being updated.
• xTriggerLevel – The new trigger level for the stream buffer.
Returns If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferSendCompletedFromISR (StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

• xStreamBuffer –The handle of the stream buffer to which data was written.
• pxHigherPriorityTaskWoken –*pxHigherPriorityTaskWoken should be initial-ised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigh-erPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReceiveCompletedFromISR (StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

• xStreamBuffer –The handle of the stream buffer from which data was read.
• pxHigherPriorityTaskWoken –*pxHigherPriorityTaskWoken should be initial-ised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *px-HigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreate (xBufferSizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
    // There was not enough heap memory space available to create the
    // stream buffer.
}
else
{
    // The stream buffer was created successfully and can now be used.
}
}

Parameters

• xBufferSizeBytes – The total number of bytes the stream buffer will be able to hold
  at any one time.
• xTriggerLevelBytes – The number of bytes that must be in the stream buffer before
  a task that is blocked on the stream buffer to wait for data is moved out of the blocked state.
  For example, if a task is blocked on a read of an empty stream buffer that has a trigger
  level of 1 then the task will be unblocked when a single byte is written to the buffer or
  the task’s block time expires. As another example, if a task is blocked on a read of an
  empty stream buffer that has a trigger level of 10 then the task will not be unblocked until
  the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading
  task’s block time expires before the trigger level is reached then the task will still receive
  however many bytes are actually available. Setting a trigger level of 0 will result in a trigger
  level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer
  size.

Returns If NULL is returned, then the stream buffer cannot be created because there is insufficient
heap memory available for FreeRTOS to allocate the stream buffer data structures and storage
area. A non-NULL value being returned indicates that the stream buffer has been created
successfully - the returned value should be stored as the handle to the created stream buffer.

xStreamBufferCreateStatic(xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea,
pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that
uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreate-
Static() to be available.

Example use:

// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xTriggerLevel = 1;

xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
xTriggerLevel,
ucBufferStorage,
&xStreamBufferStruct );

// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}

Parameters

• **xBufferSizeBytes** – The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.

• **xTriggerLevelBytes** – The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

• **pucStreamBufferStorageArea** – Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.

• **pxStaticStreamBuffer** – Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.

Returns

If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Type Definitions

typedef struct StreamBufferDef_t *StreamBufferHandle_t

Message Buffer API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h

Macros

xMessageBufferCreate( xBufferSizeBytes )

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).
configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;
    
    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    } else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

Parameters

• `xBufferSizeBytes` - The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

Returns If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

`xMessageBufferCreateStatic`(xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See `xMessageBufferCreate()` for a version that uses dynamically allocated memory.

Example use:

```c
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    // (continues on next page)
}
```
Parameters

- **xBufferSizeBytes** - The size, in bytes, of the buffer pointed to by the `pucMessageBufferStorageArea` parameter. When a message is written to the message buffer an additional size of `size_t` bytes are also written to store the message’s length. `sizeof(size_t)` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (`xBufferSizeBytes - 1`).

- **pucMessageBufferStorageArea** - Must point to a `uint8_t` array that is at least `xBufferSizeBytes + 1` big. This is the array to which messages are copied when they are written to the message buffer.

- **pxStaticMessageBuffer** - Must point to a variable of type `StaticMessageBuffer_t`, which will be used to hold the message buffer’s data structure.

Returns

If the message buffer is created successfully then a handle to the created message buffer is returned. If either `pucMessageBufferStorageArea` or `pxStaticMessageBuffer` are `NULL` then `NULL` is returned.

**xMessageBufferSend** (`xMessageBuffer`, `pvTxData`, `xDataLengthBytes`, `xTicksToWait`)  
Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to `0`. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to `0`.

Use `xMessageBufferSend()` to write to a message buffer from a task. Use `xMessageBufferSendFromISR()` to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };  
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
```
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend, ... "sizeof( ucArrayToSend ), x100ms");

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xMessageBufferSend() times out before there was enough
    // space in the buffer for the data to be written.
}

// Send the string to the message buffer. Return immediately if there is
// not enough space in the buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend, ...
      strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}

Parameters

- **xMessageBuffer** – The handle of the message buffer to which a message is being sent.
- **pvTxData** – A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** – The length of the message. That is, the number of bytes to copy from
  pvTxData into the message buffer. When a message is written to the message buffer
  an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t )
  is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting
  xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20
  bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** – The maximum amount of time the calling task should remain in the
  Blocked state to wait for enough space to become available in the message buffer, should
  the message buffer have insufficient space when xMessageBufferSend() is called. The
  calling task will never block if xTicksToWait is zero. The block time is specified in tick
  periods, so the absolute time it represents is dependent on the tick frequency. The macro
  pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time
  specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait
  indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.
- **Returns** The number of bytes written to the message buffer. If the call to xMessageBufferSend()
  times out before there was enough space to write the message into the message buffer then zero
  is returned. If the call did not time out then xDataLengthBytes is returned.

xMessageBufferSendFromISR (xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message
 can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementa-
 tion, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that
 will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It
 is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not
 safe to have multiple different writers or multiple different readers. If there are to be multiple different writers
 then the application writer must place each call to a writing API function (such as xMessageBufferSend())
 inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers
 then the application writer must place each call to a reading API function (such as xMessageBufferRead())
 inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to
write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
        ( void * )pcStringToSend,
        strlen( pcStringToSend ),
        &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was 
        // not enough free space in the buffer.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside 
    // xMessageBufferSendFromISR() then a task that has a priority above the 
    // priority of the currently executing task was unblocked and a context 
    // switch should be performed to ensure the ISR returns to the unblocked 
    // task. In most FreeRTOS ports this is done by simply passing 
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the 
    // variables value, and perform the context switch if necessary. Check the 
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- `xMessageBuffer` - The handle of the message buffer to which a message is being sent.
- `pvTxData` - A pointer to the message that is to be copied into the message buffer.
- `xDataLengthBytes` - The length of the message. That is, the number of bytes to copy from `pvTxData` into the message buffer. When a message is written to the message buffer an additional `sizeof(size_t)` bytes are also written to store the message’s length. `sizeof(size_t)` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting `xDataLengthBytes` to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- `pxHigherPriorityTaskWoken` - It is possible that a message buffer will have a task blocked on it waiting for data. Calling `xMessageBufferSendFromISR()` can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling `xMessageBufferSendFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xMessageBufferSendFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE`. If `xMessageBufferSendFromISR()` sets this value to `pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the code example below for an example.

Returns

The number of bytes actually written to the message buffer. If the message buffer didn’t have enough free space for the message to be stored then 0 is returned, otherwise `xDataLengthBytes` is returned.
xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

- Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
        { void * } ucRxData,
        sizeof( ucRxData ),
        xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}
```

**Parameters**

- **xMessageBuffer** – The handle of the message buffer from which a message is being received.
- **pvRxData** – A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** – The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLength-Bytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** – The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

**Returns** – The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the
length of the message is greater than xBufferLengthBytes then the message will be left in the
message buffer and zero is returned.

**xMessageBufferReceiveFromISR** (xMessageBuffer, pvRxData, xBufferLengthBytes,
pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages
can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation,
as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that
will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader).
It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not
safe to have multiple different writers or multiple different readers. If there are to be multiple different writers
then the application writer must place each call to a writing API function (such as xMessageBufferSend())
inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers
then the application writer must place each call to a reading API function (such as xMessageBufferRead())
inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

**Example use:**

```c
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                              ( void * ) ucRxData,
                                              sizeof( ucRxData ),
                                              &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
       // A ucRxData contains a message that is xReceivedBytes long. Process
       // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**

- **xMessageBuffer** - The handle of the message buffer from which a message is being received.
- **pvRxData** - A pointer to the buffer into which the received message is to be copied.
• **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxDataparameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.

• **pxHigherPriorityTaskWoken** - It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**Returns** The length, in bytes, of the message read from the message buffer, if any.

**vMessageBufferDelete**(xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessageBufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

**Parameters**

• **xMessageBuffer** - The handle of the message buffer to be deleted.

**xMessageBufferIsFull**(xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

**Parameters**

• **xMessageBuffer** - The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

**xMessageBufferIsEmpty**(xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

**Parameters**

• **xMessageBuffer** - The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

**xMessageBufferReset**(xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Parameters**

• **xMessageBuffer** - The handle of the message buffer being reset.

**Returns** If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

**xMessageBufferSpaceAvailable**(xMessageBuffer)

Returns the number of bytes of free space in the message buffer.

**Parameters**

• **xMessageBuffer** - The handle of the message buffer being queried.

**Returns** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size_t )
bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on
a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of
the largest message that can be written to the message buffer is 6 bytes.

xMessageBufferSpacesAvailable (xMessageBuffer)

xMessageBufferNextLengthBytes (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if
xMessageBufferReceive() returned 0 because the size of the buffer passed into
xMessageBufferReceive() was too small to hold the next
message.

Parameters
• xMessageBuffer – The handle of the message buffer being queried.

Returns The length (in bytes) of the next message in the message buffer, or 0 if the message buffer
is empty.

xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to
a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data
to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked
state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application
writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY
OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters
• xMessageBuffer – The handle of the stream buffer to which data was written.
• pxHigherPriorityTaskWoken – *pxHigherPriorityTaskWoken should be ini-

tialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR().
If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked
state, and the task has a priority above the priority of the currently running task, then *px-

HigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should
be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise
pdFALSE is returned.

xMessageBufferReceiveCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of
a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for
data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it
from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application
writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY
OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters
• xMessageBuffer – The handle of the stream buffer from which data was read.
• pxHigherPriorityTaskWoken – *pxHigherPriorityTaskWoken should be ini-

tialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *px-

HigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should
be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise
pdFALSE is returned.
Type Definitions

typedef void *MessageBufferHandle_t

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc.

2.10.10 FreeRTOS Supplemental Features

ESP-IDF uses a modified version of FreeRTOS v10.4.3 that contains significant changes for SMP compatibility (see ESP-IDF FreeRTOS SMP Changes). However, in addition to ESP-IDF FreeRTOS, various features are also provided by ESP-IDF to supplement the features offered by FreeRTOS.

This document describes these supplemental features added to ESP-IDF. This document is split into the following sections:

Contents

- FreeRTOS Supplemental Features
  - Overview
  - Ring Buffers
  - ESP-IDF Tick and Idle Hooks
  - TLSP Deletion Callbacks
  - Component Specific Properties
  - API Reference

Overview

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see ESP-IDF FreeRTOS SMP Changes). However, various new features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties**: Currently added only one component specific property ORIG_INCLUDE_PATH.

Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items **must also be returned** to the ring buffer by using vRingbufferReturnItem() or vRingbufferReturnItemFromISR(), in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

**No-Split buffers** will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. **Only this buffer type allows you to get the data item address and write to the item by yourself**. Refer the documentation of the functions xRingbufferSendAcquire() and xRingbufferSendComplete() for more details.
Allow-Split buffers will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

Note: No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

Note: Each item stored in No-Split or Allow-Split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

Usage The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))
...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when...
```
Chapter 2. API Reference

DMA_ITEM_T item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle, &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
The following example demonstrates retrieving and returning an item from a **No-Split ring buffer** using `xRingbufferReceive()` and `vRingbufferReturnItem()`

... //Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)(char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
The following example demonstrates retrieving and returning an item from an **Allow-Split ring buffer** using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

... //Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
}

(continues on next page)
The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```c
if (item2 != NULL) {
    for (int i = 0; i < item_size2; i++) {
        printf("%c", item2[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item2);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
```

The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```c
//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`

**Note:** Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.

![Diagram](Fig. 31: Sending items to No-Split or Allow-Split ring buffers)
For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is rounded up to the nearest 32-bit aligned size in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

![Diagram of sending items to byte buffers](image)

**Fig. 32: Sending items to byte buffers**

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

**Using SendAcquire and SendComplete** Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

![Diagram of SendAcquire/SendComplete items in No-Split ring buffers](image)

**Fig. 33: SendAcquire/SendComplete items in No-Split ring buffers**

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if SendComplete is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using SendAcquire or SendComplete since acquired buffers are required to be complete (not wrapped).
Wrap around  The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.

No-Split buffers will only store an item in continuous free space and will not split an item under any circumstances. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Note: Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

Byte buffers will store as much data as possible into the free space at the tail of buffer. The remaining data will
then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

![Fig. 37: Retrieving/Returning items in No-Split and Allow-Split ring buffers](image)

Items in No-Split buffers and Allow-Split buffers are retrieved in strict FIFO order and must be returned for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the 16, 20, and 8 byte items are retrieved in FIFO order. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

![Fig. 38: Retrieving/Returning data in byte buffers](image)

Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.
Ring Buffers with Queue Sets  Ring buffers can be added to FreeRTOS queue sets using \texttt{xRingbufferAddToQueueSetRead()} such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to \texttt{xQueueSelectFromSet()}. To check whether the selected queue set member is the ring buffer, call \texttt{xRingbufferCanRead()}.  

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item
    ...
} else {
    ...
}
```

Ring Buffers with Static Allocation  The \texttt{xRingbufferCreateStatic()} can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the \texttt{xRingbufferCreateStatic()} to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type \texttt{StaticRingbuffer_t}
- The ring buffer’s storage area of size \texttt{xBufferSize}. Note that \texttt{xBufferSize} must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

\textbf{Note:} When deleting a ring buffer created via \texttt{xRingbufferCreateStatic()}, the function \texttt{vRingbufferDelete()} will not free any of the memory blocks. This must be done manually by the user after \texttt{vRingbufferDelete()} is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.
Priority Inversion  Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second-highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

ESP-IDF Tick and Idle Hooks

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the `void vApplicationTickHook( void )` callback.
- FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following draw backs:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each CPU’s tick interrupt and idle tasks ends up calling the same hook.
Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per CPU)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each CPU

ESP-IDF hooks can be registered and deregistered using the following API:

For tick hooks:
- Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()`
- Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`

For idle hooks:
- Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()`
- Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`

Note: The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the SPI flash API documentation for more details.

**TLSP Deletion Callbacks**

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task’s TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task’s TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task’s lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves:

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP’s associated Deletion Callback to NULL meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible
- The callback is called shortly before a deleted task’s memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

**Component Specific Properties**

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:
Chapter 2. API Reference

- **ORIG_INCLUDE_PATH** - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

### API Reference

#### Ring Buffer API

### Header File

- components/esp_ringbuf/include/freertos/ringbuf.h

### Functions

**`RingbufHandle_t xRingbufferCreate`**

Create a ring buffer.

**Parameters**

- `xBuffSize` **[in]** Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- `xBuffType` **[in]** Type of ring buffer, see documentation.

**Returns** A handle to the created ring buffer, or NULL in case of error.

**`RingbufHandle_t xRingbufferCreateNoSplit`**

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

**Parameters**

- `xItemSize` **[in]** Size of each item to be put into the ring buffer
- `xItemNum` **[in]** Maximum number of items the buffer needs to hold simultaneously

**Returns** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

**`RingbufHandle_t xRingbufferCreateStatic`**

Create a ring buffer but manually provide the required memory.

**Parameters**

- `xBuffSize` **[in]** Size of the buffer in bytes.
- `xBuffType` **[in]** Type of ring buffer, see documentation
- `pucRingbufferStorage` **[in]** Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by xBufferSize
- `pxStaticRingbuffer` **[in]** Pointer to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**Returns** A handle to the created ring buffer

**Note:** xBuffSize of no-split/allow-split buffers MUST be 32-bit aligned.

**`BaseType_t xRingbufferSend`**

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.
Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters
- `xRingbuffer` - [in] Ring buffer to insert the item into
- `pvItem` - [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- `xItemSize` - [in] Size of data to insert.
- `xTicksToWait` - [in] Ticks to wait for room in the ring buffer.

Returns
- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t `xRingbufferSendFromISR` (RingbufHandle_t `xRingbuffer`, const void *pvItem, size_t `xItemSize`, BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters
- `xRingbuffer` - [in] Ring buffer to insert the item into
- `pvItem` - [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- `xItemSize` - [in] Size of data to insert.
- `pxHigherPriorityTaskWoken` - [out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

Returns
- `pdTRUE` if succeeded
- `pdFALSE` when the ring buffer does not have space.

BaseType_t `xRingbufferSendAcquire` (RingbufHandle_t `xRingbuffer`, void **ppvItem, size_t `xItemSize`, TickType_t `xTicksToWait`)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note: Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters
- `xRingbuffer` - [in] Ring buffer to allocate the memory
- `ppvItem` - [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- `xItemSize` - [in] Size of item to acquire.
- `xTicksToWait` - [in] Ticks to wait for room in the ring buffer.

Returns
Chapter 2. API Reference

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

```
BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)
```
Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

**Note:** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

**Parameters**
- `xRingbuffer` - [in] Ring buffer to insert the item into
- `pvItem` - [in] Pointer to item in allocated memory to insert.

**Returns**
- pdTRUE if succeeded
- pdFALSE if fail for some reason.

```
void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
```
Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note:** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Parameters**
- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `pxItemSize` - [out] Pointer to a variable to which the size of the retrieved item will be written.
- `xTicksToWait` - [in] Ticks to wait for items in the ring buffer.

**Returns**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

```
void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)
```
Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval.

**Note:** A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

**Note:** Byte buffers do not allow multiple retrievals before returning an item

**Note:** Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

**Parameters**
- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `pxItemSize` - [out] Pointer to a variable to which the size of the retrieved item will be written.
Chapter 2. API Reference

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

BaseType_t xRingbufferReceiveSplit (RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note: Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters

- **xRingbuffer** – [in] Ring buffer to retrieve the item from
- **ppvHeadItem** – [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** – [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** – [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** – [out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** – [in] Ticks to wait for items in the ring buffer.

Returns

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

BaseType_t xRingbufferReceiveSplitFromISR (RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

Note: Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters

- **xRingbuffer** – [in] Ring buffer to retrieve the item from
- **ppvHeadItem** – [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** – [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** – [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** – [out] Pointer to size of second part (unmodified if item is not split)
void *xRingbufferReceiveUpTo (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

**Note:** A call to vRingbufferReturnItem() is required after this to free up the data retrieved.

**Note:** This function should only be called on byte buffers

**Note:** Byte buffers do not allow multiple retrievals before returning an item

**Note:** Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

---

**Parameters**

- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `pxItemSize` - [out] Pointer to a variable to which the size of the retrieved item will be written.
- `xTicksToWait` - [in] Ticks to wait for items in the ring buffer.
- `xMaxSize` - [in] Maximum number of bytes to return.

**Returns**

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

void *xRingbufferReceiveUpToFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

**Note:** A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

**Note:** This function should only be called on byte buffers

**Note:** Byte buffers do not allow multiple retrievals before returning an item

---

**Parameters**

- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `pxItemSize` - [out] Pointer to a variable to which the size of the retrieved item will be written.
- `xMaxSize` - [in] Maximum number of bytes to return.

**Returns**

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
• NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void vRingbufferReturnItem(RingbufHandle_t xRingbuffer, void *pvItem)
Return a previously-retrieved item to the ring buffer.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• xRingbuffer –[in] Ring buffer the item was retrieved from
• pvItem –[in] Item that was received earlier

void vRingbufferReturnItemFromISR(RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)
Return a previously-retrieved item to the ring buffer from an ISR.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• xRingbuffer –[in] Ring buffer the item was retrieved from
• pvItem –[in] Item that was received earlier
• pxHigherPriorityTaskWoken –[out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void vRingbufferDelete(RingbufHandle_t xRingbuffer)
Delete a ring buffer.

Note: This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually by the user.

Parameters xRingbuffer –[in] Ring buffer to delete

size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer)
Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note: The max item size for a no-split buffer is limited to ((buffer_size/2)-header_size). This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Parameters xRingbuffer –[in] Ring buffer to query
Returns Maximum size, in bytes, of an item that can be placed in a ring buffer.

size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)
Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Note: An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2)-header_size). See API reference for xRingbufferGetMaxItemSize().
Warning: This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

Parameters  
**xRingbuffer**  - [in] Ring buffer to query  
  
**Returns**  Current free size, in bytes, available for an entry  

BaseType_t  **xRingbufferAddToQueueSetRead** (RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)  
Add the ring buffer’s read semaphore to a queue set.  
The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.  

Parameters  
• **xRingbuffer**  - [in] Ring buffer to add to the queue set  
• **xQueueSet**  - [in] Queue set to add the ring buffer’s read semaphore to  
  
**Returns**  
• pdTRUE on success, pdFALSE otherwise  

BaseType_t  **xRingbufferCanRead** (RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)  
Check if the selected queue set member is the ring buffer’s read semaphore.  
This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.  

Parameters  
• **xRingbuffer**  - [in] Ring buffer which should be checked  
• **xMember**  - [in] Member returned from xQueueSelectFromSet  
  
**Returns**  
• pdTRUE when semaphore belongs to ring buffer  
• pdFALSE otherwise.  

BaseType_t  **xRingbufferRemoveFromQueueSetRead** (RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)  
Remove the ring buffer’s read semaphore from a queue set.  
This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer  

Parameters  
• **xRingbuffer**  - [in] Ring buffer to remove from the queue set  
• **xQueueSet**  - [in] Queue set to remove the ring buffer’s read semaphore from  
  
**Returns**  
• pdTRUE on success  
• pdFALSE otherwise  

void  **vRingbufferGetInfo** (RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)  
Get information about ring buffer status.  
Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.  

Parameters  
• **xRingbuffer**  - [in] Ring buffer to remove from the queue set  
• **uxFree**  - [out] Pointer use to store free pointer position  
• **uxRead**  - [out] Pointer use to store read pointer position  
• **uxWrite**  - [out] Pointer use to store write pointer position  
• **uxAcquire**  - [out] Pointer use to store acquire pointer position
• **uxItemsWaiting** – [out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```

Debugging function to print the internal pointers in the ring buffer.

**Parameters**

- **xRingbuffer** – Ring buffer to show

### Structures

```c
struct xSTATIC_RINGBUFFER
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

### Type Definitions

```c
typedef void *RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

### Enumerations

```c
enum RingbufferType_t
```

**Values:**

- **RINGBUF_TYPE_NOSPLIT**
  
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_ALLOWSPLIT**
  
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_BYTEBUF**
  
  Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

- **RINGBUF_TYPE_MAX**

### Hooks API
Chapter 2. API Reference

Header File

- components/esp_system/include/esp_freertos_hooks.h

Functions

**esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)**

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**
- **new_idle_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

**Returns**
- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

**esp_err_t esp_register_freertos_idle_hook(esp_freertos_idle_cb_t new_idle_cb)**

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**
- **new_idle_cb** –[in] Callback to be called

**Returns**
- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

**esp_err_t esp_register_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)**

Register a callback to be called from the specified core’s tick hook.

**Parameters**
- **new_tick_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

**Returns**
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

**esp_err_t esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)**

Register a callback to be called from the calling core’s tick hook.

**Parameters**
- **new_tick_cb** –[in] Callback to be called

**Returns**
- ESP_OK: Callback registered to the calling core’s tick hook
• ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

```c
void esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)
```

Unregister an idle callback from the idle hook of the specified core.

**Parameters**
- `old_idle_cb` [in] Callback to be unregistered
- `cpuid` [in] id of the core

```c
void esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)
```

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters**
- `old_idle_cb` [in] Callback to be unregistered

```c
void esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)
```

Unregister a tick callback from the tick hook of the specified core.

**Parameters**
- `old_tick_cb` [in] Callback to be unregistered
- `cpuid` [in] id of the core

```c
void esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)
```

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters**
- `old_tick_cb` [in] Callback to be unregistered

---

**Type Definitions**

```c
typedef bool (*esp_freertos_idle_cb_t)(void)

typedef void (*esp_freertos_tick_cb_t)(void)
```

---

**2.10.11 Heap Memory Allocation**

**Stack and Heap**

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, **DMA-Capable Memory** or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.
Chapter 2. API Reference

Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM** (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM** (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be **32-bit aligned**.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see *Memory Types*.

It’s also possible to connect external SPI RAM to the ESP32 - **external RAM** can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability **MALLOC_CAP_8BIT** (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because malloc uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

**Note:** Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

**Heap Sizes** At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>I (252)</th>
<th>heap_init: Initializing. RAM available for dynamic allocation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>I (259)</td>
<td>heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM</td>
</tr>
<tr>
<td>I (265)</td>
<td>heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM</td>
</tr>
<tr>
<td>I (272)</td>
<td>heap_init: At 3FFE0440 len 0003AE0 (14 KiB): D/IRAM</td>
</tr>
<tr>
<td>I (278)</td>
<td>heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM</td>
</tr>
<tr>
<td>I (284)</td>
<td>heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM</td>
</tr>
</tbody>
</table>

**Finding available heap** See *Heap Information*.

Chapter 2. API Reference

Special Capabilities

DMA-Capable Memory  Use the MALLOC_CAP_DMA flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory  If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the MALLOC_CAP_32BIT flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with MALLOC_CAP_32BIT can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory  When external RAM is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via heap_caps_malloc(MALLOC_CAP_SPIRAM), depending on configuration. See Configuring External RAM for more details.

To use the region above the 4MiB limit, you can use the himem API.

API Reference - Heap Allocation

Header File

- components/heap/include/esp_heap_caps.h

Functions

esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)

registers a callback function to be invoked if a memory allocation operation fails

**Parameters**

- callback callee defined callback to be invoked

**Returns**

ESP_OK if callback was registered.

void *heap_caps_malloc (size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, malloc(p) is equivalent to heap_caps_malloc(p, MALLOC_CAP_8BIT).

**Parameters**

- size Size, in bytes, of the amount of memory to allocate
- caps Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns**

A pointer to the memory allocated on success, NULL on failure

void heap_caps_free (void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

**Parameters**

- ptr Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void *heap_caps_realloc (void *ptr, size_t size, uint32_t caps)

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).
‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

**Parameters**
- **ptr** – Pointer to previously allocated memory, or NULL for a new allocation.
- **size** – Size of the new buffer requested, or 0 to free the buffer.
- **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

**Returns** Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

`void *heap_caps_aligned_alloc (size_t alignment, size_t size, uint32_t caps)`
Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

**Parameters**
- **alignment** – How the pointer received needs to be aligned must be a power of two
- **size** – Size, in bytes, of the amount of memory to allocate
- **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure

`void heap_caps_aligned_free (void *ptr)`
Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

**Note:** This function is deprecated, please consider using heap_caps_free() instead

**Parameters**
- **ptr** – Pointer to the memory allocated

`void *heap_caps_alignedcalloc (size_t alignment, size_t n, size_t size, uint32_t caps)`
Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**Parameters**
- **alignment** – How the pointer received needs to be aligned must be a power of two
- **n** – Number of continuing chunks of memory to allocate
- **size** – Size, in bytes, of a chunk of memory to allocate
- **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure

`void *heap_caps_calloc (size_t n, size_t size, uint32_t caps)`
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

**Parameters**
- **n** – Number of continuing chunks of memory to allocate
- **size** – Size, in bytes, of a chunk of memory to allocate
- **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure

`size_t heap_caps_get_total_size (uint32_t caps)`
Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.
Parameters`caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns total size in bytes

`size_t heap_caps_get_free_size(uint32_t caps)`

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

**Note:** Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

Parameters`caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Amount of free bytes in the regions

`size_t heap_caps_get_minimum_free_size(uint32_t caps)`

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

**Note:** Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

Parameters`caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Amount of free bytes in the regions

`size_t heap_caps_get_largest_free_block(uint32_t caps)`

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

Parameters`caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Size of the largest free block in bytes.

