This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
If you have one of ESP32 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-DevKitC V4 Getting Started Guide**

This guide shows how to start using the ESP32-DevKitC V4 development board.

**What You Need**

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**  ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-DA
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROVER-E
  - ESP32-WROVER-IE
- male or female pin headers.

For details please refer to ESP Product Selector.

**Functional Description**  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROOM-32</td>
<td>A module with ESP32 at its core. For more information, see ESP32-WROOM-32 Datasheet.</td>
</tr>
<tr>
<td>EN</td>
<td>Reset button. Holding down <strong>Boot</strong> and then pressing <strong>EN</strong> initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>Boot</td>
<td>Download button. Download button. Holding down <strong>Boot</strong> and then pressing <strong>EN</strong> initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates of up to 3 Mbps.</td>
</tr>
<tr>
<td>Micro USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-WROOM-32 module.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>Turns on when the USB or an external 5V power supply is connected to the board. For details see the schematics in Related Documents.</td>
</tr>
<tr>
<td>I/O</td>
<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>
Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

Warning: The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

Header Block The two tables below provide the Name and Function of I/O header pins on both sides of the board, as shown in ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered.

### Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

---

1. P: Power supply; I: Input; O: Output.
2. The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.
3. The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.
In case these issues occur, please remove the component. The figure below shows the location of C15 highlighted in yellow.

Start Application Development  Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins
Warning: The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

Start Application Development Before powering up your ESP32-DevKitC V2, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options.

What You Need
- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:
- ESP32-WROOM-E module
- LCD screen
- microSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.
Chapter 1. Get Started

Fig. 6: ESP-WROVER-KIT block diagram

Fig. 7: ESP-WROVER-KIT board layout - front

Fig. 8: ESP-WROVER-KIT board layout - back
Functional Description  The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

• Starting from the first picture’s top right corner and going clockwise
• Then moving on to the second picture

Espressif Systems

Release v5.1-dev-131-g2761ad4865
Allocation of ESP32 Pins

Some pins or terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data/Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>

<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 or R23 and re-soldering them to positions R12 or R24.
**Chapter 1. Get Started**

</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

Start Application Development  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the Power Switch to ON, and the 5V Power On LED should light up.

Now to Development  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

A Board Support Package can be found in IDF Component Registry.
Chapter 1. Get Started

The application examples that use some hardware specific to your ESP-WROVER-KIT can be found below.

- On-board LCD example: peripherals/spi_master/lcd
- SD card slot example: storage/sd_card
- Camera connector example: https://github.com/espressif/esp32-camera

**ESP-WROVER-KIT V3 Getting Started Guide**

This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check Hardware Reference.

**What You Need**

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

**Overview**

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

**Functionality Overview**

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

**Functional Description**

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

**Start Application Development**  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development**  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 12: ESP-WROVER-KIT block diagram

Fig. 13: ESP-WROVER-KIT board layout - front
Fig. 14: ESP-WROVER-KIT board layout - back
### Key Component | Description
---|---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

**ESP32 Module** | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.

**CTS/RTS** | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

**UART** | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

**SPI** | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.

**JTAG** | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

**FT2232** | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.

**EN** | Reset button.

**Boot** | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

**USB** | USB interface. Power supply for the board as well as the communication interface between a computer and the board.

**Power Select** | Power supply selector interface. The board can be powered either via USB or via the 5 V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.

**Power Key** | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.

**5V Input** | The 5 V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).

**LDO** | NCP1117(1 A): 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1 A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.

**Camera** | Camera interface, a standard OV7670 camera module.

**RGB** | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).

**I/O** | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, 12C, 12S, SPI, etc.

**microSD Card** | microSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the microSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.

**LCD** | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

### Setup Options
There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table above.

ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4/V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

What You Need

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. There are two versions of ESP32-PICO-KIT boards, respectively with male headers and female headers. In this guide, the male header version is taken as an example.
2. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details, see module’s datasheet in Related Documents.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

---

Fig. 15: ESP32-PICO-KIT block diagram
**Functional Description**  The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

![ESP32-PICO-KIT board layout](image)

Fig. 16: ESP32-PICO-KIT board layout (with female headers)

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:**  The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
**Pin Descriptions**  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see ESP32-PICO-KIT board layout (with female headers). The pin numbering and header names are the same as in the schematic given in Related Documents.

Chapter 1. Get Started

Note:
1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input, b) output.
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development  Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions  The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4” ).

Fig. 17: ESP32-PICO-KIT dimensions - back (with male headers)

Fig. 18: ESP32-PICO-KIT dimensions - side (with male headers)

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-Ethernet-Kit V1.2 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

Fig. 20: ESP32-Ethernet-Kit V1.2 Overview (click to enlarge)

What You Need

- ESP32-Ethernet-Kit V1.2 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.
Chapter 1. Get Started

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)

The table below provides description starting from the picture’s top right corner and going clockwise.
Chapter 1. Get Started

Fig. 23: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
### Table 1: Table 1 Component Description

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROVER-E</td>
<td>This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.</td>
</tr>
<tr>
<td>GPIO Header 2</td>
<td>Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see GPIO Header 2.</td>
</tr>
<tr>
<td>Function Switch</td>
<td>A 4-bit DIP switch used to configure the functionality of selected GPIOs of ESP32. For details see Function Switch.</td>
</tr>
<tr>
<td>Tx/Rx LEDs</td>
<td>Two LEDs to show the status of UART transmission.</td>
</tr>
<tr>
<td>FT2232H</td>
<td>The FT2232H chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232H also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232H chip enhances user-friendliness in terms of application development and debugging. See ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.</td>
</tr>
<tr>
<td>USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the board.</td>
</tr>
<tr>
<td>Power Switch</td>
<td>Power On/Off Switch. Toggling the switch to 5V0 position powers the board on, toggling to GND position powers the board off.</td>
</tr>
<tr>
<td>5V Input</td>
<td>The 5 V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board, either from USB or 5 V Input.</td>
</tr>
<tr>
<td>DC/DC Converter</td>
<td>Provided DC 5 V to 3.3 V conversion, output current up to 2 A.</td>
</tr>
<tr>
<td>Board B Connectors</td>
<td>A pair male and female header pins for mounting the PoE board (B)</td>
</tr>
<tr>
<td>IP101GRI (PHY)</td>
<td>The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GRI chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3/802.3u standard of 10/100 Mbps.</td>
</tr>
<tr>
<td>RJ45 Port</td>
<td>Ethernet network data transmission port.</td>
</tr>
<tr>
<td>Magnetics Module</td>
<td>The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.</td>
</tr>
<tr>
<td>Link/Activity LEDs</td>
<td>Two LEDs (green and red) that respectively indicate the “Link” and “Activity” statuses of the PHY.</td>
</tr>
<tr>
<td>BOOT Button</td>
<td>Download button. Holding down BOOT and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
<tr>
<td>GPIO Header 1</td>
<td>This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see GPIO Header 1.</td>
</tr>
</tbody>
</table>

**Note:** Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users don’t need to do any operation with BOOT button or EN button.

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an
Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Fig. 24: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)](image)

<table>

</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).

**Note:**  For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

**RMII Clock Sourced Externally by PHY**  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GR PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).
Fig. 25: RMII Clock from IP101GRI PHY
Fig. 26: RMII Clock from ESP Internal APLL
Chapter 1. Get Started

**RMII Clock Sourced Internally from ESP32’s APLL**  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to [ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic](#), sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP1GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP1GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>

<td>3V3</td>
<td>3.3 V power supply</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

2. Functionality depends on the settings of the **Function Switch**.

</tbody>
</table>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the **RESET_N** signal to PHY defaults to low, turning the clock output off. After power-on you can control RE-
SET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic](#).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-32D module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the **Ethernet board (A)** to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development**  Proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**  After setting up the development environment and testing the board, you can configure and flash the **ethernet/basic** example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.2* ([click to enlarge]).

**Summary of Changes from ESP32-Ethernet-Kit V1.1**

- Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
- Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check [ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic](#).
- Replace ESP32-WROOM-B with ESP32-WROOM-E.

Chapter 1. Get Started

ESP32-Ethernet-Kit V1.0 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface.
without a separate JTAG debugger.

**Functionality Overview** The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

![ESP32-Ethernet-Kit Block Diagram](image)

</table>

![Fig. 29: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)](image-url)
**PoE Board (B)**  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview.*

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

<td>See note 2</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.
**GPIO Header 3** The functionality of GPIOs connected to this header depends on the settings of the *Function Switch*.

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

**Start Application Development** Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development  Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

To use the older GNU Make compilation system, please refer to Installation section.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example  After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.0 board.

ESP32-Ethernet-Kit V1.1 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.
Ethernet Board (A)

PoE Board (B)

Fig. 31: ESP32-Ethernet-Kit V1.1
Functionality Overview  The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Fig. 32: ESP32-Ethernet-Kit block diagram (click to enlarge)

Functional Description  The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)  The table below provides description starting from the picture’s top right corner and going clockwise.
### Table 3: Table 1 Component Description

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board, either from USB or 5 V Input.</td>
</tr>
<tr>
<td>DC/DC Converter</td>
<td>Provided DC 5 V to 3.3 V conversion, output current up to 2 A.</td>
</tr>
<tr>
<td>Board B Connectors</td>
<td>A pair male and female header pins for mounting the PoE board (B).</td>
</tr>
<tr>
<td>IP101GRI (PHY)</td>
<td>The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GRI chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3 / 802.3u standard of 10/100 Mbps.</td>
</tr>
<tr>
<td>RJ45 Port</td>
<td>Ethernet network data transmission port.</td>
</tr>
<tr>
<td>Magnetics Module</td>
<td>The Magnetics are part of the Ethernet specification to protect against faults and Transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.</td>
</tr>
</tbody>
</table>
**PoE Board (B)**  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE Board Image](image-url)

**Fig. 34: ESP32-Ethernet-Kit PoE board (B) layout (click to enlarge)**

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options**  This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APPLL.

**Note:** For additional information on the RMII clock selection, please refer to *ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic*, sheet 2, location D2.
**RMII Clock Sourced Externally by PHY**  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’ s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 35: RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMII Clock Sourced Internally from ESP32’ s APLL**  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Fig. 36: RMII Clock from ESP Internal APLL
**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>
<td></td>
</tr>
<tr>
<td>1   GPIO21</td>
<td>TX_EN</td>
</tr>
<tr>
<td>2   GPIO19</td>
<td>TXD[0]</td>
</tr>
<tr>
<td>3   GPIO22</td>
<td>TXD[1]</td>
</tr>
<tr>
<td>4   GPIO25</td>
<td>RXD[0]</td>
</tr>
<tr>
<td>5   GPIO26</td>
<td>RXD[1]</td>
</tr>
<tr>
<td>6   GPIO27</td>
<td>CRS_DV</td>
</tr>
<tr>
<td>7   GPIO0</td>

<td>MDC</td>
</tr>
<tr>
<td>9   GPIO18</td>
<td>MDIO</td>
</tr>
<tr>
<td>PHY Reset</td>
<td></td>
</tr>
<tr>
<td>10  GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

**Note:** Except for REF_CLK, the allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 GPIO32</td>
</tr>

</tbody>
</table>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic](#).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

### Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

### Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to **Get Started**, where Section **Installation** will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the `ethernet/basic` example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on **ESP32-Ethernet-Kit V1.1**.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**ESP32-DevKitS(-R)**

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif.

ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
The document consists of the following major sections:

- **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.
- **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section How to Flash a Board provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

**Overview**  ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

- **ESP32-DevKitS**:  
  - ESP32-WROOM-32  
  - ESP32-WROOM-32D  
  - ESP32-WROOM-32U  
  - ESP32-SOLO-1  
  - ESP32-WROOM-32E  
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R**:  
  - ESP32-WROVER (PCB & IPEX)  
  - ESP32-WROVER-B (PCB & IPEX)  
  - ESP32-WROVER-E  
  - ESP32-WROVER-IE

For information about above modules, please refer to ESP32 Series Modules.

**Description of Components**
Chapter 1. Get Started

Fig. 37: ESP32-DevKitS - front

Fig. 38: ESP32-DevKitS-R - front
Key Component | Description
--- | ---
Spring Pins | Click the module in. The pins will fit into the module’s castellated holes.
2.54 mm Female Headers | These female headers are connected to pins of the module mounted on this board. For description of female headers, please refer to [Header Blocks](#).
USB-to-UART Bridge | Single-chip USB to UART bridge provides transfer rates of up to 3 Mbps.
LDO | 5V-to-3.3V low-dropout voltage regulator (LDO).
Micro-USB Connector/Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
EN Button | Reset button.
Boot Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
Power On LED | Turns on when the USB or power supply is connected to the board.

**How to Flash a Board** Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Hardware Setup** Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:
- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

**Software Setup**

**Preferred Method** The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to [Get Started](#), where Section [Installation](#) will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

**Alternative Method** As an alternative, Windows users can flash binaries using the [Flash Download Tool](#). Just download it, unzip it, and follow the instructions inside the `doc` folder.

**Note:**
1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

**Board Dimensions**

**Contents and Packaging**
Chapter 1. Get Started

Fig. 39: ESP32-DevKitS board dimensions - back

Fig. 40: ESP32-DevKitS-R board dimensions - back
Retail orders If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

### ESP32-PICO-KIT-1

#### Overview
ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-V3 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:
Chapter 1. Get Started

• 40 MHz crystal oscillator
• 4 MB flash
• Filter capacitors
• RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

• Getting Started: Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
• Contents and Packaging: Provides information about packaging and contents for retail and wholesale orders.
• Hardware Reference: Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
• Hardware Revision Details: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
• Related Documents: Gives links to related documentation.

Getting Started This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section Start Application Development provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

Description of Components The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 42: ESP32-PICO-KIT-1 Overview (click to enlarge)
Start Application Development  Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

Required Hardware

- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS

Software Setup  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment.

Contents and Packaging

Retail Orders  If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins
Chapter 1. Get Started

Fig. 44: ESP32-PICO-KIT-1 Block Diagram (click to enlarge)

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

**Note:**

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

ESP32-PICO-DevKitM-2

Overview

ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif. The core of this board is ESP32-PICO-MINI-02(02U) module with complete Wi-Fi and Bluetooth functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02(02U) are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started**: Provides an overview of the ESP32-PICO-DevKitM-2 and software setup instructions to get started.
- **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference**: Provides more detailed information about the ESP32-PICO-DevKitM-2’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions (if any) of the ESP32-PICO-DevKitM-2.
- **Related Documents**: Gives links to related documentation.

Getting Started

This section describes how to get started with the ESP32-PICO-DevKitM-2. It begins with a few introductory sections about the ESP32-PICO-DevKitM-2, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-DevKitM-2.

Chapter 1. Get Started

Note:

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-DevKitM-2’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

**Fig. 49: ESP32-PICO-DevKitM-2 Pin Layout (click to enlarge)**

**Pin Layout**

**Hardware Revision Details**  No previous versions available.

**ESP32-DevKitM-1**

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-1(1U)-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.
The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentaiton.

**Getting Started** This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section **Start Application Development** provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.

**Overview** This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

**Contents and Packaging**

**Retail orders** If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

**Description of Components** The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.
Chapter 1. Get Started

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On-board module</td>
<td>ESP32-MINI-1 module or ESP32-MINI-1U module. ESP32-MINI-1 comes with an on-board PCB antenna. ESP32-MINI-1U comes with an external antenna connector. The two modules both have a 4 MB flash in chip package. For details, please see ESP32-MINI-1 &amp; ESP32-MINI-1U Datasheet.</td>
</tr>
<tr>
<td>5 V to 3.3 V LDO</td>
<td>Power regulator converts 5 V to 3.3 V.</td>
</tr>
<tr>
<td>Boot Button</td>
<td>Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>Reset Button</td>
<td>Reset Button</td>

<tr>
<td>Micro-USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32 chip.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates up to 3 Mbps.</td>
</tr>
<tr>
<td>3.3 V Power On LED</td>
<td>Turns on when the USB is connected to the board. For details, please see the schematics in Related Documents.</td>
</tr>
<tr>
<td>I/O Connector</td>
<td>All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. Users can program ESP32 chip to enable multiple functions.</td>
</tr>
</tbody>
</table>

**Start Application Development** Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Software Setup** Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.
Chapter 1. Get Started

**Attention:** ESP32-DevKitM-1 boards manufactured before December 2, 2021 have a single core module installed. To verify what module you have, please check module marking information in PCN-2021-021. If your board has a single core module installed, please enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing your applications.

Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

![Block Diagram of ESP32-DevKitM-1](image)

**Power Source Select** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

**Warning:**

- The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.

**Pin Descriptions** The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

1.2.2 Software

To start using ESP-IDF on ESP32, install the following software:

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full Application for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain

1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 IDE

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

- Eclipse Plugin
- VSCode Extension

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.
Standard Setup of Toolchain for Windows

Introduction ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

What is the usecase for Online and Offline Installer Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.
Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

![Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment](image)

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt  For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs export.bat script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

First Steps on ESP-IDF  Now since all requirements are met, the next topic will guide you on how to start your first project.

- C:\Users\test\esp\esp-idf\tools\idf-exe\1.0.1
- C:\Users\test\esp\esp-idf\tools\ccache\3.7
- C:\Users\test\esp\esp-idf\tools\dfu-util\0.9\dfu-util-0.9-win64
- C:\Users\test\esp\esp-idf\python_env\idf4.3_py3.7.env\Scripts
- C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

```
idf.py build
```

C:\Users\test\esp\esp-idf>
Chapter 1. Get Started

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project**  
Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device**  
Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial port names start with `COM` in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32](#) for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project**  
Navigate to your `hello_world` directory, set ESP32 as the target, and run the project configuration utility `menuconfig`.

**Windows**

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”, since this example runs with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MIN1-1(1U) module, please enable single core mode (`CONFIG_FREERTOS_UNICORE`) in menuconfig before flashing examples.
Chapter 1. Get Started

Fig. 56: Project configuration - Home window

Note: The colors of the menu could be different in your terminal. You can change the appearance with the option --style. Please run idf.py menuconfig --help for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See Additional Tips for more information.

Build the Project  Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.../.../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.bin build 0x10000 build/bootloader/bootloader.bin 0x8000 build/partition_table/partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.
Chapter 1. Get Started

**Flash onto the Device**  To flash the binaries that you just built for the ESP32 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32 board’s USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See this Flashing Troubleshooting page or Establish Serial Connection with ESP32 for more detailed information.

**Normal Operation**  When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
--0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting...........
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14
Uploading stub...
Running stub...
Stub running...

Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.
If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out Eclipse Plugin, VSCode Extension.

**Monitor the Output** To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```bash
$ idf.py -p <PORT> monitor
Running idf_monitor in directory .../esp/hello_world/build
Executing "python .../esp-idf/tools/idf_monitor.py -b 115200 .../esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+\] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
...[output truncated]
Hello world!
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```plaintext
...Hello world!
    Restarting in 10 seconds...
    This is esp32 chip with 2 CPU core(s), WiFi/Bluetooth, silicon revision 1, 2MB...
    external flash
Minimum free heap size: 298968 bytes
    Restarting in 9 seconds...
    Restarting in 8 seconds...
    Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+\]`.

If IDF Monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```plaintext
$66$Xn9yp,66$M0Wb$++/Hn9a7/;+/t566P6-@k0666ca866oJ
~z7005Y(0,166$e66)(Xn9yp,1Dr0zY()jpi8()@z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to `Component config -> Hardware Settings -> Main XTAL Config -> Main XTAL frequency`, then change `CONFIG_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32 are as follows:

- 26 MHz
- 40 MHz

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

- **idf.py** for a full reference of idf.py commands and options.

**That’s all that you need to get started with ESP32!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the **Supported Targets** table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

**Additional Tips**

**Permission issues /dev/ttyUSB0**  With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

**Python compatibility**  ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as **pyenv**.

**Start with Board Support Package**  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via **IDF Component Manager**, so they can be found in **IDF Component Registry**.

**Here’s an example of how to add ESP-WROVER-KIT BSP to your project:**

```
idf.py add-depency esp_wrover_kit
```

More examples of BSP usage can be found in **BSP examples folder**.

**Flash Erase**  Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.
Chapter 1. Get Started

Related Documents For advanced users who want to customize the install process:

- Updating ESP-IDF tools on Windows
- Establish Serial Connection with ESP32
- Eclipse Plugin
- VSCode Extension
- IDF Monitor

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

Add ESP-IDF tools to PATH using an export script ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

Establish Serial Connection with ESP32

Establishing a serial connection with the ESP32 target device could be done using a USB-to-UART bridge.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

USB-to-UART Bridge on Development Board For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32 is UART.

External USB-to-UART Bridge Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.
This section provides guidance on how to establish a serial connection between ESP32 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32 to PC** Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

**Flash using UART** This section provides guidance on how to establish a serial connection between ESP32 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32 to PC** Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:

- **CP210x**: CP210x USB to UART Bridge VCP Drivers
- **FTDI**: FTDI Virtual COM Port Drivers

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing **BAUD** with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the **BOOT** button and then press the **RESET** button once. After that release the **BOOT** button.
Check port on Windows  
Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

![USB to UART bridge of ESP32-DevKitC in Windows Device Manager](image)

Check port on Linux and macOS  
To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

Note: macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed. See Section Connect ESP32 to PC for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux  
The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:
Fig. 60: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection**  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32.

**Windows and Linux**  In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 61: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32, see *Example Output*.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.
Fig. 62: Setting Serial Communication in PuTTY on Linux
**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in *Check port on Linux and macOS*, run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32, see *Example Output*. To exit the `screen` session type Ctrl-A + \. 

**Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

### Example Output

An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)

ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the *esptool documentation* for more details.

If you got her from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

### Flashing Troubleshooting

**Failed to Connect** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by *esptool.py*, the utility that is called...
by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the esptool troubleshooting page.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

**IDF Monitor**

IDF Monitor is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running idf.py monitor.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>Interrupt running application</td>
<td>Pauses IDF Monitor and run GDB project debugger to debug the application at runtime. This requires :ref:<code>CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME</code> option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line_ to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:
Chapter 1. Get Started

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
→ unhandled.
Register dump:

To decode each address, IDF Monitor runs the following command in the background:

xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

Note: Set environment variable ESP_MONITOR DECODE to 0 or call idf_monitor.py with specific command line
option: idf_monitor.py --disable-address-decoding to disable address decoding.

**Target Reset on Connection**  By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the **--no-reset** option (e.g., idf_monitor.py --no-reset).

**Note:** The **--no-reset** option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., idf.py monitor --no-reset -p [PORT]).

**Launching GDB with GDBStub**  GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub on runtime`. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub on panic`. When a crash occurs, GDBStub will output a special string pattern over the serial port that indicates that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board’s Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex
→interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering**  IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using * defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).
Examples of Filtering Rules:

- * can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:*," and "tag1:1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:N" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example

The following log snippet was acquired without any filtering options:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_→1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```plaintext
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vsf:N wifi:N *:V"` show the following output:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.
Standard Toolchain Setup for Linux and macOS

Installation Step by Step  This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment  These are the steps for setting up the ESP-IDF for your ESP32.

•  Step 1. Install Prerequisites
•  Step 2. Get ESP-IDF
•  Step 3. Set up the tools
•  Step 4. Set up the environment variables
•  Step 5. First Steps on ESP-IDF

Step 1. Install Prerequisites  In order to use ESP-IDF with the ESP32, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

For Linux Users  To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

•  Ubuntu and Debian:
  
  ```
  sudo apt-get install git wget flex bison gperf python3 python3-venv cmake
  --ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

•  CentOS 7 & 8:
  
  ```
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake
  --ninja-build ccache dfu-util libusb
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

•  Arch:
  
  ```
  sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja
  --ccache dfu-util libusb
  ```

Note:

•  CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf_tools.py install cmake” to install a suitable version if your OS versions doesn’t have one.

•  If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF will use the version of Python installed by default on macOS.

•  Install CMake & Ninja build:
  
  – If you have HomeBrew, you can run:
    
    ```
    brew install cmake ninja dfu-util
    ```

  – If you have MacPorts, you can run:
    
    ```
    sudo port install cmake ninja dfu-util
    ```

  – Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.
Chapter 1. Get Started

- It is strongly recommended to also install `ccache` for faster builds. If you have HomeBrew, this can be done via `brew install ccache` or `sudo port install ccache` on MacPorts.

**Note:** If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2--patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:

  ```
brew install python3
  ```

- If you have MacPorts, you can run:

  ```
sudo port install python38
  ```

**Step 2. Get ESP-IDF** To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:
Chapter 1. Get Started

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into ~/esp/esp-idf.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools**  Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32.

```bash
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32
```

The above commands install tools for ESP32 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```bash
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```bash
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
--to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see *Download Error While Installing ESP-IDF Tools*.

**Alternative File Downloads**  The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running install.sh:
Chapter 1. Get Started

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

```
alias get_idf='\$HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, source ~/.bashrc.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

**Start a Project** Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .

**Note:** There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device**  Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure Your Project**  Navigate to your hello_world directory, set ESP32 as the target, and run the project configuration utility menuconfig.

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with *idf.py set-target esp32*. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See *Select the Target Chip: set-target* for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

**Fig. 63: Project configuration - Home window**

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”, since this example runs with
default configuration.

**Attention:** If you use ESP32-DevKitC board with the **ESP32-SOLO-1** module, or ESP32-DevKitM-1 board with the **ESP32-MIN1-1(1U)** module, please enable single core mode (**CONFIG_FREERTOS_UNICORE**) in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option **--style**. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See *Additional Tips* for more information.

**Build the Project**  
Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
..././././components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device**  
To flash the binaries that you just built for the ESP32 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace **PORT** with your ESP32 board’s USB port name. If the **PORT** is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See this *Flashing Troubleshooting* page or *Establish Serial Connection with ESP32* for more detailed information.
**Normal Operation**  When flashing, you will see the output log similar to the following:

```plaintext
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB -- 0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin -- 0x10000 hello_world.bin esptool.py v3.0-dev Serial port /dev/ttyUSB0 Connecting........ Chip is ESP32D0WDQ6 (revision 0) Features: WiFi, BT, Dual Core, Coding Scheme None Crystal is 40MHz MAC: 24:0a:c4:05:b9:14 Uploading stub... Running stub... Stub running... Changing baud rate to 460800 Changed. Configuring flash size... Compressed 3072 bytes to 103... Writing at 0x00008000... (100 %) Wrote 3072 bytes (103 compressed) at 0x00000000 in 0.0 seconds (effective 5962.8 kbit/s)...
Hash of data verified. Compressed 26096 bytes to 15408... Writing at 0x00001000... (100 %) Wrote 26096 bytes (15408 compressed) at 0x00001000 in 0.4 seconds (effective 546.7 kbit/s)...
Hash of data verified. Compressed 147104 bytes to 77364... Writing at 0x00010000... (20 %) Writing at 0x00014000... (40 %) Writing at 0x00018000... (60 %) Writing at 0x0001c000... (80 %) Writing at 0x00020000... (100 %) Wrote 147104 bytes (77364 compressed) at 0x00010000 in 1.9 seconds (effective 615.5 kbit/s)...
Hash of data verified. Leaving... Hard resetting via RTS pin... Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

**Monitor the Output**  To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```bash
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

rst:0x1 (POWERON_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB...外部的flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```
e800)(Xn@y.1080(0W+)-2Hn9a"/901050002-096e6ae050jA
~zY007Y(0,100 e800)(Xn@y.1080(0W+i0jpi0/8z5Ymv
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> Hardware Settings -> Main XTAL Config -> Main XTAL frequency, then change CONFIG_XTAL_FREQ_SEL to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32 are as follows:

- 26 MHz
- 40 MHz

**Note:** You can combine building, flashing and monitoring into one step by running:

```
-idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

**That’s all that you need to get started with ESP32!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.
Additional Tips

Permission issues /dev/ttyUSB0  With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Python compatibility  ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Start with Board Support Package  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via IDF Component Manager, so they can be found in IDF Component Registry.

Here’s an example of how to add ESP-WROVER-KIT BSP to your project:

```bash
idf.py add-dependency esp_wrover_kit
```

More examples of BSP usage can be found in BSP examples folder.

Flash Erase  Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```bash
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```bash
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

Tip: Updating ESP-IDF  It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the Start a Project on Windows or Start a Project on Linux and macOS.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the build system guide.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with esp_err_t type. See Error Handling section for more information about error handling approaches. Error Code Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:
Chapter 2. API Reference

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain private or esp_private in their name or path. Certain components, such as hal only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.
This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the [versions page](#). Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- **Deprecating functions** (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- **Renaming components**, moving source and header files between components — provided that the build system ensures that correct files are still found.
- **Renaming Kconfig options**. Kconfig system `renaming mechanism` ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- **Private APIs**.
- **Components in example projects**.
- Features clearly marked as “beta”, “preview” or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
• Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
• Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
• Location of $Kconfig$ options in menuconfig.
• Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO port

Asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component $ASIO$ has been moved from ESP-IDF since version v5.0 to a separate repository:

• ASIO component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ASIO documentation (English)

2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component $freemodbus$ has been moved from ESP-IDF since version v5.0 to a separate repository:

• ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

• protocols/modbus/serial/mb_slave
• protocols/modbus/serial/mb_master
• protocols/modbus/tcp/mb_tcp_slave
• protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.
Protocol References

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of [MQTT](mqtt.org) protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedts, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- `protocols/mqtt/tcp`: MQTT over tcp, default port 1883
- `protocols/mqtt/ssl`: MQTT over tls, default port 8883
- `protocols/mqtt/ssl_ds`: MQTT over tls using digital signature peripheral for authentication, default port 8883.
- `protocols/mqtt/ssl_mutual_auth`: MQTT over tls using certificates for authentication, default port 8883
- `protocols/mqtt/ssl_psk`: MQTT over tls using pre-shared keys for authentication, default port 8883.
- `protocols/mqtt/ws`: MQTT over Websocket, default port 80
- `protocols/mqtt/wss`: MQTT over Websocket Secure, default port 443

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `broker`: Allow to set address and security verification.
- `credentials`: Client credentials for authentication.
- `session`: Configuration for MQTT session aspects.
- `network`: Networking related configuration.
- `task`: Allow to configure FreeRTOS task.
- `buffer`: Buffer size for input and output.

In the following session the most common aspects are detailed.

Broker

Address

Broker address can be set by usage of `broker.address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in websocket connections.

The `uri` field is used in the following format `scheme://hostname:port/path`. - Currently support `mqtt`, `mqtts`, `ws`, `wss` schemes - MQTT over TCP samples:

- `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
• `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password

• MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io` MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884` MQTT over SSL, port 8884

• MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`

• MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`

• Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    client);
esp_mqtt_client_start(client);
```

• Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

**Verification** For secure connections TLS is used, and to guarantee Broker’s identity the `broker verification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER the equivalent `_len` field must be set, otherwise a NULL terminated string in PEM format should be provided to `certificate` field.