`void heap_caps_get_info(multi_heap_info_t *info, uint32_t caps)`

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**
- `info` – Pointer to a structure which will be filled with relevant heap metadata.
- `caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`void heap_caps_print_heap_info(uint32_t caps)`

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**`caps` – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`bool heap_caps_check_integrity_all(bool print_errors)`

Check integrity of all heap memory in the system.

Calls `multi_heap_check()` on all heaps. Optionally print errors if heaps are corrupt.
Chapter 2. API Reference

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

**Parameters**
- `print_errors` - Print specific errors if heap corruption is found.

**Returns**
- True if all heaps are valid, False if at least one heap is corrupt.

bool heap_caps_check_integrity (uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

**Parameters**
- `caps` - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- `print_errors` - Print specific errors if heap corruption is found.

**Returns**
- True if all heaps are valid, False if at least one heap is corrupt.

bool heap_caps_check_integrity_addr (intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note:** The entire heap region around the address is checked, not only the adjacent heap blocks.

**Parameters**
- `addr` - Address in memory. Check for corruption in region containing this address.
- `print_errors` - Print specific errors if heap corruption is found.

**Returns**
- True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

void heap_caps_malloc_extmem_enable (size_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**
- `limit` - Limit, in bytes.

void *heapp_caps_malloc_prefer (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**Parameters**
- `size` - Size, in bytes, of the amount of memory to allocate
- `num` - Number of variable parameters

**Returns** A pointer to the memory allocated on success, NULL on failure
void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

**Parameters**
- **ptr** – Pointer to previously allocated memory, or NULL for a new allocation.
- **size** – Size of the new buffer requested, or 0 to free the buffer.
- **num** – Number of variable parameters

**Returns** Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

void *heap_caps_calloc_prefer (size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Parameters**
- **n** – Number of continuing chunks of memory to allocate
- **size** – Size, in bytes, of a chunk of memory to allocate
- **num** – Number of variable parameters

**Returns** A pointer to the memory allocated on success, NULL on failure

void heap_caps_dump (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

**Parameters caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_dump_all (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t heap_caps_get_allocated_size (void *ptr)

Return the size that a particular pointer was allocated with.

---

**Note:** The app will crash with an assertion failure if the pointer is not valid.

**Parameters ptr** – Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

**Returns** Size of the memory allocated at this block.

**Macros**

**MALLOC_CAP_EXEC**

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

**MALLOC_CAP_32BIT**

Memory must allow for aligned 32-bit data accesses.
Chapter 2. API Reference

MALLOC_CAP_8BIT
Memory must allow for 8/16/…-bit data accesses.

MALLOC_CAP_DMA
Memory must be able to accessed by DMA.

MALLOC_CAP_PID2
Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3
Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4
Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5
Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6
Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7
Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM
Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT
Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION

MALLOC_CAP_RTCRAM
Memory must be in RTC fast memory.

MALLOC_CAP_INVALID
Memory can’t be used / list end marker.

Type Definitions

typedef void (esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
callback called when an allocation operation fails, if registered

Param size in bytes of failed allocation
Thread Safety

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- Heap Information (free space, etc.)
- Heap Corruption Detection
- Heap Tracing (memory leak detection, monitoring, etc.)

API Reference - Initialisation

Header File

- components/heap/include/esp_heap_caps_init.h

Functions

void heap_caps_init (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void heap_caps_enable_nonos_stack_heaps (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can’t be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

Note: Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):
Chapter 2. API Reference

| Existing region: 0x1000 <-> 0x3000 |
| New region: 0x1000 <-> 0x3000 (Allowed) |
| New region: 0x1000 <-> 0x2000 (Allowed) |
| New region: 0x0000 <-> 0x1000 (Allowed) |
| New region: 0x3000 <-> 0x4000 (Allowed) |
| New region: 0x0000 <-> 0x2000 (NOT Allowed) |
| New region: 0x0000 <-> 0x4000 (NOT Allowed) |
| New region: 0x1000 <-> 0x4000 (NOT Allowed) |
| New region: 0x2000 <-> 0x4000 (NOT Allowed) |

Parameters
- **start** – Start address of new region.
- **end** – End address of new region.

Returns
- ESP_OK on success,
- ESP_ERR_INVALID_ARG if a parameter is invalid,
- ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

```c
esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)
```

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

Note:
Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

| Existing region: 0x1000 <-> 0x3000 |
| New region: 0x1000 <-> 0x3000 (Allowed) |
| New region: 0x1000 <-> 0x2000 (Allowed) |
| New region: 0x0000 <-> 0x1000 (Allowed) |
| New region: 0x3000 <-> 0x4000 (Allowed) |
| New region: 0x0000 <-> 0x4000 (NOT Allowed) |
| New region: 0x1000 <-> 0x4000 (NOT Allowed) |
| New region: 0x2000 <-> 0x4000 (NOT Allowed) |

Parameters
- **caps** – Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start** – Start address of new region.
- **end** – End address of new region.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.
Each contiguous region of memory contains its own memory heap. The heaps are created using the `multi_heap` functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling `multi_heap_malloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular `multi_heap` instance.

**API Reference - Multi Heap API**

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- `components/heap/include/multi_heap.h`

Functions

```c
void* multi_heap_aligned_alloc(multi_heap_handle_t heap, size_t size, size_t alignment)
```

allocate a chunk of memory with specific alignment

**Parameters**
- `heap` - Handle to a registered heap.
- `size` - size in bytes of memory chunk
- `alignment` – how the memory must be aligned

**Returns** pointer to the memory allocated, NULL on failure

```c
void* multi_heap_malloc(multi_heap_handle_t heap, size_t size)
```

malloc() a buffer in a given heap

Semantics are the same as standard `malloc()`, only the returned buffer will be allocated in the specified heap.

**Parameters**
- `heap` - Handle to a registered heap.
- `size` - Size of desired buffer.

**Returns** Pointer to new memory, or NULL if allocation fails.

```c
void multi_heap_aligned_free(multi_heap_handle_t heap, void*p)
```

free() a buffer aligned in a given heap.

**Note:** This function is deprecated, consider using `multi_heap_free()` instead

```c
void multi_heap_free(multi_heap_handle_t heap, void*p)
```

free() a buffer in a given heap.

Semantics are the same as standard `free()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**
- `heap` - Handle to a registered heap.
• \texttt{p} – NULL, or a pointer previously returned from \texttt{multi_heap_malloc()} or \texttt{multi_heap_realloc()} for the same heap.

\begin{verbatim}
void *\texttt{multi_heap_realloc} (\texttt{multi_heap_handle_t} heap, void *p, size_t size)
\end{verbatim}

\texttt{multi_heap_realloc()} reallo() a buffer in a given heap.

Semantics are the same as standard \texttt{realloc()}, only the argument \texttt{‘p’} must be NULL or have been allocated in the specified heap.

\textbf{Parameters}
- \texttt{heap} – Handle to a registered heap.
- \texttt{p} – NULL, or a pointer previously returned from \texttt{multi_heap_malloc()} or \texttt{multi_heap_realloc()} for the same heap.
- \texttt{size} – Desired new size for buffer.

\textbf{Returns} New buffer of \texttt{‘size’} containing contents of \texttt{‘p’}, or NULL if reallocation failed.

\begin{verbatim}
size_t \texttt{multi_heap_get_allocated_size} (\texttt{multi_heap_handle_t} heap, void *p)
\end{verbatim}

Return the size that a particular pointer was allocated with.

\textbf{Parameters}
- \texttt{heap} – Handle to a registered heap.
- \texttt{p} – Pointer, must have been previously returned from \texttt{multi_heap_malloc()} or \texttt{multi_heap_realloc()} for the same heap.

\textbf{Returns} Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

\begin{verbatim}
\texttt{multi_heap_handle_t} \texttt{multi_heap_register} (void *start, size_t size)
\end{verbatim}

\texttt{multi_heap_register()} register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations. There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

\textbf{Parameters}
- \texttt{start} – Start address of the memory to use for a new heap.
- \texttt{size} – Size (in bytes) of the new heap.

\textbf{Returns} Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

\begin{verbatim}
void \texttt{multi_heap_set_lock} (\texttt{multi_heap_handle_t} heap, void *lock)
\end{verbatim}

\texttt{multi_heap_set_lock()} associate a private lock pointer with a heap.

The lock argument is supplied to the \texttt{MULTI_HEAP_LOCK()} and \texttt{MULTI_HEAP_UNLOCK()} macros, defined in \texttt{multi_heap_platform.h}.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

\textbf{Parameters}
- \texttt{heap} – Handle to a registered heap.
- \texttt{lock} – Optional pointer to a locking structure to associate with this heap.

\begin{verbatim}
void \texttt{multi_heap_dump} (\texttt{multi_heap_handle_t} heap)
\end{verbatim}

\texttt{multi_heap_dump()} dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

\textbf{Parameters} \texttt{heap} – Handle to a registered heap.

\begin{verbatim}
bool \texttt{multi_heap_check} (\texttt{multi_heap_handle_t} heap, bool print_errors)
\end{verbatim}

\texttt{multi_heap_check()} check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining \texttt{MULTI_CHECK_FAIL_PRINTF} in \texttt{multi_heap_platform.h}.
## Parameters
- `heap` - Handle to a registered heap.
- `print_errors` - If true, errors will be printed to stderr.

## Returns
- `true` if heap is valid, `false` otherwise.

```
size_t multi_heap_free_size (multi_heap_handle_t heap)
```

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

**Parameters**
- `heap` - Handle to a registered heap.

**Returns**
- Number of free bytes.

```
size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)
```

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime “low watermark” of possible values returned from `multi_free_heap_size()`, for the specified heap.

**Parameters**
- `heap` - Handle to a registered heap.

**Returns**
- Number of free bytes.

```void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)`
```

Return metadata about a given heap.

Fills a `multi_heap_info_t` structure with information about the specified heap.

**Parameters**
- `heap` - Handle to a registered heap.
- `info` - Pointer to a structure to fill with heap metadata.

## Structures

```struct multi_heap_info_t```

Structure to access heap metadata via `multi_heap_get_info`.

## Public Members

```size_t total_free_bytes```

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

```size_t total_allocated_bytes```

Total bytes allocated to data in the heap.

```size_t largest_free_block```

Size of the largest free block in the heap. This is the largest `malloc`-able size.

```size_t minimum_free_bytes```

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.
size_t allocated_blocks
Number of (variable size) blocks allocated in the heap.

size_t free_blocks
Number of (variable size) free blocks in the heap.

size_t total_blocks
Total number of (variable size) blocks in the heap.

Type Definitions
typedef struct multi_heap_info *multi_heap_handle_t
Opaque handle to a registered heap.

2.10.12 Heap Memory Debugging

Overview
ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the Heap Memory Allocation page.

Heap Information

To obtain information about the state of the heap:

• xPortGetFreeHeapSize() is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling heap_caps_get_free_size(MALLOC_CAP_8BIT).
• heap_caps_get_free_size() can also be used to return the current free memory for different memory capabilities.
• heap_caps_get_largest_free_block() can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
• xPortGetMinimumEverFreeHeapSize() and the related heap_caps_get_minimum_free_size() can be used to track the heap “low watermark” since boot.
• heap_caps_get_info() returns a multi_heap_info_t structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
• heap_caps_print_heap_info() prints a summary to stdout of the information returned by heap_caps_get_info().
• heap_caps_dump() and heap_caps_dump_all() will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

• Out of bounds writes & buffer overflow.
• Writes to freed memory.
• Reads from freed or uninitialized memory.
**Assertions**  The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL.

If a heap integrity assertion fails, a line will be printed like CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling heap_caps_check_integrity_all() or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

**Memory Allocation Failed Hook**  Users can use heap_caps_register_failed_alloc_callback() to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS).

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char *function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

**Finding Heap Corruption**  Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to heap_caps_check_integrity_all() or heap_caps_check_integrity_addr() in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via esp_cpu_set_watchpoint(). A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE). Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
• For buffer overflows, **heap tracing** in **HEAP_TRACE_ALL** mode lets you see which callers are allocating which addresses from the heap. See [Heap Tracing To Find Heap Corruption](#) for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
• Calling **heap_caps_dump()** or **heap_caps_dump_all()** can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under **Component config** there is a menu **Heap memory debugging**. The setting **CONFIG_HEAP_CORRUPTION_DETECTION** can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling **heap_caps_check_integrity()** in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time **free()** is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When **heap_caps_check_integrity()** is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.
Crashes in Comprehensive Mode  If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode  Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks  If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the xPortGetFreeHeapSize(), heap_caps_get_free_size(), or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see CONFIG_HEAP_TRACING_DEST).
- Call the function heap_trace_init_standalone() early in the program, to register a buffer which can be used to record the memory trace.
• Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
• Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
• Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"
#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in
        → internal RAM
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 count 0x2e9b7384 caller...
    → 0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./
    → blink.c:27
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 count 0x2e9b79c0 caller...
    → 0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./
    → blink.c:29
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

• XX bytes is the number of bytes allocated
• @ 0x... is the heap address returned from malloc/calloc.
Chapter 2. API Reference

- CPU x is the CPU (0 or 1) running when the allocation was made.
- cc0unt 0x... is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging -> Enable heap tracing -> Heap tracing stack depth. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each heap_trace_record_t record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

**Host-Based Mode**  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> CONFIG_HEAP_TRACING_DEST and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> CONFIG_APPTRACE_DESTINATION1 and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable CONFIG_APPTRACE_SV_ENABLE.
- Call the function heap_trace_init_tohost() early in the program, to initialize JTAG heap tracing module.
- Call the function heap_trace_start() to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like HEAP_TRACE_ALL was passed: all allocations and deallocations are sent to the host.
- Call the function heap_trace_stop() to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"

...

void app_main()
{
  ...
  ESP_ERROR_CHECK( heap_trace_init_tohost() );
  ...
}

void some_function()
{
  ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
  do_something_you_suspect_is_leaking();
  ESP_ERROR_CHECK( heap_trace_stop() );
  ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).
3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```plaintext
target remote :3333
mon reset halt
flushregs
tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end
tb heap_trace_stop
commands
mon esp sysview stop
c
```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:

   ```bash
   xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>
   ```

5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`

6. Run processing script:

   ```bash
   $IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b</path/to/program/elf> /tmp/heap_log.svdat
   ```

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from ['/tmp/heap.svdat']...

(continues on next page)
Heap Tracing To Find Heap Corruption  
Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact  
Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks  
Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- `components/heap/include/esp_heap_trace.h`

Functions
**esp_err_t heap_trace_init_standalone** *(heap_trace_record_t *record_buffer, size_t num_records)*

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call

`heap_trace_init_standalone(NULL, 0);`

**Parameters**

- **record_buffer** – Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- **num_records** – Size of the heap trace buffer, as number of record structures.

**Returns**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**esp_err_t heap_trace_init_tohost** *(void)*

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Returns**

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**esp_err_t heap_trace_start** *(heap_trace_mode_t mode)*

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

**Note:** `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

**Note:** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Parameters**

- **mode** – Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

**Returns**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- ESP_OK Tracing is started.

**esp_err_t heap_trace_stop** *(void)*

Stop heap tracing.

**Returns**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped.

**esp_err_t heap_trace_resume** *(void)*

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.
The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

**Returns**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

```c
size_t heap_trace_get_count (void)
```

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

```c
esp_err_t heap_trace_get (size_t index, heap_trace_record_t *record)
```

Return a raw record from the heap trace buffer.

**Note:** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

**Parameters**
- `index` – Index (zero-based) of the record to return.
- `record` – [out] Record where the heap trace record will be copied.

**Returns**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

```c
void heap_trace_dump (void)
```

Dump heap trace record data to stdout.

**Note:** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

**Structures**

```c
struct heap_trace_record_t
```

Trace record data type. Stores information about an allocated region of memory.

**Public Members**

```c
uint32_t ccount
```

CACCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

```c
void *address
```

Address which was allocated.

```c
size_t size
```

Size of the allocation.
void *\texttt{allocated\_by}[][\texttt{CONFIG\_HEAP\_TRACING\_STACK\_DEPTH}]
Call stack of the caller which allocated the memory.

void *\texttt{freed\_by}[][\texttt{CONFIG\_HEAP\_TRACING\_STACK\_DEPTH}]
Call stack of the caller which freed the memory (all zero if not freed.)

**Macros**

\texttt{CONFIG\_HEAP\_TRACING\_STACK\_DEPTH}

**Enumerations**

\begin{verbatim}
enum heap_trace_mode_t
    {
        enumerator HEAP_TRACE_ALL,
        enumerator HEAP_TRACE_LEAKS
    }
\end{verbatim}

### 2.10.13 High Resolution Timer (ESP Timer)

**Overview**

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the \texttt{CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL} option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

\texttt{esp\_timer} set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, \texttt{esp\_timer} uses a 64-bit hardware timer, where the implementation depends on the target. LAC timer is used for ESP32.

Timer callbacks can be dispatched by two methods:

- \texttt{ESP\_TIMER\_TASK}
- \texttt{ESP\_TIMER\_ISR}. Available only if \texttt{CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD} is enabled (by default disabled).

\texttt{ESP\_TIMER\_TASK}. Timer callbacks are dispatched from a high-priority \texttt{esp\_timer} task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than \texttt{esp\_timer} are running, callback dispatching will be delayed until \texttt{esp\_timer} task has a chance to run. For example, this will happen if an SPI Flash operation is in progress.

\texttt{ESP\_TIMER\_ISR}. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.
Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot esp_timer. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic esp_timer also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

**Using esp_timer APIs**

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

**Callback functions**

**Note:** Keep the callback functions as short as possible otherwise it will affect all timers.

Timer callbacks which are processed by ESP_TIMER_ISR method should not call the context switch call `- portYIELD_FROM_ISR()`, instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

**esp_timer during the light sleep**

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with `skip_unhandled_events` option will not wake up the system.

**Handling callbacks**

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has
not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after
the other without waiting for the set period. This can be bad for some applications, and the skip_unhandled_events
option was introduced to eliminate this behavior. If skip_unhandled_events is set then a periodic timer that has expired
multiple times without being able to call the callback will still result in only one callback event once processing is
possible.

Obtaining Current Time

esp_timer also provides a convenience function to obtain the time passed since start-up, with microsecond pre-
cision: esp_timer_get_time(). This function returns the number of microseconds since esp_timer was
initialized, which usually happens shortly before app_main function is called.

Unlike gettimeofday function, values returned by esp_timer_get_time():

• Start from zero after the chip wakes up from deep sleep
• Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of esp_timer APIs: system/esp_timer.

API Reference

Header File

• components/esp_timer/include/esp_timer.h

Functions

esp_err_t esp_timer_early_init (void)

Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can
be used.

Note: This function is called from startup code. Applications do not need to call this function before using
other esp_timer APIs.

Returns

• ESP_OK on success

esp_err_t esp_timer_init (void)

Initialize esp_timer library.

Note: This function is called from startup code. Applications do not need to call this function before using
other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

Returns

• ESP_OK on success
• ESP_ERR_NO_MEM if allocation has failed
• ESP_ERR_INVALID_STATE if already initialized
• other errors from interrupt allocator
Chapter 2. API Reference

**esp_err_t esp_timer_deinit (void)**

De-initialize esp_timer library.

**Note:** Normally this function should not be called from applications

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

**esp_err_t esp_timer_create (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)**

Create an esp_timer instance.

**Note:** When done using the timer, delete it with esp_timer_delete function.

**Parameters**

- **create_args** – Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** – [out] Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

**esp_err_t esp_timer_start_once (esp_timer_handle_t timer, uint64_t timeout_us)**

Start one-shot timer.

Timer should not be running when this function is called.

**Parameters**

- **timer** – timer handle created using esp_timer_create
- **timeout_us** – timer timeout, in microseconds relative to the current moment

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_start_periodic (esp_timer_handle_t timer, uint64_t period)**

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

**Parameters**

- **timer** – timer handle created using esp_timer_create
- **period** – timer period, in microseconds

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_stop (esp_timer_handle_t timer)**

Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

**Parameters**

- **timer** – timer handle created using esp_timer_create
Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

`esp_err_t esp_timer_delete(esp_timer_handle_t timer)`
Delete an esp_timer instance.
The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

Parameters
timer – timer handle allocated using esp_timer_create

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

`int64_t esp_timer_get_time(void)`
Get time in microseconds since boot.

Returns
- number of microseconds since underlying timer has been started

`int64_t esp_timer_get_next_alarm(void)`
Get the timestamp when the next timeout is expected to occur.

Returns
- Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

`int64_t esp_timer_get_next_alarm_for_wake_up(void)`
Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

Returns
- Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

`esp_err_t esp_timer_get_period(esp_timer_handle_t timer, uint64_t *period)`
Get the period of a timer.

This function fetches the timeout period of a timer.

Note: The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

Parameters
- timer – timer handle allocated using esp_timer_create
- period – memory to store the timer period value in microseconds

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

`esp_err_t esp_timer_get_expiry_time(esp_timer_handle_t timer, uint64_t *expiry)`
Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

Note: This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

Parameters
- timer – timer handle allocated using esp_timer_create
- expiry – memory to store the timeout value in microseconds

Returns
- ESP_OK on success
• ESP_ERR_INVALID_ARG if the arguments are invalid
• ESP_ERR_NOT_SUPPORTED if the timer type is periodic

`esp_err_t esp_timer_dump(FILE *stream)`

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times_armed times_triggered total_callback_run_time

where:

name — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period — period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

times_armed — number of times the timer was armed via esp_timer_start X times_triggered - number of times the callback was called total_callback_run_time - total time taken by callback to execute, across all calls

Parameters

stream — stream (such as stdout) to dump the information to

Returns

• ESP_OK on success
• ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

`void esp_timer_isr_dispatch_need_yield(void)`

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

`bool esp_timer_is_active(esp_timer_handle_t timer)`

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

Parameters

timer — timer handle created using esp_timer_create

Returns

• 1 if timer is still active
• 0 if timer is not active.

**Structures**

`struct esp_timer_create_args_t`

Timer configuration passed to esp_timer_create.

**Public Members**

`esp_timer_cb_t callback`

Function to call when timer expires.

`void *arg`

Argument to pass to the callback.

`esp_timer_dispatch_t dispatch_method`

Call the callback from task or from ISR.
const char *\texttt{name}

Timer name, used in \texttt{esp\_timer\_dump} function.

\textbf{bool \texttt{skip\_unhandled\_events}}

Skip unhandled events for periodic timers.

\section*{Type Definitions}

\texttt{typedef struct esp\_timer *\texttt{esp\_timer\_handle\_t}}

Opaque type representing a single \texttt{esp\_timer}.

\texttt{typedef void (*\texttt{esp\_timer\_cb\_t})(void *\texttt{arg})}

Timer callback function type.

\textbf{Param arg} pointer to opaque user-specific data

\section*{Enumerations}

\texttt{enum \texttt{esp\_timer\_dispatch\_t}}

Method for dispatching timer callback.

\textbf{Values:}

\begin{itemize}
  \item \texttt{ESP\_TIMER\_TASK} Callback is called from timer task.
  \item \texttt{ESP\_TIMER\_MAX} Count of the methods for dispatching timer callback.
\end{itemize}

\subsection*{2.10.14 Internal and Unstable APIs}

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

\section*{API Reference}

\subsection*{Header File}

\texttt{• components/esp\_rom/include/esp\_rom\_sys.h}

\subsection*{Functions}

\texttt{int \texttt{esp\_rom\_printf} (const char *fmt, ...)}

Print formatted string to console device.

\textbf{Note:} float and long long data are not supported!

\textbf{Parameters}

\begin{itemize}
  \item \texttt{fmt} – Format string
  \item \ldots – Additional arguments, depending on the format string
\end{itemize}

\textbf{Returns} \texttt{int}: Total number of characters written on success; A negative number on failure.
void esp_rom_delay_us (uint32_t us)
    Pauses execution for us microseconds.

Parameters

us ⚶ Number of microseconds to pause

void esp_rom_install_channel_putchar (int channel, void (*)(char)putc)
    esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

Parameters

• channel ⚶ Channel number (starting from 1)
• putc ⚶ Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

void esp_rom_install_uart_putchar (void)
    Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putchar(1, esp_rom_uart_putchar)

soc_reset_reason_t esp_rom_get_reset_reason (int cpu_no)
    Get reset reason of CPU.

Parameters

cpu_no ⚶ CPU number

Returns
Reset reason code (see in soc/reset_reasons.h)

void esp_rom_route_intr_matrix (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)
    Route peripheral interrupt sources to CPU’s interrupt port by matrix.

Usually there’re 4 steps to use an interrupt:

a. Route peripheral interrupt source to CPU, e.g. esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)
b. Set interrupt handler for CPU
c. Enable CPU interrupt
d. Enable peripheral interrupt

Parameters

• cpu_core ⚶ The CPU number, which the peripheral interrupt will inform to
• periph_intr_id ⚶ The peripheral interrupt source number
• cpu_intr_num ⚶ The CPU interrupt number

uint32_t esp_rom_get_cpu_ticks_per_us (void)
    Get the real CPU ticks per us.

Returns
CPU ticks per us

2.10.15 Inter-Processor Call

Note: The IPC is an Inter-Processor Call and NOT Inter-Process Communication as found on other operating systems.

Overview

Due to the dual core nature of the ESP32, there are instances where a certain callback must be run in the context of a particular CPU such as:

• When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU’s interrupt source as well).
• On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
• Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see High-Level Interrupts for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

**IPC in Task Context**

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU’s IPC task.

When using IPCs in a task context, users need to consider the following:

- IPC callbacks should ideally be simple and short. **An IPC callback should avoid attempting to block or yield.**
- The IPC tasks are created at the highest possible priority (i.e., `configMAX_PRIORITIES - 1`) thus the callback should also run at that priority as a result. However, `CONFIG_ESP_IPC_USES_CALLERS_PRIORITY` is enabled by default which will temporarily lower the priority of the target CPU’s IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via `CONFIG_ESP_IPC_TASK_STACK_SIZE`.
- The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

**API Usage** Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`
- The callback should avoid attempting to block or yield as this will result in the target CPU’s IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling `vTaskPrioritySet(NULL, x)`).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback’s execution has completed, or return immediately once the callback’s execution has started.

- `esp_ipc_call()` will trigger an IPC call on the target CPU. This function will block until the target CPU’s IPC task begins execution of the callback.
- `esp_ipc_call_blocking()` will trigger an IPC on the target CPU. This function will block until the target CPU’s IPC task completes execution of the callback.

**IPC in ISR Context**

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a High Priority Interrupt context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` option
- **When the callback executes:**
  - The calling CPU will disable interrupts of level 3 and lower
– Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

**API Usage**

High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
- The callback is invoked via the `CALLX0` instruction with register windowing disabled, thus the callback:
  - Must not call any register window related instructions (e.g., `entry` and `retw`).
  - Must not call other C functions as register windowing is disabled
- The callback should be placed in IRAM at a 4-byte aligned address
- (On invocation of/after returning from) the callback, the registers `a2`, `a3`, `a4` are (saved/restored) automatically thus:
  - `a2` will contain the `void *arg` of the callback
  - `a3`/`a4` are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU’s cycle count.

```assembly
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads C_COUNT of the target CPU and stores it in arg.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function

// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret

unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, -(void *arg) cycle_count);
```

**Note:** The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the `system/ipc/ipc_isr`.

**Note:** For more examples of High Priority Interrupt IPC callbacks, see `components/esp_system/port/arch/xtensa/esp_ipc_isr_routines.S` and `components/esp_system/test/test_ipc_isr.S`

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU
will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.

- `esp_ipc_isr_release_other_cpu()` resums the target CPU.

**API Reference**

**Header File**

- `components/esp_system/include/esp_ipc.h`

**Functions**

**`esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`**

Execute a callback on a given CPU.

 Execute a given callback on a particular CPU. The callback must be of type `esp_ipc_func_t` and will be invoked in the context of the target CPU’s IPC task.

- This function will block the target CPU’s IPC task has begun execution of the callback
- If another IPC call is ongoing, this function will block until the ongoing IPC call completes
- The stack size of the IPC task can be configured via the `CONFIG_ESP_IPC_TASK_STACK_SIZE` option

**Note:** In single-core mode, returns ESP_ERR_INVALID_ARG for `cpu_id` 1.

**Parameters**

- `cpu_id` - [in] CPU where the given function should be executed (0 or 1)
- `func` - [in] Pointer to a function of type `void func(void* arg)` to be executed
- `arg` - [in] Arbitrary argument of type `void*` to be passed into the function

**Returns**

- ESP_ERR_INVALID_ARG if `cpu_id` is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

**`esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`**

Execute a callback on a given CPU until and block until it completes.

This function is identical to `esp_ipc_call()` except that this function will block until the execution of the callback completes.

**Note:** In single-core mode, returns ESP_ERR_INVALID_ARG for `cpu_id` 1.

**Parameters**

- `cpu_id` - [in] CPU where the given function should be executed (0 or 1)
- `func` - [in] Pointer to a function of type `void func(void* arg)` to be executed
- `arg` - [in] Arbitrary argument of type `void*` to be passed into the function

**Returns**

- ESP_ERR_INVALID_ARG if `cpu_id` is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

**Type Definitions**
Chapter 2. API Reference

typedef void (*esp_ipc_func_t)(void *arg)

IPC Callback.

A callback of this type should be provided as an argument when calling esp_ipc_call() or esp_ipc_call_blocking().

Header File

• components/esp_system/include/esp_ipc_isr.h

Functions

void esp_ipc_isr_asm_call (esp_ipc_isr_func_t func, void *arg)

Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

• This function will busy-wait in a critical section until the other CPU has started execution of the callback
• The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

Note: This function is not available in single-core mode.

Parameters

• func −[in] Pointer to a function of type void func(void* arg) to be executed
• arg −[in] Arbitrary argument of type void* to be passed into the function

void esp_ipc_isr_asm_call_blocking (esp_ipc_isr_func_t func, void *arg)

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

Note: This function is not available in single-core mode.

Parameters

• func −[in] Pointer to a function of type void func(void* arg) to be executed
• arg −[in] Arbitrary argument of type void* to be passed into the function

void esp_ipc_isr_stall_other_cpu (void)

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

• This function is internally implemented using IPC ISR
• This function is used for DPORT workaround.
• If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

Note: This function is not available in single-core mode.
void esp_ipc_isr_release_other_cpu (void)
Release the other CPU.

This function will release the other CPU that was previously stalled from calling esp_ipc_isr_stall_other_cpu()

- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

Note: This function is not available in single-core mode.

void esp_ipc_isr_stall_pause (void)
Pause the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

void esp_ipc_isr_stall_abort (void)
Abort a CPU stall.

This function will abort any stalling routine of the other CPU due to a previous call to esp_ipc_isr_stall_other_cpu(). This function aborts the stall in a non-recoverable manner, thus should only be called in case of a panic().

- This function is used in panic handling code

void esp_ipc_isr_stall_resume (void)
Resume the CPU stall feature.

This function will resume the CPU stall feature that was previously paused by calling esp_ipc_isr_stall_pause(). Once resumed, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have effect again.

Type Definitions

typedef void (*esp_ipc_isr_func_t)(void *arg)
IPC ISR Callback.

A callback of this type should be provided as an argument when calling esp_ipc_isr_asm_call() or esp_ipc_isr_asm_call_blocking().

2.10.16 Interrupt allocation

Overview

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The esp_intr_alloc() abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc() (or esp_intr_alloc_intrstatus()). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.
This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc()` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let’s say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB’s ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

**Multicore issues**

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

**Internal peripheral interrupts**

Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in `esp_intr_alloc.h` as `ETS_INTERNAL_*_INTR_SOURCE`.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc()` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts**

The remaining interrupt sources are from external peripherals. These are defined in `soc/soc.h` as `ETS_*_INTR_SOURCE`.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.
IRAM-Safe Interrupt Handlers

The **ESP_INTR_FLAG_IRAM** flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the [SPI flash API documentation](https://github.com/espressif/esp-idf) for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the **ESP_INTR_FLAG_SHARED** flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist two ways to stop an interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt**. Please note that leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

API Reference

**Header File**

- components/esp_hw_support/include/esp_intr_alloc.h

**Functions**

`esp_err_t esp_intr_mark_shared` (int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Parameters**

- **intno** – The number of the interrupt (0-31)
- **cpu** – CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram** – Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

`esp_err_t esp_intr_reserve` (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Parameters**

- **intno** – The number of the interrupt (0-31)
- **cpu** – CPU on which the interrupt should be marked as shared (0 or 1)

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise
**esp_err_t esp_intr_alloc**(int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Parameters**

- **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** – An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg** – Optional argument for passed to the interrupt handler
- **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**

ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**esp_err_t esp_intr_alloc_intrstatus**(int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Parameters**

- **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** – An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** – The address of an interrupt status register
- **intrstatusmask** – A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg** – Optional argument for passed to the interrupt handler
- **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**

ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise
**esp_err_t esp_intr_free (intr_handle_t handle)**

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note:** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. See `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

**Parameters**

- **handle** — The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**

- ESP_ERR_INVALID_ARG if the handle is NULL
- ESP_FAIL if failed to release this handle
- ESP_OK otherwise

**int esp_intr_get_cpu (intr_handle_t handle)**

Get CPU number an interrupt is tied to.

**Parameters**

- **handle** — The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**

- The core number where the interrupt is allocated

**int esp_intr_get_intno (intr_handle_t handle)**

Get the allocated interrupt for a certain handle.

**Parameters**

- **handle** — The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**

- The interrupt number

**esp_err_t esp_intr_disable (intr_handle_t handle)**

Disable the interrupt associated with the handle.

**Note:**

- a. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
- b. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**Parameters**

- **handle** — The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**

- ESP_ERR_INVALID_ARG if the combination of arguments is invalid
- ESP_OK otherwise

**esp_err_t esp_intr_enable (intr_handle_t handle)**

Enable the interrupt associated with the handle.

**Note:**

- For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**Parameters**

- **handle** — The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**

- ESP_ERR_INVALID_ARG if the combination of arguments is invalid
- ESP_OK otherwise
**esp_err_t esp_intr_set_in_iram** \( \text{intr_handle_t handle, bool is_in_iram} \)

Set the “in IRAM” status of the handler.

**Note:** Does not work on shared interrupts.

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- **is_in_iram**: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

**Returns** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

```c
void esp_intr_noniram_disable (void)
```
Disable interrupts that aren’t specifically marked as running from IRAM.

```c
void esp_intr_noniram_enable (void)
```
Re-enable interrupts disabled by esp_intr_noniram_disable.

```c
void esp_intr_enable_source (int inum)
```
enable the interrupt source based on its number

**Parameters**
- **inum**: interrupt number from 0 to 31

```c
void esp_intr_disable_source (int inum)
```
disable the interrupt source based on its number

**Parameters**
- **inum**: interrupt number from 0 to 31

```c
static inline int esp_intr_flags_to_level (int flags)
```
Get the lowest interrupt level from the flags.

**Parameters**
- **flags**: The same flags that pass to esp_intr_alloc_intrstatus API

**Macros**

**ESP_INTR_FLAG_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

**ESP_INTR_FLAG_LEVEL2**

Accept a Level 2 interrupt vector.

**ESP_INTR_FLAG_LEVEL3**

Accept a Level 3 interrupt vector.

**ESP_INTR_FLAG_LEVEL4**

Accept a Level 4 interrupt vector.

**ESP_INTR_FLAG_LEVEL5**

Accept a Level 5 interrupt vector.

**ESP_INTR_FLAG_LEVEL6**

Accept a Level 6 interrupt vector.
ESP_INTR_FLAG_NMI
Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
Low and medium prii interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are
routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do
not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the
functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE
Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE
Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly
Chapter 2. API Reference

**ESP_INTR_ENABLE** (inum)
Enable interrupt by interrupt number

**ESP_INTR_DISABLE** (inum)
Disable interrupt by interrupt number

**Type Definitions**

typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function

typedef struct intr_handle_data_t intr_handle_data_t
Interrupt handler associated data structure

typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler

### 2.10.17 Logging library

**Overview**

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note**: The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

**How to use this library**

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char* TAG = "MyModule";
```

Then use one of the logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%. Requested: %d baud, actual: %d baud", error_→ * 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:
Chapter 2. API Reference

- ESP_LOGE - error (lowest)
- ESP_LOGW - warning
- ESP_LOGI - info
- ESP_LOGD - debug
- ESP_LOGV - verbose (highest)

Additionally, there are ESP_EARLY_LOGx versions for each of these macros, e.g. ESP_EARLY_LOGE. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP_EARLY_LOGx macros.

There are also ESP_DRAM_LOGx versions for each of these macros, e.g. ESP_DRAM_LOGE. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**Note:** Inside critical sections interrupts are disabled so it’s only possible to use ESP_DRAM_LOGx (preferred) or ESP_EARLY_LOGx. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
target_compile_definitions({${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_ 
VERBOSE")
```

To configure logging output per module at runtime, add calls to the function esp_log_level_set() as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling esp_log_level("*", level).

**Logging to Host via JTAG** By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

**Application Example**

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request
API Reference

Header File

- `components/log/include/esp_log.h`

Functions

`void esp_log_level_set (const char *tag, esp_log_level_t level)`

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Note:** Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

**Parameters**

- **tag** – Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- **level** – Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`esp_log_level_t esp_log_level_get (const char *tag)`

Get log level for a given tag, can be used to avoid expensive log statements.

**Parameters** **tag** – Tag of the log to query current level. Must be a non-NULL zero terminated string.

**Returns** The current log level for the given tag

`void esp_log_set_vprintf (vprintf_like_t func)`

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Note:** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

**Parameters** **func** – new Function used for output. Must have same signature as vprintf.

**Returns** func old Function used for output.

`uint32_t esp_log_timestamp (void)`

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Returns** timestamp, in milliseconds

`char *esp_log_system_timestamp (void)`

Function which returns system timestamp to be used in log output.
This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

**Returns** timestamp, in “HH:MM:SS.sss”

```c
uint32_t esp_log_early_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

**Returns** timestamp, in milliseconds

```c
void esp_log_write (esp_log_level_t level, const char*tag, const char*format, ...)
```

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

```c
void esp_log_writev (esp_log_level_t level, const char*tag, const char*format, va_list args)
```

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

**See also:**

esp_log_write()

**Macros**

```c
ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)
```

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

**Parameters**

- `tag` – description tag
- `buffer` – Pointer to the buffer array
- `buff_len` – length of buffer in bytes
- `level` – level of the log

```c
ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)
```

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

**Parameters**

- `tag` – description tag
- `buffer` – Pointer to the buffer array
- `buff_len` – length of buffer in bytes
- `level` – level of the log

```c
ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)
```

Dump a buffer to the log at specified level.

The dump log shows just like the one below:
It is highly recommended to use terminals with over 102 text width.

Parameters
- `tag` - description tag
- `buffer` - Pointer to the buffer array
- `buff_len` - length of buffer in bytes
- `level` - level of the log

**ESP_LOG_BUFFER_HEX**(tag, buffer, buff_len)
Log a buffer of hex bytes at Info level.

See also:
`esp_log_buffer_hex_level`

Parameters
- `tag` - description tag
- `buffer` - Pointer to the buffer array
- `buff_len` - length of buffer in bytes

**ESP_LOG_BUFFER_CHAR**(tag, buffer, buff_len)
Log a buffer of characters at Info level. Buffer should contain only printable characters.

See also:
`esp_log_buffer_char_level`

**ESP_EARLY_LOGE**(tag, format, ...)
macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See also:
`printf, ESP_LOGE, ESP_DRAM_LOGE`
In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW**(tag, format, ...)
macro to output logs in startup code at ESP_LOG_WARN level.

See also:
`ESP_EARLY_LOGE, ESP_LOGE, printf`
ESP_EARLY_LOGI (tag, format, ...)
macro to output logs in startup code at ESP_LOG_INFO level.

See also:
ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGD (tag, format, ...)
macro to output logs in startup code at ESP_LOG_DEBUG level.

See also:
ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGV (tag, format, ...)
macro to output logs in startup code at ESP_LOG_VERBOSE level.

See also:
ESP_EARLY_LOGE, ESP_LOGE, printf

__ESP_LOG_EARLY_ENABLED (log_level)

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)
ESP_LOGW (tag, format, ...)
ESP_LOGI (tag, format, ...)
ESP_LOGD (tag, format, ...)
ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)
runtime macro to output logs at a specified level.

See also:
printf

Parameters
- `tag` – tag of the log, which can be used to change the log level by esp_log_level_set at runtime.
- `level` – level of the output log.
- `format` – format of the output log. See printf
- `...` – variables to be replaced into the log. See printf

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)
runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.

See also:
printf, ESP_LOG_LEVEL
**ESP_DRAM_LOGE** (tag, format, ...)
Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", ...`, or `ESP_DRAM_LOGE(TAG, "format", ...)`, where TAG is a char* that points to a str in the DRAM.

See also:

ESP_EARLY_LOGE, the log level cannot be changed per-tag, however esp_log_level_set("*", level) will set the default level which controls these log lines also.

See also:

esp_rom_printf,ESP_LOGE

---

Note: Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

---

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

**ESP_DRAM_LOGW** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_WARN level.

See also:

ESP_DRAM_LOGW,ESP_LOGW,esp_rom_printf

**ESP_DRAM_LOGI** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See also:

ESP_DRAM_LOGI,ESP_LOGI,esp_rom_printf

**ESP_DRAM_LOGD** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See also:

ESP_DRAM_LOGD,ESP_LOGD,esp_rom_printf

**ESP_DRAM_LOGV** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See also:

ESP_DRAM_LOGV,ESP_LOGV,esp_rom_printf

---

**Type Definitions**

typedef int (*`vprintf_like_t`)(const char*, va_list)
Chapter 2. API Reference

Enumerations

**enum esp_log_level_t**

Log level.

*Values:*

- Enumerator **ESP_LOG_NONE**
  - No log output

- Enumerator **ESP_LOG_ERROR**
  - Critical errors, software module can not recover on its own

- Enumerator **ESP_LOG_WARN**
  - Error conditions from which recovery measures have been taken

- Enumerator **ESP_LOG_INFO**
  - Information messages which describe normal flow of events

- Enumerator **ESP_LOG_DEBUG**
  - Extra information which is not necessary for normal use (values, pointers, sizes, etc).

- Enumerator **ESP_LOG_VERBOSE**
  - Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.10.18 Miscellaneous System APIs

Software Reset

To perform software reset of the chip, the **esp_restart()** function is provided. When the function is called, execution of the program stops, both CPUs are reset, and the application is loaded by the bootloader and starts execution again.

Additionally, the **esp_register_shutdown_handler()** function can register a routine that will be automatically called before a restart (that is triggered by **esp_restart()**) occurs. This is similar to the functionality of **atexit** POSIX function.

Reset Reason

ESP-IDF applications can be started or restarted due to a variety of reasons. To get the last reset reason, call **esp_reset_reason()** function. See description of **esp_reset_reason_t** for the list of possible reset reasons.

Heap Memory

Two heap-memory-related functions are provided:

- **esp_get_free_heap_size()** returns the current size of free heap memory.
- **esp_get_minimum_free_heap_size()** returns the minimum size of free heap memory that has ever been available (i.e., the smallest size of free heap memory in the applications lifetime).
Chapter 2. API Reference

Note that ESP-IDF supports multiple heaps with different capabilities. The functions mentioned in this section return the size of heap memory that can be allocated using the `malloc` family of functions. For further information about heap memory, see *Heap Memory Allocation*.

**MAC Address**

These APIs allow querying and customizing MAC addresses for different supported network interfaces (e.g., Wi-Fi, Bluetooth, Ethernet).

To fetch the MAC address for a specific network interface (e.g., Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()`.

In ESP-IDF, the MAC addresses for the various network interfaces are calculated from a single *base MAC address*. By default, the Espressif base MAC address is used. This base MAC address is pre-programmed into the ESP32 eFuse in the factory during production.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address (4 universally administered, default)</th>
<th>MAC Address (2 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td><code>base_mac</code></td>
<td><code>base_mac</code></td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td><code>base_mac, +1 to the last octet</code></td>
<td><code>Local MAC</code> (derived from Wi-Fi Station MAC)</td>
</tr>
<tr>
<td>Bluetooth</td>
<td><code>base_mac, +2 to the last octet</code></td>
<td><code>base_mac, +1 to the last octet</code></td>
</tr>
<tr>
<td>Ethernet</td>
<td><code>base_mac, +3 to the last octet</code></td>
<td><code>Local MAC</code> (derived from Bluetooth MAC)</td>
</tr>
</tbody>
</table>

**Note:** The *configuration* configures the number of universally administered MAC addresses that are provided by Espressif.

**Custom Base MAC**  The default base MAC is pre-programmed by Espressif in eFuse BLK0. To set a custom base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The custom MAC address can be stored in any supported storage device (e.g., flash, NVS).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Based on the table above, users can configure the option `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC.

**Note:** It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface after network initialization. But it is recommended to use the base MAC approach documented here to avoid the possibility of the original MAC address briefly appearing on the network before being changed.

**Custom MAC Address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others — valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

**Note:** If the 3/4 coding scheme is enabled, all eFuse fields in this block must be burnt at the same time.
Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Local vs Universal MAC Addresses**  
ESP32 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The table above shows how to calculate and derive the MAC address for a specific interface according to the base MAC address. When using a custom MAC address scheme, it is possible that not all interfaces can be assigned with a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network only.

See [this article](#) for the definition of locally and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (i.e., the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

**Chip Version**

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

**SDK Version**

`esp_get_idf_version()` returns a string describing the ESP-IDF version which is used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on the ESP-IDF version.

- `ESP_IDF_VERSION_MAJOR, ESP_IDF_VERSION_MINOR, ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```c
#include "esp_idf_version.h"

#if ESP_IDF_VERSION => ESP_IDF_VERSION_VAL(4, 0, 0)
   // enable functionality present in ESP-IDF v4.0
#endif
```

**App Version**

The application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The type of the field version is string and it has a maximum length of 32 chars.

To set the version in your project manually, you need to set the `PROJECT_VER` variable in the `CMakeLists.txt` of your project. In application `CMakeLists.txt`, put `set(PROJECT_VER "0.1.0.1")` before including `project.cmake`.

If the `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise, if the `PROJECT_VER` variable is not set in the project, it will be retrieved either from the `$(PROJECT_PATH)/version.txt` file (if present) or using `git command git describe`.  

---
If neither is available, \texttt{PROJECT\_VER} will be set to "1". Application can make use of this by calling \texttt{esp\_ota\_get\_app\_description()} or \texttt{esp\_ota\_get\_partition\_description()} functions.

**API Reference**

**Header File**

- components/esp_system/include/esp_system.h

**Functions**

\begin{verbatim}
\textbf{esp\_err\_t esp\_register\_shutdown\_handler} (\texttt{shutdown\_handler\_t handle})
\end{verbatim}

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

\textbf{Parameters} \texttt{handle} – function to execute on restart

\textbf{Returns}

- ESP_OK on success
- ESP\_ERR\_INVALID\_STATE if the handler has already been registered
- ESP\_ERR\_NO\_MEM if no more shutdown handler slots are available

\begin{verbatim}
\textbf{esp\_err\_t esp\_unregister\_shutdown\_handler} (\texttt{shutdown\_handler\_t handle})
\end{verbatim}

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP\_ERR\_INVALID\_STATE if the given handler hasn’t been registered before

\begin{verbatim}
\textbf{void esp\_restart} (void)
\end{verbatim}

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW\_CPU\_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

\begin{verbatim}
\textbf{esp\_reset\_reason\_t esp\_reset\_reason} (void)
\end{verbatim}

Get reason of last reset.

\textbf{Returns} See description of esp_reset_reason_t for explanation of each value.

\begin{verbatim}
\textbf{uint32\_t esp\_get\_free\_heap\_size} (void)
\end{verbatim}

Get the size of available heap.

\textbf{Note:} Note that the returned value may be larger than the maximum contiguous block which can be allocated.

\textbf{Returns} Available heap size, in bytes.

\begin{verbatim}
\textbf{uint32\_t esp\_get\_free\_internal\_heap\_size} (void)
\end{verbatim}

Get the size of available internal heap.

\textbf{Note:} Note that the returned value may be larger than the maximum contiguous block which can be allocated.

\textbf{Returns} Available internal heap size, in bytes.
uint32_t esp_get_minimum_free_heap_size (void)
Get the minimum heap that has ever been available.

Returns Minimum free heap ever available

void esp_system_abort (const char *details)
Trigger a software abort.

Parameters details - Details that will be displayed during panic handling.

Type Definitions
typedef void (*shutdown_handler_t)(void)
Shutdown handler type

Enumerations
enum esp_reset_reason_t
Reset reasons.

Values:

enumerator ESP_RST_UNKNOWN
Reset reason can not be determined.

tenumerator ESP_RST_POWERON
Reset due to power-on event.

tenumerator ESP_RST_EXT
Reset by external pin (not applicable for ESP32)

tenumerator ESP_RST_SW
Software reset via esp_restart.

tenumerator ESP_RST_PANIC
Software reset due to exception/panic.

tenumerator ESP_RST_INT_WDT
Reset (software or hardware) due to interrupt watchdog.

tenumerator ESP_RST_TASK_WDT
Reset due to task watchdog.

tenumerator ESP_RST_WDT
Reset due to other watchdogs.

tenumerator ESP_RST_DEEPSLEEP
Reset after exiting deep sleep mode.

tenumerator ESP_RST_BROWNOUT
Brownout reset (software or hardware)

tenumerator ESP_RST_SDIO
Reset over SDIO.
Header File

- components/esp_common/include/esp_idf_version.h

Functions

const char *esp_get_idf_version (void)

Return full IDF version string, same as ‘git describe’ output.

Note: If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

Returns constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR
Major version number (X.x.x)

ESP_IDF_VERSION_MINOR
Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH
Patch version number (x.X.X)

ESP_IDF_VERSION_VAL (major, minor, patch)
Macro to convert IDF version number into an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

ESP_IDF_VERSION
Current IDF version, as an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

Header File

- components/esp_hw_support/include/esp_mac.h

Functions

esp_err_t esp_base_mac_addr_set (const uint8_t *mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

Note: Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

Note: If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions.
Chapter 2. API Reference

Parameters `mac` - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

Returns ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

```c
esp_err_t esp_base_mac_addr_get (uint8_t *mac)
```

Return base MAC address which is set using `esp_base_mac_addr_set()`.

**Note:** If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

Parameters `mac` - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)

Returns ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC base MAC address has not been set

```c
esp_err_t esp_efuse_mac_get_custom (uint8_t *mac)
```

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see `esp_base_mac_addr_set()` for details.

**Note:** This function is currently only supported on ESP32.

```c
esp_err_t esp_efuse_mac_get_default (uint8_t *mac)
```

Return base MAC address which is factory-programmed by Espressif in EFUSE.

```c
esp_err_t esp_read_mac (uint8_t *mac, esp_mac_type_t type)
```

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using `esp_base_mac_addr_get()`. Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

**Parameters**

- `mac` - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4)
- `type` - Type of MAC address to return

**Returns** ESP_OK on success

```c
esp_err_t esp_derive_local_mac (uint8_t *local_mac, const uint8_t *universal_mac)
```

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the “locally...”
administered” bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

**Parameters**
- `local_mac` – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48
  8 bytes for EUI-64 (used for IEEE 802.15.4)
- `universal_mac` – Source universal MAC address, length: 6 bytes.

**Returns** ESP_OK on success

**Macros**

MAC2STR (a)

MACSTR

**Enumerations**

enum *esp_mac_type_t*

Values:

enumerator ESP_MAC_WIFI_STA

enumerator ESP_MAC_WIFI_SOFTAP

enumerator ESP_MAC_BT

enumerator ESP_MAC_ETH

enumerator ESP_MAC_IEEE802154

**Header File**

- components/esp_hwsupport/include/esp_chip_info.h

**Functions**

void *esp_chip_info* (esp_chip_info_t *out_info)

Fill an `esp_chip_info_t` structure with information about the chip.