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883` `</dev/null>` `2>/dev/null` `null` `openssl` `x509 -outform PEM` `>mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char*)mqtt_eclipse_org_pem_start,
    },
};
```

To details on other fields check the Reference API and **TLS Server verification**.

**Client Credentials** All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI.
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format

**Authentication** It’s possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- Using a password by setting `authentication.password`.
- Mutual authentication with TLS by setting `authentication.certificate` and `authentication.key`, both can be provided in PEM or DER format.
- Using secure element available in ESP32-WROOM-32SE, setting `authentication.use_secure_element`.
- Using Digital Signature Peripheral available in some Espressif devices, setting `authentication.ds_data`.
Session  For MQTT session related configurations section fields should be used.

Last Will and Testament  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` session.last_will-struct.

- `topic`: pointer to the LWT message topic
- `msg`: pointer to the LWT message
- `msg_len`: length of the LWT message, required if `msg` is not null-terminated
- `qos`: quality of service for the LWT message
- `retain`: specifies the retain flag of the LWT message

Change settings in Project Configuration Menu  The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)`

Creates MQTT client handle based on the configuration.
Parameters **config** — MQTT configuration structure
Returns mqtt_client_handle if successfully created, NULL on error

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets MQTT connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Parameters
- **client** — MQTT client handle
- **uri** —

Returns ESP_FAIL if URI parse error, ESP_OK on success

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```

Starts MQTT client with already created client handle.

Parameters **client** — MQTT client handle
Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

Parameters **client** — MQTT client handle
Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

Parameters **client** — MQTT client handle
Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

```c
esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
```

Stops MQTT client tasks.

- Notes:
- Cannot be called from the MQTT event handler

```c
esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
```

Subscribe the client to defined topic with defined qos.

Notes:
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Parameters
- **client** — MQTT client handle
- **topic** —
- **qos** — TODO describe parameters

Returns message_id of the subscribe message on success -1 on failure

```c
int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)
```

Unsubscribe the client from defined topic.

Notes:
- Client must be connected to send unsubscribe message
Chapter 2. API Reference

- It is thread safe, please refer to esp_mqtt_client_subscribe for details

**Parameters**
- `client` - MQTT client handle
- `topic` -

**Returns** message_id of the subscribe message on success, -1 on failure

```c
int esp_mqtt_client_publish ( esp_mqtt_client_handle_t client, const char *topic, const char *data, int len,
                            int qos, int retain)
```

Client to send a publish message to the broker.

**Notes:**
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueuing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

**Parameters**
- `client` - MQTT client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag

**Returns** message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

```c
int esp_mqtt_client_enqueue ( esp_mqtt_client_handle_t client, const char *topic, const char *data, int len,
                             int qos, int retain, bool store)
```

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

**Parameters**
- `client` - MQTT client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag
- `store` - if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message_id if queued successfully, -1 otherwise

```c
esp_err_t esp_mqtt_client_destroy ( esp_mqtt_client_handle_t client)
```

Destroys the client handle.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- `client` - MQTT client handle

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG on wrong initialization
esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Parameters
- client - MQTT client handle
- config - MQTT configuration structure

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)

Registers MQTT event.

Parameters
- client - MQTT client handle
- event - event type
- event_handler - handler callback
- event_handler_arg - handlers context

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)

Get outbox size.

Parameters client - MQTT client handle

Returns outbox size 0 on wrong initialization

Structures

struct esp_mqtt_error_codes

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

Public Members

esp_err_t esp_tls_last_esp_err

last esp_err code reported from esp-tls component

int esp_tls_stack_err

tls specific error code reported from underlying tls stack

int esp_tls_cert_verify_flags

tls flags reported from underlying tls stack during certificate verification
Chapter 2. API Reference

`esp_mqtt_error_type_t error_type`
error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`
connection refused error code reported from MQTT broker on connection

`int esp_transport_sock_errno`
erno from the underlying socket

`struct esp_mqtt_event_t`
`MQTT` event configuration structure

**Public Members**

`esp_mqtt_event_id_t event_id`
`MQTT` event type

`esp_mqtt_client_handle_t client`
`MQTT` client handle for this event

`char *data`
Data associated with this event

`int data_len`
Length of the data for this event

`int total_data_len`
Total length of the data (longer data are supplied with multiple events)

`int current_data_offset`
Actual offset for the data associated with this event

`char *topic`
Topic associated with this event

`int topic_len`
Length of the topic for this event associated with this event

`int msg_id`
`MQTT` message id of message

`int session_present`
`MQTT` session_present flag for connection event

`esp_mqtt_error_codes_t *error_handle`
esp-mqtt error handle including esp-tls errors as well as internal `MQTT` errors
bool retain
   Retained flag of the message associated with this event

int qos
   QoS of the messages associated with this event

bool dup
   dup flag of the message associated with this event

*esp_mqtt_protocol_ver_t* protocol_ver
   MQTT protocol version used for connection, defaults to value from menuconfig

struct *esp_mqtt_client_config_t*
   MQTT client configuration structure

   • Default values can be set via menuconfig
   • All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating
     NULL character and the related len field set to 0. DER format requires a related len field set to the correct
     length.

Public Members

struct *esp_mqtt_client_config_t::broker_t* broker
   Broker address and security verification

struct *esp_mqtt_client_config_t::credentials_t* credentials
   User credentials for broker

struct *esp_mqtt_client_config_t::session_t* session
   MQTT session configuration.

struct *esp_mqtt_client_config_t::network_t* network
   Network configuration

struct *esp_mqtt_client_config_t::task_t* task
   FreeRTOS task configuration.

struct *esp_mqtt_client_config_t::buffer_t* buffer
   Buffer size configuration.

struct broker_t
   Broker related configuration

Public Members

struct *esp_mqtt_client_config_t::broker_t::address_t* address
   Broker address configuration
struct esp_mqtt_client_config_t::broker_t::verification_t verification

Security verification of the broker

struct address_t

Broker address

• uri have precedence over other fields
• If ‘uri’ isn’t set at least hostname, transport and port should.

Public Members

const char *uri

Complete MQTT broker URI

const char *hostname

Hostname, to set ipv4 pass it as string)

esp_mqtt_transport_t transport

Selects transport

const char *path

Path in the URI

uint32_t port

MQTT server port

struct verification_t

Broker identity verification

If fields are not set broker’s identity isn’t verified. It’s recommended to set the options in this struct for security reasons.

Public Members

bool use_global_ca_store

Use a global ca_store, look esp-tls documentation for details.

esp_err_t (*crt_bundle_attach)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char *certificate

Certificate data, default is NULL, not required to verify the server.

size_t certificate_len

Length of the buffer pointed to by certificate.
const struct psk_key_hint *psk_hint_key

Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool skip_cert_common_name_check

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the MQTT client susceptible to MITM attacks

const char **alpn_protos

NULL-terminated list of supported application protocols to be used for ALPN

struct buffer_t

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int size

size of MQTT send/receive buffer

int out_size

size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t

Client related credentials for authentication.

Public Members

const char *username

MQTT username

const char *client_id

Set MQTT client identifier. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool set_null_client_id

Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_t authentication

Client authentication

struct authentication_t

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.
Public Members

const char * **password**
MQTT password

const char * **certificate**
Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with **key**.

size_t **certificate_len**
Length of the buffer pointed to by certificate.

const char * **key**
Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also **certificate** has to be provided.

size_t **key_len**
Length of the buffer pointed to by key.

const char * **key_password**
Client key decryption password, not PEM nor DER, if provided **key_password_len** must be correctly set.

int **key_password_len**
Length of the password pointed to by **key_password**

bool **use_secure_element**
Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void * **ds_data**
Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct network_t
Network related configuration

Public Members

int **reconnect_timeout_ms**
Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout_ms**
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh_connection_after_ms**
Refresh connection after this value (in milliseconds)
bool disable_auto_reconnect

Client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

struct session_t

MQTT Session related configuration

Public Members

struct esp_mqtt_client_config_t::session_t::last_will last_will

Last will configuration

bool disable_clean_session

MQTT clean session, default clean_session is true

int keepalive

MQTT keepalive, default is 120 seconds

bool disable_keepalive

Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t protocol_ver

MQTT protocol version used for connection.

int message_retransmit_timeout

timeout for retransmitting of failed packet

struct last_will_t

Last Will and Testament message configuration.

Public Members

const char *topic

LWT (Last Will and Testament) message topic

const char *msg

LWT message, may be NULL terminated

int msg_len

LWT message length, if msg isn’t NULL terminated must have the correct length

int qos

LWT message QoS

int retain

LWT retained message flag
struct task_t
    Client task configuration

Public Members

int priority
    MQTT task priority

int stack_size
    MQTT task stack size

 Macros

MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
    MQTT event types.
    User event handler receives context data in esp_mqtt_event_t structure with
        • client - MQTT client handle
        • various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

  typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
      MQTT protocol version used for connection

  typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
      MQTT error code structure to be passed as a contextual information into ERROR event

      Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

      Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

      | error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from

typedef struct esp_mqtt_event_t esp_mqtt_event_t
MQTT event configuration structure

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t
MQTT client configuration structure

• Default values can be set via menuconfig
• All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Enumerations

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

• client - MQTT client handle
• various other data depending on event type

Values:

enumerator MQTT_EVENT_ANY

enumerator MQTT_EVENT_ERROR
on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator MQTT_EVENT_CONNECTED
connected event, additional context: session_present flag

enumerator MQTT_EVENT_DISCONNECTED
disconnected event

enumerator MQTT_EVENT_SUBSCRIBED
subscribed event, additional context:
• msg_id message id
• data pointer to the received data
• data_len length of the data for this event

enumerator MQTT_EVENT_UNSUBSCRIBED
unsubscribed event
enumerator **MQTT_EVENT_PUBLISHED**
  published event, additional context: msg_id

enumerator **MQTT_EVENT_DATA**
  data event, additional context:
  - msg_id message id
  - topic pointer to the received topic
  - topic_len length of the topic
  - data pointer to the received data
  - data_len length of the data for this event
  - current_data_offset offset of the current data for this event
  - total_data_len total length of the data received
  - retain retain flag of the message
  - qos QoS level of the message
  - dup dup flag of the message
  Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**
  The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**
  Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  - This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  - Additional context: msg_id (id of the deleted message).

enum **esp_mqtt_connect_return_code_t**
  MQTT connection error codes propagated via ERROR event

  **Values:**

  enumerator **MQTT_CONNECTION_ACCEPTED**
    Connection accepted

  enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**
    MQTT connection refused reason: Wrong protocol

  enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**
    MQTT connection refused reason: ID rejected

  enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**
    MQTT connection refused reason: Server unavailable

  enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**
    MQTT connection refused reason: Wrong user

  enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
    MQTT connection refused reason: Wrong username or password
enum esp_mqtt_error_type_t

MQTT connection error codes propagated via ERROR event

Values:

enumerator MQTT_ERROR_TYPE_NONE
enumerator MQTT_ERROR_TYPE_TCP_TRANSPORT
enumerator MQTT_ERROR_TYPE_CONNECTION_REFUSED

denum esp_mqtt_transport_t

Values:

enumerator MQTT_TRANSPORT_UNKNOWN
enumerator MQTT_TRANSPORT_OVER_TCP
MQTT over TCP, using scheme: MQTT
enumerator MQTT_TRANSPORT_OVER_SSL
MQTT over SSL, using scheme: MQTTS
enumerator MQTT_TRANSPORT_OVER_WS
MQTT over Websocket, using scheme: ws
enumerator MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss

denum esp_mqtt_protocol_ver_t

MQTT protocol version used for connection

Values:

enumerator MQTT_PROTOCOL_UNDEFINED
enumerator MQTT_PROTOCOL_V_3_1
enumerator MQTT_PROTOCOL_V_3_1_1
enumerator MQTT_PROTOCOL_V_5

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
Chapter 2. API Reference

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](protocols/https_request).

**Tree structure for ESP-TLS component**

```plaintext
├── esp_tls.c

    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

**TLS Server verification**

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- `cacert_buf` and `cacert_bytes`: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf`: pointer to the buffer which contains the CA cert.
  - `cacert_bytes`: size of the CA certificate in bytes.

- `use_global_ca_store`: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.

- `crt_bundle_attach`: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle.

- `psk_hint_key`: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- `skip server verification`: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. **WARNING:** Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.
Chapter 2. API Reference

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

• Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

• Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedtls as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.
To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add `esp-cryptoauthlib` in your project, for details please refer `esp-cryptoauthlib` with ESP_IDF

2) Enable following menuconfig option:

   ```
   menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
   ```

3) Select type of ATECC608A chip with following option:

   ```
   menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
   ```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit `ATECC608A chip type`

4) Enable use of ATECC608A in ESP-TLS by providing following config option in `esp_tls_cfg_t`

   ```
   esp_tls_cfg_t cfg = {
     /* other configurations options */
     .use_secure_element = true,
   };
   ```

### API Reference

#### Header File

- `components/esp-tls/esp_tls.h`

#### Functions

**esp_tls_t** *(esp_tls_init*) *(void)*

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns**

- `tls` Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

**esp_tls_t** *(esp_tls_conn_http_new*) *(const char *url, const esp_tls_cfg_t *cfg)*

Create a new blocking TLS/SSL connection with a given “HTTP” url.

**Parameters**

- `url` -in] url of host.
- `cfg` -in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.

**Returns**

- `pointer to esp_tls_t`, or NULL if connection couldn’t be opened.

**int esp_tls_conn_new_sync** *(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)*

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Parameters**

- `hostname` -in] Hostname of the host.
• **hostlen** – [in] Length of hostname.
• **port** – [in] Port number of the host.
• **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
• **tls** – [in] Pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_http_new_sync (const char*url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```
Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_sync() API. However this API accepts host’s url.

**Parameters**
- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’ . At a minimum, this structure should be zero-initialized.
- **tls** – [in] Pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_new_async (const char*hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```
Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Parameters**
- **hostname** – [in] Hostname of the host.
- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection state is in progress.
- 1 If connection establishment is successful.

```c
int esp_tls_conn_http_new_async (const char*url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```
Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.

**Parameters**
- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
```
Write from buffer ‘data’ into specified tls connection.
### Parameters
- **tls** [in] pointer to esp-tls as esp-tls handle.
- **data** [in] Buffer from which data will be written.
- **datalen** [in] Length of data buffer.

### Returns
- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

```c
ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer ‘data’.

### Parameters
- **tls** [in] pointer to esp-tls as esp-tls handle.
- **data** [in] Buffer to hold read data.
- **datalen** [in] Length of data buffer.

### Returns
- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

```c
int esp_tls_conn_destroy(esp_tls_t *tls)
```

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

### Parameters
- **tls** [in] pointer to esp-tls as esp-tls handle.

### Returns
- 0 on success
- -1 if socket error or an invalid argument

```c
ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
```

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

### Parameters
- **tls** [in] pointer to esp-tls as esp-tls handle.

### Returns
- -1 in case of invalid arg
- bytes available in the application data record read buffer

```c
esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
```

Returns the connection socket file descriptor from esp_tls session.

### Parameters
- **tls** [in] handle to esp_tls context
- **sockfd** [out] int pointer to sockfd value.

### Returns
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

```c
void *esp_tls_get_ssl_context(esp_tls_t *tls)
```

Returns the ssl context.

### Parameters
- **tls** [in] handle to esp_tls context

### Returns
- ssl_ctx pointer to ssl context of underlying TLS layer on success
- NULL in case of error
**esp_err_t esp_tls_init_global_ca_store (void)**

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Returns**
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls resources.

**esp_err_t esp_tls_set_global_ca_store** (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Parameters**
- cacert_pem_buf - [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- cacert_pem_bytes - [in] Length of the buffer.

**Returns**
- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

**void esp_tls_free_global_ca_store (void)**

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

**esp_err_t esp_tls_get_and_clear_last_error** (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**
- h - [in] esp-tls error handle.
- esp_tls_code - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- esp_tls_flags - [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**esp_err_t esp_tls_get_and_clear_error_type** (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

**Parameters**
- h - [in] esp-tls error handle.
- err_type - [in] specific error type
- error_code - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**
- ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK if a valid error returned and was cleared

```
esp_err_t esp_tls_get_error_handle (esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
```

Returns the ESP-TLS error handle.

**Parameters**
- `tls` - [in] handle to esp_tls context
- `error_handle` - [out] pointer to the error handle.

**Returns**
- ESP_OK on success and `error_handle` will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (`tls` == NULL || `error_handle` == NULL)

```
mbedtls_x509_crt *esp_tls_get_global_ca_store (void)
```

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

```
esp_err_t esp_tls_plain_tcp_connect (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg,
                                   esp_tls_error_handle_t error_handle, int *sockfd)
```

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**
- `host` - [in] Hostname of the host.
- `hostlen` - [in] Length of hostname.
- `port` - [in] Port number of the host.
- `cfg` - [in] ESP-TLS configuration as `esp_tls_cfg_t`.
- `error_handle` - [out] ESP-TLS error handle holding potential errors occurred during connection
- `sockfd` - [out] Socket descriptor if successfully connected on TCP layer

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid output parameters
- ESP-TLS based error codes on failure

**Structures**

```
struct psk_key_hint
```

ESP-TLS preshared key and hint structure.

**Public Members**

```
const uint8_t *key
```

key in PSK authentication mode in binary format

```
const size_t key_size
```

length of the key

```
const char *hint
```

hint in PSK authentication mode in string format
struct tls_keep_alive_cfg
  esp-tls client session ticket ctx
  Keep alive parameters structure

Public Members

bool keep_alive_enable
  Enable keep-alive timeout

int keep_alive_idle
  Keep-alive idle time (second)

int keep_alive_interval
  Keep-alive interval time (second)

int keep_alive_count
  Keep-alive packet retry send count

struct esp_tls_cfg
  ESP-TLS configuration parameters.

---

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

---

Public Members

const char **alpn_protos
  Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = [“h2”, NULL];
  - where ‘h2’ is the protocol name

const unsigned char *cacert_buf
  Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
  CA certificate buffer legacy name
unsigned int **cacert_bytes**
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**
Size of Certificate Authority certificate legacy name

const unsigned char * **clientcert_buf**
Client certificate in a buffer Format may be PEM or DER, depending on mbedtlss-support This buffer should be NULL terminated in case of PEM

const unsigned char * **clientcert_pem_buf**
Client certificate legacy name

unsigned int **clientcert_bytes**
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**
Size of client certificate legacy name

const unsigned char * **clientkey_buf**
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char * **clientkey_pem_buf**
Client key legacy name

unsigned int **clientkey_bytes**
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**
Size of client key legacy name

const unsigned char * **clientkey_password**
Client key decryption password string

unsigned int **clientkey_password_len**
String length of the password pointed to by clientkey_password

bool **non_block**
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**
Enable this option to use secure element or atecc608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout_ms**
Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX
bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_aliveCfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx
Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
ESP-TLS configuration parameters.

Note: Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t

Enumerations
enum esp_tls_conn_state
    ESP-TLS Connection State.
    Values:
    enumerator ESP_TLS_INIT
    enumerator ESP_TLS_CONNECTING
    enumerator ESP_TLS_HANDSHAKE
    enumerator ESP_TLS_FAIL
    enumerator ESP_TLS_DONE

enum esp_tls_role
    Values:
    enumerator ESP_TLS_CLIENT
    enumerator ESP_TLS_SERVER

Header File
  • components/esp-tls/esp_tls_errors.h

Structures
struct esp_tls_last_error
    Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t last_error
    error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error
int esp_tls_error_code
    esp_tls error code from last esp_tls failed api

int esp_tls_flags
    last certification verification flags

Macros

ESP_ERR_ESP_TLS_BASE
    Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
    Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
    Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
    Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
    Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
    failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
    new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK
    mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
    mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
    mbedtls api returned error

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED
wolfSSL api returned failed
Chapter 2. API Reference

**ESP_TLS_ERR_SSL_WANT_READ**
Definition of errors reported from IO API (potentially non-blocking) in case of error:
- esp_tls_conn_read()
- esp_tls_conn_write()

**ESP_TLS_ERR_SSL_WANT_WRITE**

**ESP_TLS_ERR_SSL_TIMEOUT**

**Type Definitions**

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t

Error structure containing relevant errors in case tls error occurred.

**Enumerations**

enum esp_tls_error_type_t
Definition of different types/sources of error codes reported from different components

Values:

enumerator ESP_TLS_ERR_TYPE_UNKNOWN

enumerator ESP_TLS_ERR_TYPE_SYSTEM
          System error &8212; errno

enumerator ESP_TLS_ERR_TYPE_MBEDTLS
          Error code from mbedTLS library

enumerator ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS
          Certificate flags defined in mbedTLS

enumerator ESP_TLS_ERR_TYPE_ESP
          ESP-IDF error type &8212; esp_err_t

enumerator ESP_TLS_ERR_TYPE_WOLFSSL
          Error code from wolfSSL library

enumerator ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS
          Certificate flags defined in wolfSSL

enumerator ESP_TLS_ERR_TYPE_MAX
          Last err type &8212; invalid entry
2.2.5 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

• *esp_http_client_init()*: Creates an *esp_http_client_config_t* instance i.e. a HTTP client handle based on the given *esp_http_client_config_t* configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.

• *esp_http_client_perform()*: Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in *esp_http_client_config_t*).

• *esp_http_client_cleanup()*: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

Basic HTTP request

Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the Connection: close header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the url configuration starting with https scheme or transport_type set to HTTP_TRANSPORT_OVER_SSL. HTTPS support can be configured via CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS (enabled by default).

Note: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the cert_pem member in esp_http_client_config_t configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the crt_bundle_attach member of the esp_http_client_config_t configuration.

Check out the example functions https_with_url and https_with_hostname_path in the application example. (Implementation details of the above note are found here)
HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.
- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI

```c
esp_http_client_config_t config = {
  .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
  .url = "http://httpbin.org/basic-auth/user/passwd",
  .username = "user",
  .password = "passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```
Functions

`esp_http_client_init` (const `esp_http_client_config_t` *config)

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters**
- `config` - [in] The configurations, see `http_client_config_t`

**Returns**
- `esp_http_client_handle_t`
- `NULL` if any errors

`esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invocations to set options for the following `esp_http_client_perform`.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

**Parameters**
- `client` - The `esp_http_client` handle

**Returns**
- `ESP_OK` on successful
- `ESP_FAIL` on error

`esp_http_client_set_url` (`esp_http_client_handle_t` client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**
- `client` - [in] The `esp_http_client` handle
- `url` - [in] The url

**Returns**
- `ESP_OK`
- `ESP_FAIL`

`esp_http_client_set_post_field` (`esp_http_client_handle_t` client, const char *data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**
- `client` - [in] The `esp_http_client` handle
- `data` - [in] post data pointer
- `len` - [in] post length

components/esp_http_client/include/esp_http_client.h
returns

- ESP_OK
- ESP_FAIL

int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)

Get current post field information.

Parameters

- client -[in] The client
- data -[out] Point to post data pointer

Returns

Size of post data

esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

Parameters

- client -[in] The esp_http_client handle
- key -[in] The header key
- value -[in] The header value

Returns

- ESP_OK
- ESP_FAIL

esp_err_t esp_http_client_get_header (esp_http_client_handle_t client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- client -[in] The esp_http_client handle
- key -[in] The header key
- value -[out] The header value

Returns

- ESP_OK
- ESP_FAIL

esp_err_t esp_http_client_get_username (esp_http_client_handle_t client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- client -[in] The esp_http_client handle
- value -[out] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t esp_http_client_set_username (esp_http_client_handle_t client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Parameters

- client -[in] The esp_http_client handle
- username -[in] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t esp_http_client_get_password (esp_http_client_handle_t client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.
Chapter 2. API Reference

Parameters
- **client** - [in] The esp_http_client handle
- **value** - [out] The password value

Returns
- ESP_OK
- ESP_ERR_INVALID_ARG

```
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Parameters
- **client** - [in] The esp_http_client handle
- **password** - [in] The password value

Returns
- ESP_OK
- ESP_ERR_INVALID_ARG

```
esp_err_t esp_http_client_set_auth_type(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
```

Set http request auth_type.

Parameters
- **client** - [in] The esp_http_client handle
- **auth_type** - [in] The esp_http_client auth type

Returns
- ESP_OK
- ESP_ERR_INVALID_ARG

```
int esp_http_client_get_errno(esp_client_handle_t client)
```

Get HTTP client session errno.

Parameters
- **client** - [in] The esp_http_client handle

Returns
- (-1) if invalid argument
- errno

```
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)
```

Set http request method.

Parameters
- **client** - [in] The esp_http_client handle
- **method** - [in] The method

Returns
- ESP_OK
- ESP_ERR_INVALID_ARG

```
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
```

Set http request timeout.

Parameters
- **client** - [in] The esp_http_client handle
- **timeout_ms** - [in] The timeout value

Returns
- ESP_OK
- ESP_ERR_INVALID_ARG

```
esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)
```

Delete http request header.

Parameters
- **client** - [in] The esp_http_client handle
**Chapter 2. API Reference**

- **key** – [in] The key

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)`

This function will be open the connection, write all header strings and return.

**Parameters**
- `write_len` – [in] HTTP Content length need to write to the server

**Returns**
- ESP_OK
- ESP_FAIL

`int esp_http_client_write(esp_http_client_handle_t client, const char* buffer, int len)`

This function will write data to the HTTP connection previously opened by `esp_http_client_open()`

**Parameters**
- `buffer` – The buffer
- `len` – [in] This value must not be larger than the write_len parameter provided to `esp_http_client_open()`

**Returns**
- (-1) if any errors
- Length of data written

`int64_t esp_http_client_fetch_headers(esp_http_client_handle_t client)`

This function need to call after `esp_http_client_open()`, it will read from http stream, process all receive headers.

**Parameters**

**Returns**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked_response`)  
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready  
- Download data length defined by content-length header

`bool esp_http_client_is_chunked_response(esp_http_client_handle_t client)`

Check response data is chunked.

**Parameters**

**Returns**
- true or false

`int esp_http_client_read(esp_http_client_handle_t client, char *buffer, int len)`

Read data from http stream.

**Note:** (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

**Parameters**
- `buffer` – The buffer
- `len` – [in] The length

**Returns**
- (-1) if any errors
- Length of data was read

`int esp_http_client_get_status_code(esp_http_client_handle_t client)`

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`
**Parameters**

client  - [in] The esp_http_client handle

**Returns**

Status code

```c
int64_t esp_http_client_get_content_length(esp_http_client_handle_t client)
```

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters**

client  - [in] The esp_http_client handle

**Returns**

• (-1) Chunked transfer
  • Content-Length value as bytes

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)
```

Close http connection, still kept all http request resources.

**Parameters**

client  - [in] The esp_http_client handle

**Returns**

• ESP_OK
  • ESP_FAIL

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)
```

Get transport type.

**Parameters**

client  - [in] The esp_http_client handle

**Returns**

• HTTP_TRANSPORT_UNKNOWN
  • HTTP_TRANSPORT_OVER_TCP
  • HTTP_TRANSPORT_OVER_SSL

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)
```

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Parameters**

client  - [in] The esp_http_client handle

**Returns**

• ESP_OK
  • ESP_FAIL

```c
void esp_http_client_add_auth(esp_http_client_handle_t client)
```

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

client  - [in] The esp_http_client handle

```c
bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)
```

Checks if entire data in the response has been read without any error.
Parameters

client  - [in] The esp_http_client handle

Returns

• true
• false

int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)

Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

Parameters

• client  - [in] The esp_http_client handle
• buffer  - The buffer
• len  - [in] The buffer length

Returns

• Length of data was read

esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to esp_http_client_read_response in situations where the content of the response may be ignored.

Parameters

• client  - [in] The esp_http_client handle
• len  - Length of data discarded

Returns

• ESP_OK If successful, len will have discarded length
• ESP_FAIL If failed to read response
• ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)

Get URL from client.

Parameters

• client  - [in] The esp_http_client handle
• url  - [inout] The buffer to store URL
• len  - [in] The buffer length

Returns

• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)

Get Chunk-Length from client.

Parameters

• client  - [in] The esp_http_client handle
• len  - [out] Variable to store length

Returns

• ESP_OK If successful, len will have length of current chunk
• ESP_FAIL If the server is not a chunked server
• ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct esp_http_client_event

HTTP Client events data.

Public Members

```c
struct esp_http_client_event_id_t

  event_id

  event_id, to know the cause of the event

struct esp_http_client_handle_t

  esp_http_client_handle_t context

void *data

  data of the event

int data_len

  data length of data

void *user_data

  user_data context, from esp_http_client_config_t user_data

char *header_key

  For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value

  For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value
```

```c
struct esp_http_client_config_t

  HTTP configuration.

public Members

const char *url

  HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host

  Domain or IP as string

int port

  Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username

  Using for Http authentication

const char *password

  Using for Http authentication

struct esp_http_client_auth_type_t auth_type

  Http authentication type, see esp_http_client_auth_type_t

const char *path

  HTTP Path, if not set, default is /
const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password

const char *user_agent
    The User Agent string to send with HTTP requests

exp_http_client_method_t method
    HTTP Method

int timeout_ms
    Network timeout in milliseconds

bool disable_auto_redirect
    Disable HTTP automatic redirects

int max_redirection_count
    Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
    Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
    HTTP Event Handle
**esp_http_client_transport_t**

*transport_type*

HTTP transport type, see `esp_http_client_transport_t`

```c
int buffer_size
HTTP receive buffer size
```

```c
int buffer_size_tx
HTTP transmit buffer size
```

```c
void *user_data
HTTP user_data context
```

```c
bool is_async
Set asynchronous mode, only supported with HTTPS for now
```

```c
bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.
```

```c
bool skip_cert_common_name_check
Skip any validation of server certificate CN field
```

```c
esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig
```

```c
bool keep_alive_enable
Enable keep-alive timeout
```

```c
int keep_alive_idle
Keep-alive idle time. Default is 5 (second)
```

```c
int keep_alive_interval
Keep-alive interval time. Default is 5 (second)
```

```c
int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts
```

```c
struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting
```

**Macros**

**DEFAULT_HTTP_BUF_SIZE**

**ESP_ERR_HTTP_BASE**

Starting number of HTTP error codes

**ESP_ERR_HTTP_MAX_REDIRECT**

The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT
    Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
    Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
    Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
    There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
    HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
    Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
    Read FIN from peer and the connection closed

Type Definitions
typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations
enum esp_http_client_event_id_t
    HTTP Client events id.
    Values:

    enumerator HTTP_EVENT_ERROR
        This event occurs when there are any errors during execution

    enumerator HTTP_EVENT_ON_CONNECTED
        Once the HTTP has been connected to the server, no data exchange has been performed

    enumerator HTTP_EVENT_HEADERS_SENT
        After sending all the headers to the server

    enumerator HTTP_EVENT_HEADER_SENT
        This header has been kept for backward compatibility and will be deprecated in future versions esp-idf
Chapter 2. API Reference

enumerator **HTTP_EVENT_ON_HEADER**
Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**
Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**
Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**
The connection has been disconnected

enumerator **HTTP_EVENT_REDIRECT**
Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**
HTTP Client transport.

*Values:*

enumerator **HTTP_TRANSPORT_UNKNOWN**
Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**
Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**
Transport over ssl

enum **esp_http_client_method_t**
HTTP method.

*Values:*

enumerator **HTTP_METHOD_GET**
HTTP GET Method

enumerator **HTTP_METHOD_POST**
HTTP POST Method

enumerator **HTTP_METHOD_PUT**
HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**
HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**
HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**
HTTP HEAD Method
enumerator HTTP_METHOD_NOTIFY

HTTP NOTIFY Method

enumerator HTTP_METHOD_SUBSCRIBE

HTTP SUBSCRIBE Method

enumerator HTTP_METHOD_UNSUBSCRIBE

HTTP UNSUBSCRIBE Method

enumerator HTTP_METHOD_OPTIONS

HTTP OPTIONS Method

enumerator HTTP_METHOD_COPY

HTTP COPY Method

enumerator HTTP_METHOD_MOVE

HTTP MOVE Method

enumerator HTTP_METHOD_LOCK

HTTP LOCK Method

enumerator HTTP_METHOD_UNLOCK

HTTP UNLOCK Method

enumerator HTTP_METHOD_PROPFIND

HTTP PROPFIND Method

enumerator HTTP_METHOD_PROPPATCH

HTTP PROPPATCH Method

enumerator HTTP_METHOD_MKCOL

HTTP MKCOL Method

enumerator HTTP_METHOD_MAX

enum esp_http_client_auth_type_t

HTTP Authentication type.

Values:

enumerator HTTP_AUTH_TYPE_NONE

No authentication

enumerator HTTP_AUTH_TYPE_BASIC

HTTP Basic authentication

enumerator HTTP_AUTH_TYPE_DIGEST

HTTP Digest authentication
enum HttpStatus_Code
    Enum for the HTTP status codes.
    
    Values:
    
    enumerator HttpStatus_Ok
    enumerator HttpStatus_MultipleChoices
    enumerator HttpStatus_MovedPermanently
    enumerator HttpStatus_Found
    enumerator HttpStatus_SeeOther
    enumerator HttpStatus_TemporaryRedirect
    enumerator HttpStatus_PermanentRedirect
    enumerator HttpStatus_BadRequest
    enumerator HttpStatus_Unauthorized
    enumerator HttpStatus_Forbidden
    enumerator HttpStatus_NotFound
    enumerator HttpStatus_InternalError

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                 * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    }
};
```

(continues on next page)
Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_\n\"start\"");
 extern const unsigned char servercert_end[] asm("_binary_servercert_pem_\n\"end\"");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_\n\"start\"");
 extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_\n\"end\"");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOL_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};
```
You may set security for transport in ESP local control using following options:

1. **PROTOCOL_SEC2**: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. **PROTOCOL_SEC1**: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. **PROTOCOL_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTOCOL_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocomm security version section in Protocol Communication for more details.

### Creating a property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g. enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the `size` field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and READONLY, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
  .name = "timestamp",
  .type = TYPE_TIMESTAMP,
  .size = sizeof(int32_t),
  .flags = READONLY,
  .ctx = func_get_time,
  .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_prop_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop,
                                 void *usr_ctx)
```

(continues on next page)
for (uint32_t i = 0; i < props_count; i++) {
    ESP_LOGI(TAG, "Reading %s", props[i].name);
    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;
        /* Use static variable for saving the value. */
        /* This is essential because the value has to be */
        /* valid even after this function returns. */
        /* Alternative is to use dynamic allocation */
        /* and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count,
    const esp_local_ctrl_prop_t *props,
    const esp_local_ctrl_prop_val_t *prop_values,
    void *usr_ctx)
{
    /*prop_values,
    
    void *usr_ctx)
    
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", 
            props[i].name);
            return ESP_ERR_INVALID_ARG;
        }
        else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                prop_values[i].size, ESP_LOG_INFO);
            
        }
    }
    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl

**Client Side Implementation**

The client side implementation will have establish a protobuf session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. **get_prop_count**: This should simply return the total number of properties supported by the service
2. **get_prop_values**: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. **set_prop_values**: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client
should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

### API Reference

**Header File**

- components/esp_local_ctrl/include/esp_local_ctrl.h

**Functions**

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble(void)
```

Function for obtaining BLE transport mode.

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd(void)
```

Function for obtaining HTTPD transport mode.

```c
esp_err_t esp_local_ctrl_start(const esp_local_ctrl_config_t *config)
```

Start local control service.

**Parameters**

config – [in] Pointer to configuration structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Failure

```c
esp_err_t esp_local_ctrl_stop(void)
```

Stop local control service.

```c
esp_err_t esp_local_ctrl_add_property(const esp_local_ctrl_prop_t *prop)
```

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`.

**Parameters**

prop – [in] Property description structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Failure

```c
esp_err_t esp_local_ctrl_remove_property(const char *name)
```

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters**

name – [in] Name of the property to remove

**Returns**

- ESP_OK : Success
Chapter 2. API Reference

- ESP_ERR_NOT_FOUND : Failure

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known.

Parameters name –[in] Name of the property to find

Returns
- Pointer to property
- NULL if not found

esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Parameters
- ep_name –[in] Name of the endpoint
- handler –[in] Endpoint handler function
- user_ctx –[in] User data

Returns
- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h> Transport mode (BLE/HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop
Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.
Public Members

char *name
  Unique name of property

uint32_t type
  Type of property. This may be set to application defined enums

size_t size
  Size of the property value, which:
  • if zero, the property can have values of variable size
  • if non-zero, the property can have values of fixed size only, therefore, checks are performed internally
    by esp_local_ctrl when setting the value of such a property

uint32_t flags
  Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only
  / constant

void *ctx
  Pointer to some context data relevant for this property. This will be available for use inside the
  get_prop_values and set_prop_values handlers as a part of this property structure. When
  set, this is valid throughout the lifetime of a property, till either the property is removed or the
  esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)
  Function used by esp_local_ctrl to internally free the property context when
  esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
  Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers
  for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
  Pointer to memory holding property value

size_t size
  Size of property value

void (*free_fn)(void *data)
  This may be set by the application in get_prop_values() handler to tell esp_local_ctrl
  to call this function on the data pointer above, for freeing its resources after sending the
  get_prop_values response.

struct esp_local_ctrl_handlers
  Handlers for receiving and responding to local control commands for getting and setting properties.
Public Members

\texttt{esp_err_t (*get\_prop\_values)(size\_t props\_count, const esp\_local\_ctrl\_prop\_t props[], es

Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in \texttt{prop\_values} need to be set.

\begin{itemize}
  \item \texttt{Param props\_count [in]} Total elements in the props array
  \item \texttt{Param props [in]} Array of properties, the current values for which have been requested by the client
  \item \texttt{Param prop\_values [out]} Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
  \item \texttt{Param usr\_ctx [in]} This provides value of the \texttt{usr\_ctx field} of \texttt{esp\_local\_ctrl\_handlers\_t structure}
\end{itemize}

Return

Returning different error codes will convey the corresponding protocol level errors to the client:

\begin{itemize}
  \item ESP\_OK: Success
  \item ESP\_ERR\_INVALID\_ARG: InvalidArgument
  \item ESP\_ERR\_INVALID\_STATE: InvalidProto
  \item All other error codes: InternalError
\end{itemize}

\texttt{esp_err_t (*set\_prop\_values)(size\_t props\_count, const esp\_local\_ctrl\_prop\_t props[], const

Handler function to be implemented for changing values of properties.

Note: If any of the properties have variable sizes, the size field of the corresponding element in \texttt{prop\_values} must be checked explicitly before making any assumptions on the size.

\begin{itemize}
  \item \texttt{Param props\_count [in]} Total elements in the props array
  \item \texttt{Param props [in]} Array of properties, the values for which the client requests to change
  \item \texttt{Param prop\_values [in]} Array of property values, the elements of which need to be used for updating those properties specified by props argument
  \item \texttt{Param usr\_ctx [in]} This provides value of the \texttt{usr\_ctx field} of \texttt{esp\_local\_ctrl\_handlers\_t structure}
\end{itemize}

Return

Returning different error codes will convey the corresponding protocol level errors to the client:

\begin{itemize}
  \item ESP\_OK: Success
  \item ESP\_ERR\_INVALID\_ARG: InvalidArgument
  \item ESP\_ERR\_INVALID\_STATE: InvalidProto
  \item All other error codes: InternalError
\end{itemize}

\texttt{void *usr\_ctx}

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the \texttt{esp\_local\_ctrl service}, and freed only when the service is stopped.

\texttt{void (*usr\_ctx\_free\_fn)(void *usr\_ctx)}

Pointer to function which will be internally invoked on \texttt{usr\_ctx} for freeing the context resources when \texttt{esp\_local\_ctrl\_stop()} is called.
struct esp_local_ctrl_proto_sec_cfg

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t version

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

void *custom_handle

Custom security handle if security is set custom via proto_sec above This handle must follow protocomm_security_t signature

const void *pop

Proof of possession to be used for local control. Could be NULL.

const void *sec_params

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type esp_local_ctrl_security1_params_t for protocomm security 1 and esp_local_ctrl_security2_params_t for protocomm security 2 respectively. Could be NULL.

struct esp_local_ctrl_config

Configuration structure to pass to esp_local_ctrl_start()

Public Members

const esp_local_ctrl_transport_t *transport

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t transport_config

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t proto_sec

Security version and POP

esp_local_ctrl_handlers_t handlers

Register handlers for responding to get/set requests on properties

size_t max_properties

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD
Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t

    Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

    Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t

    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t

    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t

    Transport mode (BLE/HTTPD) over which the service will be provided.

    This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t

    Configuration for transport mode BLE.

    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t

    Configuration for transport mode HTTPD.

    This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t

    Security types for esp_local_control.

    typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t

    typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

    typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t

    Protocom security configs

    typedef struct esp_local_ctrl_config esp_local_ctrl_config_t

    Configuration structure to pass to esp_local_ctrl_start()
2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave  This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif chips  The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDIO slave</td>
<td>Y</td>
</tr>
<tr>
<td>Tohost intr</td>
<td>8</td>
</tr>
<tr>
<td>Ffrom intr</td>
<td>8</td>
</tr>
<tr>
<td>TX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>RX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>Shared registers</td>
<td>56*</td>
</tr>
</tbody>
</table>

* Not including the interrupt registers

ESP SDIO Slave Initialization  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of SDIO Simplified Specification). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000
   
   CMD5 arg = 0x00f8000 (according to the response above, poll until ready)
   **Example:**  Arg of R4 after first CMD5 (arg=0x00000000) is 0x00FFFFF00.
   
   Keep sending CMD5 with arg=0x00FFFFF00 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3

6. **Select card** CMD7 (arg address according to CMD3 response)
   
   **Example:** Arg of R6 after CMD3 is 0x0001xxxx.
   
   Arg of CMD7 should be 0x00010000.

7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)

8. **Enable func1** CMD52 (Write 0x02=0x02)

9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)

10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)
   
   CMD52/53 (Write 0x10=0x00)
   
   CMD52/53 (Write 0x11=0x02)
   
   CMD52/53 (Read 0x10~0x11, read to check the final value)

11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)
   
   CMD52/53 (Write 0x110=0x00)
   
   CMD52/53 (Write 0x111=0x02)
   
   CMD52/53 (Read 0x110~0x111, read to check the final value)

---

**ESP SDIO Slave Protocol**

The ESP SDIO Slave protocol is based on the SDIO Specification’s I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example peripherals/sdio.

The ESP Serial Slave Link component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

**Slave register table**

**32-bit**

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

**8-bit**

Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)**

0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[
\text{requested length} = 0x1F800-\text{address}
\]
Chapter 2. API Reference

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the requested length, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

**Note:** The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

**Interrupts** SDIO interrupts are “level sensitive”. For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO** To write to the slave’s receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** (*buffer_size* x *buffer_num* is greater than the data to write, *buffer_size* is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the requested length should not exceed the length calculated at Step 2, and the FIFO address is related to requested length.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

**Sending FIFO** To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. **Update the read length.**

**Warning:** The driver for ESP32 hasn’t been developed yet.

**ESP SPI Slave HD (Half Duplex) Mode Protocol**
## SPI Slave Capabilities of Espressif chips

### Introduction

In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command**: 8-bit, master to slave
  
  This phase determines the rest phases of the transactions. See Supported Commands.

- **Address**: 8-bit, master to slave, optional
  
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy**: 8-bit, floating, optional
  
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data**: variable length, the direction is also determined by the command.
  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

### Data IO Modes

In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>

<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

**QPI Mode**

The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

**Note**: The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>

<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>

<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slavedevice connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. To host Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. From Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See [SDIO Slave Capabilities of Espressif chips](#) and [SPI Slave Capabilities of Espressif chips](#) for more details.

**Initialization of ESP Serial Slave Link**

**ESP SDIO Slave**  The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `doc:` Document of SDMMC driver `<api-reference/storage/sdmmc>` ) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essi_init()` to do initialization of the SDIO part.
5. Call `essi_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the `SDIO interface` instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**To host Interrupts (optional)**

1. Call `essi_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essi_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essi_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essi_get_intr()` to know which events are active, and call `essi_clear_intr()` to clear them.

**F rom host Interrupts**

1. Call `essi_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essi_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essi_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essi_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essi_get_packet()` to receive data from the slave.

**Reset counters (Optional)**

Call `essi_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.
API Reference

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

\texttt{esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)}

Initialize the slave.

**Parameters**
- \texttt{handle} – Handle of an ESSL device.
- \texttt{wait_ms} – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

\texttt{esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)}

Wait for interrupt of an ESSL slave device.

**Parameters**
- \texttt{handle} – Handle of an ESSL device.
- \texttt{wait_ms} – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

\texttt{esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)}

Get buffer num for the host to send data to the slave. The buffers are size of \texttt{buffer_size}.

**Parameters**
- \texttt{handle} – Handle of a ESSL device.
- \texttt{out_tx_num} – Output of buffer num that host can send data to ESSL slave.
- \texttt{wait_ms} – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

\texttt{esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)}

Get the size, in bytes, of the data that the ESSL slave is ready to send.

**Parameters**
- \texttt{handle} – Handle of an ESSL device.
- \texttt{out_rx_size} – Output of data size to read from slave, in bytes
- \texttt{wait_ms} – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

\texttt{esp_err_t essl_reset_cnt (essl_handle_t handle)}

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Parameters** \texttt{handle} – Handle of an ESSL device.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.
*esp_err_t* `essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**Parameters**

- **handle** – Handle of an ESSL device.
- **start** – Start address of the packet to send
- **length** – Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error froom SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp_err_t* `essl_get_packet (essl_handle_t handle, void*out_data, size_t size, size_t*out_length, uint32_t wait_ms)`

Get a packet from ESSL slave.

**Parameters**

- **handle** – Handle of an ESSL device.
- **out_data** – [out] Data output address
- **size** – The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- **out_length** – [out] Output of length the data actually received from slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp_err_t* `essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t* value, uint32_t wait_ms)`

Write general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** – Handle of an ESSL device.
- **addr** – Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** – Value to write to the register.
- **value_o** – Output of the returned written value.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp_err_t* `essl_read_reg (essl_handle_t handle, uint8_t addr, uint8_t* value, uint32_t wait_ms)`

Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** – Handle of an ESSL device.
- **addr** – Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** – Value to write to the register.
- **value_o** – Output of the returned written value.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller
### Parameters

- **handle**: Handle of a `essl` device.
- **add**: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value**: Output value read from the register.
- **wait Ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Returns

- ESP_OK: Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

### Parameters

- **handle**: Handle of an ESSL device.
- **wait Ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Returns

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

### Parameters

- **handle**: Handle of an ESSL device.
- **intr Mask**: Mask of interrupt bits to clear.
- **wait Ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr(essl_handle_t handle, uint32_t* intr_raw, uint32_t* intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

### Parameters

- **handle**: Handle of an ESSL device.
- **intr Raw**: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr St**: Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- **wait Ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Returns

- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

### Parameters

- **handle**: Handle of an ESSL device.
- **ena Mask**: Mask of the interrupt bits to enable.
- **wait Ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller
**esp_err_t essl_get_intr_ena** (essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **ena_mask_o** – Output of interrupt bit enable mask.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**esp_err_t essl_send_slave_intr** (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**
- **handle** – Handle of an ESSL device.
- **intr_mask** – Mask of interrupt bits to send to slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t essl_sdio_init_dev** (essl_handle_t *out_handle, const essl_sdio_config_t *config)

Initialize the ESSL SDIO device and get its handle.

**Parameters**
- **out_handle** – Output of the handle.
- **config** – Configuration for the ESSL SDIO device.

**Returns**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**esp_err_t essl_sdio_deinit_dev** (essl_handle_t handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters**
- **handle** – Handle of the ESSL SDIO device to deinit.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

**Structures**

**struct essl_sdio_config_t**

Configuration for the ESSL SDIO device.
Public Members

sdmmc_card_t *card
The initialized sdmcc card pointer of the slave.

int recv_buffer_size
The pre-negotiated recv buffer size used by both the host and the slave.

Header File
• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)
Initialize the ESSL SPI device function list and get its handle.

Parameters
• out_handle –[out] Output of the handle
• init_config –Configuration for the ESSL SPI device

Returns
• ESP_OK: On success
• ESP_ERR_NO_MEM: Memory exhausted
• ESP_ERR_INVALID_STATE: SPI driver is not initialized
• ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t essl_spi_deinit_dev (essl_handle_t handle)
Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters handle –Handle of the ESSL SPI device

Returns
• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)
Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Parameters
• arg –Context of the component. (Member arg from essl_handle_t)
• addr –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
• out_value –[out] Read buffer for the shared registers.
• wait_ms –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• or other return value from: cpp:func:spi_device_transmit.

esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)
Get a packet from Slave.
Parameters

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** – [out] Output data address
- **size** – The size of the output data.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

`esp_err_t essl_spi_write_reg` (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

Note: Feature of checking the actual written value (`out_value`) is not supported.

Parameters

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** – Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value** – Buffer for data to send, should be align to 4.
- **out_value** – [out] Not supported, should be set to NULL.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note 2.

or other return value from `cpp:func:spi_device_transmit`

`esp_err_t essl_spi_send_packet` (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

Parameters

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)
- **data** – Address of the data to send
- **size** – Size of the data to send.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer
void **essl_spi_reset_cnt**(void *arg)
Reset the counter in Master context.

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized.

**Parameters**
- **arg** - Context of the component. (Member arg from essl_handle_t)

```c
esp_err_t essl_spi_rdbuf**(spi_device_handle_t** spi, uint8_t *out_data, int addr, int len, uint32_t flags)**
Read the shared buffer from the slave in ISR way.

**Note:** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note:** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**
- **spi** - SPI device handle representing the slave
- **out_data** - [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** - Address of the slave shared buffer
- **len** - Length to read
- **flags** - SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

```c
esp_err_t essl_spi_rdbuf_polling**(spi_device_handle_t** spi, uint8_t *out_data, int addr, int len, uint32_t flags)**
Read the shared buffer from the slave in polling way.

**Note:** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**
- **spi** - SPI device handle representing the slave
- **out_data** - [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** - Address of the slave shared buffer
- **len** - Length to read
- **flags** - SPI_TRANS_* flags to control the transaction mode of the transaction to send.

** Returns**
- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

```c
esp_err_t essl_spi_wrbuf**(spi_device_handle_t** spi, const uint8_t *data, int addr, int len, uint32_t flags)**
Write the shared buffer of the slave in ISR way.
Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**
- spi – SPI device handle representing the slave
- data – Buffer for data to send, strongly suggested to be in the DRAM
- addr – Address of the slave shared buffer,
- len – Length to write
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spl_device_transmit`.

```c
esp_err_t essl_spi_wrbuf_polling (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**
- spi – SPI device handle representing the slave
- data – Buffer for data to send, strongly suggested to be in the DRAM
- addr – Address of the slave shared buffer,
- len – Length to write
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spl_device_polling_transmit`.

```c
esp_err_t essl_spi_rddma (spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several `cpp:func:essl_spi_rddma_seg` and one `cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- spi – SPI device handle representing the slave
- out_data – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len – Total length of data to receive.
- seg_len – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spl_device_transmit`. 
**esp_err_t essl_spi_rddma_seg** *(spi_device_handle_t spi, uint8_t*out_data, int seg_len, uint32_t flags)*

Read one data segment from the slave through its DMA.

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

**Parameters**
- `spi` – SPI device handle representing the slave
- `out_data` – [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- `seg_len` – Length of this segment
- `flags` –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

**esp_err_t essl_spi_rddma_done** *(spi_device_handle_t spi, uint32_t flags)*

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note:** This is required only when the slave is working in segment mode.

**Parameters**
- `spi` – SPI device handle representing the slave
- `flags` –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

**esp_err_t essl_spi_wrdma** *(spi_device_handle_t spi, const uint8_t*data, int len, int seg_len, uint32_t flags)*

Send long buffer in segments to the slave through its DMA.

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- `spi` – SPI device handle representing the slave
- `data` – Buffer for data to send, strongly suggested to be in the DRAM
- `len` –Total length of data to send.
- `seg_len` –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- `flags` –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

**esp_err_t essl_spi_wrdma_seg** *(spi_device_handle_t spi, const uint8_t*data, int seg_len, uint32_t flags)*

Send one data segment to the slave through its DMA.

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.
Chapter 2. API Reference

Parameters
• spi – SPI device handle representing the slave
• data – Buffer for data to send, strongly suggested to be in the DRAM
• seg_len – Length of this segment
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

esp_err_t essl_spi_wrdma_done (spi_device_handle_t spi, uint32_t flags)
Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note: This is required only when the slave is working in segment mode.

Parameters
• spi – SPI device handle representing the slave
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

Structures
struct essl_spi_config_t
Configuration of ESSL SPI device.

Public Members

*spi
Pointer to SPI device handle.

tx_buf_size
The pre-negotiated Master TX buffer size used by both the host and the slave.

tx_sync_reg
The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

rx_sync_reg
The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle

Overview
The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.
Chapter 2. API Reference

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jul 19 03:12:06 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacert_all.pem.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS-custom CERTIFICATE BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init($conf);
esp_crt_bundle_attach($conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script mk-ca-bundle.pl that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla.

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.
Chapter 2. API Reference

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in *Generating the List of Root Certificates*.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

```c
esp_err_t esp_crt_bundle_attach (void *conf)
```

Attach and enable use of a bundle for certificate verification.

Parameters

- `conf` [in] The config struct for the SSL connection.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

```c
void esp_crt_bundle_detach (mbedtls_ssl_config *conf)
```

Disable and dealloc the certification bundle.

Parameters

- `conf` [in] The config struct for the SSL connection.

Set the default certificate bundle used for verification.

Parameters

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

2.2.9 HTTP Server
Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. * httpd_req_recv() accepts char* only, but content could * as well be any binary data (needs type casting). * In case of string data, null termination will be absent, and * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling * httpd_req_recv(), but to keep it simple, here we * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
```

(continues on next page)
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}
/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};
/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};
/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    } /* If server failed to start, handle will be NULL */
    return server;
}
/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.
Persistent Connections Example

#define free_ctx_func *(void)ctx
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx)
    {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));  /* Pointer to context
        data */
        req->free_ctx = free_ctx_func;  /* Function to free
        context data */
    }
    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    
    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the CONFIG_HTTPD_WS_SUPPORT option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.

API Reference

Header File

• components/esp_http_server/include/esp_http_server.h

Functions

esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)
  Registers a URI handler.

Example usage:

esp_err_t my_uri_handler(httpd_req_t* req)
{
    /* Recv, Process and Send
     * ...
     * ...
     * ...
     * Fail condition
     * (continues on next page)
if (...) {  
    // Return fail to close session //  
    return ESP_FAIL;  
}

// On success  
return ESP_OK;  
}

// URI handler structure  
httpd_uri_t my_uri {  
    .uri = "/my_uri/path/xyz",  
    .method = HTTPD_GET,  
    .handler = my_uri_handler,  
    .user_ctx = NULL  
};  

// Register handler  
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {  
    // If failed to register handler  
    ....  
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters
• handle [in] handle to HTTPD server instance  
• uri_handler [in] pointer to handler that needs to be registered

Returns
• ESP_OK : On successfully registering the handler  
• ESP_ERR_INVALID_ARG : Null arguments  
• ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler  
• ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

esp_err_t httpd_unregister_uri_handler (httpd_handle_t handle, const char *uri, httpd_method_t method)  
Unregister a URI handler.