**Parameters**

`out_info` – [out] structure to be filled

**Structures**

struct *esp_chip_info_t*

The structure represents information about the chip.

**Public Members**

`esp_chip_model_t model`

chip model, one of `esp_chip_model_t`

Espressif Systems 1943

Submit Document Feedback
```c
uint32_t features
    bit mask of CHIP_FEATURE_x feature flags

uint16_t revision
    chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

uint8_t cores
    number of CPU cores
```

**Macros**

- **CHIP_FEATURE_EMB_FLASH**
  Chip has embedded flash memory.

- **CHIP_FEATURE_WIFI_BGN**
  Chip has 2.4GHz WiFi.

- **CHIP_FEATURE_BLE**
  Chip has Bluetooth LE.

- **CHIP_FEATURE_BT**
  Chip has Bluetooth Classic.

- **CHIP_FEATURE_IEEE802154**
  Chip has IEEE 802.15.4.

- **CHIP_FEATURE_EMB_PSRAM**
  Chip has embedded psram.

**Enumerations**

```c
enum esp_chip_model_t
    Chip models.

Values:

enumerator CHIP_ESP32
    ESP32.

enumerator CHIP_ESP32S2
    ESP32-S2.

enumerator CHIP_ESP32S3
    ESP32-S3.

enumerator CHIP_ESP32C3
    ESP32-C3.

enumerator CHIP_ESP32H2
    ESP32-H2.
```
Chapter 2. API Reference

enumerator CHIP_ESP32C2

ESP32-C2.

**Header File**

- components/esp_hw_support/include/esp_cpu.h

**Functions**

void esp_cpu_stall (int core_id)

Stall a CPU core.

**Parameters**

- core_id – The core’s ID

void esp_cpu_unstall (int core_id)

Resume a previously stalled CPU core.

**Parameters**

- core_id – The core’s ID

void esp_cpu_reset (int core_id)

Reset a CPU core.

**Parameters**

- core_id – The core’s ID

void esp_cpu_wait_for_intr (void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int esp_cpu_get_core_id (void)

Get the current core’s ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

**Returns**

The current core’s ID [0..SOC_CPU_CORES_NUM - 1]

void *esp_cpu_get_sp (void)

Read the current stack pointer address.

**Returns**

Stack pointer address

esp_cpu_cycle_count_t esp_cpu_get_cycle_count (void)

Get the current CPU core’s cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

**Returns**

Current CPU’s cycle count, 0 if not supported.

void esp_cpu_set_cycle_count (esp_cpu_cycle_count_t cycle_count)

Set the current CPU core’s cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

**Parameters**

- cycle_count – CPU cycle count

void *esp_cpu_pc_to_addr (uint32_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU’s PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned.

**Parameters**

- pc – PC value

**Returns**

Virtual address
void esp_cpu_intr_get_desc (int core_id, int intr_num, esp_cpu_intr_desc_t *intr_desc_ret)
Get a CPU interrupt’s descriptor.

Each CPU interrupt has a descriptor describing the interrupt’s capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

Parameters
• core_id – [in] The core’s ID
• intr_num – [in] Interrupt number
• intr_desc_ret – [out] The interrupt’s descriptor

void esp_cpu_intr_set_ivt_addr (const void *ivt_addr)
Set the base address of the current CPU’s Interrupt Vector Table (IVT)

Parameters ivt_addr – Interrupt Vector Table’s base address

bool esp_cpu_intr_has_handler (int intr_num)
Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

Note: This function simply checks if the IVT of the current CPU already has a handler assigned.

Parameters intr_num – Interrupt number (from 0 to 31)
Returns True if the interrupt has a handler function, false otherwise.

void esp_cpu_intr_set_handler (int intr_num, esp_cpu_intr_handler_t handler, void *handler_arg)
Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

Note: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

Parameters
• intr_num – Interrupt number (from 0 to 31)
• handler – Handler function
• handler_arg – Argument passed to the handler function

void *esp_cpu_intr_get_handler_arg (int intr_num)
Get a handler function’s argument of.

Get the argument of a previously assigned handler function on the current CPU.

Parameters intr_num – Interrupt number (from 0 to 31)
Returns The the argument passed to the handler function

void esp_cpu_intr_enable (uint32_t intr_mask)
Enable particular interrupts on the current CPU.

Parameters intr_mask – Bit mask of the interrupts to enable

void esp_cpu_intr_disable (uint32_t intr_mask)
Disable particular interrupts on the current CPU.

Parameters intr_mask – Bit mask of the interrupts to disable

uint32_t esp_cpu_intr_get_enabled_mask (void)
Get the enabled interrupts on the current CPU.

Returns Bit mask of the enabled interrupts
void esp_cpu_intr_edge_ack (int intr_num)

Acknowledges an edge interrupt.

**Parameters**

- **intr_num** – Interrupt number (from 0 to 31)

void esp_cpu_configure_region_protection (void)

Configures the CPU to disable access to invalid memory regions.

**esp_err_t esp_cpu_set_breakpoint** (int bp_num, const void* bp_addr)

Sets and enables a hardware breakpoint on the current CPU.

**Note:** This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

**Parameters**

- **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** – Address to set a breakpoint on

**Returns**

- ESP_OK if breakpoint is set. Failure otherwise

**esp_err_t esp_cpu_clear_breakpoint** (int bp_num)

Clears a hardware breakpoint on the current CPU.

**Note:** Clears a breakpoint regardless of whether it was previously set

**Parameters**

- **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

**Returns**

- ESP_OK if breakpoint is cleared. Failure otherwise

**esp_err_t esp_cpu_set_watchpoint** (int wp_num, const void* wp_addr, size_t size, esp_cpu_watchpoint_trigger_t trigger)

Sets and enables a hardware watchpoint on the current CPU.

**Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.**

**Note:** Overwrites previously set watchpoint with same watchpoint number.

**Parameters**

- **wp_num** – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** – Watchpoint’s base address
- **size** – Size of the region to watch. Must be one of 2^n, with n in [0..6].
- **trigger** – Trigger type

**Returns**

- ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

**esp_err_t esp_cpu_clear_watchpoint** (int wp_num)

Clears a hardware watchpoint on the current CPU.

**Note:** Clears a watchpoint regardless of whether it was previously set
Parameters `wp_num` – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

Returns ESP_OK if watchpoint was cleared. Failure otherwise.

bool `esp_cpu_dbgr_is_attached` (void)
Check if the current CPU has a debugger attached.

Returns True if debugger is attached, false otherwise

void `esp_cpu_dbgr_break` (void)
Trigger a call to the current CPU’s attached debugger.

intptr_t `esp_cpu_get_call_addr` (intptr_t return_address)
Given the return address, calculate the address of the preceding call instruction This is typically used to answer the question “where was the function called from?”.

Parameters `return_address` – The value of the return address register. Typically set to the value of __builtin_return_address(0).

Returns Address of the call instruction preceding the return address.

bool `esp_cpu_compare_and_set` (volatile uint32_t* addr, uint32_t compare_value, uint32_t new_value)
Atomic compare-and-set operation.

Parameters
• `addr` – Address of atomic variable
• `compare_value` – Value to compare the atomic variable to
• `new_value` – New value to set the atomic variable to

Returns Whether the atomic variable was set or not

bool `esp_cpu_in_ocd_debug_mode` (void)
Returns true if a JTAG debugger is attached to CPU OCD (on-chip debug) port.

[refactor-todo] See if this can be replaced with esp_cpu_dbgr_is_attached directly

Note: Always returns false if CONFIG_ESP_DEBUG_OCDATAWARE is not enabled

Structures

struct `esp_cpu_intr_desc_t`
CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt’s characteristics. Call esp_cpu_intr_get_desc() to get the descriptors of a particular interrupt.

Public Members

int `priority`
Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

`esp_cpu_intr_type_t` `type`
Whether the interrupt is an edge or level type interrupt, ESP_CPU_INTR_TYPE_NA if the type is configurable.

uint32_t `flags`
Flags indicating extra details.
Chapter 2. API Reference

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL
Interrupt descriptor flags of esp_cpu_intr_desc_t.
The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD
The interrupt is reserved for internal use

esp_cpu_get_ccount()
esp_cpu_set_ccount(ccount)

Type Definitions
typedef uint32_t esp_cpu_cycle_count_t
CPU cycle count type.
This data type represents the CPU’s clock cycle count
typedef void (*esp_cpu_intr_handler_t)(void *arg)
CPU interrupt handler type.
typedef esp_cpu_cycle_count_t esp_cpu_ccount_t

Enumerations
enum esp_cpu_intr_type_t
CPU interrupt type.
Values:
enumerator ESP_CPU_INTR_TYPE_LEVEL
enumerator ESP_CPU_INTR_TYPE_EDGE
enumerator ESP_CPU_INTR_TYPE_NA

enum esp_cpu_watchpoint_trigger_t
CPU watchpoint trigger type.
Values:
enumerator ESP_CPU_WATCHPOINT_LOAD
enumerator ESP_CPU_WATCHPOINT_STORE
enumerator ESP_CPU_WATCHPOINT_ACCESS

2.10.19 Over The Air Updates (OTA)
OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the **Partition Table** of the device with at least two “OTA app slot” partitions (i.e. `ota_0` and `ota_1`) and an “OTA Data Partition”.

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the **Partition Table** of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the partition table. If no factory app is included in the partition table, the first available OTA slot (usually `ota_0`) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

**Note:** The state is not written to the binary image of the application but rather to the `otadata` partition. The partition contains a `ota_seq` counter which is a pointer to the slot (`ota_0`, `ota_1`, ...) from which the application will be selected for boot.

App OTA State

States control the process of selecting a boot app:
### States

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_NEW</td>
<td>If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING_VERIFY</td>
<td>If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will not be selected, and the state will change to ESP_OTA_IMG_ABORTED.</td>
</tr>
</tbody>
</table>

If CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is not enabled (by default), then the use of the following functions esp_ota_mark_app_valid_cancel_rollback() and esp_ota_mark_app_invalid_rollback_and_reboot() are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING VERIFY states are not used.

An option in Kconfig CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling esp_ota_mark_app_valid_cancel_rollback() function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

### Rollback Process

The description of the rollback process when CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled:

- The new application is successfully downloaded and esp_ota_set_boot_partition() function makes this partition bootable and sets the state ESP_OTA_IMG_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot esp_restart().
- The bootloader checks for the ESP_OTA_IMG_PENDING_VERIFY state if it is set, then it will be written to ESP_OTA_IMG_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED.
- The bootloader checks the selected application for ESP_OTA_IMG_NEW state if it is set, then it will be written to ESP_OTA_IMG_PENDING_VERIFY. This state means that the application requires confirmation of its operability. If this does not happen and a reboot occurs, this state will be overwritten to ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous working application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function esp_ota_mark_app_valid_cancel_rollback() because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails then call esp_ota_mark_app_invalid_rollback_and_reboot() function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED. That will prevent re-boot of this application. There will be a rollback to the previous working application.

### Unexpected Reset

If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.
Booting invalid/aborted apps  Booting an application which was previously set to ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the otadata.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is ESP_OTA_IMG_PENDING_VERIFY then self-testing and subsequent confirmation of operability is required.

Where the states are set  A brief description of where the states are set:

- ESP_OTA_IMG_VALID state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- ESP_OTA_IMG_UNDEFINED state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- ESP_OTA_IMG_NEW state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- ESP_OTA_IMG_INVALID state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- ESP_OTA_IMG_ABORTED state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- ESP_OTA_IMG_PENDING_VERIFY state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has ESP_OTA_IMG_NEW state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the ESP_OTA_IMG_VALID state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen as the device may not have any bootable apps. It will then return ESP_ERR_OTA_ROLLBACK_FAILED error and stay in the ESP_OTA_IMG_PENDING_VERIFY state.
- The next update of app is possible if a running app is in the ESP_OTA_IMG_VALID state.
Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than the running app, you have to get new_app_info.secure_version from the first package of an image and compare it with the secure version of efuse. Use esp_efuse_check_secure_version(new_app_info. secure_version) function if it is true then continue downloading otherwise abort.

```c
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }
                image_header_was_checked = true;
                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
    }
    esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
}
...
```

Restrictions:

- The number of bits in the secure_version field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field using CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option.
- Anti-rollback works only if the encoding scheme for efuse is set to NONE.
- Factory and Test partitions are not supported in anti rollback scheme and hence partition table should not have partition with SubType set to factory or test.

security_version:

- In application image it is stored in esp_app_desc structure. The number is set CONFIG_BOOTLOADER_APP_SECURE_VERSION.
- In ESP32 it is stored in efuse EFUSE_BLK3_RDATA4_REG. (when a eFuse bit is programmed to 1, it can never be reverted to 0). The number of bits set in this register is the security_version from app.

Secure OTA Updates Without Secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT and CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

For more information refer to Signed App Verification Without Hardware Secure Boot
OTA Tool (otatool.py)

The component app_update provides a tool otatool.py for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (read_otadata)
- erase otadata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

Python API  Before anything else, make sure that the otatool module is imported.

```python
import sys
import os

idf_path = os.environ['IDF_PATH']  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py lives in $IDF_PATH/components/app_update
sys.path.append(otatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```

The starting point for using the tool’s Python API to do is create a OmatoolTarget object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OmatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, reseting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

Command-line Interface  The command-line interface of otatool.py has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]
- command-args - these are arguments that are needed for executing the main command
- subcommand (parttool.py), mostly pertaining to the target device
- subcommand-args - these are arguments that are specific to the chosen operation
```
# Erase otadata, resetting the device to factory app
```
otatool.py --port "/dev/ttyUSB1" erase_otadata
```

# Erase contents of OTA app slot 0
```
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0
```

# Switch boot partition to that of app slot 1
```
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1
```

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
```
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `--help` as argument:
```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

**Application Example**
End-to-end example of OTA firmware update workflow: system/ota.

**API Reference**

**Header File**
- components/app_update/include/esp_ota_ops.h

**Functions**

```c
const esp_app_desc_t *esp_ota_get_app_description (void)
```

Return esp_app_desc structure. This structure includes app version.

Returns
- Pointer to esp_app_desc structure.

```c
int esp_ota_get_app_elf_sha256 (char *dst, size_t size)
```

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Parameters
- `dst` - Destination buffer
- `size` - Size of the buffer

Returns
- Number of bytes written to dst (including null terminator)

```c
esp_err_t esp_ota_begin (const esp_partition_t *partition, size_t image_size, esp_ota_handle_t *out_handle)
```

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.
If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

**Parameters**
- `partition` - Pointer to info for partition which will receive the OTA update. Required.
- `image_size` - Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- `out_handle` - On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

**Returns**
- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_OA_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.

```c
esp_err_t esp_ota_write(esp_ota_handle_t handle, const void* data, size_t size)
```

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

**Parameters**
- `handle` - Handle obtained from esp_ota_begin
- `data` - Data buffer to write
- `size` - Size of data buffer in bytes.

**Returns**
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OA_SELECT_INFO_INVALID: OTA data partition has invalid contents

```c
esp_err_t esp_ota_write_with_offset(esp_ota_handle_t handle, const void* data, size_t size, uint32_t offset)
```

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

**Note:** While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non-contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write()
is not recommended.

Parameters
- **handle** – Handle obtained from esp_ota_begin
- **data** – Data buffer to write
- **size** – Size of data buffer in bytes
- **offset** – Offset in flash partition

Returns
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: Handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

```c
esp_err_t esp_ota_end (esp_ota_handle_t handle)
```
Finish OTA update and validate newly written app image.

Note: After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

Parameters **handle** – Handle obtained from esp_ota_begin().

Returns
- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

```c
esp_err_t esp_ota_abort (esp_ota_handle_t handle)
```
Abort OTA update, free the handle and memory associated with it.

Parameters **handle** – obtained from esp_ota_begin().

Returns
- ESP_OK: Handle and its associated memory is freed successfully.
- ESP_ERR_NOT_FOUND: OTA handle was not found.

```c
esp_err_t esp_ota_set_boot_partition (const esp_partition_t *partition)
```
Configure OTA data for a new boot partition.

Note: If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

Parameters **partition** – Pointer to info for partition containing app image to boot.

Returns
- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

const esp_partition_t *esp_ota_get_boot_partition (void)
Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

Returns Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_running_partition (void)
Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

Returns Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

Parameters start_from – If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

Returns Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
Returns esp_app_desc structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

Parameters

• partition – [in] Pointer to app partition. (only app partition)

• app_desc – [out] Structure of info about app.

Returns

• ESP_OK Successful.

• ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.

• ESP_ERR_NOT_SUPPORTED Partition is not application.

• ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.

• ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
• or one of error codes from lower-level flash driver.

```c
uint8_t esp_ota_get_app_partition_count (void)

Returns number of ota partitions provided in partition table.
```

**Returns**

• Number of OTA partitions

```c
esp_err_t esp_ota_mark_app_valid_cancel_rollback (void)

This function is called to indicate that the running app is working well.
```

**Returns**

• ESP_OK: if successful.

```c
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.
```

**Returns**

• ESP_FAIL: if not successful.

```c
const esp_partition_t *esp_ota_get_last_invalid_partition (void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).
```

**Parameters**

• partition –[in] Pointer to partition.

**Returns**

• ESP_OK: Successful.

```c
esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t *ota_state)

Returns state for given partition.
```

**Parameters**

• partition –[in] Pointer to partition.

**Parameters**

• ota_state –[out] state of partition (if this partition has a record in otadata).

**Returns**

• ESP_OK: Successful.

• ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.

• ESP_ERR_NOT_SUPPORTED: partition is not ota.

• ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

```c
esp_err_t esp_ota_erase_last_boot_app_partition (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.
```

**Returns**

• ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).
```

**Returns**

• True: Returns true if the slots have at least one app (except the running app).

• False: The rollback is not possible.
Chapter 2. API Reference

Macros

**OTA_SIZE_UNKNOWN**
Used for esp_ota_begin() if new image size is unknown

**OTA_WITH_SEQUENTIAL_WRITES**
Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

**ESP_ERR_OTA_BASE**
Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT**
Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID**
Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED**
Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER**
Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED**
Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE**
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t esp_ota_handle_t
Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Debugging OTA Failure

**2.10.20 Performance Monitor**

The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

Application Example

An example which combines performance monitor is provided in examples/system/perfmon directory. This example initializes the performance monitor structure and execute them with printing the statistics.
Fig. 39: How to Debug When OTA Fails (click to enlarge)
High level API Reference

Header Files

- perfmon/include/perfmon.h

API Reference

Header File

- components/perfmon/include/xtensa_perfmon_access.h

Functions

`esp_err_t xtensa_perfmon_init` (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)

Initialize Performance Monitor.

Parameters

- `id` - [in] performance counter number
- `select` - [in] select value from PMCTRLx register
- `mask` - [in] mask value from PMCTRLx register
- `kernelcnt` - [in] kernelcnt value from PMCTRLx register
- `tracelevel` - [in] tracelevel value from PMCTRLx register

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

`esp_err_t xtensa_perfmon_reset` (int id)

Reset PM counter.

Parameters `id` - [in] performance counter number

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

`void xtensa_perfmon_start` (void)

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

`void xtensa_perfmon_stop` (void)

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

`uint32_t xtensa_perfmon_value` (int id)

Read PM counter.

Read value of defined PM counter.

Parameters `id` - [in] performance counter number

Returns

- Performance counter value

`esp_err_t xtensa_perfmon_overflow` (int id)

Read PM overflow state.

Read overflow value of defined PM counter.

Parameters `id` - [in] performance counter number

Returns
• ESP_OK if there is no overflow (overflow = 0)
• ESP_FAIL if overflow occurs (overflow = 1)

void **xtensa_perfmon_dump** (void)
  Dump PM values.
  Dump all PM registers to the console.

**Header File**

- components/perfmon/include/xtensa_perfmon_apis.h

**Functions**

**esp_err_t xtensa_perfmon_exec** (const xtensa_perfmon_config_t *config)
  Execute PM.

  **Parameters**
  
  * config - [in] pointer to the configuration structure

  **Returns**
  
  • ESP_OK if no errors
  • ESP_ERR_INVALID_ARG if one of the required parameters not defined
  • ESP_FAIL - counter overflow

void **xtensa_perfmon_view_cb** (void *params, uint32_t select, uint32_t mask, uint32_t value)
  Dump PM results.

  Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

  **Parameters**
  
  • params - [in] used parameters passed from configuration (callback_params). This parameter expected as FILE* handle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
  • select - [in] select value for current counter
  • mask - [in] mask value for current counter
  • value - [in] counter value for current counter

**Structures**

**struct xtensa_perfmon_config**
  Performance monitor configuration structure.

  Structure to configure performance counter to measure dedicated function

**Public Members**

int **repeat_count**
  how much times function will be called before the callback will be repeated

float **max_deviation**
  Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void **call_params**
  This pointer will be passed to the call_function as a parameter
void (*call_function)(void *params)
    pointer to the function that have to be called

void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)
    pointer to the function that will be called with result parameters

void *callback_params
    parameter that will be passed to the callback

int tracelevel
    trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the
    perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

uint32_t counters_size
    amount of counter in the list

const uint32_t *select_mask
    list of the select/mask parameters

Type Definitions

typedef struct xtensa_perfmon_config xtensa_perfmon_config_t
    Performance monitor configuration structure.
    Structure to configure performance counter to measure dedicated function

2.10.21 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU
frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given
the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the
  peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please
keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option CONFIG_PM_ENABLE.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on
a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs
to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (true/false).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the Sleep Modes documentation can be used to trigger wakeup from the light sleep state.

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

### Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESP_PM_CPU_FREQ_MAX</code></td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code>. For ESP32, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td><code>ESP_PM_APB_FREQ_MAX</code></td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32, this is 80 MHz.</td>
</tr>
<tr>
<td><code>ESP_PM_NO_LIGHT_SLEEP</code></td>
<td>Disables automatic switching to light sleep.</td>
</tr>
</tbody>
</table>

### ESP32 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`. 
Max CPU Frequency Set | Lock Acquisition | CPU and APB Frequencies
---|---|---
240 | Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired | CPU: 240 MHz  
| | | APB: 80 MHz  
| None | Min values for both frequencies set with `esp_pm_configure()` | |
160 | ESP_PM_CPU_FREQ_MAX acquired | CPU: 160 MHz  
| | | APB: 80 MHz  
| ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired | CPU: 80 MHz  
| | | APB: 80 MHz  
| None | Min values for both frequencies set with `esp_pm_configure()` | |
80 | Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired | CPU: 80 MHz  
| | | APB: 80 MHz  
| None | Min values for both frequencies set with `esp_pm_configure()` | |

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with `High resolution timer` APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

To skip unnecessary wake-up, you can consider initializing an esp_timer with the `skip_unhandled_events` option as true. Timers with this flag will not wake up the system and it helps to reduce consumption.

**Dynamic Frequency Scaling and Peripheral Drivers**

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK or XTAL is used as a clock source. See `uart_config_t::source_clk`.
- **LED**: if REF_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT**: if REF_TICK or XTAL is used as a clock source. See `rmt_config_t::flags` and macro `RMT_CHANNEL_FLAGS_AWARE_DFS`.
- **GPTimer**: if APB is used as the clock source. See `gptimer_config_t::clk_src`.
- **TSENS**: XTAL or RTC_8M is used as a clock source. So, APB frequency changing will not influence it.
Chapter 2. API Reference

Currently, the following peripheral drivers are aware of DFS and will use the ESP_PM_APB_FREQ_MAX lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APPLL clock is used, then it will use the ESP_PM_NO_LIGHT_SLEEP lock)
- SDMMC

The following drivers will hold the ESP_PM_APB_FREQ_MAX lock while the driver is enabled:

- SPI slave: between calls to spi_slave_initialize() and spi_slave_free().
- Ethernet: between calls to esp_eth_driver_install() and esp_eth_driver_uninstall().
- WiFi: between calls to esp_wifi_start() and esp_wifi_stop(). If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- TWAI: between calls to twai_driver_install() and twai_driver_uninstall().
- Bluetooth: between calls to esp_bt_controller_enable() and esp_bt_controller_disable(). If Bluetooth modem sleep is enabled, the ESP_PM_APB_FREQ_MAX lock will be released for the periods of time when radio is disabled. However the ESP_PM_NO_LIGHT_SLEEP lock will still be held, unless CONFIG_BTDM_CTRL_LOWPOWER_CLOCK option is set to “External 32kHz crystal”.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- The legacy timer group driver
- MCPWM

API Reference

Header File

- components/esp_pm/include/esp_pm.h

Functions

\texttt{esp_err_t esp_pm_configure \ (const\ void *config)}

Set implementation-specific power management configuration.

\textbf{Parameters config} — pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

\textbf{Returns}

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

\texttt{esp_err_t esp_pm_get_configuration \ (void *config)}

Get implementation-specific power management configuration.

\textbf{Parameters config} — pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

\textbf{Returns}

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

\texttt{esp_err_t esp_pm_lock_create \ (const\ char *name, esp_pm_lock_type_t lock_type, int arg, esp_pm_lock_handle_t *out_handle)}

Espressif Systems 1967 Release v5.0-dev-4379-g36f49f361c
Submit Document Feedback
Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

**Parameters**

- **lock_type** – Power management constraint which the lock should control
- **arg** – argument, value depends on lock_type, see esp_pm_lock_type_t
- **name** – arbitrary string identifying the lock (e.g., “wifi” or “spi”). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out_handle** [out] handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure cannot be allocated
- ESP_ERR_INVALID_ARG if out_handle is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```c
esp_err_t esp_pm_lock_acquire(esp_pm_lock_handle_t handle)
```

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

**Parameters handle** – handle obtained from esp_pm_lock_create function

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```c
esp_err_t esp_pm_lock_release(esp_pm_lock_handle_t handle)
```

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

**Parameters handle** – handle obtained from esp_pm_lock_create function

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```c
esp_err_t esp_pm_lock_delete(esp_pm_lock_handle_t handle)
```

Delete a lock created using esp_pm_lock.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Parameters handle** – handle obtained from esp_pm_lock_create function
Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```c
esp_err_t esp_pm_dump_locks(FILE *stream)
```

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream. This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

**Parameters**

- `stream` – stream to print information to; use stdout or stderr to print to the console; use fmemopen/open_memstream to print to a string buffer.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Type Definitions

typedef struct esp_pm_lock *esp_pm_lock_handle_t

Opaque handle to the power management lock.

Enumerations

```c
eenum esp_pm_lock_type_t
```

Power management constraints.

**Values:**

- `ESP_PM_CPU_FREQ_MAX`
  - Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

- `ESP_PM_APB_FREQ_MAX`
  - Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

- `ESP_PM_NO_LIGHT_SLEEP`
  - Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- components/esp_pm/include/esp32/pm.h

Structures