Parameters
• handle [in] handle to HTTPD server instance  
• uri [in] URI string  
• method [in] HTTP method

Returns
• ESP_OK : On successfully deregistering the handler  
• ESP_ERR_INVALID_ARG : Null arguments  
• ESP_ERR_HTTPD_NOT_FOUND : Handler with specified URI and method not found

esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)  
Unregister all URI handlers with the specified uri string.

Parameters
• handle [in] handle to HTTPD server instance  
• uri [in] uri string specifying all handlers that need to be deregistered

Returns
• ESP_OK : On successfully deregistering all such handlers  
• ESP_ERR_INVALID_ARG : Null arguments  
• ESP_ERR_HTTPD_NOT_FOUND : No handler registered with specified uri string
**esp_err_t** `httpd_sess_set_recv_override` *(httpd_handle_t `hd`, int `sockfd`, httpd_recv_func_t `recv_func`)*

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- `hd` [in] HTTPD instance handle
- `sockfd` [in] Session socket FD
- `recv_func` [in] The receive function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** `httpd_sess_set_send_override` *(httpd_handle_t `hd`, int `sockfd`, httpd_send_func_t `send_func`)*

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- `hd` [in] HTTPD instance handle
- `sockfd` [in] Session socket FD
- `send_func` [in] The send function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** `httpd_sess_set_pending_override` *(httpd_handle_t `hd`, int `sockfd`, httpd_pending_func_t `pending_func`)*

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Parameters**
- `hd` [in] HTTPD instance handle
- `sockfd` [in] Session socket FD
- `pending_func` [in] The receive function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
**ESP_ERR_INVALID_ARG**: Null arguments

```c
int httpd_req_to_sockfd (httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e.: `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Parameters**
- **r**  - [in] The request whose socket descriptor should be found

**Returns**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

```c
int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.

**Note:**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Parameters**
- **r**  - [in] The request being responded to
- **buf**  - [in] Pointer to a buffer that the data will be read into
- **buf_len**  - [in] Length of the buffer

**Returns**
- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

```c
size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)
```

Search for a field in request headers and return the string length of it’s value.

**Note:**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
* r [in] The request being responded to
* field [in] The header field to be searched in the request

Returns
* Length: If field is found in the request URL
* Zero: Field not found / Invalid request / Null arguments

```c
esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char* field, char* val, size_t val_size)
```

Get the value string of a field from the request headers.

Note:
* This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
* Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
* If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
* Use httpd_req_get_hdr_value_len() to know the right buffer length

```c
size_t httpd_req_get_url_query_len(httpd_req_t *r)
```

Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

```c
esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)
```

Get Query string from the request URL.

Note:
* Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
* This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
* If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string.

**Parameters**
- `r` [in] The request being responded to
- `buf` [out] Pointer to the buffer into which the query string will be copied (if found)
- `buf_len` [in] Length of output buffer

**Returns**
- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

```c
esp_err_t httpd_query_key_value(const char* qry, const char* key, char* val, size_t val_size)
```

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

**Note:**
- The components of URL query string (keys and values) are not URLdecoded. The user must check for the `Content-Type` field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

**Parameters**
- `qry` [in] Pointer to query string
- `key` [in] The key to be searched in the query string
- `val` [out] Pointer to the buffer into which the value will be copied if the key is found
- `val_size` [in] Size of the user buffer “val”

**Returns**
- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

```c
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char* cookie_name, char* val, size_t *val_size)
```

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

**Parameters**
- `req` [in] Pointer to the HTTP request
- `cookie_name` [in] The cookie name to be searched in the request
- `val` [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- `val_size` [in] Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length in case ESP_ERR_HTTPD_RESULT_TRUNC is returned.

**Returns**
- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure
Chapter 2. API Reference

bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "*" for a wildcard match, and "???" to make the previous character optional, and if present, allow anything to follow.

Example:

• * matches everything
• /foo/? matches /foo and /foo/
• /foo/*/ (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
• /foo/?* or /foo/*/? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /fooxor /fo

The special characters "?" and "*" anywhere else in the template will be taken literally.

Parameters

• uri_template ~in] URI template (pattern)
• uri_to_match ~in] URI to be matched
• match_upto ~in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters

• r ~[in] The request being responded to
• buf ~[in] Buffer from where the content is to be fetched
• buf_len ~[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns

• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null request pointer
• ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request

esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.
If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• When you are finished sending all your chunks, you must call this function with buf_len as 0.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

• r –[in] The request being responded to
• buf –[in] Pointer to a buffer that stores the data
• buf_len –[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

**Returns**

• ESP_OK : On successfully sending the response packet chunk
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

• r –[in] The request being responded to
• str –[in] String to be sent as response body

**Returns**

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

• r –[in] The request being responded to
• str –[in] String to be sent as response body (NULL to finish response packet)

**Returns**

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

`esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)`

API to set the HTTP status code.
This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Parameters**
- `r` [in] The request being responded to
- `status` [in] The HTTP status code of this response

**Returns**
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request pointer

```c
esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)
```

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Parameters**
- `r` [in] The request being responded to
- `type` [in] The Content Type of the response

**Returns**
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request pointer

```c
esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)
```

This API sets any additional header fields that need to be sent in the response.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Parameters**
- `r` [in] The request being responded to
- `field` [in] The field name of the HTTP header
Chapter 2. API Reference

• **value** – [in] The value of this HTTP header

**Returns**
• ESP_OK: On successfully appending new header
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

`esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

**Note:**
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Parameters**
• `req` – [in] Pointer to the HTTP request for which the response needs to be sent
• `error` – [in] Error type to send
• `msg` – [in] Error message string (pass NULL for default message)

**Returns**
• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_404(httpd_req_t *r)`

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters** `r` – [in] The request being responded to

**Returns**
• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_408(httpd_req_t *r)`

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- `r` - [in] The request being responded to

**Returns**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_send_500 (httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- `r` - [in] The request being responded to

**Returns**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()
Chapter 2. API Reference

- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Parameters**
- `hd` - [in] server instance
- `sockfd` - [in] session socket file descriptor
- `buf` - [in] buffer with bytes to send
- `buf_len` - [in] data size
- `flags` - [in] flags for the send() function

**Returns**
- `Bytes`: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_recv (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Parameters**
- `hd` - [in] server instance
- `sockfd` - [in] session socket file descriptor
- `buf` - [in] buffer with bytes to send
- `buf_len` - [in] data size
- `flags` - [in] flags for the send() function

**Returns**
- `Bytes`: The number of bytes received successfully
- `0`: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

**esp_err_t** httpd_register_err_handler (httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

**Parameters**
**handle** - [in] HTTP server handle
**error** - [in] Error type
**handler_fn** - [in] User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

```
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

**Example usage:**

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Parameters**
- **config** - [in] Configuration for new instance of the server
- **handle** - [out] Handle to newly created instance of the server. NULL on error

**Returns**
- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

```
esp_err_t httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

**Example usage:**

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```
Chapter 2. API Reference

Parameters handle - [in] Handle to server returned by httpd_start

Returns
- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is null

esp_err_t httpd_queue_work (httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Parameters
- handle - [in] Handle to server returned by httpd_start
- work - [in] Pointer to the function to be executed in the HTTPD’s context
- arg - [in] Pointer to the arguments that should be passed to this function

Returns
- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Parameters
- handle - [in] Handle to server returned by httpd_start
- sockfd - [in] The socket descriptor for which the context should be extracted.

Returns
- void*: Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

Parameters
- handle - [in] Handle to server returned by httpd_start
- sockfd - [in] The socket descriptor for which the context should be extracted.
- ctx - [in] Context object to assign to the session
- free_fn - [in] Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:
httpd_sess_get_ctx()
• void*: Pointer to the transport context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void* ctx, httpd_free_ctx_fn_t free_fn)

Set session ‘transport’ context by socket descriptor.

See also:
httpd_sess_set_ctx()

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.
• ctx [in] Transport context object to assign to the session
• free_fn [in] Function that should be called to free the transport context

void* httpd_get_global_user_ctx(httpd_handle_t handle)
Get HTTPD global user context (it was set in the server config struct)

Parameters handle [in] Handle to server returned by httpd_start
Returns global user context

void* httpd_get_global_transport_ctx(httpd_handle_t handle)
Get HTTPD global transport context (it was set in the server config struct)

Parameters handle [in] Handle to server returned by httpd_start
Returns global transport context

esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
Trigger an httpd session close externally.

Note: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor of the session to be closed

Returns
• ESP_OK: On successfully initiating closure
• ESP_FAIL: Failure to queue work
• ESP_ERR_NOT_FOUND: Socket fd not found
• ESP_ERR_INVALID_ARG: Null arguments

esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note: Calling this API is only necessary if the LRU Purge Enable option is enabled.
Parameters

- **handle**  [in] Handle to server returned by httpd_start
- **sockfd** [in] The socket descriptor of the session for which LRU counter is to be updated

Returns

- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t httpd_get_client_list (httpd_handle_t handle, size_t*fds, int*client_fds)**

Returns list of current socket descriptors of active sessions.

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

Parameters

- **handle**  [in] Handle to server returned by httpd_start
- **fds**  [inout] In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds**  [out] Array of client fds

Returns

- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

Structures

**struct httpd_config**

HTTP Server Configuration Structure.

**Note:** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

- **unsigned task_priority**
  Priority of FreeRTOS task which runs the server
- **size_t stack_size**
  The maximum stack size allowed for the server task
- **BaseType_t core_id**
  The core the HTTP server task will run on
- **uint16_t server_port**
  TCP Port number for receiving and transmitting HTTP traffic
- **uint16_t ctrl_port**
  UDP Port number for asynchronously exchanging control signals between various components of the server
uint16_t **max_open_sockets**
Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**
Maximum allowed uri handlers

uint16_t **max_resp_headers**
Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**
Number of backlog connections

bool **lru_purge_enable**
Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**
Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**
Timeout for send function (in seconds)

void ***global_user_ctx**
Global user context.
This field can be used to store arbitrary user data within the server context. The value can be retrieved
using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
If you wish to use a custom function for freeing the global user context, please specify that here.

*httpd_free_ctx_fn_t** / **global_user_ctx_free_fn**
Free function for global user context

void ***global_transport_ctx**
Global transport context.
Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
will be freed using free(), unless global_transport_ctx_free_fn is specified.

*httpd_free_ctx_fn_t** / **global_transport_ctx_free_fn**
Free function for global transport context

*httpd_open_func_t** **open_fn**
Custom session opening callback.
Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
session overrides.

If a context needs to be maintained between these functions, store it in the session using
httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()
Returning a value other than ESP_OK will immediately close the new socket.
**httpd_close_func_t close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

**httpd_uri_match_func_t uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct httpd_req**

HTTP Request Data Structure.

**Public Members**

**httpd_handle_t handle**

Handle to server instance

**int method**

The type of HTTP request, -1 if unsupported method

**const char uri[HTTPD_MAX_URI_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size_t content_len**

Length of the request body

**void *aux**

Internally used members

**void *user_ctx**

User context pointer passed during URI registration.

**void *sess_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.
By default, this is NULL. URI Handlers can set this to any meaningful value. If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

```
httpd_free_ctx_fn_t free_ctx
```
Pointer to free context hook
Function to free session context
If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

```
bool ignore_sess_ctx_changes
```
Flag indicating if Session Context changes should be ignored
By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

```
struct httpd_uri
```
Structure for URI handler.

**Public Members**

```
const char *uri
```
The URI to handle

```
httpd_method_t method
```
Method supported by the URI

```
esp_err_t (*handler)(httpd_req_t *r)
```
Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

```
void *user_ctx
```
Pointer to user context data which will be available to handler

**Macros**

```
HTTPD_MAX_REQ_HDR_LEN
```

```
HTTPD_MAX_URI_LEN
```

```
HTTPD_SOCK_ERR_FAIL
```

```
HTTPD_SOCK_ERR_INVALID
```

```
HTTPD_SOCK_ERR_TIMEOUT
```
Chapter 2. API Reference

HTTPD_200
   HTTP Response 200

HTTPD_204
   HTTP Response 204

HTTPD_207
   HTTP Response 207

HTTPD_400
   HTTP Response 400

HTTPD_404
   HTTP Response 404

HTTPD_408
   HTTP Response 408

HTTPD_500
   HTTP Response 500

HTTPD_TYPE_JSON
   HTTP Content type JSON

HTTPD_TYPE_TEXT
   HTTP Content type text/HTML

HTTPD_TYPE_OCTET
   HTTP Content type octet-stream

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
   Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
   All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
   URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
   Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
   Result string truncated

ESP_ERR_HTTPD_RESP_HDR
   Response header field larger than supported
Chapter 2. API Reference

**ESP_ERR_HTTPD_RESP_SEND**
Error occurred while sending response packet

**ESP_ERR_HTTPD_ALLOC_MEM**
Failed to dynamically allocate memory for resource

**ESP_ERR_HTTPD_TASK**
Failed to launch server task/thread

**HTTPD_RESP_USE_STRLEN**

**Type Definitions**

```c
typedef struct httpd_req httpd_req_t
    HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
    Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char* buf, size_t buf_len, int flags)
    Prototype for HTTPD's low-level send function.
```

**Note:** User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

```c
    Param hd [in] server instance
    Param sockfd [in] session socket file descriptor
    Param buf [in] buffer with bytes to send
    Param buf_len [in] data size
    Param flags [in] flags for the send() function

    Return
    • Bytes : The number of bytes sent successfully
    • HTTPD_SOCK_ERR_INVALID : Invalid arguments
    • HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socketsend()
    • HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()
```

```c
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)
    Prototype for HTTPD's low-level recv function.
```

**Note:** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

```c
    Param hd [in] server instance
    Param sockfd [in] session socket file descriptor
    Param buf [in] buffer with bytes to send
    Param buf_len [in] data size
    Param flags [in] flags for the send() function

    Return
```
Chapter 2. API Reference

- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPD's low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR codes, which will be handled accordingly in the server task.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_respsend_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Param req [in] HTTP request for which the error needs to be handled
Param error [in] Error type
Return
- ESP_OK: error handled successful
- ESP_FAIL: failure indicates that the underlying socket needs to be closed

typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
  
  Prototype for freeing context data (if any)

  **Param ctx [in]** object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
  
  Function prototype for opening a session.

  Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

  **Param hd [in]** server instance
  **Param sockfd [in]** session socket file descriptor

  **Return**
  - ESP_OK : On success
  - Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
  
  Function prototype for closing a session.

  **Note:** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

  **Param hd [in]** server instance
  **Param sockfd [in]** session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
  
  Function prototype for URI matching.

  **Param reference_uri [in]** URI/template with respect to which the other URI is matched
  **Param uri_to_match [in]** URI/template being matched to the reference URI/template
  **Param match_upto [in]** For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

  **Return**
  true on match

typedef struct httpd_config httpd_config_t
  
  HTTP Server Configuration Structure.

  **Note:** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)
  
  Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

  **Param arg [in]** The arguments for this work function

**Enumerations**

enum httpd_err_code_t
  
  Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

  **Values:**
Chapter 2. API Reference

enumerator HTTPD_500_INTERNAL_SERVER_ERROR
enumerator HTTPD_501_METHOD_NOT_IMPLEMENTED
enumerator HTTPD_505_VERSION_NOT_SUPPORTED
enumerator HTTPD_400_BAD_REQUEST
enumerator HTTPD_401_UNAUTHORIZED
enumerator HTTPD_403_FORBIDDEN
enumerator HTTPD_404_NOT_FOUND
enumerator HTTPD_405_METHOD_NOT_ALLOWED
enumerator HTTPD_408_REQ_TIMEOUT
enumerator HTTPD_411_LENGTH_REQUIRED
enumerator HTTPD_414_URI_TOO_LONG
enumerator HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
enumerator HTTPD_ERR_CODE_MAX

2.2.10 HTTPS Server

Overview

This component is built on top of HTTP Server. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for HTTP Server applies also to a server you create this way.

Used APIs

The following APIs of HTTP Server should not be used with HTTPS Server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” callback registration functions - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
Chapter 2. API Reference

- `httpd_get_global_transport_ctx()` - returns the shared SSL context
- `httpd_config::global_transport_ctx`
- `httpd_config::global_transport_ctx_free_fn`
- `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- `components/esp_https_server/include/esp_https_server.h`

Functions

```c
default error_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters
- config - [inout] - server config, must not be const. Does not have to stay valid after
calling this function.
- handle - [out] - storage for the server handle, must be a valid pointer

Returns
- success

```c
default error_t httpd_ssl_stop(httpd_handle_t handle)

Stop the server. Blocks until the server is shut down.

Parameters
- handle - [in]

Returns
- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

```c
struct esp_https_server_user_cb_arg

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback
is executed.
```
Public Members

`httpd_ssl_user_cb_state` `user_cb_state`
State of user callback

`esp_tls_t *tls`
ESP-TLS connection handle

`struct httpd_ssl_config`
HTTPS server config struct
Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

`httpd_config_t httpd`
Underlying HTTPD server config
Parameters like task stack size and priority can be adjusted here.

`const uint8_t *servercert`
Server certificate

`size_t servercert_len`
Server certificate byte length

`const uint8_t *cacert_pem`
CA certificate ((CA used to sign clients, or client cert itself)

`size_t cacert_len`
CA certificate byte length

`const uint8_t *prvtkey_pem`
Private key

`size_t prvtkey_len`
Private key byte length

`httpd_ssl_transport_mode_t transport_mode`
Transport Mode (default secure)

`uint16_t port_secure`
Port used when transport mode is secure (default 443)

`uint16_t port_insecure`
Port used when transport mode is insecure (default 80)

`bool session_tickets`
Enable tls session tickets
bool use_secure_element
    Enable secure element for server session

esp_https_server_user_cb *user_cb
    User callback for esp_https_server

Macros
HTTPD_SSL_CONFIG_DEFAULT()
    Default config struct init
    (http_server default config had to be copied for customization)

Notes:
• port is set when starting the server, according to `transport_mode`
• one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
• SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
• Stack size may need adjustments depending on the user application

Type Definitions
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
    Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.
typedef void esp_https_server_user_cb(esp_https_server_user_cb_arg_t *user_cb)
    Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.
        Param user_cb Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations
enum httpd_ssl_transport_mode_t
    Values:
        enumerator HTTPD_SSL_TRANSPORT_SECURE
        enumerator HTTPD_SSL_TRANSPORT_INSECURE

denum httpd_ssl_user_cb_state_t
    Indicates the state at which the user callback is executed, i.e at session creation or session close.
    Values:
        enumerator HTTPD_SSL_USER_CB_SESS_CREATE
        enumerator HTTPD_SSL_USER_CB_SESS_CLOSE
### 2.2.11 ICMP Echo

**Overview**

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility *ping* is implemented based on the ICMP packets with the type field value of 0, also called *Echo Reply*.

During a ping session, the source host firstly sends out an ICMP echo request packet and waits for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session**  To create a ping session, you need to fill in the *esp_ping_config_t* configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the *esp_ping_callbacks_t* structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;

    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));

    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
            recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));

    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    (continues on next page)
```
void initialize_ping()
{
    struct addrinfo hint;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);
    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;  // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;  // ping in infinite mode, esp_ping_stop can stop it

    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo";  // arguments that will feed to all callback functions, can be NULL
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo
Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t *config`, const `esp_ping_callbacks_t *cbs`, `esp_ping_handle_t *hdl_out`)

Create a ping session.

Parameters
- `config` – ping configuration
- `cbs` – a bunch of callback functions invoked by internal ping task
- `hdl_out` – handle of ping session

Returns
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t hdl`)

Delete a ping session.

Parameters `hdl` – handle of ping session

Returns
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

`esp_err_t esp_ping_start` (`esp_ping_handle_t hdl`)

Start the ping session.

Parameters `hdl` – handle of ping session

Returns
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

`esp_err_t esp_ping_stop` (`esp_ping_handle_t hdl`)

Stop the ping session.

Parameters `hdl` – handle of ping session

Returns
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

`esp_err_t esp_ping_get_profile` (`esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size`)

Get runtime profile of ping session.

Parameters
- `hdl` – handle of ping session
- `profile` – type of profile
- `data` – profile data
- `size` – profile data size

Returns
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

Structures

`struct esp_ping_callbacks_t`

Type of “ping” callback functions.
Public Members

void *cb_args
arguments for callback functions

void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of “ping” configuration.

Public Members

uint32_t count
A “ping” session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

int tos
Type of Service, a field specified in the IP header

int ttl
Time to Live, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX
Macros

ESP_PING_DEFAULT_CONFIG()
Default ping configuration.

ESP_PING_COUNT_INFINITE
Set ping count to zero will ping target infinitely

Type Definitions
typedef void *esp_ping_handle_t
Type of “ping” session handle.

Enumerations
enum esp_ping_profile_t
Profile of ping session.
Values:
  enumerator ESP_PING_PROF_SEQNO
    Sequence number of a ping procedure
  enumerator ESP_PING_PROF_TOS
    Type of service of a ping procedure
  enumerator ESP_PING_PROF_TTL
    Time to live of a ping procedure
  enumerator ESP_PING_PROF_REQUEST
    Number of request packets sent out
  enumerator ESP_PING_PROF_REPLY
    Number of reply packets received
  enumerator ESP_PING_PROF_IPADDR
    IP address of replied target
  enumerator ESP_PING_PROF_SIZE
    Size of received packet
  enumerator ESP_PING_PROF_TIMEGAP
    Elapsed time between request and reply packet
  enumerator ESP_PING_PROF_DURATION
    Elapsed time of the whole ping session

2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:
Chapter 2. API Reference

- mDNS component on GitHub

Hosted Documentation

The documentation can be found on the link below:
- mDNS documentation

2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

**Note:** ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:
- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

**Note:** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the old Mbed TLS site.

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF here.

**Note:** Please refer the ESP-IDF Migration Guide to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at https://github.com/espressif/esp-wolfSSL with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options docs for more information on this and comparison of Mbed TLS and wolfSSL.
Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: ESP x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed Test</th>
<th>TLS Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td><code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code></td>
<td>22013 B</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in Minimizing Binary Size docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.
Chapter 2. API Reference

2.3 Bluetooth API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h

Structures

struct esp_bt_uuid_t

UUID type.

Public Members

uint16_t len

UUID length, 16bit, 32bit or 128bit

uint16_t uuid16

16bit UUID

uint32_t uuid32

32bit UUID

uint8_t uuid128[ESP_UUID_LEN_128]

128bit UUID

union esp_bt_uuid_t::[anonymous] uuid

UUID

Macros

ESP_BLUEDROID_STATUS_CHECK(status)

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF
    Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN
    Minimum advertising interval for undirected and low duty cycle directed advertising
Chapter 2. API Reference

ESP_BLE_PRIM_ADV_INT_MAX
Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN
relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX
relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM (x, min, max)
Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.
Chapter 2. API Reference

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions

typedef uint8_t esp_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

Enumerations

enum esp_bt_status_t
Status Return Value.
Values:

enumerator ESP_BT_STATUS_SUCCESS
enumerator ESP_BT_STATUS_FAIL
enumerator ESP_BT_STATUS_NOT_READY
enumerator ESP_BT_STATUS_NOMEM
enumerator ESP_BT_STATUS_BUSY
enumerator ESP_BT_STATUS_DONE
enumerator ESP_BT_STATUS_UNSUPPORTED
enumerator ESP_BT_STATUS_PARM_INVALID
enumerator ESP_BT_STATUS_UNHANDLED
enumerator ESP_BT_STATUS_AUTH_FAILURE
enumerator ESP_BT.STATUS_RMT_DEV_DOWN
enumerator `ESP_BT_STATUS_AUTH_REJECTED`

enumerator `ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED`

enumerator `ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT`

enumerator `ESP_BT_STATUS_MEMORY_FULL`

enumerator `ESP_BT_STATUS_EIR_TOO_LARGE`

defined `esp_bt_dev_type_t`

Bluetooth device type.

Values:

enumerator `ESP_BT_DEVICE_TYPE_BREDR`

enumerator `ESP_BT_DEVICE_TYPE_BLE`

enumerator `ESP_BT_DEVICE_TYPE_DUMO`

defined `esp_ble_addr_type_t`

BLE device address type.

Values:

enumerator `BLE_ADDR_TYPE_PUBLIC`

enumerator `BLE_ADDR_TYPE_RANDOM`

enumerator `BLE_ADDR_TYPE_RPA_PUBLIC`

enumerator `BLE_ADDR_TYPE_RPA_RANDOM`
enum esp_ble_wl_addr_type_t
    white list address type

Values:

enumerator BLE_WL_ADDR_TYPE_PUBLIC
enumerator BLE_WL_ADDR_TYPE_RANDOM

BT MAIN API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

esp_bluedroid_status_t esp_bluedroid_get_status (void)
    Get bluetooth stack status.

Returns
    Bluetooth stack status

esp_err_t esp_bluedroid_enable (void)
    Enable bluetooth, must after esp_bluedroid_init().

Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_disable (void)
    Disable bluetooth, must prior to esp_bluedroid_deinit().

Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_init (void)
    Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Returns
    • ESP_OK : Succeed
    • Other : Failed

esp_err_t esp_bluedroid_deinit (void)
    Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Returns
    • ESP_OK : Succeed
    • Other : Failed

Enumerations

enum esp_bluedroid_status_t
    Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:
Chapter 2: API Reference

**BT DEVICE APIs**

**Overview**  Bluetooth device reference APIs.

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h

**Functions**

- **const uint8_t* esp_bt_dev_get_address (void)**

  Get bluetooth device address. Must use after “esp_bluedroid_enable”.

  **Returns**  bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

- **esp_err_t esp_bt_dev_set_device_name (const char* name)**

  Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

  A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

  **Parameters**  name -[in]: device name to be set

  **Returns**

  - ESP_OK : Succeed
  - ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL : others

**2.3.2 BT LE**

**GAP API**

**Application Example**  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough

- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough
API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

**esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)**

This function is called to occur gap event, such as scan result.

Parameters **callback** ([in] callback function)

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)**

This function is called to override the BTA default ADV parameters.

Parameters **adv_data** ([in] Pointer to User defined ADV data structure. This memory space cannot be freed until callback of config_adv_data is received.)

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)**

This function is called to set scan parameters.

Parameters **scan_params** ([in] Pointer to User defined scan_params data structure. This memory space cannot be freed until callback of set_scan_params)

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_start_scanning (uint32_t duration)**

This procedure keep the device scanning the peer device which advertising on the air.

Parameters **duration** ([in] Keeping the scanning time, the unit is second.)

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_stop_scanning (void)**

This function call to stop the device scanning the peer device which advertising on the air.

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_startAdvertising (esp_ble_adv_params_t *adv_params)**

This function is called to start advertising.

Parameters **adv_params** ([in] pointer to User defined adv_params data structure.)

Returns

- ESP_OK: success
- other : failed

**esp_err_t esp_ble_gap_stopAdvertising (void)**

This function is called to stop advertising.

Returns

- ESP_OK: success
- other : failed
**esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)**

Update connection parameters, can only be used when connection is up.

**Parameters**
- `params` - [in] - connection update parameters

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)**

This function is to set maximum LE data packet size.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)**

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Parameters**
- `rand_addr` - [in] - the random address which should be setting

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clear_rand_addr (void)**

This function clears the random address for the application.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)**

Enable/disable privacy on the local device.

**Parameters**
- `privacy_enable` - [in] - enable/disable privacy on remote device.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)**

set local gap appearance icon

**Parameters**
- `icon` - [in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to [https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf](https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf)

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)**

Add or remove device from white list.

**Parameters**
- `add_remove` - [in] - the value is true if added the ble device to the white list, and false remove to the white list.
- `remote_bda` - [in] - the remote device address add/remove from the white list.
- `wl_addr_type` - [in] - whitelist address type

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clear_whitelist (void)**

Clear all white list.
Chapter 2. API Reference

Returns
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_get_whitelist_size(uint16_t*length)
```

Get the whitelist size in the controller.

Parameters
length - [out] the white list length.

Returns
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Parameters
• bd_addr - [in] BD address of the peripheral
• min_conn_int - [in] minimum preferred connection interval
• max_conn_int - [in] maximum preferred connection interval
• slave_latency - [in] preferred slave latency
• supervision_tout - [in] preferred supervision timeout

Returns
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_set_device_name(const char*name)
```

Set device name to the local device.

Parameters
name - [in] - device name.

Returns
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t*addr_type)
```

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Parameters
• local_used_addr - [in] - current local used ble address (six bytes)
• addr_type - [in] - ble address type

Returns
• ESP_OK : success
• other : failed

```c
uint8_t* esp_ble_resolve_adv_data(uint8_t*adv_data,uint8_t type,uint8_t*length)
```

This function is called to get ADV data for a specific type.