```c
struct esp_pm_config_esp32_t
```

Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.
Public Members

int max_freq_mhz
   Maximum CPU frequency, in MHz

int min_freq_mhz
   Minimum CPU frequency to use when no locks are taken, in MHz

bool light_sleep_enable
   Enter light sleep when no locks are taken

2.10.22 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain libc. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`.

Note: If calling a standard libc or C++ sleep function, such as `usleep` defined in `unistd.h`, then the task will only block and yield the CPU if the sleep time is longer than one FreeRTOS tick period. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.
Thread APIs

- `pthread_create()` - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until `pthread_join()` is called on it.

- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.

- `pthread_equal()`

Thread Attributes

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn’t need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).

- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`

- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

Once

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

Note: This function can be called from tasks created using either pthread or FreeRTOS APIs

Mutexes

POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs

Condition Variables

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`
Static initializer constant PTHREAD_COND_INITIALIZER is supported.

- The resolution of pthread_cond_timedwait() timeouts is the RTOS tick period (see CONFIG_FREERTOS_HZ). Timeouts may be delayed up to one tick period after the requested timeout.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs

Read/Write Locks

- pthread_rwlock_init() - The attr argument is not implemented and is ignored.
- pthread_rwlock_destroy()
- pthread_rwlock_rdlock()
- pthread_rwlock_wrlock()
- pthread_rwlock_unlock()

Static initializer constant PTHREAD_RWLOCK_INITIALIZER is supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs

Thread-Specific Data

- pthread_key_create() - The destr_function argument is supported and will be called if a thread function exits normally, calls pthread_exit(), or if the underlying task is deleted directly using the FreeRTOS function vTaskDelete().
- pthread_key_delete()
- pthread_setspecific() / pthread_getspecific()

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs

Note: There are other options for thread local storage in ESP-IDF, including options with higher performance. See Thread Local Storage.

Not Implemented

The pthread.h header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- pthread_cancel() returns ENOSYS if called.
- pthread_condattr_init() returns ENOSYS if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub <https://github.com/espressif/esp-idf/issues> with the details.

ESP-IDF Extensions

The API esp_pthread_set_cfg() defined in the esp_threads.h header offers custom extensions to control how subsequent calls to pthread_create() will behave. Currently, the following configuration can be set:
• Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
• RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
• Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
• FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

Examples

• `system/pthread` demonstrates using the pthreads API to create threads
• `cxx/pthread` demonstrates using C++ Standard Library functions with threads

API Reference

Header File

• `components/pthread/include/esp_pthread.h`

Functions

`esp_pthread_cfg_t esp_pthread_get_default_config(void)`

Creates a default pthread configuration based on the values set via menuconfig.

Returns

A default configuration structure.

`esp_err_t esp_pthread_set_cfg(const esp_pthread_cfg_t *cfg)`

Configure parameters for creating pthread.

This API allows you to configure how the subsequent `pthread_create()` call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

Note: Passing non-NULL attributes to `pthread_create()` will override the stack_size parameter set using this API

Parameters

`cfg` - The pthread config parameters

Returns

- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

`esp_err_t esp_pthread_get_cfg(esp_pthread_cfg_t *p)`

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

Parameters

`p` - Pointer to the pthread config structure that will be updated with the currently configured parameters

Returns

- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

`esp_err_t esp_pthread_init(void)`

Initialize pthread library.
Structures

struct esp_pthread_cfg_t

pthread configuration structure that influences pthread creation

Public Members

size_t stack_size

The stack size of the pthread.

size_t prio

The thread’s priority.

bool inherit_cfg

Inherit this configuration further.

const char *thread_name

The thread name.

int pin_to_core

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros

PTHREAD_STACK_MIN

2.10.23 Random Number Generation

ESP32 contains a hardware random number generator, values from it can be obtained using the APIs esp_random() and esp_fill_random().

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling bootloader_random_enable() and not yet disabled by calling bootloader_random_disable().
- While the ESP-IDF Second stage bootloader is running. This is because the default ESP-IDF bootloader implementation calls bootloader_random_enable() when the bootloader starts, and bootloader_random_disable() before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the ESP32 Technical Reference Manual > Random Number Generator (RNG) [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.
To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, I2S, Wi-Fi or Bluetooth.

**Note:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

**Note:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

**API Reference**

**Header File**

- `components/esp_hw_support/include/esp_random.h`

**Functions**

`uint32_t esp_random (void)`

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

**Returns** Random value between 0 and UINT32_MAX

`void esp_fill_random (void *buf, size_t len)`

Fill a buffer with random bytes from hardware RNG.

**Note:** This function is implemented via calls to esp_random(), so the same constraints apply.

**Parameters**

- `buf` – Pointer to buffer to fill with random numbers.
- `len` – Length of buffer in bytes

**Header File**

- `components/bootloader_support/include/bootloader_random.h`

**Functions**

`void bootloader_random_enable (void)`

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.
Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

⚠️ Warning: This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

```c
void bootloader_random_disable (void)
Disable entropy source for RNG.
Disables internal entropy source. Must be called after bootloader_random_enable() and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.
Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.
```

```c
void bootloader_fill_random (void *buffer, size_t length)
Fill buffer with ‘length’ random bytes.
```

**Note:** If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

**Parameters**
- `buffer` - Pointer to buffer
- `length` - This many bytes of random data will be copied to buffer

```c
ssize_t getrandom (void *buf, size_t buflen, unsigned int flags);
```

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

`getrandom` is implemented by calling `esp_fill_random()` internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is NULL, and equal to `buflen` otherwise.

## 2.10.24 Sleep Modes

### Overview

ESP32 contains the following power saving modes: Light-sleep, and Deep-sleep.

In Light-sleep mode, the digital peripherals, most of the RAM, and CPUs are clock-gated and their supply voltage is reduced. Upon exit from Light-sleep, the digital peripherals, RAM, and CPUs resume operation and their internal states are preserved.

In Deep-sleep mode, the CPUs, most of the RAM, and all digital peripherals that are clocked from APB_CLK are powered off. The only parts of the chip that remain powered on are:
Chapter 2. API Reference

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory
- RTC slow memory

There are several wakeup sources in Deep-sleep and Light-sleep modes. These sources can also be combined so that the chip will wake up when any of the sources are triggered. Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering Light-sleep or Deep-sleep mode.

Additionally, the application can force specific powerdown modes for RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, the application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point, the hardware will be configured according to the requested wakeup sources, and the RTC controller will either power down or power off the CPUs and digital peripherals.

If Wi-Fi connections need to be maintained, enable Wi-Fi Modem-sleep mode and automatic Light-sleep feature (see Power Management APIs). This will allow the system to wake up from sleep automatically when required by the Wi-Fi driver, thereby maintaining a connection to the AP.

**Wi-Fi/Bluetooth and Sleep Modes**

In Deep-sleep and Light-sleep modes, the wireless peripherals are powered down. Before entering Deep-sleep or Light-sleep modes, the application must disable Wi-Fi and Bluetooth using the appropriate calls (i.e., `esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). Wi-Fi and Bluetooth connections will not be maintained in Deep-sleep or Light-sleep mode, even if these functions are not called.

**Wakeup Sources**

**Timer**  The RTC controller has a built-in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW_CLK.

For details on RTC clock options, see ESP32 Technical Reference Manual > ULP Coprocessor [PDF].

RTC peripherals or RTC memories don’t need to be powered on during sleep in this wakeup mode. `esp_sleep_enable_timer_wakeup()` function can be used to enable sleep wakeup using a timer.

**Touchpad**  The RTC IO module contains the logic to trigger wakeup when a touch sensor interrupt occurs. To wakeup from a touch sensor interrupt, users need to configure the touch pad interrupt before the chip enters Deep-sleep or Light-sleep modes.

Revisions 0 and 1 of ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e., ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO). `esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External Wakeup (ext0)**  The RTC IO module contains the logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of the RTC peripherals power domain, so RTC peripherals will be kept powered on during Deep-sleep if this wakeup source is requested.

The RTC IO module is enabled in this mode, so internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions before calling `esp_deep_sleep_start()`.

In revisions 0 and 1 of ESP32, this wakeup source is incompatible with ULP and touch wakeup sources.
esp_sleep_enable_ext0_wakeup() function can be used to enable this wakeup source.

**Warning:** After waking up from sleep, the IO pad used for wakeup will be configured as RTC IO. Therefore, before using this pad as digital GPIO, users need to reconfigure it using rtc_gpio_deinit() function.

**External Wakeup (ext1)** The RTC controller contains the logic to trigger wakeup using multiple RTC GPIOs. One of the following two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if all the selected pins are low (ESP_EXT1_WAKEUP_ALL_LOW)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request the RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using rtc_gpio_ functions before entering sleep:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

**Warning:** After waking up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using rtc_gpio_deinit() function.

esp_sleep_enable_ext1_wakeup() function can be used to enable this wakeup source.

**ULP Coprocessor Wakeup** ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of the RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

Revisions 0 and 1 of ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e., ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO).

esp_sleep_enable_ulp_wakeup() function can be used to enable this wakeup source.

**GPIO Wakeup (Light-sleep Only)** In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in Light-sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using gpio_wakeup_enable() function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

esp_sleep_enable_gpio_wakeup() function can be used to enable this wakeup source.

**Warning:** Before entering Light-sleep mode, check if any GPIO pin to be driven is part of the VDD_SDIO power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SDIO power domain. If they are configured to remain high during Light-sleep, the power domain should be configured to remain powered ON. This can be done with esp_sleep_pd_config():

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```
Chapter 2. API Reference

UART Wakeup (Light-sleep Only)  When ESP32 receives UART input from external devices, it is often necessary to wake up the chip when input data is available. The UART peripheral contains a feature which allows waking up the chip from Light-sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup before sending the data. `esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

Power-down of RTC Peripherals and Memories

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

Note: in revision 0 of ESP32, RTC fast memory will always be kept enabled in Deep-sleep, so that the Deep-sleep stub can run after reset. This can be overridden, if the application doesn’t need clean reset behaviour after Deep-sleep. If some variables in the program are placed into RTC slow memory (for example, using `RTC_DATA_ATTR` attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

Power-down of Flash

By default, to avoid potential issues, `esp_light_sleep_start()` function will not power down flash. To be more specific, it takes time to power down the flash and during this period the system may be woken up, which then actually powers up the flash before this flash could be powered down completely. As a result, there is a chance that the flash may not work properly. So, in theory, it’s ok if you only wake up the system after the flash is completely powered down. However, in reality, the flash power-down period can be hard to predict (for example, this period can be much longer when you add filter capacitors to the flash’s power supply circuit) and uncontrollable (for example, the asynchronous wake-up signals make the actual sleep time uncontrollable).

**Warning:** If a filter capacitor is added to your flash power supply circuit, please do everything possible to avoid powering down flash.

Therefore, it’s recommended not to power down flash when using ESP-IDF. For power-sensitive applications, it’s recommended to use Kconfig option `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` to reduce the power consumption of the flash during light sleep, instead of powering down the flash. It is worth mentioning that PSRAM has a similar Kconfig option `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`.

However, for those who have fully understood the risk and are still willing to power down the flash to further reduce the power consumption, please check the following mechanisms:

- Setting Kconfig option `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` only powers down the flash when the RTC timer is the only wake-up source and the sleep time is longer than the flash power-down period.
- Calling `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` powers down flash when the RTC timer is not enabled as a wakeup source or the sleep time is longer than the flash power-down period.

**Note:**
- ESP-IDF does not provide any mechanism that can power down the flash in all conditions when light sleep.
Chapter 2. API Reference

- `esp_deep_sleep_start()` function will force power down flash regardless of user configuration.

**Entering Light-sleep**

`esp_light_sleep_start()` function can be used to enter Light-sleep once wakeup sources are configured. It is also possible to enter Light-sleep with no wakeup sources configured. In this case, the chip will be in Light-sleep mode indefinitely until external reset is applied.

**Entering Deep-sleep**

`esp_deep_sleep_start()` function can be used to enter Deep-sleep once wakeup sources are configured. It is also possible to enter Deep-sleep with no wakeup sources configured. In this case, the chip will be in Deep-sleep mode indefinitely until external reset is applied.

**Configuring IOs**

Some ESP32 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in Deep-sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin to prevent extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally, and it also has an internal pulldown in the ESP32 chip. This means that in Deep-sleep, some current will flow through these external and internal resistors, increasing Deep-sleep current above the minimal possible value.

Add the following code before `esp_deep_sleep_start()` to remove such extra current:

```
rtc_gpio_isolate(GPIO_NUM_12);
```

**UART Output Handling**

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering Light-sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from Light-sleep.

**Checking Sleep Wakeup Cause**

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touchpad, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

**Disable Sleep Wakeup Source**

Previously configured wakeup sources can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally, it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`. 
Application Example

- **protocols/sntp**: the implementation of basic functionality of Deep-sleep, where ESP module is periodically waken up to retrieve time from NTP server.
- **wifi/power_save**: the implementation of modem sleep example.
- **system/deep_sleep**: the usage of various Deep-sleep wakeup triggers and ULP coprocessor programming.

API Reference

Header File

- components/esp_hw_support/include/esp_sleep.h

Functions

```c
esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)
```

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note:** This function does not modify wake up configuration in RTC. It will be performed in esp_deep_sleep_start/esp_light_sleep_start function.

**Parameters**

- **source** -- number of source to disable of type esp_sleep_source_t

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

```c
esp_err_t esp_sleep_enable_ulp_wakeup(void)
```

Enable wakeup by ULP coprocessor.

**Note:** In revisions 0 and 1 of the ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_timer_wakeup(uint64_t time_in_us)
```

Enable wakeup by timer.

**Parameters**

- **time_in_us** – time before wakeup, in microseconds

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)
**esp_err_t esp_sleep_enable_touchpad_wakeup (void)**

Enable wakeup by touch sensor.

**Note:** In revisions 0 and 1 of the ESP32, touch wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note:** The FSM mode of the touch button should be configured as the timer trigger mode.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

**touch_pad_t esp_sleep_get_touchpad_wakeup_status (void)**

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

**Returns** touch pad which caused wakeup

**bool esp_sleep_is_valid_wakeup_gpio (gpio_num_t gpio_num)**

Returns true if a GPIO number is valid for use as wakeup source.

**Note:** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Parameters**
gpio_num – Number of the GPIO to test for wakeup source capability

**Returns** True if this GPIO number will be accepted as a sleep wakeup source.

**esp_err_t esp_sleep_enable_ext0_wakeup (gpio_num_t gpio_num, int level)**

Enable wakeup using a pin.

This function uses external wakeup feature of RTC_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pin is configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

**Note:** In revisions 0 and 1 of the ESP32, ext0 wakeup source cannot be used together with touch or ULP wakeup sources.

**Parameters**
- gpio_num – GPIO number used as wakeup source. Only GPIOs which are have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- level – input level which will trigger wakeup (0=low, 1=high)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
**ESP_ERR_INVALID_STATE** if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_ext1_wakeup(uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)
```

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pins are configured in `esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

**Note:** Internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function.

**Parameters**

- **mask** - bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0, 2, 4, 12-15, 25-27, 32-39.
- **mode** - select logic function used to determine wakeup condition:
  - `ESP_EXT1_WAKEUP_ALL_LOW`: wake up when all selected GPIOs are low
  - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high

**Returns**

- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

```c
esp_err_t esp_sleep_enable_gpio_wakeup(void)
```

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wake up from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

**Note:** In revisions 0 and 1 of the ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

**Returns**

- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_uart_wakeup(int uart_num)
```

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note:** ESP32 does not support wakeup from UART2.
### Parameters

- **uart_num** – UART port to wake up from

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

```c
esp_err_t esp_sleep_enable_bt_wakeup (void)
```

Enable wakeup by bluetooth.

### Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

```c
esp_err_t esp_sleep_disable_bt_wakeup (void)
```

Disable wakeup by bluetooth.

### Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

```c
esp_err_t esp_sleep_enable_wifi_wakeup (void)
```

Enable wakeup by WiFi MAC.

### Returns

- ESP_OK on success

```c
esp_err_t esp_sleep_disable_wifi_wakeup (void)
```

Disable wakeup by WiFi MAC.

### Returns

- ESP_OK on success

```c
uint64_t esp_sleep_get_ext1_wakeup_status (void)
```

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

### Returns

- bit mask, if GPIO caused wakeup, BIT(n) will be set

```c
esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)
```

Set power down mode for an RTC power domain in sleep mode.

If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

### Parameters

- **domain** – power domain to configure
- **option** – power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

```c
void esp_deep_sleep_start (void)
```

Enter deep sleep with the configured wakeup options.

This function does not return.

```c
esp_err_t esp_light_sleep_start (void)
```

Enter light sleep with the configured wakeup options.

### Returns

- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped
void esp_deep_sleep(uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop

This function does not return.

Note: The device will wake up immediately if the deep-sleep time is set to 0

**Parameters**

time_in_us – deep-sleep time, unit: microsecond

**esp_sleep_wakeup_cause_t**

* esp_sleep_get_wakeup_cause (void)

Get the wakeup source which caused wakeup from sleep.

Returns cause of wake up from last sleep (deep sleep or light sleep)

void esp_wake_deep_sleep (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void esp_set_deep_sleep_wake_stub (esp_deep_sleep_wake_stub_fn_t new_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing esp_wake_deep_sleep() then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

* esp_deep_sleep_wake_stub_fn_t* esp_get_deep_sleep_wake_stub (void)

Get current wake from deep sleep stub.

Returns Return current wake from deep sleep stub, or NULL if no stub is installed.

void esp_default_wake_deep_sleep (void)

The default esp-idf-provided esp_wake_deep_sleep() stub.

See docs/deep-sleep-stub.rst for details.

void esp_deep_sleep_disable_rom_logging (void)

Disable logging from the ROM code after deep sleep.

Using LSB of RTC_STORE4.
void esp_sleep_config_gpio_isolate (void)
Configure to isolate all GPIO pins in sleep state.

void esp_sleep_enable_gpio_switch (bool enable)
Enable or disable GPIO pins status switching between slept status and waked status.

Parameters enable – decide whether to switch status or not

Type Definitions
typedef esp_sleep_source_t esp_sleep_wakeup_cause_t
typedef void (*esp_deep_sleep_wake_stub_fn_t)(void)
Function type for stub to run on wake from sleep.

Enumerations
enum esp_sleep_ext1_wakeup_mode_t
Logic function used for EXT1 wakeup mode.

Values:

enumerator ESP_EXT1_WAKEUP_ALL_LOW
Wake the chip when all selected GPIOs go low.

enumerator ESP_EXT1_WAKEUP_ANY_HIGH
Wake the chip when any of the selected GPIOs go high.

denum esp_sleep_pd_domain_t
Power domains which can be powered down in sleep mode.

Values:

enumerator ESP_PD_DOMAIN_RTC_PERIPH
RTC IO, sensors and ULP co-processor.

enumerator ESP_PD_DOMAIN_RTC_SLOW_MEM
RTC slow memory.

enumerator ESP_PD_DOMAIN_RTC_FAST_MEM
RTC fast memory.

enumerator ESP_PD_DOMAIN_XTAL
XTAL oscillator.

enumerator ESP_PD_DOMAIN_RTC8M
Internal 8M oscillator.

enumerator ESP_PD_DOMAIN_VDDSDIO
VDD_SDIO.

enumerator ESP_PD_DOMAIN_MAX
Number of domains.
enum **esp_sleep_pd_option_t**

Power down options.

**Values:**

enumerator **ESP_PD_OPTION_OFF**

Power down the power domain in sleep mode.

enumerator **ESP_PD_OPTION_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP_PD_OPTION_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**

Sleep wakeup cause.

**Values:**

enumerator **ESP_SLEEP_WAKEUP_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP_SLEEP_WAKEUP_ALL**

Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

enumerator **ESP_SLEEP_WAKEUP_EXT0**

Wakeup caused by external signal using RTC_IO.

enumerator **ESP_SLEEP_WAKEUP_EXT1**

Wakeup caused by external signal using RTC_CNTL.

enumerator **ESP_SLEEP_WAKEUP_TIMER**

Wakeup caused by timer.

enumerator **ESP_SLEEP_WAKEUP_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP_SLEEP_WAKEUP_ULP**

Wakeup caused by ULP program.

enumerator **ESP_SLEEP_WAKEUP_GPIO**

Wakeup caused by GPIO (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_WIFI**

Wakeup caused by WIFI (light sleep only)
enumerator `ESP_SLEEP_WAKEUP_COCPU`
   Wakeup caused by COCPU int.

enumerator `ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG`
   Wakeup caused by COCPU crash.

enumerator `ESP_SLEEP_WAKEUP_BT`
   Wakeup caused by BT (light sleep only)

### 2.10.25 SoC Capabilities

This section lists definitions of the ESP32’s SoC hardware capabilities. These definitions are commonly used in IDF to control which hardware dependent features are supported and thus compiled into the binary.

**Note:** These defines are currently not considered to be part of the public API, and may be changed at any time.

#### API Reference

**Header File**

- `components/soc32/include/soc/soc_caps.h`

**Macros**

- `SOC_CAPS_ECO_VER_MAX`
- `SOC_ADC_SUPPORTED`
- `SOC_DAC_SUPPORTED`
- `SOC_MCPWM_SUPPORTED`
- `SOC_SDMMC_HOST_SUPPORTED`
- `SOC_BT_SUPPORTED`

SOC_I2S_TRANS_SIZE_ALIGN_WORD

SOC_I2S_LCD_I80_VARIANT

SOC_LCD_I80_SUPPORTED

Intel 8080 LCD is supported

SOC_LCD_I80_BUSES

Both I2S0/1 have LCD mode

SOC_LCD_I80_BUS_WIDTH

Intel 8080 bus width

SOC_LEDC_HAS_TIMER_SPECIFIC_MUX

SOC_LEDC_SUPPORT_APB_CLOCK

SOC_LEDC_SUPPORT_REF_TICK

SOC_LEDC_SUPPORT_HS_MODE

SOC_LEDC_CHANNEL_NUM

SOC_LEDC_TIMER_BIT_WIDE_NUM

SOC_MCPWM_GROUPS

2 MCPWM groups on the chip (i.e., the number of independent MCPWM peripherals)

SOC_MCPWM_TIMERS_PER_GROUP

The number of timers that each group has.

SOC_MCPWM_OPERATORS_PER_GROUP

The number of operators that each group has.

SOC_MCPWM_COMPARATORS_PER_OPERATOR

The number of comparators that each operator has.

SOC_MCPWM_GENERATORS_PER_OPERATOR

The number of generators that each operator has.

SOC_MCPWM_TRIGGERS_PER_OPERATOR

The number of triggers that each operator has.

SOC_MCPWM_GPIO_FAULTS_PER_GROUP

The number of GPIO fault signals that each group has.
**SOC_MCPWM_CAPTURE_TIMERS_PER_GROUP**

The number of capture timers that each group has.

**SOC_MCPWM_CAPTURE_CHANNELS_PER_TIMER**

The number of capture channels that each capture timer has.

**SOC_MCPWM_GPIO_SYNCHROS_PER_GROUP**

The number of GPIO synchros that each group has.

**SOC_MPU_CONFIGURABLE_REGIONS_SUPPORTED**

**SOC_MPU_MIN_REGION_SIZE**

**SOC_MPU_REGIONS_MAX_NUM**

**SOC_MPU_REGION_RO_SUPPORTED**

**SOC_MPU_REGION_WO_SUPPORTED**

**SOC_PCNT_GROUPS**

**SOC_PCNT_UNITS_PER_GROUP**

**SOC_PCNT_CHANNELS_PER_UNIT**

**SOC_PCNT_THRESH_POINTS_PER_UNIT**

**SOC_RMT_GROUPS**

One RMT group

**SOC_RMT_TX_CANDIDATES_PER_GROUP**

Number of channels that capable of Transmit in each group

**SOC_RMT_RX_CANDIDATES_PER_GROUP**

Number of channels that capable of Receive in each group

**SOC_RMT_CHANNELS_PER_GROUP**

Total 8 channels

**SOC_RMT_MEM_WORDS_PER_CHANNEL**

Each channel owns 64 words memory

**SOC_RMT_SUPPORT_REF_TICK**

Support set REF_TICK as the RMT clock source

**SOC_RMT_SUPPORT_APB**

Support set APB as the RMT clock source
Chapter 2. API Reference

SOC_RMT_CHANNEL_CLK_INDEPENDENT
  Can select different source clock for each channel

SOC_RTCIO_PIN_COUNT

SOC_RTCIO_INPUT_OUTPUT_SUPPORTED

SOC_RTCIO_HOLD_SUPPORTED

SOC_RTCIO_WAKE_SUPPORTED

SOC_SDM_GROUPS

SOC_SDM_CHANNELS_PER_GROUP

SOC_SPI_HD_BOTH_INOUT_SUPPORTED

SOC_SPI_AS_CS_SUPPORTED

SOC_SPI_PERIPH_NUM

SOC_SPI_DMA_CHAN_NUM

SOC_SPI_PERIPH_CS_NUM (i)

SOC_SPI_MAXIMUM_BUFFER_SIZE

SOC_SPI_MAX_PRE_DIVIDER

SOC_MEMSPI_SRC_FREQ_80M_SUPPORTED

SOC_MEMSPI_SRC_FREQ_40M_SUPPORTED

SOC_MEMSPI_SRC_FREQ_26M_SUPPORTED

SOC_MEMSPI_SRC_FREQ_20M_SUPPORTED

SOC_SPI_PERIPH_SUPPORT_MULTILINE_MODE (spi_host)

SOC_TIMER_GROUPS

SOC_TIMER_GROUP_TIMERS_PER_GROUP

SOC_TIMER_GROUP_COUNTER_BIT_WIDTH

SOC_TIMER_GROUP_TOTAL_TIMERS
SOC_TIMER_GROUP_SUPPORT_APB

SOC_TOUCH_VERSION_1
   Hardware version of touch sensor

SOC_TOUCH_SENSOR_NUM

SOC_TOUCH_PAD_MEASURE_WAIT_MAX
   The timer frequency is 8Mhz, the max value is 0xff

SOC_TOUCH_PAD_THRESHOLD_MAX
   If set touch threshold max value, The touch sensor can’t be in touched status

SOC_TWAI_BRP_MIN

SOC_TWAI_BRP_MAX

SOC_TWAI_SUPPORT_MULTI_ADDRESS_LAYOUT

SOC_UART_NUM

SOC_UART_SUPPORT_REF_TICK
   Support REF_TICK as the clock source

SOC_UART_FIFO_LEN
   The UART hardware FIFO length

SOC_UART_BITRATE_MAX
   Max bit rate supported by UART

SOC_SPIRAM_SUPPORTED

SOC_SPI_MEM_SUPPORT_CONFIG_GPIO_BY_EFUSE

SOC_SHA_SUPPORT_PARALLEL_ENG

SOC_SHA_SUPPORT_SHA1

SOC_SHA_SUPPORT_SHA256

SOC_SHA_SUPPORT_SHA384

SOC_SHA_SUPPORT_SHA512

SOC_AES_SUPPORT_AES_128
SOC_AES_SUPPORT_AES_192
SOC_AES_SUPPORT_AES_256
SOC_SECURE_BOOT_V1
SOC_EFUSE_SECURE_BOOT_KEY_DIGESTS
SOC_FLASH_ENCRYPTED_XTS_AES_BLOCK_MAX
SOC_PHY_DIG_REGS_MEM_SIZE
SOC_PM_SUPPORT_EXT_WAKEUP
SOC_PM_SUPPORT_TOUCH_SENSOR_WAKEUP
  Supports waking up from touch pad trigger
SOC_PM_SUPPORT_RTC_PERIPH_PD
SOC_PM_SUPPORT_RTC_FAST_MEM_PD
SOC_PM_SUPPORT_RTC_SLOW_MEM_PD
SOC_CAN_SUPPORTED
CAN_BRP_MIN
CAN_BRP_MAX
CAN_SUPPORT_MULTI_ADDRESS_LAYOUT
SOC_SDMMC_USE_IOMUX
SOC_SDMMC_NUM_SLOTS
SOC_BLE_DONT_UPDATE_OWN_RPA
SOC_WIFI_HW_TSF
  Hardware TSF is not supported
SOC_WIFI_FTM_SUPPORT
  FTM is not supported
**SOC_WIFI_GCMP_SUPPORT**

GCMP is not supported (GCMP128 and GCMP256)

**SOC_WIFI_WAPI_SUPPORT**

Support WAPI

**SOC_WIFI_CSI_SUPPORT**

Support CSI

**SOC_WIFI_MESH_SUPPORT**

Support WIFI MESH

## 2.10.26 System Time

### Overview

ESP32 uses two hardware timers for the purpose of keeping system time. System time can be kept by using either one or both of the hardware timers depending on the application’s purpose and accuracy requirements for system time. The two hardware timers are:

- **RTC timer**: This timer allows time keeping in various sleep modes, and can also persist time keeping across any resets (with the exception of power-on resets which reset the RTC timer). The frequency deviation depends on the **RTC Timer Clock Sources** and affects the accuracy only in sleep modes, in which case the time will be measured at 6.6667 μs resolution.