Parameters
• adv_data - [in] - pointer of ADV data which to be resolved
• type - [in] - finding ADV data type
• length - [out] - return the length of ADV data not including type

Returns
pointer of ADV data

```c
esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t*raw_data,uint32_t raw_data_len)
```

This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters
• raw_data - [in] : raw advertising data
• raw_data_len - [in] : raw advertising data length , less than 31 bytes

Returns
• ESP_OK : success
**esp_err_t esp_ble_gap_config_scan_rsp_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

**Parameters**
- **raw_data** [in]: raw scan response data
- **raw_data_len** [in]: raw scan response data length, less than 31 bytes

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_read_rssi** (esp_bd_addr_t remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Parameters**
- **remote_addr** [in]: The remote connection device address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device** (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)

This function is called to add a device info into the duplicate scan exceptional list.

**Parameters**
- **type** [in]: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t
type, esp_duplicate_info_t
- **device_info** [in]: the device information.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device** (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

**Parameters**
- **type** [in]: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t
type, esp_duplicate_info_t
- **device_info** [in]: the device information.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list** (esp_duplicate_scan_exceptional_list_type_t list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Parameters**
- **list_type** [in]: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**Returns**
- ESP_OK: success
- other: failed
**esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value, uint8_t len)**

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary do as following:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

**Parameters**
- **param_type** [in]: the type of the param which to be set
- **value** [in]: the param value
- **len** [in]: the length of the param value

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)**

Grant security request access.

**Parameters**
- **bd_addr** [in]: BD address of the peer
- **accept** [in]: accept the security request or not

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)**

Set a GAP parameter value. Use this function to change the default GAP parameter values.

**Parameters**
- **bd_addr** [in]: the address of the peer device need to encryption
- **sec_act** [in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)**

Reply the key value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** [in]: BD address of the peer
- **accept** [in]: passkey entry successful or declined.
- **passkey** [in]: passkey value, must be a 6 digit number, can be lead by 0.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)**

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**

---

Submit Document Feedback

Espressif Systems 246  Release v5.1-dev-131-g2761ad4865
- **bd_addr** - [in]: BD address of the peer device
- **accept** - [in]: numbers to compare are the same or different.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)`
Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters**
- **bd_addr** - [in]: BD address of the peer device

**Returns**
- ESP_OK: success
- other: failed

```c
int esp_ble_get_bond_device_num(void)
```
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns**
- >= 0: bonded devices number.
- ESP_FAIL: failed

```c
esp_err_t esp_ble_get_bond_device_list(int*dev_num, esp_ble_bond_dev_t*dev_list)
```
Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**
- **dev_num** - [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** - [out] an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t*TK,uint8_t len)
```
This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Parameters**
- **bd_addr** - [in]: BD address of the peer device.
- **TK** - [in]: TK value, the TK value shall be a 128-bit random number
- **len** - [in]: length of tk, should always be 128-bit

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_disconnect(esp_bd_addr_t remote_device)
```
This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Parameters**
- **remote_device** - [in]: BD address of the peer device

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_get_current_conn_params(esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
```
This function is called to read the connection parameters information of the device.

**Parameters**
- **bd_addr** - [in]: BD address of the peer device.
- **conn_params** - [out]: the connection parameters information

**Returns**
- ESP_OK: success
- other: failed

### esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)

BLE set channels.

**Parameters channels** -[in] : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**Returns** - ESP_OK : success  
  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
  • other : failed

### esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Parameters**  
  • bd_addr –[in] BD address of the peer device.  
  • authorize –[out] Authorized the link or not.

**Returns** - ESP_OK : success  
  • other : failed

### esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Parameters bd_addr** –[in] : BD address of the peer device

**Returns** - ESP_OK : success  
  • other : failed

### esp_err_t esp_ble_gap_set_preferred_default_phy (tx_phy_mask, rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Parameters**  
  • tx_phy_mask –[in] : indicates the transmitter PHYs that the Host prefers the Controller to use  
  • rx_phy_mask –[in] : indicates the receiver PHYs that the Host prefers the Controller to use

**Returns** - ESP_OK : success  
  • other : failed

### esp_err_t esp_ble_gap_set_preferred_phy (esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Parameters**  
  • bd_addr –[in] : remote address  
  • all_phys_mask –[in] : a bit field that allows the Host to specify  
  • tx_phy_mask –[in] : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use  
  • rx_phy_mask –[in] : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use  
  • phy_options –[in] : a bit field that allows the Host to specify options for PHYs

**Returns** - ESP_OK : success  
  • other : failed

### esp_err_t esp_ble_gap_ext_adv_set_rand_addr (uint8_t instance, esp_bd_addr_t rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.
Parameters

• **instance** - [in] : Used to identify an advertising set
• **rand_addr** - [in] : Random Device Address

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_set_params (uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)
```

This function is used by the Host to set the advertising parameters.

**Parameters**

• **instance** - [in] : identifies the advertising set whose parameters are being configured.
• **params** - [in] : advertising parameters

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_config_ext_adv_data_raw (uint8_t instance, uint16_t length, const uint8_t *data)
```

This function is used to set the data used in advertising PDUs that have a data field.

**Parameters**

• **instance** - [in] : identifies the advertising set whose data are being configured
• **length** - [in] : data length
• **data** - [in] : data information

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)
```

This function is used to provide scan response data used in scanning response PDUs.

**Parameters**

• **instance** - [in] : identifies the advertising set whose response data are being configured.
• **length** - [in] : responsedata length
• **scan_rsp_data** - [in] : response data information

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_start (uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)
```

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

• **num_adv** - [in] : Number of advertising sets to enable or disable
• **ext_adv** - [in] : adv parameters

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_stop (uint8_t num_adv, const uint8_t *ext_adv_inst)
```

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

• **num_adv** - [in] : Number of advertising sets to enable or disable
• **ext_adv_inst** - [in] : ext adv instance

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_set_remove (uint8_t instance)
```

This function is used to remove an advertising set from the Controller.

**Parameters**

• **instance** - [in] : Used to identify an advertising set
Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_ext_adv_set_clear(void)`

This function is used to remove all existing advertising sets from the Controller.

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)`

This function is used by the Host to set the parameters for periodic advertising.

Parameters
   • `instance` [in] : identifies the advertising set whose periodic advertising parameters are being configured.
   • `params` [in] : periodic adv parameters

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`

This function is used to set the data used in periodic advertising PDUs.

Parameters
   • `instance` [in] : identifies the advertising set whose periodic advertising parameters are being configured.
   • `length` [in] : the length of periodic data
   • `data` [in] : periodic data information

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)`

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Parameters `instance` [in] : Used to identify an advertising set

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)`

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Parameters `instance` [in] : Used to identify an advertising set

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ext_scan_params_t *params)`

This function is used to set the extended scan parameters to be used on the advertising channels.

Parameters `params` [in] : scan parameters

Returns - ESP_OK : success
   • other : failed

`esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)`

This function is used to enable scanning.

Parameters
   • `duration` [in] : Scan duration
   • `period` [in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

Returns - ESP_OK : success
   • other : failed
**esp_err_t esp_ble_gap_stop_ext_scan (void)**

This function is used to disable scanning.

- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync (const esp_ble_gap_periodic_adv_sync_params_t *params)**

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

- **Parameters** params –[in]: sync parameters
- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)**

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)**

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

- **Parameters** sync_handle –[in]: identify the periodic advertiser
- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)**

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

- **Parameters**
  - addr_type –[in]: address type
  - addr –[in]: Device Address
  - sid –[in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising
- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)**

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

- **Parameters**
  - addr_type –[in]: address type
  - addr –[in]: Device Address
  - sid –[in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising
- **Returns** - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_clear_dev (void)**

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

- **Returns** - ESP_OK: success
  - other: failed
**esp_err_t esp_ble_gap_prefer_ext_connect_params_set**

```
(esp_bd_addr_t addr,
 esp_ble_gap_phy_mask_t phy_mask,
 const esp_ble_gap_conn_params_t *phy_1m_conn_params,
 const esp_ble_gap_conn_params_t *phy_2m_conn_params,
 const esp_ble_gap_conn_params_t *phy_coded_conn_params)
```

This function is used to set aux connection parameters.

**Parameters**
- **addr** [-in] : device address
- **phy_mask** [-in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** [-in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** [-in] : Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** [-in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns**
- ESP_OK : success
- other : failed

**Unions**

union **esp_ble_key_value_t**

```

**Public Members**

```c
esp_bt_status_t status
    Indicate the set pkt data length operation success status

esp_ble_pkt_data_length_params_t params
    pkt data length value
```

```c
struct ble_read_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_PHY_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
    read phy complete status

esp_bd_addr_t bda
    read phy address

esp_ble_gap_phy_t tx_phy
    tx phy type

esp_ble_gap_phy_t rx_phy
    rx phy type
```

```c
struct ble_read_rssi_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
    Indicate the read adv tx power operation success status
```
int8_t rssi

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot
be read, the RSSI metric shall be set to 127.

esp_bd_addr_t remote_addr

The remote device address

struct ble_remove_bond_dev_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the remove bond device operation success status

esp_bd_addr_t bd_addr
The device address which has been remove from the bond list

struct ble_remove_bond_dev_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the set scan param operation success status

struct ble_scan_param_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

uint8_t adv_instance
extend advertising handle

esp_ble_addr_type_t scan_addr_type
scanner address type

esp_bd_addr_t scan_addr
scanner address

struct ble_scan_result_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.

Public Members
Public Members

`esp_gap_search_evt_t search_evt`
Search event type

`esp_bd_addr_t bda`
Bluetooth device address which has been searched

`esp_bt_dev_type_t dev_type`
Device type

`esp_ble_addr_type_t ble_addr_type`
Ble device address type

`esp_ble_evt_type_t ble_evt_type`
Ble scan result event type

`int rssi`
Searched device’s RSSI

`uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]`
Received EIR

`int flag`
Advertising data flag bit

`int num_resps`
Scan result number

`uint8_t adv_data_len`
Adv data length

`uint8_t scan_rsp_len`
Scan response length

`uint32_t num_dis`
The number of discard packets

`struct ble_scan_rsp_data_cmpl_evt_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate the set scan response data operation success status

`struct ble_scan_rsp_data_raw_cmpl_evt_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.
Public Members

`esp_bt_status_t status`
Indicate the set raw advertising data operation success status

struct `ble_scan_start_cmpl_evt_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate scan start operation success status

struct `ble_scan_stop_cmpl_evt_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate scan stop operation success status

struct `ble_set_channels_evt_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SET_CHANNELS_EVT.

Public Members

`esp_bt_status_t stat`
BLE set channel status

struct `ble_set_ext_scan_params_cmpl_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate extend advertising parameters set status

struct `ble_set_perf_def_phy_cmpl_evt_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate perf default phy set status
struct **ble_set_perf_phy_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h>
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate perf phy set status

struct **ble_set_rand_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h>
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate set static rand address operation success status

struct **ble_update_conn_params_evt_param**

```c
#include <esp_gap_ble_api.h>
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate update connection parameters success status

```c
esp_bd_addr_t bda
```

Bluetooth device address

```c
uint16_t min_int
```

Min connection interval

```c
uint16_t max_int
```

Max connection interval

```c
uint16_t latency
```

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

```c
uint16_t conn_int
```

Current connection interval

```c
uint16_t timeout
```

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct **ble_update_duplicate_exceptional_list_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h>
```

**Public Members**

```c
```
Chapter 2. API Reference

Public Members

`esp_bt_status_t status`
Indicate update duplicate scan exceptional list operation success status

`uint8_t subcode`
Define in `esp_bt_duplicate_exceptional_subcode_type_t`

`uint16_t length`
The length of `device_info`

`esp_duplicate_info_t device_info`
device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

`struct ble_update_whitelist_cmpl_evt_param`
#include `<esp_gap_ble_api.h>` `ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT`

Public Members

`esp_bt_status_t status`
Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`
The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success, `ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

Structures

`struct esp_ble_adv_params_t`
Advertising parameters.

Public Members

`uint16_t adv_int_min`
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`uint16_t adv_int_max`
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

`esp_ble_adv_type_t adv_type`
Advertising type

`esp_ble_addr_type_t own_addr_type`
Owner bluetooth device address type
**Chapter 2. API Reference**

*esp_bd_addr_t* `peer_addr`

Peer device bluetooth device address

*esp_ble_addr_type_t* `peer_addr_type`

Peer device bluetooth device address type, only support public address type and random address type

*esp_ble_adv_channel_t* `channel_map`

Advertising channel map

*esp_ble_adv_filter_t* `adv_filter_policy`

Advertising filter policy

**Public Members**

bool `set_scan_rsp`

Set this advertising data as scan response or not

bool `include_name`

Advertising data include device name or not

bool `include_txpower`

Advertising data include TX power

int `min_interval`

Advertising data show slave preferred connection min interval. The connection interval in the following manner: `connIntervalmin = Conn_Interval_Min * 1.25 ms` Conn_Interval_Min range: 0x0006 to 0x0C80

Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int `max_interval`

Advertising data show slave preferred connection max interval. The connection interval in the following manner: `connIntervalmax = Conn_Interval_Max * 1.25 ms` Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int `appearance`

External appearance of device

uint16_t `manufacturer_len`

Manufacturer data length

uint8_t * `p_manufacturer_data`

Manufacturer data point

uint16_t `service_data_len`

Service data length

**Supplement to the Bluetooth Core Specification**
Chapter 2. API Reference

uint8_t *p_service_data
    Service data point

uint16_t service_uuid_len
    Service uuid length

uint8_t *p_service_uuid
    Service uuid array point

uint8_t flag
    Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
    Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
    Scan type

esp_ble_addr_type_t own_addr_type
    Owner address type

esp_ble_scan_filter_t scan_filter_policy
    Scan filter policy

uint16_t scan_interval
    Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
    Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
    The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
    connection parameters information

Public Members

uint16_t interval
    connection interval
Chapter 2. API Reference

**uint16_t latency**
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16_t timeout**
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_ble_conn_update_params_t**
Connection update parameters.

**Public Members**

**esp_bd_addr_t bda**
Bluetooth device address

**uint16_t min_int**
Min connection interval

**uint16_t max_int**
Max connection interval

**uint16_t latency**
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16_t timeout**
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_ble_pkt_data_length_params_t**
BLE pkt date length keys.

**Public Members**

**uint16_t rx_len**
pkt rx data length value

**uint16_t tx_len**
pkt tx data length value

**struct esp_ble_penc_keys_t**
BLE encryption keys.

**Public Members**

**esp_bt_octet16_t ltk**
The long term key
Chapter 2. API Reference

```

**esp_bt_octet8_t rand**
The random number

uint16_t **ediv**
The ediv value

uint8_t **sec_level**
The security level of the security link

uint8_t **key_size**
The key size(7~16) of the security link

struct **esp_ble_pcsrk_keys_t**
BLE CSRK keys.

**Public Members**

uint32_t **counter**
The counter

**esp_bt_octet16_t **csrk**
The csrk key

uint8_t **sec_level**
The security level

struct **esp_ble_pid_keys_t**
BLE pid keys.

**Public Members**

**esp_bt_octet16_t **irk**
The irk value

**esp_ble_addr_type_t **addr_type**
The address type

**esp_bd_addr_t **static_addr**
The static address

struct **esp_ble_lenc_keys_t**
BLE Encryption reproduction keys.

**Public Members**
```

```c
esp_bt_octet16_t ltk
The long term key
```

```c
uint16_t div
The div value
```

```c
uint8_t key_size
The key size of the security link
```

```c
uint8_t sec_level
The security level of the security link
```

```c
struct esp_ble_lcsrk_keys
BLESRK keys.
```

**Public Members**

```c
uint32_t counter
The counter value
```

```c
uint16_t div
The div value
```

```c
uint8_t sec_level
The security level of the security link
```

```c
esp_bt_octet16_t csrk
The csrk key value
```

```c
struct esp_ble_sec_key_notif_t
Structure associated with ESP_KEY_NOTIF_EVT.
```

**Public Members**

```c
esp_bd_addr_t bd_addr
peer address
```

```c
uint32_t passkey
the numeric value for comparison. If just_works, do not show this number to UI
```

```c
struct esp_ble_sec_req_t
Structure of the security request.
```

**Public Members**
esp_bd_addr_t bd_addr
    peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value

Public Members

esp_ble_key_mask_t key_mask
    the key mask to indicate which key is present

esp_ble_penc_keys_t penc_key
    received peer encryption key

esp_ble_pcsrk_keys_t pcsrk_key
    received peer device SRK

esp_ble_pid_keys_t pid_key
    peer device ID key

struct esp_ble_bond_dev_t
    struct type of the bond device value

Public Members

esp_bd_addr_t bd_addr
    peer address

esp_ble_bond_key_info_t bond_key
    the bond key information

struct esp_ble_key_t
    union type of the security key value

Public Members

esp_bd_addr_t bd_addr
    peer address

esp_ble_key_type_t key_type
    key type of the security link

esp_ble_key_value_t p_key_value
    the pointer to the key value

struct esp_ble_local_id_keys_t
    structure type of the ble local id keys value
Chapter 2. API Reference

Public Members

`esp_bt_octet16_t ir`
the 16 bits of the ir value

`esp_bt_octet16_t irk`
the 16 bits of the ir key value

`esp_bt_octet16_t dhk`
the 16 bits of the dh key value

`struct esp_ble_auth_cmpl_t`
Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

`esp_bd_addr_t bd_addr`
BD address peer device.

`bool key_present`
Valid link key value in key element

`esp_link_key key`
Link key associated with peer device.

`uint8_t key_type`
The type of Link Key

`bool success`
TRUE of authentication succeeded, FALSE if failed.

`uint8_t fail_reason`
The HCI reason/error code for when success=FALSE

`esp_ble_addr_type_t addr_type`
Peer device address type

`esp_bt_dev_type_t dev_type`
Device type

`esp_ble_auth_req_t auth_mode`
authentication mode

`struct esp_ble_gap_ext_adv_params_t`
ext adv parameters
Chapter 2. API Reference

Public Members

```c
esp_ble_ext_adv_type_mask_t type
    ext adv type

uint32_t interval_min
    ext adv minimum interval

uint32_t interval_max
    ext adv maximum interval

esp_ble_adv_channel_t channel_map
    ext adv channel map

esp_ble_addr_type_t own_addr_type
    ext adv own address type

esp_ble_addr_type_t peer_addr_type
    ext adv peer address type

esp_bd_addr_t peer_addr
    ext adv peer address

esp_ble_adv_filter_t filter_policy
    ext adv filter policy

int8_t tx_power
    ext adv tx power

esp_ble_gap_pri_phy_t primary_phy
    ext adv primary phy

uint8_t max_skip
    ext adv maximum skip

esp_ble_gap_phy_t secondary_phy
    ext adv secondary phy

uint8_t sid
    ext adv sid

bool scan_req_notif
    ext adv scan request event notify

struct esp_ble_ext_scan_cfg_t
    ext scan config
```
Chapter 2. API Reference

Public Members

`esp_ble_scan_type_t scan_type`
  ext scan type

`uint16_t scan_interval`
  ext scan interval

`uint16_t scan_window`
  ext scan window

 struct `esp_ble_ext_scan_params_t`
  ext scan parameters

Public Members

`esp_ble_addr_type_t own_addr_type`
  ext scan own address type

`esp_ble_scan_filter_t filter_policy`
  ext scan filter policy

`esp_ble_scan_duplicate_t scan_duplicate`
  ext scan duplicate scan

`esp_ble_ext_scan_cfg_mask_t cfg_mask`
  ext scan config mask

`esp_ble_ext_scan_cfg_t uncoded_cfg`
  ext scan uncoded config parameters

`esp_ble_ext_scan_cfg_t coded_cfg`
  ext scan coded config parameters

 struct `esp_ble_gap_conn_params_t`
  create extend connection parameters

Public Members

`uint16_t scan_interval`
  init scan interval

`uint16_t scan_window`
  init scan window

`uint16_t interval_min`
  minimum interval
uint16_t interval_max
    maximum interval

uint16_t latency
    ext scan type

uint16_t supervision_timeout
    connection supervision timeout

uint16_t min_ce_len
    minimum ce length

uint16_t max_ce_len
    maximum ce length

struct esp_ble_gap_ext_adv_t
    extend adv enable parameters

Public Members

uint8_t instance
    advertising handle

int duration
    advertising duration

int max_events
    maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
    periodic adv parameters

Public Members

uint16_t interval_min
    periodic advertising minimum interval

uint16_t interval_max
    periodic advertising maximum interval

uint8_t properties
    periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
    periodic adv sync parameters
Public Members

`esp_ble_gap_sync_t filter_policy`
periodic advertising sync filter policy

`uint8_t sid`
periodic advertising sid

`esp_ble_addr_type_t addr_type`
periodic advertising address type

`esp_bd_addr_t addr`
periodic advertising address

`uint16_t skip`
the maximum number of periodic advertising events that can be skipped

`uint16_t sync_timeout`
synchronization timeout

`struct esp_ble_gap_ext_adv_reprot_t`
extend adv report parameters

Public Members

`esp_ble_gap_adv_type_t event_type`
extend advertising type

`uint8_t addr_type`
extend advertising address type

`esp_bd_addr_t addr`
extend advertising address

`esp_ble_gap_pri_phy_t primary_phy`
extend advertising primary phy

`esp_ble_gap_phy_t secondly_phy`
extend advertising secondary phy

`uint8_t sid`
extend advertising sid

`uint8_t tx_power`
extend advertising tx power

`int8_t rssi`
extend advertising rssi
uint16_t per_adv_interval
    periodic advertising interval

uint8_t dir_addr_type
    direct address type

*esp_bd_addr_t* dir_addr
    direct address

*esp_ble_gap_ext_adv_data_status_t* data_status
    data type

uint8_t adv_data_len
    extend advertising data length

uint8_t adv_data[251]
    extend advertising data

struct *esp_ble_gap_periodic_adv_report_t*
    periodic adv report parameters

**Public Members**

uint16_t sync_handle
    periodic advertising train handle

uint8_t tx_power
    periodic advertising tx power

int8_t rssi
    periodic advertising rssi

*esp_ble_gap_ext_adv_data_status_t* data_status
    periodic advertising data type

uint8_t data_length
    periodic advertising data length

uint8_t data[251]
    periodic advertising data

struct *esp_ble_gap_periodic_adv_sync_estab_t*
    periodic adv sync establish parameters

**Public Members**
uint8_t status
    periodic advertising sync status

uint16_t sync_handle
    periodic advertising train handle

uint8_t sid
    periodic advertising sid

esp_ble_addr_type_t addr_type
    periodic advertising address type

esp_bd_addr_t adv_addr
    periodic advertising address

esp_ble_gap_phy_t adv_phy
    periodic advertising adv phy type

uint16_t period_adv_interval
    periodic advertising interval

uint8_t adv_clk_accuracy
    periodic advertising clock accuracy

**Macros**

ESP_BLE_ADV_FLAG_LIMIT_DISC
    BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE
    relate to BTM_LE_KEY_xxx in stack/btm_api.h
    No encryption key

ESP_LE_KEY_PENC
    encryption key, encryption information of peer device

ESP_LE_KEY_PID
    identity key of the peer device
ESP_LE_KEY_PCSRK
peer SRK

ESP_LE_KEY_PLK
Link key

ESP_LE_KEY_LLK
peer link key

ESP_LE_KEY_LENC
master role security information: div

ESP_LE_KEY_LID
master device ID key

ESP_LE_KEY_LCSRK
local CSRK has been deliver to peer

ESP_LE_AUTH_NO_BOND
relate to BTM_LE_AUTH_xxx in stack/btm_api.h
0 no bonding

ESP_LE_AUTH_BOND
1 << 0 device in the bonding with peer

ESP_LE_AUTH_REQ_MITM
1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM
0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY
1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND
1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM
1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND
1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE
authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE
authentication enable
ESP_BLE_OOB_DISABLE

disable the out of bond

ESP_BLE_OOB_ENABLE

enable the out of bond

ESP_IO_CAP_OUT

relate to BTM_IO_CAP_xxx in stack/btm_api.h
DisplayOnly

ESP_IO_CAP_IO

DisplayYesNo

ESP_IO_CAP_IN

KeyboardOnly

ESP_IO_CAP_NONE

NoInputNoOutput

ESP_IO_CAP_KBDISP

Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN

relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PHONE

relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_COMPUTER

relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WATCH

relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_SPORTS_WATCH

relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CLOCK

relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_DISPLAY

relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_REMOTE

relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES

relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_GENERIC_TAG
relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_KEYRING
relate to BTM_BLE_APPEARANCE_GENERIC_KEYRING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER
relate to BTM_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER
relate to BTM_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_THERMOMETER
relate to BTM_BLE_APPEARANCE_GENERIC_THERMOMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_THERMOMETER_EAR
relate to BTM_BLE_APPEARANCE_THERMOMETER_EAR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HEART_RATE
relate to BTM_BLE_APPEARANCE_GENERIC_HEART_RATE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HEART_RATE_BELT
relate to BTM_BLE_APPEARANCE_HEART_RATE_BELT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE
relate to BTM_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_ARM
relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_ARM in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST
relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST in stack/btm_ble_api.h

relate to BTM_BLE_APPEARANCE_HID_GAMEPAD in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_HID_DIGITIZER_TABLET
relate to BTM_BLE_APPEARANCE_HID_DIGITIZER_TABLET in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_CARD_READER
relate to BTM_BLE_APPEARANCE_HID_CARD_READER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITAL_PEN
relate to BTM_BLE_APPEARANCE_HID_DIGITAL_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_BARCODE_SCANNER
relate to BTM_BLE_APPEARANCE_HID_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_GLUCOSE
relate to BTM_BLE_APPEARANCE_GENERIC_GLUCOSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WALKING
relate to BTM_BLE_APPEARANCE_GENERIC_WALKING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_IN_SHOE
relate to BTM_BLE_APPEARANCE_WALKING_IN_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_SHOE
relate to BTM_BLE_APPEARANCE_WALKING_ON_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_HIP
relate to BTM_BLE_APPEARANCE_WALKING_ON_HIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CYCLING
relate to BTM_BLE_APPEARANCE_GENERIC_CYCLING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_COMPUTER
relate to BTM_BLE_APPEARANCE_CYCLING_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED
relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE
relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER
relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE
relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER
relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h
Chapter 2. API Reference

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT
relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR
relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER
relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR
relate to BTM_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP
relate to BTM_BLE_APPEARANCE_GENERIC_INSULIN_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN
relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY
relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS
relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in
stack/btm_ble_api.h

ESP_GAP_BLE_CHANNELS_LEN
channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT
This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX
Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX
Scan response data maximum length.

BLE_BIT (n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED
Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE
Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE
Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED
Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED
High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY
Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV
Omit advertiser’s address from all PDUs (“anonymous advertising”)

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR
Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK
Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement
shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms
advertising interval) shall not be used (bit 3 = 0) ADV_IND
Chapter 2  API Reference

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND
  ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR
  ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR
  ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN
  ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M
  Secondary Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M
  Secondary Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED
  Secondary Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY
  No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY
  No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M
  Primary phy only support 1M and LE coded phy.
  Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED
  Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK
  The Host prefers use the LE1M transmitter or receiver PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK
  The Host prefers use the LE2M transmitter or receiver PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK
  The Host prefers use the LE CODED transmitter or receiver PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF
  The Host has no preferred coding when transmitting on the LE Coded PHY
ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK

Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK

Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE

Advertising data.

extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE

extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED

extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO

Advertising SYNC policy.

sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST

periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND

Advertising report.

advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND

advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV

advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND

advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND

advertising report with legacy direct indication type
ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND
    advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND
    advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND
    advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND
    advertising report with legacy advertising with scan response indication type

Type Definitions

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t
    combination of the above bit pattern

typedef uint8_t esp_ble_gap_adv_type_t
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

### Enumerations

#### enum esp_gap_ble_cb_event_t

GAP BLE callback event type.