- **High-resolution timer**: This timer is not available in sleep modes and will not persist over a reset, but has greater accuracy. The timer uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 μs resolution.

The possible combinations of hardware timers used to keep system time are listed below:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended that users stick to the default option as it provides the highest accuracy. However, users can also select a different setting via the **CONFIG_NEWLIB_TIME_SYSCALL** configuration option.

### RTC Timer Clock Sources

The RTC timer has the following clock sources:

- **Internal 150 kHz RC oscillator (default)**: Features the lowest Deep-sleep current consumption and no dependence on any external components. However, the frequency stability of this clock source is affected by temperature fluctuations, so time may drift in both Deep-sleep and Light-sleep modes.

- **External 32 kHz crystal**: Requires a 32 kHz crystal to be connected to the 32K_XP and 32K_XN pins. This source provides a better frequency stability at the expense of a slightly higher (by 1 μA) Deep-sleep current consumption.

- **External 32 kHz oscillator at 32K_XN pin**: Allows using 32 kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be
in the range of $0.1 < V_{cm} < 0.5 \times V_{amp}$, where $V_{amp}$ stands for signal amplitude. In this case, the 32K_XN pin cannot be used as a GPIO pin.

- **Internal 8.5 MHz oscillator, divided by 256 (~33 kHz):** Provides better frequency stability than the Internal 150 kHz RC oscillator at the expense of a higher (by 5 $\mu$A) Deep-sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_RTC_CLK_SRC` in project configuration.

More details about the wiring requirements for the external crystal or external oscillator, please refer to ESP32 Hardware Design Guidelines.

### Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
gettimeofday
time
asctime
clock
tctime
difftime
gmtime
l localtime
mktime
strftime
adjtime
```

To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following code snippet:

```c
time_t now;
char strftime_buf[64];
struct tm timeinfo;
time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();
localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```c
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

### SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

The function to use inside the lwIP SNTP library depends on the sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:
• **SNTP_SYNC_MODE_IMMED** (default): Updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
• **SNTP_SYNC_MODE_SMOOTH**: Updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

• `sntp_set_time_sync_notification_cb()`: Can be used to set a callback function that will notify of the time synchronization process.
• `sntp_get_sync_status()` and `sntp_set_sync_status()`: Can be used to get/set time synchronization status.

To start synchronization via SNTP, just call the following three functions:

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (the default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in the `protocols/sntp` directory.

**Timezones**

To set the local timezone, use the following POSIX functions:

1. Call `setenv()` to set the `TZ` environment variable to the correct value based on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new timezone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return the correct local time taking into account the timezone offset and daylight saving time.

**64-bit time_t**

ESP-IDF uses 32-bit `time_t` type by default. To address the Y2K38 issue, you may need to use 64-bit `time_t` type when building the application.

Currently, this requires building the cross-compiler toolchain from scratch. See the instructions for building the toolchain in *Standard Toolchain Setup for Linux and macOS*. To enable 64-bit `time_t` support in the toolchain, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file before building the toolchain.

If you need to make the program compatible with both 32-bit and 64-bit `time_t`, you may use the following methods:

• In C or C++ source files, `_USE_LONG_TIME_T` preprocessor macro will be defined if 32-bit `time_t` is used. You need to include `<sys/time.h>` to make this macro available.
• In CMake files, `TIME_T_SIZE` IDF build property will be set to the size of `time_t` in bytes. You may call `idf_build_get_property(var TIME_T_SIZE)` to get the value of this property into a CMake variable var. See *ESP-IDF CMake Build System API* for more information about `idf_build_get_property`.

Note that the size of `time_t` type also affects the sizes of other types, for example, `struct timeval`, `struct stat`, and `struct utimbuf`.
Chapter 2. API Reference

Header File

- components/lwip/include/apps/esp_sntp.h

Functions

```c
void sntp_sync_time (struct timeval *tv)
```

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a sntp_sync_time() function in the app firmware source. If the default implementation is used, calling sntp_set_sync_mode() allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via sntp_set_time_sync_notification_cb(), it will be called following time synchronization.

**Parameters**

- `tv` – Time received from SNTP server.

```c
void sntp_set_sync_mode (sntp_sync_mode_t sync_mode)
```

Set the sync mode.

Modes allowed: SNTP_SYNC_MODE_IMMED and SNTP_SYNC_MODE_SMOOTH.

**Parameters**

- `sync_mode` – Sync mode.

```c
sntp_sync_mode_t sntp_get_sync_mode (void)
```

Get set sync mode.

Returns

- SNTP_SYNC_MODE_IMMED: Update time immediately.
- SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

```c
sntp_sync_status_t sntp_get_sync_status (void)
```

Get status of time sync.

After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

Returns

- SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

```c
void sntp_set_sync_status (sntp_sync_status_t sync_status)
```

Set status of time sync.

**Parameters**

- `sync_status` – Status of time sync (see sntp_sync_status_t)

```c
void sntp_set_time_sync_notification_cb (sntp_sync_time_cb_t callback)
```

Set a callback function for time synchronization notification.

**Parameters**

- `callback` – A callback function

```c
void sntp_set_sync_interval (uint32_t interval_ms)
```

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the sntp_restart() function, otherwise, it will be applied after the last interval expired.

**Parameters**

- `interval_ms` – The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.
Chapter 2. API Reference

```c
uint32_t sntp_get_sync_interval (void)

Get the sync interval of SNTP operation.

Returns the sync interval

bool sntp_restart (void)

Restart SNTP.

Returns True - Restart False - SNTP was not initialized yet
```

**Type Definitions**

```c
typedef void (*sntp_sync_time_cb_t)(struct timeval *tv)

SNTP callback function for notifying about time sync event.

Param tv Time received from SNTP server.
```

**Enumerations**

```c
enum sntp_sync_mode_t

SNTP time update mode.

Values:

enumerator SNTP_SYNC_MODE_IMMED

Update system time immediately when receiving a response from the SNTP server.

enumerator SNTP_SYNC_MODE_SMOOTH

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between
SNTP response time and system time is large (more than 35 minutes) then update immediately.
```

```c
enum sntp_sync_status_t

SNTP sync status.

Values:

enumerator SNTP_SYNC_STATUS_RESET

enumerator SNTP_SYNC_STATUS_COMPLETED

enumerator SNTP_SYNC_STATUS_IN_PROGRESS
```

2.10.27 The himem allocation API

**Overview**

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.
In order to use the himem API, you have to enable it in the menuconfig using `CONFIG_SPIRAM_BANKSWITCH_ENABLE`, as well as set the amount of banks reserved for this in `CONFIG_SPIRAM_BANKSWITCH_RESERVE`. This decreases the amount of external memory allocated by functions like `malloc()`, but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.

**Example**

An example doing a simple memory test of the high memory range is available in esp-idf: `system/himem`

**API Reference**

**Header File**

- `components/esp_psram/include/esp32/himem.h`

**Functions**

`esp_err_t esp_himem_alloc` *(size_t size, esp_himem_handle_t *handle_out)*

Allocate a block in high memory.

- **Parameters**
  - `size` - Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
  - `handle_out` - [out] Handle to be returned

- **Returns**
  - ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

`esp_err_t esp_himem_alloc_map_range` *(size_t size, esp_himem_rangehandle_t *handle_out)*

Allocate a memory region to map blocks into.

- **Parameters**
  - `size` - Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
  - `handle_out` - [out] Handle to be returned

- **Returns**
  - ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory or address space
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

`esp_err_t esp_himem_map` *(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)*

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

---

**Note:** The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

- **Parameters**
  - `handle` - Handle to the block of memory, as given by `esp_himem_alloc`
  - `range` - Range handle to map the memory into
  - `ram_offset` - Offset into the block of physical memory of the block to map
  - `range_offset` - Offset into the address range where the block will be mapped
  - `len` - Length of region to map
• **flags** – One of ESP_HIMEM_MAPFLAG_\*  
• **out_ptr** – [out] Pointer to variable to store resulting memory pointer in

**Returns**  
- ESP_OK if the memory could be mapped
  • ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
  • ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
  • ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

```c
esp_err_t esp_himem_free (esp_himem_handle_t handle)
```

Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.

**Parameters**  
- **handle** – Handle to the block of memory, as given by esp_himem_alloc

**Returns**  
- ESP_OK if the memory is succesfully freed
  • ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

```c
esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)
```

Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

**Parameters**  
- **handle** – Handle to the range block, as given by esp_himem_alloc_map_range

**Returns**  
- ESP_OK if the memory is succesfully freed
  • ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

```c
esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)
```

Unmap a region.

**Parameters**  
- **range** – Range handle
  • **ptr** – Pointer returned by esp_himem_map
  • **len** – Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

**Returns**  
- ESP_OK if the memory is succesfully unmapped,
  • ESP_ERR_INVALID_ARG if ptr or len are invalid.

```c
size_t esp_himem_get_phys_size (void)
```

Get total amount of memory under control of himem API.

**Returns**  
- Amount of memory, in bytes

```c
size_t esp_himem_get_free_size (void)
```

Get free amount of memory under control of himem API.

**Returns**  
- Amount of free memory, in bytes

```c
size_t esp_himem_reserved_area_size (void)
```

Get amount of SPI memory address space needed for bankswitching.

**Note:** This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is used, no memory is reserved.

**Returns**  
- Amount of reserved area, in bytes

**Macros**
**Chapter 2. API Reference**

**ESP_HIMEM_BLKSZ**

**ESP_HIMEM_MAPFLAG_RO**

Indicates that a mapping will only be read from. Note that this is unused for now.

**Type Definitions**

typedef struct esp_himem_ramdata_t *esp_himem_handle_t

typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t

### 2.10.28 ULP Coprocessor programming

The Ultra Low Power (ULP) coprocessor is a simple finite state machine (FSM) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in the RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers. This coprocessor is referred to as **ULP FSM** in ESP-IDF.

**Installing the Toolchain**

The ULP FSM coprocessor code is written in assembly and compiled using the `binutils-esp32ulp toolchain`.

If you have already set up ESP-IDF with CMake build system according to the [Getting Started Guide](#), then the ULP FSM toolchain will already be installed.

**Programming ULP FSM**

The ULP FSM can be programmed using the supported instruction set. Alternatively, the ULP FSM coprocessor can also be programmed using C Macros on the main CPU. These two methods are described in the following section:

**ESP32 ULP coprocessor instruction set** This document provides details about the instructions used by ESP32 ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing** ESP32 ULP FSM coprocessor’s JUMP, ST, LD family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

- When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

Consider the following example program:
When this program is assembled and linked, address of label loop will be equal to 16 (expressed in bytes). However JUMP instruction expects the address stored in register R1 to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label loop from bytes to words, when generating the MOVE instruction. Hence, the code generated code will be equivalent to:

```
0000  NOP
0004  NOP
0008  NOP
000c  NOP
0010  MOVE R1, 4
0014  JUMP R1
```

- The other case is when the argument of MOVE instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```
.set    val, 0x10
MOVE   R1, val
```

In this case, value loaded into R1 will be 0x10. However, when an immediate value is used as an offset in LD and ST instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

```
ST R1, R2, 4  // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

In this case, the value in R1 is stored at the memory location pointed by [R2 + offset / 4]

Consider the following code:

```
.global array
array: .long 0
        .long 0
        .long 0
        .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0  // write value of R2 into the first array element, 
              // i.e. array[0]

ST R2, R1, 4  // write value of R2 into the second array element 
              // (4 byte offset), i.e. array[1]

ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
ST R2, R1, 0  // write value of R2 into the third array element, 
              // i.e. array[2]
```

**Note about instruction execution time**  ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```
#include "soc/rtc.h"
// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
```

(continues on next page)
### Chapter 2. API Reference

.uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
.uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_8md256_period;

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:

**NOP - no operation**

**Syntax**  NOP

**Operands**  None

**Cycles**  2 cycle to execute, 4 cycle to fetch next instruction

**Description**  No operation is performed. Only the PC is incremented.

**Example:**

1:  NOP

**ADD - Add to register**

**Syntax**  ADD Rdst, Rsrc1, Rsrc2

ADD Rdst, Rsrc1, imm

**Operands**

- Rdst - Register R[0..3]
- Rsrc1 - Register R[0..3]
- Rsrc2 - Register R[0..3]
- Imm - 16-bit signed value

**Cycles**  2 cycles to execute, 4 cycles to fetch next instruction

**Description**  The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples:**

1:  ADD R1, R2, R3  // R1 = R2 + R3
2:  Add R1, R2, 0x1234  // R1 = R2 + 0x1234
3:  .set value1, 0x03  // constant value1=0x03
    Add R1, R2, value1  // R1 = R2 + value1
4:  .global label  // declaration of variable label
    add R1, R2, label  // R1 = R2 + label
        ...  
    label: nop  // definition of variable label

**SUB - Subtract from register**

**Syntax**  SUB Rdst, Rsrc1, Rsrc2

SUB Rdst, Rsrc1, imm

Espressif Systems  2006  Release v5.0-dev-4379-g36f49f361c

Submit Document Feedback
Operands
- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description
The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

Examples:

1: SUB R1, R2, R3  // R1 = R2 - R3
2: sub R1, R2, 0x1234  // R1 = R2 - 0x1234
3: .set value1, 0x03  // constant value1=0x03
   SUB R1, R2, value1  // R1 = R2 - value1
4: .global label  // declaration of variable label
   SUB R1, R2, label  // R1 = R2 - label
   ...
   label: nop  // definition of variable label

AND - Logical AND of two operands

Syntax
AND Rdst, Rsrc1, Rsrc2
AND Rdst, Rsrc1, imm

Operands
- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description
The instruction does a logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:

1: AND R1, R2, R3  // R1 = R2 & R3
2: AND R1, R2, 0x1234  // R1 = R2 & 0x1234
3: .set value1, 0x03  // constant value1=0x03
   AND R1, R2, value1  // R1 = R2 & value1
4: .global label  // declaration of variable label
   AND R1, R2, label  // R1 = R2 & label
   ...
   label: nop  // definition of variable label

OR - Logical OR of two operands

Syntax
OR Rdst, Rsrc1, Rsrc2
OR Rdst, Rsrc1, imm

Operands
- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction
**Description** The instruction does a logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1:
```plaintext
OR R1, R2, R3  // R1 = R2 || R3
```

2:
```plaintext
OR R1, R2, 0x1234  // R1 = R2 || 0x1234
```

3:
```plaintext
.set value1, 0x03  // constant value1=0x03
OR R1, R2, value1  // R1 = R2 || value1
```

4:
```plaintext
.global label  // declaration of variable label
OR R1, R2, label  // R1 = R2 || label
... label: nop  // definition of variable label
```

**LSH - Logical Shift Left**

**Syntax**

- `LSH Rdst, Rsrc1, Rsrc2`
- `LSH Rdst, Rsrc1, imm`

**Operands**
- `Rdst` - Register R[0..3]
- `Rsrc1` - Register R[0..3]
- `Rsrc2` - Register R[0..3]
- `imm` - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1:
```plaintext
LSH R1, R2, R3  // R1 = R2 << R3
```

2:
```plaintext
LSH R1, R2, 0x03  // R1 = R2 << 0x03
```

3:
```plaintext
.set value1, 0x03  // constant value1=0x03
LSH R1, R2, value1  // R1 = R2 << value1
```

4:
```plaintext
.global label  // declaration of variable label
LSH R1, R2, label  // R1 = R2 << label
... label: nop  // definition of variable label
```

**RSH - Logical Shift Right**

**Syntax**

- `RSH Rdst, Rsrc1, Rsrc2`
- `RSH Rdst, Rsrc1, imm`

**Operands**
- `Rdst` - Register R[0..3]
- `Rsrc1` - Register R[0..3]
- `Rsrc2` - Register R[0..3]
- `imm` - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1:
```plaintext
RSH R1, R2, R3  // R1 = R2 >> R3
```

2:
```plaintext
RSH R1, R2, 0x03  // R1 = R2 >> 0x03
```

3:
```plaintext
.set value1, 0x03  // constant value1=0x03
```
RSH R1, R2, value1  // R1 = R2 >> value1

4:        .global label  // declaration of variable label
RSH R1, R2, label  // R1 = R2 >> label
label: nop  // definition of variable label

**MOVE** – Move to register

**Syntax**
MOVE Rdst, Rsrc
MOVE Rdst, imm

**Operands**
- **Rdst** – Register R[0..3]
- **Rsrc** – Register R[0..3]
- **Imm** – 16-bit signed value

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction moves the value from the source register or a 16-bit signed value to the destination register.

**Note:**
Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. See the section *Note about addressing* for more details.

**Examples:**

1: MOVE R1, R2  // R1 = R2
2: MOVE R1, 0x03  // R1 = 0x03
3: .set value1, 0x03  // constant value1=0x03
   MOVE R1, value1  // R1 = value1
4: .global label  // declaration of label
   MOVE R1, label  // R1 = address_of(label) / 4
   ...
   label: nop  // definition of label

**ST** – Store data to the memory

**Syntax**
ST Rscc, Rdst, offset

**Operands**
- **Rscc** – Register R[0..3], holds the 16-bit value to store
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words
- **Offset** – 13-bit signed value, offset in bytes

**Cycles**
4 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction stores the 16-bit value of Rscc to the lower half-word of memory with address Rdst+offset. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with Rdst (0..3):

\[
\text{Mem[}\text{Rdst + offset / 4}]_{31:0} = (PC[10:0], 3'b0, \text{Rdst, Rscc}[15:0])
\]

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

**Note:**
Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section *Note about addressing* for more details.
Examples:

1: \[\text{ST R1, R2, 0x12} \quad \text{MEM[R2 + 0x12 / 4]} = \text{R1}\]

2: \[\text{.data} \quad \text{Data section definition}\n\text{Addr1: .word 123} \quad \text{Define label Addr1 16 bit}\n\text{.set offs, 0x00} \quad \text{Define constant offs}\n\text{.text} \quad \text{Text section definition}\n\text{MOVE R1, 1} \quad \text{R1 = 1}\n\text{MOVE R2, Addr1} \quad \text{R2 = Addr1}\n\text{ST R1, R2, offs} \quad \text{MEM[R2 + 0 / 4]} = \text{R1}\n\quad \text{MEM[Addr1 + 0] will be 32'h600001}\n
LD - Load data from the memory

Syntax \(\text{LD Rdst, Rsrc, offset}\)

Operands

- \(\text{Rdst}\) – Register R[0..3], destination
- \(\text{Rsrc}\) – Register R[0..3], holds address of destination, in 32-bit words
- \(\text{Offset}\) – 13-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction loads the lower 16-bit half-word from memory with address \([\text{Rsrc + offset / 4}]\) into the destination register \(\text{Rdst}\):

\[
\text{Rdst[15:0]} = \text{Mem[Rs}rc + \text{ offset / 4][15:0]} \]

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note about addressing for more details.

Examples:

1: \[\text{LD R1, R2, 0x12} \quad \text{R1 = MEM[R2 + 0x12 / 4]}\]

2: \[\text{.data} \quad \text{Data section definition}\n\text{Addr1: .word 123} \quad \text{Define label Addr1 16 bit}\n\text{.set offs, 0x00} \quad \text{Define constant offs}\n\text{.text} \quad \text{Text section definition}\n\text{MOVE R1, 1} \quad \text{R1 = 1}\n\text{MOVE R2, Addr1} \quad \text{R2 = Addr1 / 4 (address of label is...}\n\quad \text{converted into words)}\n\text{LD R1, R2, offs} \quad \text{R1 = MEM[R2 + 0]}\n\quad \text{R1 will be 123}\n
JUMP - Jump to an absolute address

Syntax \(\text{JUMP Rdst}\)

- \(\text{JUMP ImmAddr}\)
- \(\text{JUMP Rdst, Condition}\)
- \(\text{JUMP ImmAddr, Condition}\)

Operands

- \(\text{Rdst}\) – Register R[0..3] containing address to jump to (expressed in 32-bit words)
- \(\text{ImmAddr}\) – 13 bits address (expressed in bytes), aligned to 4 bytes
- \(\text{Condition}\):
  - \(\text{EQ}\) – jump if last ALU operation result was zero
  - \(\text{OV}\) – jump if last ALU has set overflow flag

Cycles 2 cycles to execute, 2 cycles to fetch next instruction

Description The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.
Examples:

1: JUMP R1 // Jump to address in R1 (address in R1 is in 32-bit words)

2: JUMP 0x120, EQ // Jump to address 0x120 (in bytes) if ALU result is zero

3: JUMP label // Jump to label
   ...
   label: nop // Definition of label

4: global label // Declaration of global label
   MOVE R1, label // R1 = label (value loaded into R1 is in words)
   JUMP R1 // Jump to label
   ...
   label: nop // Definition of label

JUMPR – Jump to a relative offset (condition based on R0)

Syntax  JUMPR Step, Threshold, Condition

Operands

- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition**:  
  - EQ (equal) – jump if value in R0 == threshold  
  - LT (less than) – jump if value in R0 < threshold
  - LE (less or equal) – jump if value in R0 <= threshold
  - GT (greater than) – jump if value in R0 > threshold
  - GE (greater or equal) – jump if value in R0 >= threshold

Cycles

Conditions EQ, GT and LT: 2 cycles to execute, 2 cycles to fetch next instruction. Conditions LE and GE are implemented in the assembler using two JUMPR instructions:

```c
// JUMPR target, threshold, LE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, GT
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

Description The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

Examples:

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if R0 >= 20

2: // Down counting loop using R0 register
   MOVE R0, 16 // load 16 into R0
   label: SUB R0, R0, 1 // R0--
   NOP // do something
   JUMPR label, 1, GE // jump to label if R0 >= 1

JUMPS – Jump to a relative address (condition based on stage count)
Chapter 2. API Reference

Syntax JUMPS Step, Threshold, Condition

Operands
- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition**:  
  - *EQ* (equal) – jump if value in stage_cnt == threshold  
  - *LT* (less than) – jump if value in stage_cnt < threshold  
  - *LE* (less or equal) – jump if value in stage_cnt <= threshold  
  - *GT* (greater than) – jump if value in stage_cnt > threshold  
  - *GE* (greater or equal) – jump if value in stage_cnt >= threshold

Cycles 2 cycles to execute, 2 cycles to fetch next instruction:

```c
// JUMPS target, threshold, EQ is implemented as:

JUMPS next, threshold, LT
JUMPS target, threshold, LE

next:
// JUMPS target, threshold, GT is implemented as:

JUMPS next, threshold, LE
JUMPS target, threshold, GE

next:
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

1: `pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt == 20`

2: `// Up counting loop using stage count register
STAGE_RST // set stage_cnt to 0
label: STAGE_INC 1 // stage_cnt++
NOP // do something
JUMPS label, 16, LT // jump to label if stage_cnt < 16`

**STAGE_RST** – Reset stage count register

Syntax **STAGE_RST**

Operands No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

1: `STAGE_RST // Reset stage count register`

**STAGE_INC** – Increment stage count register

Syntax **STAGE_INC** *Value*

Operands
- **Value** – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments the stage count register by the given value.

**Examples:**
Chapter 2. API Reference

### STAGE_INC

// stage_cnt += 10

```c
STAGE_INC 10 // stage_cnt += 10
```

### STAGE_RST

// set stage_cnt to 0

```c
STAGE_RST // set stage_cnt to 0
```

### STAGE_INC

// stage_cnt++

```c
STAGE_INC 1 // stage_cnt++
```

### NOP

// do something

```c
NOP // do something
```

### JUMPS

// jump to label if stage_cnt < 16

```c
JUMPS label, 16, LT // jump to label if stage_cnt < 16
```

#### STAGE_DEC – Decrement stage count register

**Syntax** STAGE_DEC

**Operands**

- **Value** – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements the stage count register by the given value.

**Examples**

1:

```c
STAGE_DEC 10 // stage_cnt -= 10;
```

2:

```c
// Down counting loop example
STAGE_RST // set stage_cnt to 0
STAGE_INC 16 // increment stage_cnt to 16
```

### HALT – End the program

**Syntax** HALT

**Operands** No operands

**Cycles** 2 cycles to execute

**Description** The instruction halts the ULP coprocessor and restarts the ULP wakeup timer, if it is enabled.

**Examples**

```c
HALT // Halt the coprocessor
```

### WAKE – Wake up the chip

**Syntax** WAKE

**Operands** No operands

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction sends an interrupt from the ULP coprocessor to the RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may need to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOWPOWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

**Examples**

```c
is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
READ_RTC_FIELD(RTC_CNTL_LOWPOWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
AND r0, r0, 1
JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
```

(continues on next page)
SLEEP – set ULP wakeup timer period

Syntax SLEEP sleep_reg

Operands
- sleep_reg 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction selects which of the SENS_ULP_CP_SLEEP_CYCx_REG (x = 0..4) registers is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

Examples:

1: SLEEP 1 // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG

2: .set sleep_reg, 4 // Set constant
   SLEEP sleep_reg // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG

WAIT – wait some number of cycles

Syntax WAIT Cycles

Operands
- Cycles number of cycles for wait

Cycles 2 + Cycles cycles to execute, 4 cycles to fetch next instruction

Description The instruction delays for given number of cycles.

Examples:

1: WAIT 10 // Do nothing for 10 cycles

2: .set wait_cnt, 10 // Set a constant
   WAIT wait_cnt // wait for 10 cycles

ADC – do measurement with ADC

Syntax
- ADC Rdst, Sar_sel, Mux
- ADC Rdst, Sar_sel, Mux, 0 — deprecated form

Operands
- Rdst – Destination Register R[0..3], result will be stored to this register
- Sar_sel – Select ADC: 0 = SARADC1, 1 = SARADC2
- Mux - Enable ADC channel. Channel number is [Mux-1]. If the user passes Mux value 1, then ADC channel 0 gets used.

Cycles 23 + max(1, SAR_AMP_WAIT1) + max(1, SAR_AMP_WAIT2) + max(1, SAR_AMP_WAIT3) + SARx_SAMPLE_CYCLE + SARx_SAMPLE_BIT cycles to execute, 4 cycles to fetch next instruction

Description The instruction makes measurements from ADC.

Examples:
1: ADC R1, 0, 1 // Measure value using ADC1 channel 0 and store result into R1

**I2C_RD - read single byte from I2C slave**

**Syntax**

- `{I2C_RD} Sub_addr, High, Low, Slave_sel`

**Operands**

- `Sub_addr` - Address within the I2C slave to read.
- `High, Low` — Define range of bits to read. Bits outside of [High, Low] range are masked.
- `Slave_sel` - Index of I2C slave address to use.

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** `I2C_RD` instruction reads one byte from I2C slave with index `Slave_sel`. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == Slave_sel`. 8 bits of read result is stored into `R0` register.

**Examples:**

```c
1: I2C_RD 0x10, 7, 0, 0 // Read byte from sub-address 0x10 of slave with address set in SENS_I2C_SLAVE_ADDR0
```

**I2C_WR - write single byte to I2C slave**

**Syntax**

- `{I2C_WR} Sub_addr, Value, High, Low, Slave_sel`

**Operands**

- `Sub_addr` - Address within the I2C slave to write.
- `Value` - 8-bit value to be written.
- `High, Low` — Define range of bits to write. Bits outside of [High, Low] range are masked.
- `Slave_sel` - Index of I2C slave address to use.

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** `I2C_WR` instruction writes one byte to I2C slave with index `Slave_sel`. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == Slave_sel`.

**Examples:**

```c
1: I2C_WR 0x20, 0x33, 7, 0, 1 // Write byte 0x33 to sub-address 0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.
```

**REG_RD – read from peripheral register**

**Syntax** `{REG_RD} Addr, High, Low`

**Operands**

- `Addr` - Register address, in 32-bit words
- `High` - Register end bit number
- `Low` - Register start bit number

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction reads up to 16 bits from a peripheral register into a general purpose register: `R0 = REG[Addr][High:Low]`.

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```c
addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4
```

**Examples:**

```c

```
REG_RD - load 4 bits

REG_RD Addr, High, Low

Operands
- Addr - Register address, in 32-bit words.
- High - Register end bit number
- Low - Register start bit number
- Data - Value to write, 8 bits

Description
The instruction reads up to 4 bits from an immediate data value into a peripheral register:
REG[Addr][High:Low] = data.

Examples:
1: REG_RD 0x120, 7, 4 // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}

REG_WR - write to peripheral register

Syntax REG_WR Addr, High, Low, Data

Operands
- Addr - Register address, in 32-bit words.
- High - Register end bit number
- Low - Register start bit number
- Data - Value to write, 8 bits

Cycles
8 cycles to execute, 4 cycles to fetch next instruction

Description
The instruction writes up to 8 bits from an immediate data value into a peripheral register:
REG[Addr][High:Low] = data.

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4

Examples:
1: REG_WR 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10

Convenience macros for peripheral registers access

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in soc/soc_ulp.h header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in soc/rtc_cntl_reg.h, soc/rtc_io_reg.h, soc/sens_reg.h, and soc/rtc_i2c_reg.h.

READ_RTC_REG(rtc_reg, low_bit, bit_width)
Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

READ_RTC_FIELD(rtc_reg, field)
Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value)
Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_REG + 2, 1, 1)
```

WRITE_RTC_FIELD(rtc_reg, field, value)
Write immediate value into a field in rtc_reg, up to 8 bits. For example:
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)

Programming ULP FSM coprocessor using C macros (legacy)  In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),  // R3 <- 16
    I_LD(R0, R3, 0), // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1), // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1), // R2 <- R0 + R1
    I_ST(R2, R3, 2),  // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 — R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

**Note:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

**Note:** Load, store and move instructions use **addresses expressed in 32-bit words**. Address 0 corresponds to the first word of RTC_SLOW_MEM. This is different to how address arguments are handled in assembly code of the same instructions. See the section Note about addressing for more details for reference.

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),  // R0 <- 34
    M_LABEL(1),      // label_1
    I_MOVI(R1, 32),  // R1 <- 32
    I_LD(R1, R1, 0), // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),  // R2 <- 33
    I_LD(R2, R2, 0), // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2), // R3 <- R1 - R2
    I_ST(R3, R0, 0),  // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1), // R0++
    I_HALT()
};
```
(continues on next page)
M_BL(1, 64), // if (R0 < 64) goto label_1
I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);

API Reference

Header File

Functions
staticinlineuint32_t SOC_REG_TO_ULP_PERIPH_SEL(uint32_t reg)
Map SoC peripheral register to periph_sel field of RD_REG and WR_REG instructions.
  Parameters reg - peripheral register in RTC_CNTL_, RTC_IO_, SENS_, RTC_I2C peripherals.
  Returns periph_sel value for the peripheral to which this register belongs.

Unions
union ulp_insn
  #include <ulp.h> Instruction format structure.
  All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions.
  This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed
  by the CPU. It acts as a token which is removed from the program by the ulp_process_macros_and_load
  function.
  These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields
  of these structure with the right arguments.

Public Members

uint32_t cycles
  Number of cycles to sleep
  TBD, cycles used for measurement

uint32_t unused
  Unused

uint32_t opcode
  Opcodes:
  OPCODE_DELAY
  OPCODE_ST
  OPCODE_LD
  OPCODE_HALT
Chapter 2. API Reference

Opcode (OPCODE_BRANCH)
Opcode (OPCODE_ALU)
Opcode (OPCODE_WR_REG)
Opcode (OPCODE_RD_REG)

Opcode (OPCODE_TSENS)
Opcode (OPCODE_I2C)
Opcode (OPCODE_END)
Opcode (OPCODE_MACRO)

struct ulp_insn::[anonymous] delay
  Format of DELAY instruction

  uint32_t dreg
    Register which contains data to store
    Register where the data should be loaded to
    Register which contains target PC, expressed in words (used if .reg == 1)
    Destination register
    Register where to store ADC result
    Register where to store temperature measurement result
    Destination register (for SUB_OPCODE_MACRO_LABELPC) >

  uint32_t sreg
    Register which contains address in RTC memory (expressed in words)
    Register with operand A

  uint32_t unused1
    Unused

  uint32_t offset
    Offset to add to sreg
    Absolute value of target PC offset w.r.t. current PC, expressed in words

  uint32_t unused2
    Unused

  uint32_t sub_opcode
    Sub opcode (SUB_OPCODE_ST)
    Sub opcode (SUB_OPCODE_BX)
    Sub opcode (SUB_OPCODE_B)
    Sub opcode (SUB_OPCODE_BS)
    Sub opcode (SUB_OPCODE_ALU_REG)
    Sub opcode (SUB_OPCODE_ALU_CNT)
Chapter 2. API Reference

- Sub opcode (SUB_OPCODE_ALU_IMM)
- Sub opcode (SUB_OPCODE_WAKEUP)
- Sub opcode (SUB_OPCODE_SLEEP)
- SUB_OPCODE_MACRO_LABEL or SUB_OPCODE_MACRO_BRANCH or SUB_OPCODE_MACRO_LABELPC

```c
struct ulp_insn::[anonymous] st
  Format of ST instruction

struct ulp_insn::[anonymous] ld
  Format of LD instruction

struct ulp_insn::[anonymous] halt
  Format of HALT instruction

uint32_t addr
  Target PC, expressed in words (used if .reg == 0)
  Address within either RTC_CNTL, RTC_IO, or SARADC

uint32_t reg
  Target PC in register (1) or immediate (0)

uint32_t type
  Jump condition (BX_JUMP_TYPE_xxx)

struct ulp_insn::[anonymous] bx
  Format of BRANCH instruction (absolute address)

uint32_t imm
  Immediate value to compare against
  Immediate value of operand
  Immediate value of operand B

uint32_t cmp
  Comparison to perform: B_CMP_L or B_CMP_GE
  Comparison to perform: JUMPS_LT, JUMPS_GE or JUMPS_LE

uint32_t sign
  Sign of target PC offset: 0: positive, 1: negative

struct ulp_insn::[anonymous] b
  Format of BRANCH instruction (relative address, conditional on R0)

struct ulp_insn::[anonymous] bs
  Format of BRANCH instruction (relative address, conditional on the stage counter)

uint32_t treg
  Register with operand B
```
uint32_t sel
    Operation to perform, one of ALU_SEL_xxx
    Operation to perform, one of ALU_SEL_Sxxx

struct ulp_insn::[anonymous] alu_reg
    Format of ALU instruction (both sources are registers)

struct ulp_insn::[anonymous] alu_reg_s
    Format of ALU instruction (stage counter and an immediate)

struct ulp_insn::[anonymous] alu_imm
    Format of ALU instruction (one source is an immediate)

uint32_t periph_sel
    Select peripheral: RTC_CNTL (0), RTC_IO(1), SARADC(2)

uint32_t data
    8 bits of data to write
    8 bits of data for write operation

uint32_t low
    Low bit

uint32_t high
    High bit

struct ulp_insn::[anonymous] wr_reg
    Format of WR_REG instruction

struct ulp_insn::[anonymous] rd_reg
    Format of RD_REG instruction

uint32_t mux
    Select SARADC pad (mux + 1)

uint32_t sar_sel
    Select SARADC0 (0) or SARADC1 (1)

struct ulp_insn::[anonymous] adc
    Format of ADC instruction

uint32_t wait_delay
    Cycles to wait after measurement is done

uint32_t reserved
    Reserved, set to 0
struct _ulp_insn::[anonymous] _t_sens
  Format of TSENS instruction

  uint32_t _i2c_addr
  I2C slave address

  uint32_t _low_bits
  low bit of range for write operation (lower bits are masked)

  uint32_t _high_bits
  high bit of range for write operation (higher bits are masked)

  uint32_t _i2c_sel
  index of slave address register [7:0]

  uint32_t _rw
  Write (1) or read (0)

struct _ulp_insn::[anonymous] _i2c
  Format of I2C instruction

  uint32_t _wakeup
  Set to 1 to wake up chip

struct _ulp_insn::[anonymous] _end
  Format of END instruction with wakeup

  uint32_t _cycle_sel
  Select which one of SARADC_ULP_CP_SLEEP_CYCx_REG to get the sleep duration from

struct _ulp_insn::[anonymous] _sleep
  Format of END instruction with sleep

  uint32_t _label
  Label number

struct _ulp_insn::[anonymous] _macro
  Format of tokens used by MACROs

  uint32_t _instruction
  Encoded instruction for ULP coprocessor

**Macros**

R0
general purpose register 0

R1
general purpose register 1
Chapter 2. API Reference

R2

general purpose register 2

R3

general purpose register 3

**OPCODE_WR_REG**

Instruction: write peripheral register (RTC_CNTL/RTC_IO/SARADC)

**OPCODE_RD_REG**

Instruction: read peripheral register (RTC_CNTL/RTC_IO/SARADC)

**RD_REG_PERIPH_RTC_CNTL**

Identifier of RTC_CNTL peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_IO**

Identifier of RTC_IO peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_SENS**

Identifier of SARADC peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_I2C**

Identifier of RTC_I2C peripheral for RD_REG and WR_REG instructions

**OPCODE_I2C**

Instruction: read/write I2C

**SUB_OPCODE_I2C_RD**

I2C read

**SUB_OPCODE_I2C_WR**

I2C write

**OPCODE_DELAY**

Instruction: delay (nop) for a given number of cycles

**OPCODE_ADC**

Instruction: SAR ADC measurement

**OPCODE_ST**

Instruction: store indirect to RTC memory

**SUB_OPCODE_ST**

Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

**OPCODE_ALU**

Arithmetic instructions
Chapter 2. API Reference

SUB_OPCODE_ALU_REG
Arithmetic instruction, both source values are in register

SUB_OPCODE_ALU_IMM
Arithmetic instruction, one source value is an immediate

SUB_OPCODE_ALU_CNT
Arithmetic instruction, stage counter and an immediate

ALU_SEL_ADD
Addition

ALU_SEL_SUB
Subtraction

ALU_SEL_AND
Logical AND

ALU_SEL_OR
Logical OR

ALU_SEL_MOV
Copy value (immediate to destination register or source register to destination register)

ALU_SEL_LSH
Shift left by given number of bits

ALU_SEL_RSH
Shift right by given number of bits

ALU_SEL_SINC
Increment the stage counter

ALU_SEL_SDEC
Decrement the stage counter

ALU_SEL_SRST
Reset the stage counter

OPCODE_BRANCH
Branch instructions

SUB_OPCODE_BX
Branch to absolute PC (immediate or in register)

SUB_OPCODE_BR
Branch to relative PC, conditional on R0
SUB_OPCODE_BS
  Branch to relative PC, conditional on the stage counter

BX_JUMP_TYPE_DIRECT
  Unconditional jump

BX_JUMP_TYPE_ZERO
  Branch if last ALU result is zero

BX_JUMP_TYPE_OVF
  Branch if last ALU operation caused and overflow

SUB_OPCODE_B
  Branch to a relative offset

B_CMP_L
  Branch if R0 is less than an immediate

B_CMP_GE
  Branch if R0 is greater than or equal to an immediate

JUMPS_LT
  Branch if the stage counter <

JUMPS_GE
  Branch if the stage counter >=

JUMPS_LE
  Branch if the stage counter <=

_OPCODE_END
  Stop executing the program

SUB_OPCODE_END
  Stop executing the program and optionally wake up the chip

SUB_OPCODE_SLEEP
  Stop executing the program and run it again after selected interval

_OPCODE_TSENS
  Instruction: temperature sensor measurement. Poor accuracy, not recommended for most use-cases

_OPCODE_HALT
  Halt the coprocessor

_OPCODE_LD
  Indirect load lower 16 bits from RTC memory
**OPCODE_MACRO**

Not a real opcode. Used to identify labels and branches in the program

**SUB_OPCODE_MACRO_LABEL**

Label macro

**SUB_OPCODE_MACRO_BRANCH**

Branch macro

**SUB_OPCODE_MACRO_LABELPC**

Label pointer macro

**I_DELAY (cycles_)**

Delay (nop) for a given number of cycles

**I_HALT ()**

Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

**I_WR_REG (reg, low_bit, high_bit, val)**

Write literal value to a peripheral register

\[ reg[high\_bit : low\_bit] = val \]

This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_RD_REG (reg, low_bit, high_bit)**

Read from peripheral register into R0

\[ R0 = reg[high\_bit : low\_bit] \]

This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_WR_REG_BIT (reg, shift, val)**

Set or clear a bit in the peripheral register.

Sets bit (1 << shift) of register reg to value val. This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_WAKE ()**

Wake the SoC from deep sleep.

This instruction initiates wake up from deep sleep. Use esp_deep_sleep_enable_ulp_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.

To stop the ULP program, use I_HALT instruction.

To disable the timer which start ULP program, use I_END() instruction. I_END instruction clears the RTC_CNTL_ULP_CP_SLP_TIMER_EN_S bit of RTC_CNTL_STATE0_REG register, which controls the ULP timer.

**I_END ()**

Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().
**I_SLEEP_CYCLE_SEL** (timer_idx)

Select the time interval used to run ULP program.

This instruction selects which of the SENS_SLEEP_CYCLES_Sx registers’ value is used by the ULP program timer. When the ULP program stops at I_HALT instruction, ULP program timer start counting. When the counter reaches the value of the selected SENS_SLEEP_CYCLES_Sx register, ULP program starts running again from the start address (passed to the ulp_run function). There are 5 SENS_SLEEP_CYCLES_Sx registers, so 0 <= timer_idx < 5.

By default, SENS_SLEEP_CYCLES_S0 register is used by the ULP program timer.

**I_TSENS** (reg_dest, delay)

Perform temperature sensor measurement and store it into reg_dest.

Delay can be set between 1 and ((1 << 14) - 1). Higher values give higher measurement resolution.

**I_ADC** (reg_dest, adc_idx, pad_idx)

Perform ADC measurement and store result in reg_dest.

adc_idx selects ADC (0 or 1). pad_idx selects ADC pad (0 - 7).

**I_ST** (reg_val, reg_addr, offset_)

Store value from register reg_val into RTC memory.

The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:

- bits [31:21] hold the PC of current instruction, expressed in 32-bit words
- bits [20:18] = 3’b0
- bits [17:16] reg_addr (0..3)
- bits [15:0] are assigned the contents of reg_val

\[
\text{RTC}_{-}\text{SLOW}_{-}\text{MEM}[\text{addr} + \text{offset}_\_] = \{ \text{insn}_{-}\text{PC}[10:0], 3’b0, \text{reg}_{-}\text{addr}, \text{reg}_{-}\text{val}[15:0] \}
\]

**I_LD** (reg_dest, reg_addr, offset_)

Load value from RTC memory into reg_dest register.

Loads 16 LSBs from RTC memory word given by the sum of value in reg_addr and value of offset_.

**I_BL** (pc_offset, imm_value)

Branch relative if R0 less than immediate value.

pc_offset is expressed in words, and can be from -127 to 127. imm_value is a 16-bit value to compare R0 against

**I_BGE** (pc_offset, imm_value)

Branch relative if R0 greater or equal than immediate value.

pc_offset is expressed in words, and can be from -127 to 127. imm_value is a 16-bit value to compare R0 against

**I_BXR** (reg_pc)

Unconditional branch to absolute PC, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXI** (imm_pc)

Unconditional branch to absolute PC, immediate address.

Address imm_pc is expressed in 32-bit words.

**I_BXZR** (reg_pc)

Branch to absolute PC if ALU result is zero, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.
Chapter 2. API Reference

I_BXZI (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)
Branch to absolute PC if ALU overflow, address in register
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXFI (imm_pc)
Branch to absolute PC if ALU overflow, immediate address
Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)
Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)
Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)
Logical OR: dest = src1 | src2

I_MOVR (reg_dest, reg_src)
Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)
Logical shift left: dest = src << shift

I_RSHR (reg_dest, reg_src, reg_shift)
Logical shift right: dest = src >> shift

I_ADDI (reg_dest, reg_src, imm_)
Add register and an immediate value: dest = src1 + imm

I_SUBI (reg_dest, reg_src, imm_)
Subtract register and an immediate value: dest = src - imm

I_ANDI (reg_dest, reg_src, imm_)
Logical AND register and an immediate value: dest = src & imm

I_ORI (reg_dest, reg_src, imm_)
Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)
Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)
Logical shift left register value by an immediate: dest = src << imm

I_RSHI (reg_dest, reg_src, imm_)
Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
Define a label with number label_num.
This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.
**M_BRANCH** (label_num)
Token macro used by M_B and M_BX macros. Not to be used directly.

**M_LABELPC** (label_num)
Token macro used by M_MOVL macro. Not to be used directly.

**M_MOVL** (reg_dest, label_num)
Macro: Move the program counter at the given label into the register. This address can then be used with I_BXR, I_BXZR, I_BXFR, etc.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BL** (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BGE** (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BX** (label_num)
Macro: unconditional branch to label

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXZ** (label_num)
Macro: branch to label if ALU result is zero

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXF** (label_num)
Macro: branch to label if ALU overflow

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**I_STAGE_INC** (imm_)
Increment the stage counter by immediate value

**I_STAGE_DEC** (imm_)
Decrement the stage counter by immediate value

**I_STAGE_RST** ()
Reset the stage counter

**M_BSLT** (label_num, imm_value)
Macro: branch to label if the stage counter is less than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.
**Chapter 2. API Reference**

**M_BSGE** (label_num, imm_value)

Macro: branch to label if the stage counter is greater than or equal to immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BSLE** (label_num, imm_value)

Macro: branch to label if the stage counter is less than or equal to immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BSEQ** (label_num, imm_value)

Macro: branch to label if the stage counter is equal to immediate value. Implemented using two JUMPS instructions: JUMPS next, imm_value, LT JUMPS label_num, imm_value, LE

This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulp_insn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BSGT** (label_num, imm_value)

Macro: branch to label if the stage counter is greater than immediate value. Implemented using two instructions: JUMPS next, imm_value, LE JUMPS label_num, imm_value, GE

This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulp_insn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**I_JUMPS** (pc_offset, imm_value, comp_type)

Branch relative if (stage counter [comp_type] [imm_value]) evaluates to true.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is an 8-bit value to compare the stage counter against comp_type is the type of comparison to perform: JUMPS_LT (<), JUMPS_GE (>=) or JUMPS_LE (<=)

**I_I2C_RW** (sub_addr, val, low_bit, high_bit, slave_sel, rw_bit)

Perform an I2C transaction with a slave device. I_I2C_READ and I_I2C_WRITE are provided for convenience, instead of using this directly.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel. For read operations, 8 bits of read result is stored into R0 register. For write operations, val will be written to sub_addr at [high_bit:low_bit]. Bits outside of this range are masked.

**I_I2C_READ** (slave_sel, sub_addr)

Read a byte from the sub address of an I2C slave, and store the result in R0.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

**I_I2C_WRITE** (slave_sel, sub_addr, val)

Write a byte to the sub address of an I2C slave.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

### Compiling the ULP Code

To compile the ULP FSM code as part of the component, the following steps must be taken:

1. The ULP FSM code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance, ulp/.
2. Call `ulp_embed_binary` from the component CMakeLists.txt after registration. For example:

```cpp
... idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}"
```

The first argument to `ulp_embed_binary` specifies the ULP FSM binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP FSM assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See the section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g. `idf.py app`).

   Inside, the build system will take the following steps to build ULP FSM program:

   1. **Run each assembly file (foo.S) through the C preprocessor.** This step generates the preprocessed assembly files (foo.ulp.S) in the component build directory. This step also generates dependency files (foo.ulp.d).
   2. **Run preprocessed assembly sources through the assembler.** This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
   3. **Run the linker script template through the C preprocessor.** The template is located in components/ulp/ld directory.
   4. **Link the object files into an output ELF file (ulp_app_name.elf).** The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.
   5. **Dump the contents of the ELF file into a binary (ulp_app_name.bin) which can then be embedded into the application.**
   6. **Generate a list of global symbols (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.**
   7. **Create an LD export script and a header file (ulp_app_name.ld and ulp_app_name.h) containing the symbols from ulp_app_name.sym.** This is done using the esp32ulp_mapgen.py utility.
   8. **Add the generated binary to the list of binary files to be embedded into the application.**

### Accessing the ULP FSM Program Variables

Global symbols defined in the ULP FSM program may be used inside the main program.

For example, the ULP FSM program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:

```assembly
.global measurement_count
measurement_count: .long 0

// later, use measurement_count
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the `${ULP_APP_NAME}.h` and `${ULP_APP_NAME}.ld` files which define the global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with `ulp_`.

The header file contains the declaration of the symbol:
extern uint32_t ulp_measurement_count;

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `#include` statement. This will allow the ULP program variables to be accessed as regular variables:

```
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note that the ULP FSM program can only use the lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word. Likewise, the ULP store instruction writes register values into the lower 16 bits of the 32-bit word in RTC memory. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP coprocessor, the main application needs to mask the upper 16 bits, e.g.:

```
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

## Starting the ULP FSM Program

To run a ULP FSM program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary()` function, and then start it using the `ulp_run()` function.

Note that the **Enable Ultra Low Power (ULP) Coprocessor** option must be enabled in menuconfig to work with ULP. To select the type of ULP to be used, the **ULP Co-Processor type** option must be set. To reserve memory for the ULP, the **RTC slow memory reserved for coprocessor** option must be set to a value big enough to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to `ulp_app_name`):

```
extern const uint8_t bin_start[] asm ("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm ("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 // load address, set to 0 when using default linker scripts
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

Once the program is loaded into RTC memory, the application can start it by passing the address of the entry point to the `ulp_run` function:

```
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM ) );
```

Declaration of the entry point symbol comes from the generated header file mentioned above, `$<ULP_APP_NAME>.h`. In the assembly source of the ULP FSM application, this symbol must be marked as `.global`:
ESP32 ULP program flow

ESP32 ULP coprocessor is started by a timer. The timer is started once `ulp_run()` is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of ticks is set using `SENS_ULP_CP_SLEEP_CYCx_REG` registers (x = 0..4). When starting the ULP for the first time, `SENS_ULP_CP_SLEEP_CYC0_REG` will be used to set the number of timer ticks. Later the ULP program can select another `SENS_ULP_CP_SLEEP_CYCx_REG` register using `sleep` instruction.

The application can set ULP timer period values (`SENS_ULP_CP_SLEEP_CYCx_REG`, x = 0..4) using `ulp_set_wakeup_period` function.

Once the timer counts the number of ticks set in the selected `SENS_ULP_CP_SLEEP_CYCx_REG` register, ULP coprocessor powers up and starts running the program from the entry point set in the call to `ulp_run()`.