**Values:**

- Enumerator **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**
  - When advertising data set complete, the event comes

- Enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**
  - When scan response data set complete, the event comes

- Enumerator **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**
  - When scan parameters set complete, the event comes

- Enumerator **ESP_GAP_BLE_SCAN_RESULT_EVT**
  - When one scan result ready, the event comes each time

- Enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**
  - When raw advertising data set complete, the event comes

- Enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**
  - When raw advertising data set complete, the event comes

- Enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**
  - When start advertising complete, the event comes

- Enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**
  - When start scan complete, the event comes

- Enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**
  - Authentication complete indication.

- Enumerator **ESP_GAP_BLE_KEY_EVT**
  - BLE key event for peer device keys

- Enumerator **ESP_GAP_BLE_SEC_REQ_EVT**
  - BLE security request

- Enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**
  - passkey notification event
enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**
passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**
OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**
BLE local IR event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**
BLE local ER event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**
Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_ADDR_EVT**
When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_PKT_LENGTH_COMPLETE_EVT**
When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_COMPLETE_EVT**
When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**
When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**
When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**
When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**
When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**
When add or remove whitelist complete, the event comes
enumerator `ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT`
   When update duplicate exceptional list complete, the event comes

enumerator `ESP_GAP_BLE_SET_CHANNELS_EVT`
   When setting BLE channels complete, the event comes

enumerator `ESP_GAP_BLE_READ_PHY_COMPLETE_EVT`
   When reading phy complete, this event comes

enumerator `ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT`
   When preferred default phy complete, this event comes

enumerator `ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT`
   When preferred phy complete, this event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT`
   When extended set random address complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT`
   When extended advertising parameter complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT`
   When extended advertising data complete, the event comes

enumerator `ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT`
   When extended scan response data complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT`
   When extended advertising start complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT`
   When extended advertising stop complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT`
   When extended advertising set remove complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT`
   When extended advertising set clear complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT`
   When periodic advertising parameter complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT`
   When periodic advertising data complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT`
   When periodic advertising start complete, the event comes
enumerator `ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT`
when periodic advertising stop complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT`
when periodic advertising create sync complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT`
when extended advertising sync cancel complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT`
when extended advertising sync terminate complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT`
when extended advertising add device complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT`
when extended advertising remove device complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT`
when extended advertising clear device, the event comes

enumerator `ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT`
when extended scan parameter complete, the event comes

enumerator `ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT`
when extended scan start complete, the event comes

enumerator `ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT`
when extended scan stop complete, the event comes

enumerator `ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT`
when extended prefer connection parameter set complete, the event comes

enumerator `ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT`
when ble phy update complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_REPORT_EVT`
when extended advertising report complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_TIMEOUT_EVT`
when scan timeout complete, the event comes

enumerator `ESP_GAP_BLE_ADV_TERMINATED_EVT`
when advertising terminate data complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT`
when scan req received complete, the event comes
enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**
when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**
when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**
when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**
when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_EVT_MAX**
when maximum advertising event complete, the event comes

enum **esp_ble_adv_data_type**
The type of advertising data(not adv_type)

Values:

enumerator **ESP_BLE_AD_TYPE_FLAG**

enumerator **ESP_BLE_AD_TYPE_16SRV_PART**

enumerator **ESP_BLE_AD_TYPE_16SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_32SRV_PART**

enumerator **ESP_BLE_AD_TYPE_32SRV_CMPL**

enum `esp_ble_adv_type_t`  
Advertising mode. 

Values:

tenumerator `ADV_TYPE_IND`

tenumerator `ADV_TYPE_DIRECT_IND_HIGH`

tenumerator `ADV_TYPE_SCAN_IND`

tenumerator `ADV_TYPE_NONCONN_IND`

tenumerator `ADV_TYPE_DIRECT_IND_LOW`

enum `esp_ble_adv_channel_t`  
Advertising channel mask. 

Values:

tenumerator `ADV_CHNL_37`

tenumerator `ADV_CHNL_38`

tenumerator `ADV_CHNL_39`

tenumerator `ADV_CHNL_ALL`

enum `esp_ble_adv_filter_t`  

Values:

tenumerator `ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY`  
Allow both scan and connection requests from anyone.

tenumerator `ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY`  
Allow both scan req from White List devices only and connection req from anyone.

tenumerator `ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST`  
Allow both scan req from anyone and connection req from White List devices only.

tenumerator `ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST`  
Allow scan and connection requests from White List devices only.

enum `esp_ble_sec_act_t`  

Values:

tenumerator `ESP_BLE_SEC_ENCRYPT`
relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will use LTK to encrypt with the remote device directly. Else if the device hasn’t bonded, the stack will use the default authentication request used the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**
relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has already bonded, the stack will check the LTK Whether the authentication request has been met, if met, used the LTK to encrypt with the remote device directly, else Re-pair with the remote device. Else if the device hasn’t bonded, the stack will used NO MITM authentication request in the current link instead of used the authreq in the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**
relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has already bonded, the stack will check the LTK Whether the authentication request has been met, if met, used the LTK to encrypt with the remote device directly, else Re-pair with the remote device. Else if the device hasn’t bonded, the stack will used MITM authentication request in the current link instead of used the authreq in the esp_ble_gap_set_security_param function set by the user.

**enum esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**
Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**
The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**
Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**
Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**
Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**
Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**
Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**
Reset static Passkey

enumerator **ESP_BLE_SM_Clear_STATIC_PASSKEY**
Accept only specified SMP Authentication requirement
Chapter 2. API Reference

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**

Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all:

i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only:

i. advertisement packets from devices where the advertiser’s address is in the White list.
ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all:

i. undirected advertisement packets, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all:

i. advertisement packets from devices where the advertiser’s address is in the White list, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.
enum esp_ble_scan_duplicate_t
Ble scan duplicate type.

Values:

enumerator BLE_SCAN_DUPLICATE_DISABLE
the Link Layer should generate advertising reports to the host for each packet received

enumerator BLE_SCAN_DUPLICATE_ENABLE
the Link Layer should filter out duplicate advertising reports to the Host

enumerator BLE_SCAN_DUPLICATE_MAX
0x02 –0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator ESP_GAP_SEARCH_INQ_RES_EVT
Inquiry result for a peer device.

enumerator ESP_GAP_SEARCH_INQ_CMPL_EVT
Inquiry complete.

enumerator ESP_GAP_SEARCH_DISC_RES_EVT
Discovery result for a peer device.

enumerator ESP_GAP_SEARCH_DISC_BLE_RES_EVT
Discovery result for BLE GATT based service on a peer device.

enumerator ESP_GAP_SEARCH_DISC_CMPL_EVT
Discovery complete.

enumerator ESP_GAP_SEARCH_DI_DISC_CMPL_EVT
Discovery complete.

enumerator ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT
Search cancelled

enumerator ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator ESP_BLE_EVT_CONN_ADV
Connectable undirected advertising (ADV_IND)
enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
   Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**
   Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
   Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
   Scan Response (SCAN_RSP)

enum **esp_ble wl_operation_t**
   Values:

   enumerator **ESP_BLE_WHITELIST_REMOVE**
      remove mac from whitelist

   enumerator **ESP_BLE_WHITELIST_ADD**
      add address to whitelist

enum **esp bt duplicate exceptional subcode type t**
   Values:

   enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
      Add device info into duplicate scan exceptional list

   enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
      Remove device info from duplicate scan exceptional list

   enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
      Clean duplicate scan exceptional list

enum **esp ble duplicate exceptional info type t**
   Values:

   enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
      BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

   enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
      BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

   enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
      BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

   enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
      BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ….
enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is 0x02 0x01 flags 0x03 0x03 0x1828 ...

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

**GATT DEFINES**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

union **esp_gatt_rsp_t**

#include <esp_gatt_defs.h> GATT remote read request response type.

**Public Members**

```c
esp_gatt_value_t attr_value
```

Gatt attribute structure

```c
uint16_t handle
```

Gatt attribute handle

**Structures**

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.
**Public Members**

```c
esp_bt_uuid_t uuid
    UUID

uint8_t inst_id
    Instance id
```

```c
struct esp_gatt_srvc_id_t
    Gatt service id, include id (uuid and instance id) and primary flag.
```

**Public Members**

```c
esp_gatt_id_t id
    Gatt id, include uuid and instance

bool is_primary
    This service is primary or not
```

```c
struct esp_attr_desc_t
    Attribute description (used to create database)
```

**Public Members**

```c
uint16_t uuid_length
    UUID length

uint8_t *uuid_p
    UUID value

uint16_t perm
    Attribute permission

uint16_t max_length
    Maximum length of the element

uint16_t length
    Current length of the element

uint8_t *value
    Element value array
```

```c
struct esp_attr_control_t
    attribute auto response flag
```
Public Members

`uint8_t auto_rsp`
if `auto_rsp` set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if `auto_rsp` set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

`struct esp_gatts_attr_db_t`
attribute type added to the gatt server database

Public Members

`esp_attr_control_t attr_control`
The attribute control type

`esp_attr_desc_t att_desc`
The attribute type

`struct esp_attr_value_t`
set the attribute value type

Public Members

`uint16_t attr_max_len`
attribute max value length

`uint16_t attr_len`
attribute current value length

`uint8_t *attr_value`
the pointer to attribute value

`struct esp_gatts_incl_svc_desc_t`
Gatt include service entry element.

Public Members

`uint16_t start_hdl`
Gatt start handle value of included service

`uint16_t end_hdl`
Gatt end handle value of included service

`uint16_t uuid`
Gatt attribute value UUID of included service

`struct esp_gatts_incl128_svc_desc_t`
Gatt include 128 bit service entry element.
Chapter 2. API Reference

Public Members

```c
uint16_t start_hdl
    Gatt start handle value of included 128 bit service
```

```c
uint16_t end_hdl
    Gatt end handle value of included 128 bit service
```

```c
struct esp_gatt_value_t
    Gatt attribute value.
```

Public Members

```c
uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value
```

```c
uint16_t handle
    Gatt attribute handle
```

```c
uint16_t offset
    Gatt attribute value offset
```

```c
uint16_t len
    Gatt attribute value length
```

```c
uint8_t auth_req
    Gatt authentication request
```

```c
struct esp_gatt_conn_params_t
    Connection parameters information.
```

Public Members

```c
uint16_t interval
    connection interval
```

```c
uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```c
uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_gattc_multi_t
    read multiple attribute
```
Chapter 2. API Reference

Public Members

uint8_t num_attr
The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t type
The attribute type

uint16_t attribute_handle
The attribute handle, it’s valid for all of the type

uint16_t start_handle
The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
The attribute uuid, it’s valid for all of the type

struct esp_gattc_service_elem_t
service element

Public Members

bool is_primary
The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
The start handle of the service

uint16_t end_handle
The end handle of the service
struct esp_gatt_char_elem_t
characteristic element

Public Members

uint16_t char_handle
The characteristic handle

esp_gatt_char_prop_t properties
The characteristic properties

uint16_t uuid
The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members

uint16_t handle
The characteristic descriptor handle

esp_bt_uuid_t uuid
The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
include service element

Public Members

uint16_t handle
The include service current attribute handle

uint16_t incl_srvc_s_handle
The start handle of the service which has been included

uint16_t incl_srvc_e_handle
The end handle of the service which has been included

esp_bt_uuid_t uuid
The include service uuid

   If callback report gatte_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
   Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
   Attribute write data type from the client.
   Values:
   enumerator ESP_GATT_PREP_WRITE_CANCEL
      Prepare write cancel
   enumerator ESP_GATT_PREP_WRITE_EXEC
      Prepare write execute

enum esp_gatt_status_t
   GATT success code and error codes.
   Values:
   enumerator ESP_GATT_OK
enumerator ESP_GATT_INVALID_HANDLE
enumerator ESP_GATT_READ_NOT_PERMIT
enumerator ESP_GATT_WRITE_NOT_PERMIT
enumerator ESP_GATT_INVALID_PDU
enumerator ESP_GATT_INSUF_AUTHENTICATION
enumerator ESP_GATT_REQ_NOT_SUPPORTED
enumerator ESP_GATT_INVALID_OFFSET
enumerator ESP_GATT_INSUF_AUTHORIZATION
enumerator ESP_GATT_PREPARE_Q_FULL
enumerator ESP_GATT_NOT_FOUND
enumerator ESP_GATT_NOT_LONG
enumerator ESP_GATT_INSUF_KEY_SIZE
enumerator ESP_GATT_INVALID_ATTR_LEN
enumerator ESP_GATT_ERR_UNLIKELY
enumerator ESP_GATT_INSUF_ENCRYPTION

enumerator ESP_GATT_CCC_CFG_ERR

enumerator ESP_GATT_PRC_IN_PROGRESS

enumerator ESP_GATT_OUT_OF_RANGE

enum esp_gatt_conn_reason_t

  Gatt Connection reason enum.

  Values:

  enumerator ESP_GATT_CONN_UNKNOWN
    Gatt connection unknown
enumerator **ESP_GATT_CONN_L2C_FAILURE**
General L2cap failure

enumerator **ESP_GATT_CONN_TIMEOUT**
Connection timeout

enumerator **ESP_GATT_CONN_TERMINATE_PEER_USER**
Connection terminate by peer user

enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**
Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**
Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**
Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**
L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**
No connection to cancel

enum **esp_gatt_auth_req_t**
Gatt authentication request type.

*Values:*

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

*Values:*

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**
enum **esp_gatt_write_type_t**
    Gatt write type.

    Values:

    enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**
        Gatt write attribute need no response

    enumerator **ESP_GATT_WRITE_TYPE_RSP**
        Gatt write attribute need remote response

denum **esp_gatt_db_attr_type_t**
    the type of attribute element

    Values:

    enumerator **ESP_GATT_DB_PRIMARY_SERVICE**
        Gattc primary service attribute type in the cache

    enumerator **ESP_GATT_DB_SECONDARY_SERVICE**
        Gattc secondary service attribute type in the cache

    enumerator **ESP_GATT_DB_CHARACTERISTIC**
        Gattc characteristic attribute type in the cache

    enumerator **ESP_GATT_DB_DESCRIPTOR**
        Gattc characteristic descriptor attribute type in the cache

    enumerator **ESP_GATT_DB_INCLUDED_SERVICE**
        Gattc include service attribute type in the cache

    enumerator **ESP_GATT_DB_ALL**
        Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

**GATT SERVER API**

**Application Example**  
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

**API Reference**
Chapter 2. API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

**esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)**

This function is called to register application callbacks with BTA GATTS module.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_app_register (uint16_t app_id)**

This function is called to register application identifier.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)**

 unregister with GATT Server.

**Parameters**

- gatts_if – [in] GATT server access interface

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)**

Create a service. When service creation is done, a callback event ESP_GATTTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- gatts_if – [in] GATT server access interface
- service_id – [in] service ID.
- num_handle – [in] number of handle requested for this service.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)**

Create a service attribute tab.

**Parameters**

- gatts_attr_db – [in] the pointer to the service attr tab
- gatts_if – [in] GATT server access interface
- max_nb_attr – [in] the number of attribute to be added to the service database.
- srvc_inst_id – [in] the instance id of the service

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_add_included_service (uint16_t service_handle, uint16_t included_service_handle)**

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Parameters**

- service_handle – [in] service handle to which this included service is to be added.
• included_service_handle - [in] the service ID to be included.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_add_char (uint16_t service_handle, esp_bt_uuid_t *char_uuid, 
    esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val,
    esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

Parameters
• service_handle - [in] service handle to which this included service is to be added.
• char_uuid –[in] : Characteristic UUID.
• perm - [in] : Characteristic value declaration attribute permission.
• property [in] : Characteristic Properties
• char_val - [in] : Characteristic value
• control –[in] : attribute response control byte

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_add_char_descr (uint16_t service_handle, esp_bt_uuid_t *descr_uuid, 
    esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, 
    esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTSD_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Parameters
• service_handle - [in] service handle to which this characteristic descriptor is to be added.
• perm - [in] descriptor access permission.
• descr_uuid –[in] descriptor UUID.
• char_descr_val - [in] : Characteristic descriptor value
• control –[in] : attribute response control byte

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)
```

This function is called to delete a service. When this is done, a callback event ESP_GATTSD_DELETE_EVT is report with the status.

Parameters service_handle - [in] service.handle to be deleted.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)
```

This function is called to start a service.

Parameters service_handle - [in] the service handle to be started.

Returns
• ESP_OK : success
• other : failed

```
esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)
```

This function is called to stop a service.

Parameters service.handle- [in] - service to be stopped.

Returns
• ESP_OK : success
• other : failed
Esp_err_t esp_ble_gatts_send_indicate(esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Parameters
- gatts_if - [in] GATT server access interface
- conn_id - [in] connection id to indicate.
- attr_handle - [in] attribute handle to indicate.
- value_len - [in] indicate value length.
- value - [in] value to indicate.
- need_confirm - [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

Returns
- ESP_OK : success
- other : failed

Esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)

This function is called to send a response to a request.

Parameters
- gatts_if - [in] GATT server access interface
- conn_id - [in] connection identifier.
- trans_id - [in] transfer id
- status - [in] - response status
- rsp - [in] - response data.

Returns
- ESP_OK : success
- other : failed

Esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Parameters
- attr_handle - [in] the attribute handle which to be set
- length - [in] the value length
- value - [in] the pointer to the attribute value

Returns
- ESP_OK : success
- other : failed

Esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

Parameters
- attr_handle - [in] Attribute handle.
- length - [out] pointer to the attribute value length
- value - [out] Pointer to attribute value payload, the value cannot be modified by user

Returns
- ESP_GATT_OK : success
- other : failed

Esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

Parameters
- gatts_if - [in] GATT server access interface
- remote_bda - [in] remote device bluetooth device address.
- is_direct - [in] direct connection or background auto connection
Returns

• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

Parameters

• `gatts_if` - [in] GATT server access interface
• `conn_id` - [in] connection ID to be closed.

Returns

• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

Parameters

• `gatts_if` - [in] GATT server access interface
• `remote_bda` - [in] remote device bluetooth device address. If `remote_bda` is NULL then it will send service change indication to all the connected devices and if not then to a specific device.

Returns

• ESP_OK : success
• other : failed

Unions

union `esp_ble_gatts_cb_param_t`

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct `esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`

Gatt server callback param of ESP_GATTS_REG_EVT

struct `esp_ble_gatts_cb_param_t::gatts_read_evt_param read`

Gatt server callback param of ESP_GATTS_READ_EVT

struct `esp_ble_gatts_cb_param_t::gatts_write_evt_param write`

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct `esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write`

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct `esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu`

Gatt server callback param of ESP_GATTS_MTU_EVT

struct `esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf`

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct `esp_ble_gatts_cb_param_t::gatts_create_evt_param create`

Gatt server callback param of ESP_GATTS_CREATE_EVT
struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAREvt

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gattsrsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.
Public Members

esp_bd_addr_t bda
The bluetooth device address which been written

uint16_t handle
The attribute handle

uint16_t offset
Offset of the value, if the value is too long

bool need_rsp
The write operation need to do response
bool is_prep
This write operation is prepare write

uint16_t len
The write attribute value length

uint8_t *value
The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL
Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC
Prepare write flag to indicate execute prepare write

Type Definitions
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
GATT Server callback function type.

Param event : Event type
Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile
Param param : Point to callback parameter, currently is union type

Enumerations

enum esp_gatts_cb_event_t
GATT Server callback function events.

Values:

enumerator ESP_GATTS_REG_EVT
When register application id, the event comes

enumerator ESP_GATTS_READ_EVT
When gatt client request read operation, the event comes

enumerator ESP_GATTS_WRITE_EVT
When gatt client request write operation, the event comes

enumerator ESP_GATTS_EXEC_WRITE_EVT
When gatt client request execute write, the event comes

enumerator ESP_GATTS_MTU_EVT
When set mtu complete, the event comes

enumerator ESP_GATTS_CONF_EVT
When receive confirm, the event comes
enumerator **ESP_GATTS_UNREG_EVT**
   When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**
   When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**
   When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**
   When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**
   When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**
   When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**
   When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**
   When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**
   When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**
   When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**
   When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**
   When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**
   When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**
   When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**
   When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**
   When gatt send response complete, the event comes
Chapter 2. API Reference

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**
When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**
When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**
When gatt send service change indication complete, the event comes

**GATT CLIENT API**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h

**Functions**

- `esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)`
  This function is called to register application callbacks with GATTC module.
  Parameters **callback** – [in]: pointer to the application callback function.
  Returns
  - ESP_OK: success
  - other: failed

- `esp_err_t esp_ble_gattc_app_register (uint16_t app_id)`
  This function is called to register application callbacks with GATTC module.
  Parameters **app_id** – [in]: Application Identify (UUID), for different application
  Returns
  - ESP_OK: success
  - other: failed

- `esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)`
  This function is called to unregister an application from GATTC module.
  Returns
  - ESP_OK: success
  - other: failed
**esp_err_t esp_ble_gattc_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**

Open a direct connection or add a background auto connection.

**Parameters**
- `remote_bda` - [in] remote device Bluetooth device address.
- `remote_addr_type` - [in] remote device Bluetooth device address type.
- `is_direct` - [in] direct connection or background auto connection (by now, background auto connection is not supported).

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_aux_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**

**esp_err_t esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id)**

Close the virtual connection to the GATT server. Gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. If you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Parameters**
- `conn_id` - [in] connection ID to be closed.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_send_mtu_req (esp_gatt_if_t gattc_if, uint16_t conn_id)**

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Parameters**
- `conn_id` - [in] connection ID.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_search_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)**

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**Parameters**
- `conn_id` - [in] connection ID.
- `filter_uuid` - [in] a UUID of the service application is interested in. If Null, discover for all services.

**Returns**
- ESP_OK: success
- other: failed

**esp_gatt_status_t esp_ble_gattc_get_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)**

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
Chapter 2. API Reference

Parameters
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `svc_uuid` - [in] the pointer to the service uuid.
• `result` - [out] The pointer to the service which has been found in the gattc cache.
• `count` - [inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• `offset` - [in] Offset of the service position to get.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Parameters
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `start_handle` - [in] the attribute start handle.
• `end_handle` - [in] the attribute end handle
• `result` - [out] The pointer to the characteristic in the service.
• `count` - [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• `offset` - [in] Offset of the characteristic position to get.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Parameters
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `char_handle` - [in] the given characteristic handle
• `result` - [out] The pointer to the descriptor in the characteristic.
• `count` - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• `offset` - [in] Offset of the descriptor position to get.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Parameters
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
Chapter 2. API Reference

• **start_handle** [in] the attribute start handle
• **end_handle** [in] the attribute end handle
• **char_uuid** [in] the characteristic uuid
• **result** [out] The pointer to the characteristic in the service.
• **count** [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

Returns
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Parameters
- **gattc_if** [in] Gatt client access interface.
- **conn_id** [in] connection ID which identify the server.
- **start_handle** [in] the attribute start handle
- **end_handle** [in] the attribute end handle
- **char_uuid** [in] the characteristic uuid.
- **descr_uuid** [in] the descriptor uuid.
- **result** [out] The pointer to the descriptor in the given characteristic.
- **count** [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Parameters
- **gattc_if** [in] Gatt client access interface.
- **conn_id** [in] connection ID which identify the server.
- **char_handle** [in] the characteristic handle.
- **descr_uuid** [in] the descriptor uuid.
- **result** [out] The pointer to the descriptor in the given characteristic.
- **count** [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

Parameters
**Chapter 2. API Reference**

- **conn_id** - [in] connection ID which identify the server.
- **start_handle** - [in] the attribute start handle
- **end_handle** - [in] the attribute end handle
- **incl_uuid** - [in] the include service uuid
- **result** - [out] The pointer to the include service in the given service.
- **count** - [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                             esp_gatt_db_attr_type_t type, uint16_t start_handle,
                                             uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**
- **conn_id** - [in] connection ID which identify the server.
- **type** - [in] the attribute type.
- **start_handle** - [in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **end_handle** - [in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **char_handle** - [in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- **count** - [out] output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle,
                                         uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Parameters**
- **start_handle** - [in] the attribute start handle
- **end_handle** - [in] the attribute end handle
- **conn_id** - [in] connection ID which identify the server.
- **db** - [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** - [in] number of elements in database.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                   esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Parameters**
- **conn_id** - [in]: connection ID.
- **handle** - [in]: characteristic handle to read.
• auth_req [in] : authenticate request type

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_read_by_type (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)`

This function is called to read a service’s characteristics of the given characteristic UUID.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in] : connection ID.
• start_handle [in] : the attribute start handle.
• end_handle [in] : the attribute end handle
• uuid [in] : The UUID of attribute which will be read.
• auth_req [in] : authenticate request type

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_read_multiple (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)`

This function is called to read multiple characteristic or characteristic descriptors.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in] : connection ID.
• read_multi [in] : pointer to the read multiple parameter.
• auth_req [in] : authenticate request type

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_read_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)`

This function is called to read a characteristics descriptor.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in] : connection ID.
• handle [in] : descriptor handle to read.
• auth_req [in] : authenticate request type

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gattc_write_char (esp_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)`

This function is called to write characteristic value.

Parameters
• gattc_if [in] Gatt client access interface.
• conn_id [in] : connection ID.
• handle [in] : characteristic handle to write.
• value_len [in] : length of the value to be written.
• value [in] : the value to be written.
• write_type [in] : the type of attribute write operation.
• auth_req [in] : authentication request.

Returns
Chapter 2. API Reference

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Parameters**
- `conn_id` [in]: connection ID.
- `handle` [in]: descriptor handle to write.
- `value_len` [in]: length of the value to be written.
- `value` [in]: the value to be written.
- `write_type` [in]: the type of attribute write operation.
- `auth_req` [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

**Parameters**
- `conn_id` [in]: connection ID.
- `handle` [in]: characteristic handle to prepare write.
- `offset` [in]: offset of the write value.
- `value_len` [in]: length of the value to be written.
- `value` [in]: the value to be written.
- `auth_req` [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

**Parameters**
- `conn_id` [in]: connection ID.
- `handle` [in]: characteristic descriptor handle to prepare write.
- `offset` [in]: offset of the write value.
- `value_len` [in]: length of the value to be written.
- `value` [in]: the value to be written.
- `auth_req` [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

**Parameters**
- `conn_id` [in]: connection ID.
• **is_execute** [in]: execute or cancel.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_register_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to register for notification of a service.

Parameters
- **gattc_if** [in]: Gatt client access interface.
- **server_bda** [in]: target GATT server.
- **handle** [in]: GATT characteristic handle.

Returns
- ESP_OK: registration succeeds
- other: failed

`esp_err_t esp_ble_gattc_unregister_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to de-register for notification of a service.

Parameters
- **gattc_if** [in]: Gatt client access interface.
- **server_bda** [in]: target GATT server.
- **handle** [in]: GATT characteristic handle.

Returns
- ESP_OK: unregister succeeds
- other: failed

`esp_err_t esp_ble_gattc_cache_refresh (esp_bd_addr_t remote_bda)`

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Parameters **remote_bda** [in]: remote device BD address.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_cache_assoc (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)`

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

Parameters
- **gattc_if** [in]: Gatt client access interface.
- **src_addr** [in]: the source address which provide the attribute table.
- **assoc_addr** [in]: the associated device address which went to share the attribute table with the source address.
- **is_assoc** [in]: true add the associated device address, false remove the associated device address.

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_cache_get_addr_list (esp_gatt_if_t gattc_if)`

Get the address list which has store the attribute table in the gattc cache. There will callback
Chapter 2. API Reference

ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Parameters**

**Returns**

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)`

Clean the service cache of this device in the gattc stack.

**Parameters**

remote_bda [in] remote device BD address.

**Returns**

- ESP_OK: success
- other: failed

**Unions**

union esp_ble_gattc_cb_param_t

#include <esp_gattc_api.h> Gatt client callback parameters union.