The program runs until it encounters a `halt` instruction or an illegal instruction. Once the program halts the ULP coprocessor powers down and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the `RTC_CNTL_ULP_CP_SLP_TIMER_EN` bit in the `RTC_CNTL_STATE0_REG` register. This can be done both from ULP code and from the main program.

Application Examples

- ULP FSM Coprocessor counts pulses on an IO while main CPU is in deep sleep: `system/ulp_fsm/ulp`
- ULP FSM Coprocessor polls ADC in while main CPU is in deep sleep: `system/ulp_fsm/ulp_adc`

API Reference

Header File

- `components/ulp/ulp_fsm/include/ulp_fsm_common.h`

Functions

`esp_err_t ulp_process_macros_and_load(uint32_t load_addr, const ulp_insn_t *program, size_t *psize)`

Resolve all macro references in a program and load it into RTC memory.

Parameters

- `load_addr` – address where the program should be loaded, expressed in 32-bit words
- `program` – `ulp_insn_t` array with the program
- `psize` – size of the program, expressed in 32-bit words

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or can not be loaded

`esp_err_t ulp_load_binary(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)`

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

a. MAGIC, (value 0x00706c75, 4 bytes)
b. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
c. TEXT_SIZE, size of .text section (2 bytes)
d. DATA_SIZE, size of data section (2 bytes)
e. BSS_SIZE, size of .bss section (2 bytes)
f. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
g. .text section
h. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

Parameters

- load_addr – address where the program should be loaded, expressed in 32-bit words
- program_binary – pointer to program binary
- program_size – size of the program binary

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

\texttt{esp_err_t ulp\_run} (\texttt{uint32\_t entry\_point})

Run the program loaded into RTC memory.

Parameters entry_point – entry point, expressed in 32-bit words

Returns ESP_OK on success

Macros

\texttt{ESP\_ERR\_ULP\_BASE}

Offset for ULP-related error codes

\texttt{ESP\_ERR\_ULP\_SIZE\_TOO\_BIG}

Program doesn’t fit into RTC memory reserved for the ULP

\texttt{ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR}

Load address is outside of RTC memory reserved for the ULP

\texttt{ESP\_ERR\_ULP\_DUPLICATE\_LABEL}

More than one label with the same number was defined

\texttt{ESP\_ERR\_ULP\_UNDEFINED\_LABEL}

Branch instructions references an undefined label

\texttt{ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE}

Branch target is out of range of B instruction (try replacing with BX)

Type Definitions

typedef union upl_insn ulp_insn_t

Header File

- components/ulp/ulp_common/include/ulp_common.h
**Functions**

`esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)`

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC_CNTL_ULP_CP_TIMER_1_REG register for ESP32-S2/S3. By default, for ESP32, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2/S3 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

**Note:**  The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Parameters**
- `period_index` – wakeup period setting number (0 - 4)
- `period_us` – wakeup period, us

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

void `ulp_timer_stop()`

Stop the ULP timer.

**Note:** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

void `ulp_timer_resume()`

Resume the ULP timer.

**Note:** This will resume an already configured timer, but does no other configuration

**Header File**
- `components/ulp/ulp_common/include/esp32/ulp_common_defs.h`

**Macros**

`RTC_SLOW_MEM`

RTC slow memory, 8k size

### 2.10.29 Watchdogs
Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using Project Configuration Menu, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

ESP-IDF has support for the following types of watchdog timers:

- Interrupt Watchdog Timer (IWDT)
- Task Watchdog Timer (TWDT)

The various watchdog timers can be enabled using the Project Configuration Menu. However, the TWDT can also be enabled during runtime.

Interrupt Watchdog Timer (IWDT)

The purpose of the IWDT is to ensure that interrupt service routines (ISRs) are not blocked from running for a prolonged period of time (i.e., the IWDT timeout period). Blocking ISRs from running in a timely manner is undesirable as it can increases ISR latency, and also prevents task switching (as task switching is executed form an ISR). The things that can block ISRs from running include:

- Disabling interrupts
- Critical Sections (also disables interrupts)
- Other same/higher priority ISRs (will block same/lower priority ISRs from running it completes execution)

The IWDT utilizes the watchdog timer in Timer Group 1 as its underlying hardware timer and leverages the FreeRTOS tick interrupt on each CPU to feed the watchdog timer. If the tick interrupt on a particular CPU is not run at within the IWDT timeout period, it is indicative that something is blocking ISRs from being run on that CPU (see the list of reasons above).

When the IWDT times out, the default action is to invoke the panic handler and display the panic reason as Interrupt wdt timeout on CPU0 or Interrupt wdt timeout on CPU1 (as applicable). Depending on the panic handler’s configured behavior (see CONFIG_ESP_SYSTEM_PANIC), users can then debug the source of the IWDT timeout (via the backtrace, OpenOCD, gdbstub etc) or simply reset the chip (which may be preferred in a production environment).

If for whatever reason the panic handler is unable to run after an IWDT timeout, the IWDT has a secondary timeout that will hard-reset the chip (i.e., a system reset).

Configuration

- The IWDT is enabled by default via the CONFIG_ESP_INT_WDT option.
- The IWDT’s timeout is configured by setting the CONFIG_ESP_INT_WDT_TIMEOUT_MS option.
  - Note that the default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances.
  - The timeout should always at least twice longer than the period between FreeRTOS ticks (see CONFIG_FREERTOS_HZ).

Tuning  If you find the IWDT timeout is triggered because an interrupt or critical section is running longer than the timeout period, consider rewriting the code:

- Critical sections should be made as short as possible. Any non-critical code/computation should be placed outside the critical section.
- Interrupt handlers should also perform the minimum possible amount of computation. Users can consider deferring any computation to a task by having the ISR push data to a task using queues.
Neither critical sections or interrupt handlers should ever block waiting for another event to occur. If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` setting instead.

### Task Watchdog Timer (TWDT)

The Task Watchdog Timer (TWDT) is used to monitor particular tasks, ensuring that they are able to execute within a given timeout period. The TWDT primarily watches the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. By watching the Idle Tasks of each CPU, the TWDT can detect instances of tasks running for a prolonged period of time without yielding. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. When a timeout occurs, an interrupt is triggered. Users can redefine the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and handle it differently.

#### Usage

The following functions can be used to watch tasks using the TWDT:

- `esp_task_wdt_init()` to initialize the TWDT and subscribe the idle tasks.
- `esp_task_wdt_add()` subscribes other tasks to the TWDT.
- Once subscribed, `esp_task_wdt_reset()` should be called from the task to feed the TWDT.
- `esp_task_wdt_delete()` unsubscribes a previously subscribed task
- `esp_task_wdt_deinit()` unsubscribes the idle tasks and deinitializes the TWDT

In the case where applications need to watch at a more granular level (i.e., ensure that a particular function/stub/code-path is called), the TWDT allows subscription of “users”.

- `esp_task_wdt_add_user()` to subscribe an arbitrary user of the TWDT. This function will return a user handle to the added user.
- `esp_task_wdt_reset_user()` must be called using the user handle in order to prevent a TWDT timeout.
- `esp_task_wdt_delete_user()` unsubscribes an arbitrary user of the TWDT.

#### Configuration

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

**Note:** Erasing large flash areas can be time consuming and can cause a task to run continuously, thus triggering a TWDT timeout. The following two methods can be used to avoid this:

- Increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period.
- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.

For more information, you can refer to `SPI Flash`

#### Configuration Options

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_init()` again.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.
Chapter 2. API Reference

JTAG & Watchdogs

While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

API Reference

Task Watchdog  A full example using the Task Watchdog is available in esp-idf: system/task_watchdog

Header File

- components/esp_system/include/esp_task_wdt.h

Functions

`esp_err_t esp_task_wdt_init (const esp_task_wdt_config_t *config)`

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s current configuration. This function will also subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using esp_task_wdt_add() or esp_task_wdt_add_user().

Note: esp_task_wdt_init() must only be called after the scheduler is started

Parameters config –[in] Configuration structure

Returns

- ESP_OK: Initialization was successful
- Other: Failed to initialize TWDT

`esp_err_t esp_task_wdt_deinit (void)`

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

Returns

- ESP_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

`esp_err_t esp_task_wdt_add (TaskHandle_t task_handle)`

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

Parameters task_handle –Handle of the task. Input NULL to subscribe the current running task to the TWDT

Returns

- ESP_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task
Chapter 2. API Reference

`esp_err_t esp_task_wdt_add_user (const char *user_name, esp_task_wdt_user_handle_t *user_handle_ret)`

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call `esp_task_wdt_reset_user()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

**Parameters**
- `user_name` - [in] String to identify the user
- `user_handle_ret` - [out] Handle of the user

**Returns**
- ESP_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

`esp_err_t esp_task_wdt_reset` (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

**Returns**
- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

`esp_err_t esp_task_wdt_reset_user (esp_task_wdt_user_handle_t user_handle)`

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

**Parameters**
- `user_handle` - [in] User handle

**Returns**
- ESP_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

`esp_err_t esp_task_wdt_delete` (TaskHandle_t task_handle)

Unsubscribe a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`.

**Parameters**
- `task_handle` - [in] Handle of the task. Input NULL to unsubscribe the current running task.

**Returns**
- ESP_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

`esp_err_t esp_task_wdt_delete_user (esp_task_wdt_user_handle_t user_handle)`

Unsubscribe a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call `esp_task_wdt_reset_user()`.

**Parameters**
- `user_handle` - [in] User handle

**Returns**
- ESP_OK: Successfully unsubscribed the user from the TWDT
- Other: Failed to unsubscribe user

`esp_err_t esp_task_wdt_status` (TaskHandle_t task_handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.
**Parameters** task_handle - \[in\] Handle of the task. Input NULL to query the current running task.

**Returns**:
- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is not subscribed
- ESP_ERR_INVALID_STATE: TWDT was never initialized

**Structures**

struct esp_task_wdt_config_t

Task Watchdog Timer (TWDT) configuration structure.

**Public Members**

- uint32_t timeout_ms
  - TWDT timeout duration in milliseconds
- uint32_t idle_core_mask
  - Mask of the cores whose idle task should be subscribed on initialization
- bool trigger_panic
  - Trigger panic when timeout occurs

**Type Definitions**

typedef struct esp_task_wdt_user_handle_s *esp_task_wdt_user_handle_t

Task Watchdog Timer (TWDT) user handle.

Code examples for this API section are provided in the system directory of ESP-IDF examples.

Chapter 4

API Guides

4.1 Application Level Tracing library

4.1.1 Overview

ESP-IDF provides a useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG, UART, or USB interfaces with small overhead on program execution. It is possible to use JTAG and UART interfaces simultaneously. The UART interface is mostly used for connection with SEGGER SystemView tool (see SystemView).

Developers can use this library to send application-specific state of execution to the host and receive commands or other types of information from the opposite direction at runtime. The main use cases of this library are:

1. Collecting application-specific data. See Application Specific Tracing.
2. Lightweight logging to the host. See Logging to Host.

Tracing components used when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode:** This is the default mode. The mode does not need interaction with the host side. In this mode, tracing module does not check whether the host has read all the data from HW UP BUFFER, but directly overwrites old data with the new ones. This mode is useful when only the latest trace data is interesting to the user, e.g., for analyzing program’s behavior just before the crash. The host can read the data later on upon user request, e.g., via special OpenOCD command in case of working via JTAG interface.

**Streaming mode:** Tracing module enters this mode when the host connects to ESP32. In this mode, before writing new data to HW UP BUFFER, the tracing module checks that whether there is enough space in it and if necessary, waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to the trace buffer using the finite value of the maximum waiting time, it is possible that this data will be dropped. This is especially true for tracing from time critical code (ISRs, OS scheduler code, etc.) where infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data, developers can enable additional data buffering via menuconfig option.
Chapter 4. API Guides

Fig. 1: Tracing Components Used When Working Over JTAG

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX.** This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g., due to USB bus congestions. But it will not help when the average bitrate of the trace data stream exceeds the hardware interface capabilities.

### 4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see JTAG Debugging for details.

2. **Target side:** Application tracing functionality can be enabled in menuconfig. Please go to Component config > Application Level Tracing menu, which allows selecting destination for the trace data (hardware interface for transport: JTAG or/and UART). Choosing any of the destinations automatically enables the `CONFIG_APPTRACE_ENABLE` option. For UART interfaces, users have to define baud rate, TX and RX pins numbers, and additional UART-related parameters.

**Note:** In order to achieve higher data rates and minimize the number of dropped packets, it is recommended to optimize the setting of JTAG clock frequency, so that it is at maximum and still provides stable operation of JTAG. See Optimize JTAG speed.

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic** (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In this mode, trace data is exposed to the host in 16 KB blocks. In post-mortem mode, when one block is filled, it is exposed to the host and the previous one becomes unavailable. In other words, the trace data is overwritten in 16 KB granularity. On panic, the latest data from the current input block is exposed to the host and the host can read them for post-analysis. System panic may occur when a very small amount of data are not exposed to the host yet. In this case, the previous 16 KB of collected data will be lost and the host will see the latest, but very small piece of the trace.
It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example, users can decide that it needs no less than 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic, they will not be flushed and will not overwrite the previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic** (*CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO*). The option is only meaningful in streaming mode and it controls the maximum time that the tracing module will wait for the host to read the last data in case of panic.

3. **UART RX/TX ring buffer size** (*CONFIG_APPTRACE_UART_TX_BUFF_SIZE*). The size of the buffer depends on the amount of data transferred through the UART.

4. **UART TX message size** (*CONFIG_APPTRACE_UART_TX_MSG_SIZE*). The maximum size of the single message to transfer.

### 4.1.4 How to Use This Library

This library provides APIs for transferring arbitrary data between the host and ESP32. When enabled in menuconfig, the target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding APIs to send, receive or flush the data.

#### Application Specific Tracing

In general, users should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between the target and the host:

1. On the target side, users should implement algorithms for writing trace data to the host. Piece of code below shows an example on how to do this.

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf,
      strlen(buf), ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

*esp_apptrace_write() function uses memcpy to copy user data to the internal buffer. In some cases, it can be more optimal to use *esp_apptrace_buffer_get() and *esp_apptrace_buffer_put() functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.*

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32,
      100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr,
      100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g., OpenOCD) will report...
    incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    res;
}
```
Also according to his needs, the user may want to receive data from the host. Piece of code below shows an example on how to do this.

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/
--*do not wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

*esp_apptrace_read()* function uses memcpy to copy host data to user buffer. In some casesm it can be more optimal to use *esp_apptrace_down_buffer_get()* and *esp_apptrace_down_buffer_put()* functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number \%d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX,--ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g., OpenOCD) will report--incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the *Getting Started Guide.*
3. Run OpenOCD (see *JTAG Debugging*).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal *telnet <oocd_host> 4444.* If telnet session is opened on the same machine which runs OpenOCD, you can use *localhost* as *<oocd_host>* in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to the specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands, see OpenOCD Application Level Tracing Commands.

6. The final step is to process received data. Since the format of data is defined by users, the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in $IDF_PATH/tools/esp_app_trace: apptrace_proc.py (used for feature tests) and logtrace_proc.py (see more details in section Logging to Host).

OpenOCD Application Level Tracing Commands  
HW UP BUFFER is shared between user data blocks and the filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment, it can happen that the task_ISR which fills the buffer is preempted by another high priority task_ISR. So it is possible that the user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions, the tracing module prepends all user data chunks with header which contains the allocated user buffer size (2 bytes) and the length of the actually written data (2 bytes). So the total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case, it puts the contents of the whole user chunk (including unfilled area) to the output file.

Below is the description of available OpenOCD application tracing commands.

**Note:** Currently, OpenOCD does not provide commands to send arbitrary user data to the target.

Command usage:

```bash
esp aptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

Start command syntax:

```bash
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: file://path/to/file.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.
- **wait4halt** If 0, start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default, 0.
- **skip_size** Number of bytes to skip at the start. By default, 0.

**Note:** If poll_period is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set trace_size and wait until this size of data is collected. At this point, tracing stops automatically.

Command usage examples:
1. Collect 2048 bytes of tracing data to the file `trace.log`. The file will be saved in the `openocd-esp32` directory.

   ```
   esp aptrace start file://trace.log 1 2048 5 0 0
   ```

   The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

   **Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then it is likely that the target is not sending enough data to empty the buffer to OpenOCD before the timeout. Either increase the timeout or use the function `esp_aptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

   ```
   esp aptrace start file://trace.log 1 -1 -1 0 0
   ```

   There is no limitation on the size of collected data and there is no data timeout set. This process may be stopped by issuing `esp aptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

   ```
   esp aptrace start file://trace.log 0 -1 -1 0 0
   ```

   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

4. Wait for the target to be halted. Then resume the target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

   ```
   esp aptrace start file://trace.log 0 2048 -1 1 0
   ```

   To configure tracing immediately after reset, use the OpenOCD `reset halt` command.

---

**Logging to Host**

ESP-IDF implements a useful feature: logging to the host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. Most part of the work is done on the host.

By default, ESP-IDF’s logging library uses `vprintf`-like function to write formatted output to dedicated UART. In general, it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type, every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though the implementation of the `vprintf`-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced. And in the worst cases, the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or to move string formatting procedure to the host.

The application level tracing feature can be used to transfer log information to the host using `esp_aptrace_vprintf` function. This function does not perform full parsing of the format string and arguments. Instead, it just calculates the number of arguments passed and sends them along with the format string address to the host. On the host, log data is processed and printed out by a special Python script.

**Limitations** Current implementation of logging over JTAG has some limitations:
1. No support for tracing from ESP_EARLY_LOGx macros.
2. No support for printf arguments whose size exceeds 4 bytes (e.g., double and uint64_t).
3. Only strings from the .rodata section are supported as format strings and arguments.
4. The maximum number of printf arguments is 256.

How To Use It  
In order to use logging via trace module, users need to perform the following steps:
1. On the target side, the special vprintf-like function esp_apptrace_vprintf needs to be installed. It sends log data to the host. Example code is provided in system/app_trace_to_host.
2. Follow instructions in items 2-5 in Application Specific Tracing.
3. To print out collected log records, run the following command in terminal: $IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file.

Log Trace Processor Command Options  
Command usage:

logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>

Positional arguments:

trace_file Path to log trace file.
elf_file Path to program ELF file.

Optional arguments:

-h, --help Show this help message and exit.
--no-errors, -n Do not print errors.

System Behavior Analysis with SEGGER SystemView

Another useful ESP-IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application. It is possible to view events in real-time through the UART interface.

How To Use It  
Support for this feature is enabled by Component config>Application Level Tracing>FreeRTOS SystemView Tracing (CONFIG_APPTRACE_SV_ENABLE) menuconfig option. There are several other options enabled under the same menu:

1. SystemView destination. Select the destination interface: JTAG or UART. In case of UART, it will be possible to connect SystemView application to the ESP32 directly and receive data in real-time.
2. ESP32 timer to use as SystemView timestamp source: (CONFIG_APPTRACE_SV_TS_SOURCE) selects the source of timestamps for SystemView events. In the single core mode, timestamps are generated using ESP32 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In the dual-core mode, external timer working at 40 Mhz is used, so the timestamp granularity is 25 ns.
3. Individually enabled or disabled collection of SystemView events (CONFIG_APPTRACE_SV_EVT_XXX):
   • Trace Buffer Overflow Event
   • ISR Enter Event
   • ISR Exit Event
   • ISR Exit to Scheduler Event
   • Task Start Execution Event
   • Task Stop Execution Event
   • Task Start Ready State Event
   • Task Stop Ready State Event
   • Task Create Event
   • Task Terminate Event
   • System Idle Event
   • Timer Enter Event
   • Timer Exit Event
ESP-IDF has all the code required to produce SystemView compatible traces, so users can just configure necessary project options (see above), build, download the image to target, and use OpenOCD to collect data as described in the previous sections.

4. Select Pro or App CPU in menuconfig options Component config > Application Level Tracing > FreeRTOS SystemView Tracing to trace over the UART interface in real-time.

**OpenOCD SystemView Tracing Command Options**

Command usage:
```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:
- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.

Start command syntax:
```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1** Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.
- **outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger).

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in the OpenOCD window (not the one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point, tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files `pro-cpu.SVDat` and `app-cpu.SVDat`. The files will be saved in `openocd-esp32` directory.
```
esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
```
The tracing data will be retrieved and saved in non-blocking mode. To stop this process, enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in the OpenOCD window.

2. Retrieve tracing data and save them indefinitely.
```
esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
```
OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

**Data Visualization**

After trace data are collected, users can use a special tool to visualize the results and inspect behavior of the program.

Unfortunately, SystemView does not support tracing from multiple cores. So when tracing from ESP32 with JTAG interfaces in the dual-core mode, two files are generated: one for PRO CPU and another for APP CPU. Users can load each file into separate instances of the tool. For tracing over UART, users can select Component config > Application Level Tracing > FreeRTOS SystemView Tracing in menuconfig Pro or App to choose which CPU has to be traced.
It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately, there is an Eclipse plugin called Impulse which can load several trace files, thus making it possible to inspect events from both cores in one view. Also, this plugin has no limitation of 1,000,000 events as compared to the free version of SystemView.

Good instructions on how to install, configure, and visualize data in Impulse from one core can be found here.

**Note:** ESP-IDF uses its own mapping for SystemView FreeRTOS events IDs, so users need to replace the original file mapping $SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt with $IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt. Also, contents of that IDF-specific file should be used when configuring SystemView serializer using the above link.

### Configure Impulse for Dual Core Traces

After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs, users can add special Multi Adapter port and load both files into one view. To do this, users need to do the following steps in Eclipse:

1. Open the Signal Ports view. Go to Windows > Show View > Other menu. Find the Signal Ports view in Impulse folder and double-click it.
2. In the Signal Ports view, right-click Ports and select Add > New Multi Adapter Port.
3. In the open dialog box, click Add and select New Pipe/File.
4. In the open dialog box, select SystemView Serializer as Serializer and set path to PRO CPU trace file. Click OK.
5. Repeat the steps 3-4 for APP CPU trace file.
6. Double-click the created port. View for this port should open.
7. Click the Start/Stop Streaming button. Data should be loaded.
8. Use the Zoom Out, Zoom In and Zoom Fit buttons to inspect data.
9. For settings measurement cursors and other features, please see Impulse documentation.

**Note:** If you have problems with visualization (no data is shown or strange behaviors of zoom action are observed), you can try to delete current signal hierarchy and double-click on the necessary file or port. Eclipse will ask you to create a new signal hierarchy.

### Gcov (Source Code Coverage)

#### Basics of Gcov and Gcovr

Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’s runtime. Gcov is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The Gcovr tool is a utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the host will undergo these steps:

1. Compile the source code using GCC with the --coverage option enabled. This will cause the compiler to generate a .gcno notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the --coverage option should have their own .gcno file of the same name (e.g., a main.c will generate a main.gcno when compiled).
2. Execute the program. During execution, the program should generate .gcda data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a .gcda file for each source file compiled with the --coverage option (e.g., main.c will generate a main.gcda).
3. Gcov or Gcovr can be used to generate a code coverage based on the .gcno, .gcda, and source files. Gcov will generate a text-based coverage report for each source file in the form of a .gcov file, whilst Gcovr will generate a coverage report in HTML format.

**Gcov and Gcovr in ESP-IDF** Using Gcov in ESP-IDF is complicated due to the fact that the program is running remotely from the host (i.e., on the target). The code coverage data (i.e., the .gcda files) is initially stored on the
target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. **Setting Up a Project for Gcov**
2. **Dumping Code Coverage Data**
3. **Generating Coverage Report**

### Setting Up a Project for Gcov

**Compiler Option**  In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

- To cause all source files in a component to be compiled with the `--coverage` option, you can add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the CMakeLists.txt file of the component.
- To cause a select number of source files (e.g., `source1.c` and `source2.c`) in the same component to be compiled with the `--coverage` option, you can add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the CMakeLists.txt file of the component.

When a source file is compiled with the `--coverage` option (e.g., `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project’s build directory.

### Project Configuration

Before building a project with source code coverage, make sure that the following project configuration options are enabled by running `idf.py menuconfig`.

- Enable the application tracing module by selecting `Trace Memory for the CON-FIG_APPTRACE_DESTINATION1` option.
- Enable Gcov to the host via the `CONFIG_APPTRACE_GCOV_ENABLE`.

### Dumping Code Coverage Data

Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the host is known as dumping.

The dumping of coverage data is done via OpenOCD (see *JTAG Debugging* on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <oocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project’s build directory. For example, if `gcov_example_main.c` of the main component is compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda. Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application’s lifetime. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application’s entire lifetime.

ESP-IDF supports two methods of dumping code coverage data form the target to the host:

- **Instant Run-Time Dump**
- **Hard-coded Dump**

**Instant Run-Time Dump**  An Instant Run-Time Dump is triggered by calling the `ESP32 gcov OpenOCD` command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32’s current state and execute a built-in ESP-IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the host. Upon completion, the ESP32 will resume its current state.
Chapter 4. API Guides

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the host must execute the `esp gcov dump` OpenOCD command (via a telnet session). The `esp gcov dump` command will cause OpenOCD to connect to the ESP32, retrieve the code coverage data, then disconnect from the ESP32, thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application’s lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application’s lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application’s main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp gcov dump` automatically via the use a `gdbinit` script (see Using GDB from Command Line).

The following GDB script will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp gcov dump` OpenOCD command.

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.

**Generating Coverage Report** Once the code coverage data has been dumped, the `.gcno`, `.gcdla` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to Gcov documentation and Gcovr documentation.

**Adding Gcovr Build Target to Project** To make report generation more convenient, users can define additional build targets in their projects such that the report generation can be done with a single build command.

Add the following lines to the `CMakeLists.txt` file of your project.

```
include(${ENV{IDF_PATH}/tools/cmake/gcov.cmake})
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `${BUILD_DIR_BASE}/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

**4.2 Application Startup Flow**

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. **First stage bootloader** in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. **Second stage bootloader** loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. Application startup executes. At this point the second CPU and RTOS scheduler are started. This process is explained in detail in the following sections.

4.2.1 First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located in the mask ROM of the ESP32 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.

2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32 datasheet for a description of SoC boot modes and how to execute them.

3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

**Note:** During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

Second stage bootloader binary image is loaded from flash starting at address 0x1000. If Secure Boot is in use then the first 4 KB sector of flash is used to store secure boot IV and digest of the bootloader image. Otherwise, this sector is unused.

4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in components/bootloader directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.