**Public Members**

struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg

Gatt client callback param of ESP_GATTC_REG_EVT

  - Operation status

- `uint16_t conn_id`
  - Connection id

- `uint16_t handle`
  - The characteristic or descriptor handle

- `uint16_t offset`
  - The prepare write offset, this value is valid only when prepare write

### Type Definitions

```c
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event,
 esp_gatt_if_t gattc_if,
 esp_ble_gattc_cb_param_t *param)
```

- **GATT Client callback function type.**

  - **Param event**: Event type
Chapter 2. API Reference

**Param gattc_if**: GATT client access interface, normally different gattc_if correspond to different profile

**Param param**: Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
{
    GATT_CLIENT_CALLBACK_FUNCTION_EVENTS,
    ESP_GATTC_REG_EVT,  // When GATT client is registered, the event comes
    ESP_GATTC_UNREG_EVT, // When GATT client is unregistered, the event comes
    ESP_GATTC_OPEN_EVT, // When GATT virtual connection is set up, the event comes
    ESP_GATTC_READ_CHAR_EVT, // When GATT characteristic is read, the event comes
    ESP_GATTC_WRITE_CHAR_EVT, // When GATT characteristic write operation completes, the event comes
    ESP_GATTC_CLOSE_EVT,  // When GATT virtual connection is closed, the event comes
    ESP_GATTC_SEARCH_CMPL_EVT, // When GATT service discovery is completed, the event comes
    ESP_GATTC_SEARCH_RES_EVT, // When GATT service discovery result is got, the event comes
    ESP_GATTC_READ_DESCR_EVT, // When GATT characteristic descriptor read completes, the event comes
    ESP_GATTC_WRITE_DESCR_EVT, // When GATT characteristic descriptor write completes, the event comes
    ESP_GATTC_NOTIFY_EVT, // When GATT notification or indication arrives, the event comes
    ESP_GATTC_PREP_WRITE_EVT, // When GATT prepare-write operation completes, the event comes
    ESP_GATTC_EXEC_EVT,  // When write execution completes, the event comes
};
```
enumerator **ESP_GATTC_ACL_EVT**
When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**
When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**
When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**
When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**
When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**
When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**
When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**
When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**
When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**
When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**
When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**
When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**
When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**
When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**
When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**
When Batch scan parameters are set, the event comes
Chapter 2. API Reference

enumerator ESP_GATTC_BTH_SCAN_DIS_EVT
   When Batch scan is disabled, the event comes

enumerator ESP_GATTC_SCAN_FLT_CFG_EVT
   When Scan filter configuration completes, the event comes

enumerator ESP_GATTC_SCAN_FLT_PARAM_EVT
   When Scan filter parameters are set, the event comes

enumerator ESP_GATTC_SCAN_FLT_STATUS_EVT
   When Scan filter status is reported, the event comes

enumerator ESP_GATTC_ADV_VSC_EVT
   When advertising vendor spec content event is reported, the event comes

enumerator ESP_GATTC_REG_FOR_NOTIFY_EVT
   When register for notification of a service completes, the event comes

enumerator ESP_GATTC_UNREG_FOR_NOTIFY_EVT
   When unregister for notification of a service completes, the event comes

enumerator ESP_GATTC_CONNECT_EVT
   When the ble physical connection is set up, the event comes

enumerator ESP_GATTC_DISCONNECT_EVT
   When the ble physical connection disconnected, the event comes

enumerator ESP_GATTC_READ_MULTIPLE_EVT
   When the ble characteristic or descriptor multiple complete, the event comes

enumerator ESP_GATTC_QUEUE_FULL_EVT
   When the gattc command queue full, the event comes

enumerator ESP_GATTC_SET_ASSOC_EVT
   When the ble gattc set the associated address complete, the event comes

enumerator ESP_GATTC_GET_ADDR_LIST_EVT
   When the ble get gattc address list in cache finish, the event comes

enumerator ESP_GATTC_DIS_SRVC_CMPL_EVT
   When the ble discover service complete, the event comes

BLUFI API

Overview  BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.
Application Example  Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

API Reference

Header File

- components/bt/common/api/include/api/esp_blufi_api.h

Functions

**esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)**

This function is called to receive blufi callback event.

**Parameters**
- callbacks[in] callback functions

**Returns**
- ESP_OK - success, other - failed

**esp_err_t esp_blufi_profile_init (void)**

This function is called to initialize blufi_profile.

**Returns**
- ESP_OK - success, other - failed

**esp_err_t esp_blufi_profile_deinit (void)**

This function is called to de-initialize blufi_profile.

**Returns**
- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)**

This function is called to send wifi connection report.

**Parameters**
- opmode: wifi opmode
- sta_conn_state: station is already in connection or not
- softap_conn_num: softap connection number
- extra_info: extra information, such as sta_ssid, softap_ssid and etc.

**Returns**
- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)**

This function is called to send wifi list.

**Parameters**
- apCount: wifi list count
- list: wifi list

**Returns**
- ESP_OK - success, other - failed

**uint16_t esp_blufi_get_version (void)**

Get BLUFI profile version.

**Returns**
- Most 8bit significant is Great version, Least 8bit is Sub version

**esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)**

This function is called to send blufi error information.

**Parameters**
- state: error state

**Returns**
- ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)**

This function is called to custom data.

**Parameters**
- data: custom data
- data_len: length of custom data
Chapter 2. API Reference

- **data**: custom data value
- **data_len**: the length of custom data

**Returns**
ESP_OK - success, other - failed

**Unions**

union `esp_blufi_cb_param_t`

```c
#include <esp_blufi_api.h> BLUFI callback parameters union.

**Public Members**

struct `esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish`
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct `esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish`
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct `esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode`
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct `esp_blufi_cb_param_t::blufi_connect_evt_param connect`
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct `esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect`
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

struct `esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid`
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

bool softap_channel_set
   is channel of softap interface set

struct esp_blufi_ap_record_t
   Description of an WiFi AP.

Public Members

uint8_t ssid[33]
   SSID of AP

int8_t rssi
   signal strength of AP

struct esp_blufi_callbacks_t
   BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
   BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
   BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
   BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
   BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
   BLUFI check sum function (FCS)

Macros

ESP_BLUFI_BD_ADDR_LEN
   Bluetooth address length.

Type Definitions

typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]
   Bluetooth device address.
typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)

BLUFI event callback function type.

    Param event : Event type
    Param param : Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t*data, int len, uint8_t**output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

    Param data : data from phone
    Param len : length of data from phone
    Param output_data : data want to send to phone
    Param output_len : length of data want to send to phone
    Param need_free : output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t*crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

    Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
    Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt
    Param crypt_len : length of plain text
    Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t*crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

    Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
    Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt
    Param crypt_len : length of encrypted text
    Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t*data, int len)

BLUFI checksum.

    Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
    Param data : data need to checksum
    Param len : length of data

### 2.3.3 CLASSIC BT

**CLASSIC BLUETOOTH GAP API**

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

**Functions**

- static inline uint32_t *esp_bt_gap_get_cod srvc* (uint32_t cod)
  - get major service field of COD
  - **Parameters**
    - *cod* - [in] Class of Device
  - **Returns**
    - major service bits

- static inline uint32_t *esp_bt_gap_get_cod_major_dev* (uint32_t cod)
  - get major device field of COD
  - **Parameters**
    - *cod* - [in] Class of Device
  - **Returns**
    - major device bits

- static inline uint32_t *esp_bt_gap_get_cod_minor_dev* (uint32_t cod)
  - get minor service field of COD
  - **Parameters**
    - *cod* - [in] Class of Device
  - **Returns**
    - minor service bits

- static inline uint32_t *esp_bt_gap_get_cod_format_type* (uint32_t cod)
  - get format type of COD
  - **Parameters**
    - *cod* - [in] Class of Device
  - **Returns**
    - format type

- static inline bool *esp_bt_gap_is_valid_cod* (uint32_t cod)
  - decide the integrity of COD
  - **Parameters**
    - *cod* - [in] Class of Device
  - **Returns**
    - true if cod is valid
    - false otherwise

**esp_err_t esp_bt_gap_register_callback** (*esp bt gap cb t* callback)

- register callback function. This function should be called after esp_bluedroid_enable() completes successfully.
  - **Returns**
    - ESP_OK: Succeed
    - ESP_FAIL: others

**esp_err_t esp bt_gap_set_scan_mode** (*esp bt connection mode t* c_mode, *esp bt discovery mode t* d_mode)

- Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.
  - **Parameters**
Chapter 2. API Reference

• c_mode [in]: one of the enums of esp_bt_connection_mode_t
• d_mode [in]: one of the enums of esp_bt_discovery_mode_t

Returns
• ESP_OK: Succeed
• ESP_ERR_INVALID_ARG: if argument invalid
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_bt_gap_start_discovery (esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)
```

This function starts Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.

Parameters
• mode [in] - Inquiry mode
• inq_len [in] - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process, – when this time expires, Inquiry will be halted.
• num_rsps [in] - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

Returns
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if invalid parameters are provided
• ESP_FAIL: others

```c
esp_err_t esp_bt_gap_cancel_discovery (void)
```

Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.

Returns
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_remote_services (esp_bd_addr_t remote_bda)
```

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

Returns
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_remote_service_record (esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)
```

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends.

Returns
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others
uint8_t* `esp_bt_gap_resolve_eir_data` (uint8_t*eir, esp_bt_eir_type_t type, uint8_t*length)

This function is called to get EIR data for a specific type.

**Parameters**
- **eir** -in- pointer of raw eir data to be resolved
- **type** -in- specific EIR data type
- **length** -out- return the length of EIR data excluding fields of length and data type

**Returns**
- pointer of starting position of eir data excluding eir data type, NULL if not found

`esp_err_t esp_bt_gap_config_eir_data` (esp_bt_eir_data_t*eir_data)

This function is called to config EIR data.

```
esp_bt_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.
```

**Parameters**
- **eir_data** -in- pointer of EIR data content

**Returns**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

`esp_err_t esp_bt_gap_set_cod` (esp_bt_cod_t cod, esp_bt_cod_mode_t mode)

This function is called to set class of device. The structure esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Parameters**
- **cod** -in- class of device
- **mode** -in- setting mode

**Returns**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

`esp_err_t esp_bt_gap_get_cod` (esp_bt_cod_t*cod)

This function is called to get class of device.

**Parameters**
- **cod** -out- class of device

**Returns**
- ESP_OK: Succeed
- ESP_FAIL: others

`esp_err_t esp_bt_gap_read_rssi_delta` (esp_bd_addr_t remote_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

**Parameters**
- **remote_addr** -in- remote device address, corresponding to a certain connection handle

**Returns**
- ESP_OK: Succeed
- ESP_FAIL: others

`esp_err_t esp_bt_gap_remove_bond_device` (esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device.

**Parameters**
- **bd_addr** -in- BD address of the peer device

**Returns**
- ESP_OK: success
- ESP_FAIL: failed
int esp_bt_gap_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Returns  - >= 0 : bonded devices number
• ESP_FAIL : failed

esp_err_t esp_bt_gap_get_bond_device_list (int *dev_num, esp_bd_addr_t *dev_list)
Get the device from the security database list of peer device. It will return the device bonded information immediately.

Parameters
• dev_num [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• dev_list [out] an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

Returns
• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_bt_gap_set_pin (esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
Set pin type and default pin code for legacy pairing.

Parameters
• pin_type [in] Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
• pin_code_len [in] Length of pin_code
• pin_code [in] Pin_code

Returns
- ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

esp_err_t esp_bt_gap_pin_reply (esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Parameters
• bd_addr [in] BD address of the peer
• accept [in] Pin_code reply successful or declined.
• pin_code_len [in] Length of pin_code
• pin_code [in] Pin_code

Returns
- ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

esp_err_t esp_bt_gap_set_security_param (esp_bt_sp_param_t param_type, void *value, uint8_t len)
Set a GAP security parameter value. Overrides the default value.

Parameters
• param_type [in] : the type of the param which is to be set
• value [in] : the param value
• len [in] : the length of the param value

Returns
- ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed
**esp_err_t** **esp_bt_gap_ssp_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** - [in] : BD address of the peer
- **accept** - [in] : passkey entry successful or declined.
- **passkey** - [in] : passkey value, must be a 6 digit number, can be lead by 0.

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

**esp_err_t** **esp_bt_gap_ssp_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** - [in] : BD address of the peer device
- **accept** - [in] : numbers to compare are the same or different

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

**esp_err_t** **esp_bt_gap_set_afh_channels** *(esp_bt_gap_afh_channels channels)*

Set the AFH channels.

**Parameters**
- **channels** - [in] : The n th such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

**esp_err_t** **esp_bt_gap_read_remote_name** *(esp_bd_addr_t remote_bda)*

Read the remote device name.

**Parameters**
- **remote_bda** - [in] : The remote device’s address

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

**esp_err_t** **esp_bt_gap_set_qos** *(esp_bd_addr_t remote_bda, uint32_t t_poll)*

Config Quality of service.

**Parameters**
- **remote_bda** - [in] : The remote device’s address
- **t_poll** - [in] : Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

  Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
  Bits of minor device class field.
  Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
  Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
  Bits of format type.
  Format type bit mask

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
  Format type bit offset
Chapter 2. API Reference

**ESP_BT_COD_FORMAT_TYPE_1**
Class of device format type 1.

**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
Combination of the IO Capability

typedef uint8_t esp_bt_pm_mode_t

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

**Param event**: Event type
**Param param**: Pointer to callback parameter

**Enumerations**

enum esp_bt_cod_mode_t
class of device settings

**Values:**

enumerator ESP_BT_SET_COD_MAJOR_MINOR
overwrite major, minor class

enumerator ESP_BT_SET_COD_SERVICE_CLASS
set the bits in the input, the current bit will remain

enumerator ESP_BT_CLR_COD_SERVICE_CLASS
clear the bits in the input, others will remain

enumerator ESP_BT_SET_COD_ALL
overwrite major, minor, set the bits in service class

enumerator ESP_BT_INIT_COD
overwrite major, minor, and service class
enum **esp_bt_connection_mode_t**
   Discoverability and Connectability mode.
   
   *Values:*

   - enumerator **ESP_BT_NON_CONNECTABLE**
     Non-connectable

   - enumerator **ESP_BT_CONNECTABLE**
     Connectable

enum **esp_bt_discovery_mode_t**
   *Values:*

   - enumerator **ESP_BT_NON_DISCOVERABLE**
     Non-discoverable

   - enumerator **ESP_BT_LIMITED_DISCOVERABLE**
     Limited Discoverable

   - enumerator **ESP_BT_GENERAL_DISCOVERABLE**
     General Discoverable

enum **esp_bt_gap_dev_prop_type_t**
   Bluetooth Device Property type.
   
   *Values:*

   - enumerator **ESP_BT_GAP_DEV_PROP_BDNAME**
     Bluetooth device name, value type is int8_t[]

   - enumerator **ESP_BT_GAP_DEV_PROP_COD**
     Class of Device, value type is uint32_t

   - enumerator **ESP_BT_GAP_DEV_PROP_RSSI**
     Received Signal strength indication, value type is int8_t, ranging from -128 to 127

   - enumerator **ESP_BT_GAP_DEV_PROP_EIR**
     Extended Inquiry Response, value type is uint8_t[]

enum **esp_bt_cod_srvc_t**
   Major service class field of Class of Device, multiple bits can be set.
   
   *Values:*

   - enumerator **ESP_BT_COD_SRVC_NONE**
     None indicates an invalid value

   - enumerator **ESP_BT_COD_SRVC_LMTD_DISCOVER**
     Limited Discoverable Mode
enumerator **ESP_BT_COD_SRVC_POSITIONING**
Positioning (Location identification)

enumerator **ESP_BT_COD_SRVC_NETWORKING**
Networking, e.g. LAN, Ad hoc

enumerator **ESP_BT_COD_SRVC_RENDERING**
Rendering, e.g. Printing, Speakers

enumerator **ESP_BT_COD_SRVC_CAPTUREING**
Capturing, e.g. Scanner, Microphone

enumerator **ESP_BT_COD_SRVC_OBJ_TRANSFER**
Object Transfer, e.g. v-Inbox, v-Folder

enumerator **ESP_BT_COD_SRVC_AUDIO**
Audio, e.g. Speaker, Microphone, Headset service

enumerator **ESP_BT_COD_SRVC_TELEPHONY**
Telephony, e.g. Cordless telephony, Modem, Headset service

enumerator **ESP_BT_COD_SRVC_INFORMATION**
Information, e.g., WEB-server, WAP-server

enum **esp_bt_pin_type_t**

Values:

enumerator **ESP_BT_PIN_TYPE_VARIABLE**
Refer to BTM_PIN_TYPE_VARIABLE

denumerator **ESP_BT_PIN_TYPE_FIXED**
Refer to BTM_PIN_TYPE_FIXED

enum **esp_bt_sp_param_t**

Values:

enumerator **ESP_BT_SP_IOCAP_MODE**
Set IO mode

enum **esp_bt_cod_major_dev_t**

Major device class field of Class of Device.

Values:

enumerator **ESP_BT_COD_MAJOR_DEV_MISC**
Miscellaneous

enumerator **ESP_BT_COD_MAJOR_DEV_COMPUTER**
Computer
enumerator **ESP_BT_COD_MAJOR_DEV_PHONE**
    Phone (cellular, cordless, pay phone, modem)

enumerator **ESP_BT_COD_MAJOR_DEV_LAN_NAP**
    LAN, Network Access Point

enumerator **ESP_BT_COD_MAJOR_DEV_AV**
    Audio/Video (headset, speaker, stereo, video display, VCR)

enumerator **ESP_BT_COD_MAJOR_DEV_PERIPHERAL**
    Peripheral (mouse, joystick, keyboard)

enumerator **ESP_BT_COD_MAJOR_DEV_IMAGING**
    Imaging (printer, scanner, camera, display)

enumerator **ESP_BT_COD_MAJOR_DEV_WEARABLE**
    Wearable

enumerator **ESP_BT_COD_MAJOR_DEV_TOY**
    Toy

enumerator **ESP_BT_COD_MAJOR_DEV_HEALTH**
    Health

enumerator **ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED**
    Uncategorized: device not specified

enum **esp_bt_gap_discovery_state_t**
    Bluetooth Device Discovery state
    
    **Values:**
    
    enumerator **ESP_BT_GAP_DISCOVERY_STOPPED**
        Device discovery stopped
    
    enumerator **ESP_BT_GAP_DISCOVERY_STARTED**
        Device discovery started

enum **esp_bt_gap_cb_event_t**
    BT GAP callback events.
    
    **Values:**
    
    enumerator **ESP_BT_GAP_DISC_RES_EVT**
        Device discovery result event
    
    enumerator **ESP_BT_GAP_DISC_STATE_CHANGED_EVT**
        Discovery state changed event
enumerator ESP_BT_GAP_RMT_SRVCS_EVT
    Get remote services event

enumerator ESP_BT_GAP_RMT_SRVCS_REC_EVT
    Get remote service record event

enumerator ESP_BT_GAP_AUTH_CMPL_EVT
    Authentication complete event

enumerator ESP_BT_GAP_PIN_REQ_EVT
    Legacy Pairing Pin code request

enumerator ESP_BT_GAP_CFM_REQ_EVT
    Security Simple Pairing User Confirmation request.

enumerator ESP_BT_GAP_KEY_NOTIF_EVT
    Security Simple Pairing Passkey Notification

enumerator ESP_BT_GAP_KEY_REQ_EVT
    Security Simple Pairing Passkey request

enumerator ESP_BT_GAP_READ_RSSI_DELTA_EVT
    Read rssi event

enumerator ESP_BT_GAP_CONFIG_EIR_DATA_EVT
    Config EIR data event

enumerator ESP_BT_GAP_SET_AFH_CHANNELS_EVT
    Set AFH channels event

enumerator ESP_BT_GAP_READ_REMOTE_NAME_EVT
    Read Remote Name event

enumerator ESP_BT_GAP_MODE_CHG_EVT

enumerator ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
    remove bond device complete event

enumerator ESP_BT_GAP_QOS_CMPL_EVT
    QOS complete event

enumerator ESP_BT_GAP_EVT_MAX

enum esp bt inq mode t

    Inquiry Mode

    Values:
Chapter 2. API Reference

enumerator **ESP_BT_INQ_MODE_GENERAL_INQUIRY**

General inquiry mode

enumerator **ESP_BT_INQ_MODE_LIMITED_INQUIRY**

Limited inquiry mode

Bluetooth A2DP API

**Application Example**

Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - `bluetooth/bluedroid/classic_bt/a2dp_sink`

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

**Functions**

```c
esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)

Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

Parameters

- callback [in] A2DP event callback function

Returns

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
```

```c
esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

Parameters

- callback [in] A2DP sink data callback function

Returns

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
```

```c
esp_err_t esp_a2d_sink_init (void)

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
```

```c
esp_err_t esp_a2d_sink_deinit (void)

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.
```
Returns
- ESP_OK: if the deinitialization request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`
Connect to remote Bluetooth A2DP source device. This API must be called after `esp_a2d_sink_init() and before esp_a2d_sink_deinit()`.

Parameters `remote_bda` - [in] remote Bluetooth device address

Returns
- ESP_OK: connection request is sent to lower layer successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote A2DP source device. This API must be called after `esp_a2d_sink_init() and before esp_a2d_sink_deinit()`.

Parameters `remote_bda` - [in] remote Bluetooth device address

Returns
- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_set_delay_value (uint16_t delay_value)`
Set delay reporting value. The delay value of sink is caused by buffering (including protocol stack and application layer), decoding and rendering. The default delay value is 120ms, if the set value is less than 120ms, the setting will fail. This API must be called after `esp_a2dSinkInit()` and before `esp_a2dSinkDeinit()`.

Parameters `delay_value` - [in] reporting value is in 1/10 millisecond

Returns
- ESP_OK: delay value is sent to lower layer successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_get_delay_value (void)`
Get delay reporting value. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Returns
- ESP_OK: if the request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`
Media control commands. This API can be used for both A2DP sink and source and must be called after `esp_a2dSinkInit()` and before `esp_a2dSinkDeinit()`.

Parameters `ctrl` - [in] control commands for A2DP data channel

Returns
- ESP_OK: if control command is sent to lower layer successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_init (void)`
Initialize the Bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS` will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

Returns
- ESP_OK: if the initialization request is sent to lower layer successfully
**esp_err_t esp_a2d_source_deinit** (void)

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_a2d_source_register_data_callback** (*esp_a2d_source_data_cb_t callback)*

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Parameters**
- callback – [in] A2DP source data callback function

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**esp_err_t esp_a2d_source_connect** (*esp_bd_addr_t remote_bda)*

Connect to remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

**Parameters**
- remote_bda – [in] remote bluetooth device address

**Returns**
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_a2d_source_disconnect** (*esp_bd_addr_t remote_bda)*

Disconnect from the remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

**Parameters**
- remote_bda – [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Unions**

union esp_a2d_cb_param_t

#include <esp_a2dp_api.h> A2DP state callback parameters.

**Public Members**

struct esp_a2d_CB_PARAM_t:2d_conn_stat_param conn_stat

A2DP connection status

struct esp_a2d_CB_PARAM_t:2d_audio_stat_param audio_stat

audio stream playing state
struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg
media codec configuration information

struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat
status in acknowledgement to media control commands

struct esp_a2d_cb_param_t::a2d_prof_stat_param a2d_prof_stat
status to indicate a2d prof init or deinit

struct esp_a2d_cb_param_t::a2d_psc_cfg_param a2d_psc_cfg_stat
status to indicate protocol service capabilities configured

struct esp_a2d_cb_param_t::a2d_set_delay_value_stat a2d_set_delay_value_stat
A2DP sink set delay report value status

struct esp_a2d_cb_param_t::a2d_get_delay_value_stat a2d_get_delay_value_stat
A2DP sink get delay report value status

struct esp_a2d_cb_param_t::a2d_report_delay_stat_param a2d_report_delay_value_stat
A2DP source received sink report value status

struct a2d_audio_cfg_param
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.

Public Members

esp_bd_addr_t remote_bda
remote bluetooth device address

esp_a2d_mcc_t mcc
A2DP media codec capability information

struct a2d_audio_stat_param
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_STATE_EVT.

Public Members

esp_a2d_audio_state_t state
one of the values from esp_a2d_audio_state_t

esp_bd_addr_t remote_bda
remote bluetooth device address

struct a2d_conn_stat_param
#include <esp_a2dp_api.h> ESP_A2D_CONNECTION_STATE_EVT.
Public Members

`esp_a2d_connection_state_t state`
one of values from `esp_a2d_connection_state_t`

`esp_bd_addr_t remote_bda`
remote bluetooth device address

`esp_a2d_disc_rsn_t disc_rsn`
reason of disconnection for “DISCONNECTED”

```c
struct a2d_get_stat_param
#include <esp_a2dp_api.h> ESP_A2D_SNK_GET_DELAY_VALUE_EVT.
```

Public Members

`uint16_t delay_value`
delay report value

```c
struct a2d_prof_stat_param
#include <esp_a2dp_api.h> ESP_A2D_PROF_STATE_EVT.
```

Public Members

`esp_a2d_init_state_t init_state`
a2dp profile state param

```c
struct a2d_psc_cfg_param
#include <esp_a2dp_api.h> ESP_A2D_SNK_PSC_CFG_EVT.
```

Public Members

`esp_a2d_psc_t psc_mask`
protocol service capabilities configured

```c
struct a2d_report_delay_stat_param
#include <esp_a2dp_api.h> ESP_A2D_REPORT_SNK_DELAY_VALUE_EVT.
```

Public Members

`uint16_t delay_value`
delay report value

```c
struct a2d_set_stat_param
#include <esp_a2dp_api.h> ESP_A2D_SNK_SET_DELAY_VALUE_EVT.
```
Public Members

`esp_a2d_set_delay_value_state_t set_state`

a2dp profile state param

`uint16_t delay_value`

delay report value

`struct media_ctrl_stat_param`

#include `<esp_a2dp_api.h>` ESP_A2D_MEDIA_CTRL_ACK_EVT.

Public Members

`esp_a2d_media_ctrl_t cmd`

media control commands to acknowledge

`esp_a2d_media_ctrl_ack_t status`

acknowledgement to media control commands

Structures

`struct esp_a2d_mcc_t`

A2DP media codec capabilities union.

Public Members

`esp_a2d_mct_t type`

A2DP media codec type

`uint8_t [ESP_A2D_CIE_LEN_SBC] sbc`

SBC codec capabilities

`uint8_t [ESP_A2D_CIE_LEN_M12] m12`

MPEG-1,2 audio codec capabilities

`uint8_t [ESP_A2D_CIE_LEN_M24] m24`

MPEG-2, 4 AAC audio codec capabilities

`uint8_t [ESP_A2D_CIE_LEN_ATRAC] atrac`

ATRAC family codec capabilities

union esp_a2d_mcc_t::[anonymous] cie

A2DP codec information element
Chapter 2. API Reference

Macros

ESP_A2D_MCT_SBC
   Media codec types supported by A2DP.
   SBC

ESP_A2D_MCT_M12
   MPEG-1, 2 Audio

ESP_A2D_MCT_M24
   MPEG-2, 4 AAC

ESP_A2D_MCT_ATRAC
   ATRAC family

ESP_A2D_MCT_NON_A2DP
   NON-A2DP

ESP_A2D_PSC_DELAY_RPT
   Protocol service capabilities. This value is a mask.
   Delay Report

ESP_A2D_CIE_LEN_M12

ESP_A2D_CIE_LEN_M24

ESP_A2D_CIE_LEN_ATRAC

Type Definitions

typedef uint8_t esp_a2d_mct_t

typedef uint16_t esp_a2d_psc_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
   A2DP profile callback function type.
   
   Param event : Event type
   Param param : Pointer to callback parameter

 typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t *buf, uint32_t len)
   A2DP sink data callback function.
   
   Param buf [in] : pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
   Param len [in] : size(in bytes) in buf
typedef int32_t(*esp_a2d_source_data_cb_t)(uint8_t*buf,int32_t len)

A2DP source data read callback function.

**Param buf [in]**: buffer to be filled with PCM data stream from higher layer

**Param len [in]**: size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

**Return**: size of bytes read successfully, if the argument len is -1, this value is ignored.

### Enumerations

**enum esp_a2d_connection_state_t**

Bluetooth A2DP connection states.

**Values:**

enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTED**
connection released

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTING**
connecting remote device

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTED**
connection established

enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTING**
disconnecting remote device

**enum esp_a2d_disc_rsn_t**

Bluetooth A2DP disconnection reason.

**Values:**

enumerator **ESP_A2D_DISC_RSN_NORMAL**
Finished disconnection that is initiated by local or remote device

enumerator **ESP_A2D_DISC_RSN_ABNORMAL**
Abnormal disconnection caused by signal loss

**enum esp_a2d_audio_state_t**

Bluetooth A2DP datapath states.

**Values:**

enumerator **ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND**
audio stream datapath suspended by remote device

enumerator **ESP_A2D_AUDIO_STATE_STOPPED**
audio stream datapath stopped

enumerator **ESP_A2D_AUDIO_STATE_STARTED**
audio stream datapath started
enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.

Values:

enumerator ESP_A2D_MEDIA_CTRL_ACK_SUCCESS
media control command is acknowledged with success

enumerator ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

enumerator ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.

Values:

enumerator ESP_A2D_MEDIA_CTRL_NONE
Not for application use, use inside stack only.

enumerator ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

enumerator ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

enumerator ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

enumerator ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.

Values:

enumerator ESP_A2D_DEINIT_SUCCESS
A2DP profile deinit successful event

enumerator ESP_A2D_INIT_SUCCESS
A2DP profile deinit successful event

enum esp_a2d_set_delay_value_state_t
Bluetooth A2DP set delay report value states.

Values:

enumerator ESP_A2D_SET_SUCCESS
A2DP profile set delay report value successful
enumerator **ESP_A2D_SET_INVALID_PARAMS**
A2DP profile set delay report value is invalid parameter

enum **esp_a2d_cb_event_t**
A2DP callback events.

*Values:*

enumerator **ESP_A2D_CONNECTION_STATE_EVT**
connection state changed event

denumerator **ESP_A2D_AUDIO_STATE_EVT**
audio stream transmission state changed event

denumerator **ESP_A2D_AUDIO_CFG_EVT**
audio codec is configured, only used for A2DP SINK

denumerator **ESP_A2D_MEDIA_CTRL_ACK_EVT**
acknowledge event in response to media control commands

denumerator **ESP_A2D_PROF_STATE_EVT**
indicate a2dp init & deinit complete

denumerator **ESP_A2D_SNK_PSC_CFG_EVT**
protocol service capabilities configured, only used for A2DP SINK

denumerator **ESP_A2D_SNK_SET_DELAY_VALUE_EVT**
indicate a2dp sink set delay report value complete, only used for A2DP SINK

denumerator **ESP_A2D_SNK_GET_DELAY_VALUE_EVT**
indicate a2dp sink get delay report value complete, only used for A2DP SINK

denumerator **ESP_A2D_REPORT_SNK_DELAY_VALUE_EVT**
report delay value, only used for A2DP SRC

**BT AVRCP APIs**

**Overview**  Bluetooth AVRCP reference APIs.

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_avrc_api.h

**Functions**

```c
esp_err_t esp_avrc_ct_register_callback(esp_avrc_ct_cb_t callback)
```

Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.
Parameters callback - [in] AVRC controller callback function

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp_avrc_ct_init (void)}

Initialize the bluetooth AVRC controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp_avrc_ct_deinit (void)}

De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_ttl, uint8_t attr_id, uint8_t value_id)}

Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- \texttt{tl} - [in]: transaction label, 0 to 15, consecutive commands should use different values
- \texttt{attr_id} - [in]: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- \texttt{value_id} - [in]: attribute value defined for the specific player application setting attribute

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd (uint8_ttl)}

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters \texttt{tl} - [in]: transaction label, 0 to 15, consecutive commands should use different values

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp_avrc_ct_send_register_notification_cmd (uint8_ttl, uint8_t event_id, uint32_t event_parameter)}

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- \texttt{tl} - [in]: transaction label, 0 to 15, consecutive commands should use different values.
- \texttt{event_id} - [in]: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• **event_parameter** [-[in]] : playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

```c
esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd(uint8_t tl, uint8_t volume)
```

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl** [in] : transaction label, 0 to 15, consecutive commands should use different values
- **volume** [in] : volume, 0 to 0x7f, means 0% to 100%

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

```c
esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)
```

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl** [in] : transaction label, 0 to 15, consecutive commands should use different values.
- **attr_mask** [in] : mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)
```

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Parameters**
- **tl** [in] : transaction label, 0 to 15, consecutive commands should use different values.
- **key_code** [in] : passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- **key_state** [in] : passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)
```

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

**Parameters**
- **callback** [in] : AVRCP target callback function

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
**Chapter 2. API Reference**

- ESP_FAIL: others

**esp_err_t esp_avrc_tg_init (void)**

Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently; AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_tg_deinit (void)**

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently; AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)**

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

**esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)**

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHRU_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes commands that are not allowed

**bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)**
Operate on the type `esp_avrc_psth_bit_mask_t` with regard to a specific PASSTHROUGH command.

**Parameters**
- `op` [in] operation requested on the bit mask field
- `psth` [in] pointer to passthrough command bit mask structure
- `cmd` [in] passthrough command code

**Returns** For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false. For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

```c
esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

For capability type `ESP_AVRC_RN_CAP_ALLOWED_EVT`, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type `ESP_AVRC_RN_CAP_SUPPORTED_EVT`, the event set covers the notification events selected to be supported under current configuration, The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled or AVRC TG is not initialized
- `ESP_ERR_INVALID_ARG`: if `cap` is invalid or `evt_set` is NULL
- `ESP_FAIL`: otherwise

```c
esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

**Returns**
- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled
- `ESP_ERR_INVALID_ARG`: if `evt_set` is NULL

```c
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                                       esp_avrc_rn_evt_cap_mask_t *events,
                                       esp_avrc_rn_event_ids_t event_id)
```

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

**Parameters**
- `op` [in] operation requested on the bit mask field
- `events` [in] pointer to event notification capability bit mask structure
- `event_id` [in] notification event code

**Returns** For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false.

```c
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp,
                                  esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.
Parameters

- **event_id** - [in] notification event ID that remote AVRCP CT registers
- **rsp** - [in] notification response code
- **param** - [in] parameters included in the specific notification

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

Unions

union `esp_avrc_rn_param_t`

```c
#include <esp_avrc_api.h>  
AVRC notification parameters.
```

Public Members

```c
uint8_t volume
```

response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

```c
esp_avrc_playback_stat_t playback
```

response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

```c

enumerator **ESP_AVRC_TG_CONNECTION_STATE_EVT**
   connection state changed event
enumerator ESP_AVRC_TG_REMOTE_FEATURES_EVT
feature of remote device indication event

denumerator ESP_AVRC_TG_PASSTHROUGH_CMD_EVT
passthrough command event

denumerator ESP_AVRC_TG_SET.Absolute_VOLUME_CMD_EVT
set absolute volume command from remote device

denumerator ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT
register notification event

denumerator ESP_AVRC_TG_SET PLAYER_APP_VALUE_EVT
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.
Values:

enumerator ESP_AVRC_MD_ATTR_TITLE
title of the playing track

denumerator ESP_AVRC_MD_ATTR_ARTIST
track artist

denumerator ESP_AVRC_MD_ATTR_ALBUM
album name

denumerator ESP_AVRC_MD_ATTR_TRACK_NUM
track position on the album

denumerator ESP_AVRC_MD_ATTR_NUM_TRACKS
number of tracks on the album

denumerator ESP_AVRC_MD_ATTR_GENRE
track genre

denumerator ESP_AVRC_MD_ATTR_PLAYING_TIME
total album playing time in miliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.
Values:

enumerator ESP_AVRC_RN_PLAY_STATUS_CHANGE
track status change, eg. from playing to paused
enumerator ESP_AVRC_RN_TRACK_CHANGE
new track is loaded

enumerator ESP_AVRC_RN_TRACK_REACHED_END
current track reached end

enumerator ESP_AVRC_RN_TRACK_REACHED_START
current track reached start position

enumerator ESP_AVRC_RN_PLAY_POS_CHANGED
track playing position changed

enumerator ESP_AVRC_RN_BATTERY_STATUS_CHANGE
battery status changed

enumerator ESP_AVRC_RN_SYSTEM_STATUS_CHANGE
system status changed

enumerator ESP_AVRC_RN_APP_SETTING_CHANGE
application settings changed

enumerator ESP_AVRC_RN_NOWPLAYING_CHANGE
now playing content changed

enumerator ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE
available players changed

enumerator ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE
the addressed player changed

enumerator ESP_AVRC_RN_UIDS_CHANGE
UIDs changed

enumerator ESP_AVRC_RN_VOLUME_CHANGE
volume changed locally on TG

enumerator ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.

Values:

enumerator ESP_AVRC_RN_CAP_ALLOWED_EVT
all of the notification events that can possibly be supported, immutable

enumerator ESP_AVRC_RN_CAP_SUPPORTED_EVT
notification events selectively supported according to the current configuration
Chapter 2. API Reference

enumerator **ESP_AVRC_RN_CAP_MAX**

data type **esp_avrc_rn_rsp_t**

AVRC notification response type.

Values:

enumerator **ESP_AVRC_RN_RSP_INTERIM**

initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

enumerator **ESP_AVRC_RN_RSP_CHANGED**

final response to RegisterNotification command

enumerator **esp_avrc_ps_attr_ids_t**

AVRC player setting ids.

Values:

enumerator **ESP_AVRC_PS_EQUALIZER**

equalizer, on or off

enumerator **ESP_AVRC_PS_REPEAT_MODE**

repeat mode

enumerator **ESP_AVRC_PS_SHUFFLE_MODE**

shuffle mode

enumerator **ESP_AVRC_PS_SCAN_MODE**

scan mode on or off

enumerator **ESP_AVRC_PS_MAX_ATTR**

enumerator **esp_avrc_ps_eq_value_ids_t**

AVRC equalizer modes.

Values:

enumerator **ESP_AVRC_PS_EQUALIZER_OFF**

equalizer OFF

enumerator **ESP_AVRC_PS_EQUALIZER_ON**

equalizer ON

enumerator **esp_avrc_ps_rpt_value_ids_t**

AVRC repeat modes.

Values:

enumerator **ESP_AVRC_PS_REPEAT_OFF**

repeat mode off
enumerator \texttt{ESP\_AVRC\_PS\_REPEAT\_SINGLE} \\
single track repeat

enumerator \texttt{ESP\_AVRC\_PS\_REPEAT\_GROUP} \\
group repeat

class \texttt{esp\_avrc\_ps\_shf\_value\_ids\_t} \\
AVRC shuffle modes. \\
Values:

enumerator \texttt{ESP\_AVRC\_PS\_SHUFFLE\_OFF} \\

enumerator \texttt{ESP\_AVRC\_PS\_SHUFFLE\_ALL} \\

enumerator \texttt{ESP\_AVRC\_PS\_SHUFFLE\_GROUP} \\

class \texttt{esp\_avrc\_ps\_scn\_value\_ids\_t} \\
AVRC scan modes. \\
Values:

enumerator \texttt{ESP\_AVRC\_PS\_SCAN\_OFF} \\
scan off

enumerator \texttt{ESP\_AVRC\_PS\_SCAN\_ALL} \\
all tracks scan

enumerator \texttt{ESP\_AVRC\_PS\_SCAN\_GROUP} \\
group scan

class \texttt{esp\_avrc\_rsp\_t} \\
AVCTP response codes. \\
Values:

enumerator \texttt{ESP\_AVRC\_RSP\_NOT\_IMPL} \\
not implemented

enumerator \texttt{ESP\_AVRC\_RSP\_ACCEPT} \\
accept

enumerator \texttt{ESP\_AVRC\_RSP\_REJECT} \\
reject

enumerator \texttt{ESP\_AVRC\_RSP\_IN\_TRANS} \\
in transition

enumerator \texttt{ESP\_AVRC\_RSP\_IMPL\_STBL} \\
implemented/stable
Chapter 2. API Reference

enumerator **ESP_AVRC_RSP_CHANGED**
changed

enumerator **ESP_AVRC_RSP_INTERIM**
interim

denum **esp_avrc_batt_stat_t**
AVRCP battery status.
Value:

to enumerator **ESP_AVRC_BATT_NORMAL**
normal state

to enumerator **ESP_AVRC_BATT_WARNING**
unable to operate soon

to enumerator **ESP_AVRC_BATT_CRITICAL**
cannot operate any more

to enumerator **ESP_AVRC_BATT_EXTERNAL**
plugged to external power supply

to enumerator **ESP_AVRC_BATT_FULL_CHARGE**
when completely charged from external power supply

denum **esp_avrc_playback_stat_t**
AVRCP current status of playback.
Value:

to enumerator **ESP_AVRC_PLAYBACK_STOPPED**
stopped

to enumerator **ESP_AVRC_PLAYBACK_PLAYING**
playing

to enumerator **ESP_AVRC_PLAYBACK_PAUSED**
paused

to enumerator **ESP_AVRC_PLAYBACK_FWD_SEEK**
forward seek

to enumerator **ESP_AVRC_PLAYBACK_REV_SEEK**
reverse seek

to enumerator **ESP_AVRC_PLAYBACK_ERROR**
error
Chapter 2. API Reference

SPP API

Application Example  Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_spp_api.h

Functions

esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)
This function is called to init callbacks with SPP module.

Parameters callback [in] pointer to the init callback function.

Returns

- ESP_OK: success
- other: failed

esp_err_t esp_spp_init (esp_spp_mode_t mode)
This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Parameters mode [in] Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

Returns

- ESP_OK: success
- other: failed

esp_err_t esp_spp_deinit (void)
This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

Returns

- ESP_OK: success
- other: failed

esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)
This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters bd_addr [in] Remote device bluetooth device address.

Returns

- ESP_OK: success
- other: failed

esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)
This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().
Parameters

- **role** - [in] Master or slave.
- **remote_scn** - [in] Remote device bluetooth device SCN.
- **peer_bd_addr** - [in] Remote device bluetooth device address.

Returns

- ESP_OK: success
- other: failed

*esp_err_t* **esp_spp_disconnect**( uint32_t handle )

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters  **handle** - [in] The connection handle.

Returns

- ESP_OK: success
- other: failed

*esp_err_t* **esp_spp_start_srv**( esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name )

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters

- **role** - [in] Master or slave.
- **local_scn** - [in] The specific channel you want to get. If channel is 0, means get any channel.
- **name** - [in] Server’s name.

Returns

- ESP_OK: success
- other: failed

*esp_err_t* **esp_spp_stop_srv**( void )

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Returns

- ESP_OK: success
- other: failed

*esp_err_t* **esp_spp_stop_srv_scn**( uint8_t scn )

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Parameters  **scn** - [in] Server channel number.

Returns

- ESP_OK: success
- other: failed
**esp_err_t esp_spp_write** (uint32_t handle, int len, uint8_t *p_data)
This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

**Parameters**
- `handle` [in] The connection handle.
- `len` [in] The length of the data written.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_spp_vfs_register** (void)
This function is used to register VFS. For now, SPP only supports write, read and close.

**Returns**
- ESP_OK: success
- other: failed

**Unions**

union esp_spp_cb_param_t

#include <esp_spp_api.h> SPP callback parameters union.

**Public Members**

struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
SPP callback param of ESP_SPP_SRV_STOP_EVT
struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

*esp_spp_status_t* status
status

*uint32_t* handle
The connection handle

*uint8_t* sec_id
security ID used by this server

uint32_t handle
The connection handle
int `len`
The length of the data written.

bool `cong`
congestion status

**Macros**

**ESP_SPP_SEC_NONE**
No security. relate to BTA_SEC_NONE in bta/bta_api.h

**ESP_SPP_SEC_AUTHORIZE**
Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

**ESP_SPP_SEC_AUTHENTICATE**
Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

**ESP_SPP_SEC_ENCRYPT**
Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

**ESP_SPP_SEC_MODE4_LEVEL4**
Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

**ESP_SPP_SEC_MITM**
Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

**ESP_SPP_SEC_IN_16_DIGITS**
Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

**ESP_SPP_MAX_MTU**
SPP max MTU

**ESP_SPP_MAX_SCN**
SPP max SCN

**Type Definitions**

typedef uint16_t `esp_spp_sec_t`

typedef void (*`esp_spp_cb_t`)(`esp_spp_cb_event_t` `event`, `esp_spp_cb_param_t` *`param`)

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Param event**Event type
**Param param**Point to callback parameter, currently is union type

**Enumerations**
enum esp_spp_status_t

  Values:

  enumerator ESP_SPP_SUCCESS
           Successful operation.

  enumerator ESP_SPP_FAILURE
           Generic failure.

  enumerator ESP_SPP_BUSY
           Temporarily can not handle this request.

  enumerator ESP_SPP_NO_DATA
           No data

  enumerator ESP_SPP_NO_RESOURCE
           No more resource

  enumerator ESP_SPP_NEED_INIT
           SPP module shall init first

  enumerator ESP_SPP_NEED_DEINIT
           SPP module shall deinit first

  enumerator ESP_SPP_NO_CONNECTION
           Connection may have been closed

  enumerator ESP_SPP_NO_SERVER
           No SPP server

enum esp_spp_role_t

  Values:

  enumerator ESP_SPP_ROLE_MASTER
           Role: master

  enumerator ESP_SPP_ROLE_SLAVE
           Role: slave

enum esp_spp_mode_t

  Values:

  enumerator ESP_SPP_MODE_CB
           When data is coming, a callback will come with data

  enumerator ESP_SPP_MODE_VFS
           Use VFS to write/read data
enum esp_spp_cb_event_t
    SPP callback function events.

Values:

enumerator ESP_SPP_INIT_EVT
    When SPP is initialized, the event comes

enumerator ESP_SPP_UNINIT_EVT
    When SPP is deinitialized, the event comes

enumerator ESP_SPP_DISCOVERY_COMP_EVT
    When SDP discovery complete, the event comes

enumerator ESP_SPP_OPEN_EVT
    When SPP Client connection open, the event comes

enumerator ESP_SPP_CLOSE_EVT
    When SPP connection closed, the event comes

enumerator ESP_SPP_START_EVT
    When SPP server started, the event comes

enumerator ESP_SPP_CL_INIT_EVT
    When SPP client initiated a connection, the event comes

enumerator ESP_SPP_DATA_IND_EVT
    When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_CONG_EVT
    When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_WRITE_EVT
    When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

enumerator ESP_SPP_SRV_OPEN_EVT
    When SPP Server connection open, the event comes

enumerator ESP_SPP_SRV_STOP_EVT
    When SPP server stopped, the event comes
Enumerations

enum `esp_hf_in_band_ring_state_t`
  in-band ring tone state
  Values:
  
  enumerator `ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED`
  enumerator `ESP_HF_IN_BAND_RINGTONE_PROVIDED`

enum `esp_hf_vr_state_t`
  voice recognition state
  Values:
  
  enumerator `ESP_HF_VR_STATE_DISABLED`
    voice recognition disabled
  enumerator `ESP_HF_VR_STATE_ENABLED`
    voice recognition enabled

enum `esp_hf_volume_control_target_t`
  Bluetooth HFP audio volume control target.
  Values:
  
  enumerator `ESP_HF_VOLUME_CONTROL_TARGET_SPK`
    speaker
  enumerator `ESP_HF_VOLUME_CONTROL_TARGET_MIC`
    microphone

enum `esp_hf_audio_state_t`
  Bluetooth HFP audio connection status.
  Values:
  
  enumerator `ESP_HF_AUDIO_STATE_DISCONNECTED`
    audio connection released
  enumerator `ESP_HF_AUDIO_STATE_CONNECTING`
    audio connection has been initiated
  enumerator `ESP_HF_AUDIO_STATE_CONNECTED`
    audio connection is established
  enumerator `ESP_HF_AUDIO_STATE_CONNECTED_MSBC`
    mSBC audio connection is established

enum `esp_hf_volume_type_t`
  Values:
Chapter 2. API Reference

enumerator ESP_HF_VOLUME_TYPE_SPK

enumerator ESP_HF_VOLUME_TYPE_MIC

enum esp_hf_network_state_t
+CIND network service availability status

Values:

enumerator ESP_HF_NETWORK_STATE_NOT_AVAILABLE

enumerator ESP_HF_NETWORK_STATE_AVAILABLE

enum esp_hf_service_type_t
+CIEV Service type

Values:

enumerator ESP_HF_SERVICE_TYPE_HOME

enumerator ESP_HF_SERVICE_TYPE_ROAMING

enum esp_hf_call_status_t
+CIND call status indicator values

Values:

enumerator ESP_HF_CALL_STATUS_NO_CALLS
no call in progress

tenumerator ESP_HF_CALL_STATUS_CALL_IN_PROGRESS
call is present(active or held)

enum esp_hf_call_setup_status_t
+CIND call setup status indicator values

Values:

enumerator ESP_HF_CALL_SETUP_STATUS_IDLE
no call setup in progress

enumerator ESP_HF_CALL_SETUP_STATUS_INCOMING
incoming call setup in progress

enumerator ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING
outgoing call setup in dialing state

enumerator ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING
outgoing call setup in alerting state
enum esp_hf_roaming_status_t
+CIND roaming status indicator values

Values:

counter ESP_HF_ROAMING_STATUS_INACTIVE
   roaming is not active

counter ESP_HF_ROAMING_STATUS_ACTIVE
   a roaming is active

enum esp_hf_call_held_status_t
+CIND call held indicator values

Values:

counter ESP_HF_CALL_HELD_STATUS_NONE
   no calls held

counter ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE
   both active and held call

counter ESP_HF_CALL_HELD_STATUS_HELD
   call on hold, no active call

enum esp_hf_current_call_status_t
+CLCC status of the call

Values:

counter ESP_HF_CURRENT_CALL_STATUS_ACTIVE
   active

counter ESP_HF_CURRENT_CALL_STATUS_HELD
   held

counter ESP_HF_CURRENT_CALL_STATUS_DIALING
   dialing (outgoing calls only)

counter ESP_HF_CURRENT_CALL_STATUS_ALERTING
   alerting (outgoing calls only)

counter ESP_HF_CURRENT_CALL_STATUS_INCOMING
   incoming (incoming calls only)

counter ESP_HF_CURRENT_CALL_STATUS_WAITING
   waiting (incoming calls only)

counter ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD
   call held by response and hold
enum esp_hf_current_call_direction_t
+CLCC direction of the call

Values:

enumerator ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING
    outgoing

enumerator ESP_HF_CURRENT_CALL_DIRECTION_INCOMING
    incoming

enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag

Values:

enumerator ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE
    not a member of a multi-party call

enumerator ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI
    member of a multi-party call

enum esp_hf_current_call_mode_t
+CLCC call mode

Values:

enumerator ESP_HF_CURRENT_CALL_MODE_VOICE

enumerator ESP_HF_CURRENT_CALL_MODE_DATA

enumerator ESP_HF_CURRENT_CALL_MODE_FAX

enum esp_hf_call_addr_type_t
+CLCC address type

Values:

enumerator ESP_HF_CALL_ADDR_TYPE_UNKNOWN
    unknown address type

enumerator ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL
    international address

enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number

Values:

enumerator ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN
    unknown
enumerator ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
    voice service

enumerator ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
    fax service

definition esp_hf_btrh_status_t
    +BTRH response and hold result code
    Values:

    enumerator ESP_HF_BTRH_STATUS_HELD
        incoming call is put on held in AG

    enumerator ESP_HF_BTRH_STATUS_ACCEPTED
        held incoming call is accepted in AG

    enumerator ESP_HF_BTRH_STATUS_REJECTED
        held incoming call is rejected in AG

definition esp_hf_btrh_cmd_t
    AT+BTRH response and hold action code.
    Values:

    enumerator ESP_HF_BTRH_CMD_HOLD
        put the incoming call on hold

    enumerator ESP_HF_BTRH_CMD_ACCEPT
        accept a held incoming call

    enumerator ESP_HF_BTRH_CMD_REJECT
        reject a held incoming call

definition esp_hf_nrec_t
    Values:

    enumerator ESP_HF_NREC_STOP

    enumerator ESP_HF_NREC_START

definition esp_hf_call_waiting_status_t
    +CCWA resposne status
    Values:

    enumerator ESP_HF_CALL_WAITING_INACTIVE

    enumerator ESP_HF_CALL_WAITING_ACTIVE
enum esp_hf_wbs_config_t

Values:

enumerator ESP_HF_WBS_NONE
enumerator ESP_HF_WBS_NO
enumerator ESP_HF_WBS_YES

enum esp_hf_connection_state_t

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

enumerator ESP_HF_CONNECTION_STATE_DISCONNECTED
RFCOMM data link channel released
enumerator ESP_HF_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link
enumerator ESP_HF_CONNECTION_STATE_CONNECTED
RFCOMM connection established
enumerator ESP_HF_CONNECTION_STATE_SLC_CONNECTED
service level connection established
enumerator ESP_HF_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t

AT+CHLD command values.

Values:

enumerator ESP_HF_CHLD_TYPE_REL
<0>, Terminate all held or set UDUB( “busy”) to a waiting call
enumerator ESP_HF_CHLD_TYPE_REL_ACC
<1>, Terminate all active calls and accepts a waiting/held call
enumerator ESP_HF_CHLD_TYPE_HOLD_ACC
<2>, Hold all active calls and accepts a waiting/held call
enumerator ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference
enumerator ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls
enumerator `ESP_HF_CHLD_TYPE_REL_X`  
<1x>, releases specified calls only

enumerator `ESP_HF_CHLD_TYPE_PRIV_X`  
<2x>, request private consultation mode with specified call

enum `esp_hf_at_response_code_t`  
*Values:*  

enumerator `ESP_HF_AT_RESPONSE_CODE_OK`  
acknowledges execution of a command line

enumerator `ESP_HF_AT_RESPONSE_CODE_ERR`  
command not accepted

enumerator `ESP_HF_AT_RESPONSE_CODE_NO_CARRIER`  
connection terminated

enumerator `ESP_HF_AT_RESPONSE_CODE_BUSY`  
busy signal detected

enumerator `ESP_HF_AT_RESPONSE_CODE_NO_ANSWER`  
connection completion timeout

enumerator `ESP_HF_AT_RESPONSE_CODE_DELAYED`  
delayed

enumerator `ESP_HF_AT_RESPONSE_CODE BLACKLISTED`  
blacklisted

enumerator `ESP_HF_AT_RESPONSE_CODE_CME`  
CME error

enum `esp_hf_at_response_t`  
*Values:*  

enumerator `ESP_HF_AT_RESPONSE_ERROR`  

enumerator `ESP_HF_AT_RESPONSE_OK`  

enum `esp_hf_cme_err_t`  
Extended Audio Gateway Error Result Code Response.  
*Values:*  

enumerator `ESP_HF_CME_AG_FAILURE`  
ag failure
enumerator ESP_HF_CME_NO_CONNECTION_TO_PHONE
    no connection to phone
enumerator ESP_HF_CME_OPERATION_NOT_ALLOWED
    operation not allowed
enumerator ESP_HF_CME_OPERATION_NOT_SUPPORTED
    operation not supported
enumerator ESP_HF_CME_PH_SIM_PIN_REQUIRED
    PH-SIM PIN Required
enumerator ESP_HF_CME_SIM_NOT_INSERTED
    SIM not inserted
enumerator ESP_HF_CME_SIM_PIN_REQUIRED
    SIM PIN required
enumerator ESP_HF_CME_SIM_PUK_REQUIRED
    SIM PUK required
enumerator ESP_HF_CME_SIM_FAILURE
    SIM failure
enumerator ESP_HF_CME_SIM_BUSY
    SIM busy
enumerator ESP_HF_CME_INCORRECT_PASSWORD
    incorrect password
enumerator ESP_HF_CME_SIM_PIN2_REQUIRED
    SIM PIN2 required
enumerator ESP_HF_CME_SIM_PUK2_REQUIRED
    SIM PUK2 required
enumerator ESP_HF_CME_MEMORY_FULL
    memory full
enumerator ESP_HF_CME_INVALID_INDEX
    invalid index
enumerator ESP_HF_CME_MEMORY_FAILURE
    memory failure
enumerator ESP_HF_CME_TEXT_STRING_TOO_LONG
    test string too long
enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING**
invalid characters in text string

enumerator **ESP_HF_CME_DIAL_STRING_TOO_LONG**
dial string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING**
invalid characters in dial string

enumerator **ESP_HF_CME_NO_NETWORK_SERVICE**
no network service

enumerator **ESP_HF_CME_NETWORK_TIMEOUT**
network timeout

enumerator **ESP_HF_CME_NETWORK_NOT_ALLOWED**
network not allowed & emergency calls only

### HFP CLIENT API

#### API Reference

### Header File

- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h

### Functions

**esp_err_t esp_hf_client_register_callback (esp_hf_client_cb_t callback)**

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Parameters**

- **callback**  
  - [in] HFP client event callback function

**Returns**

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**esp_err_t esp_hf_client_init (void)**

Initialize the Bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

**Returns**

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_deinit (void)**

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Returns**

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)
Establish a Service Level Connection to remote bluetooth HFP audio gateway(AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Parameters remote_bda –[in] remote bluetooth device address

Returns
• ESP_OK: connect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)
Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Parameters remote_bda –[in] remote bluetooth device address

Returns
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)
Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters remote_bda –[in] remote bluetooth device address

Returns
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_disconnect_audio (esp_bd_addr_t remote_bda)
Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters remote_bda –[in] remote bluetooth device address

Returns
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_start_voice_recognition (void)
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_stop_voice_recognition (void)
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_volume_update (esp_hf_volume_control_target_t type, int volume)
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters
• **type** [in] volume control target, speaker or microphone
  • **volume** [in] gain of the speaker of microphone, ranges 0 to 15

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_dial (const char *number)

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
number – [in] number string of the call. If NULL, the last number is called (aka re-dial)

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_dial_memory (int location)

Place a call with number specified by location (speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
location – [in] location of the number in the memory

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_send_chld_cmd (esp_hf_chld_type_t chld, int idx)

Send call hold and multiparty commands, or enhanced call control commands (Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
• chld – [in] AT+CHLD call hold and multiparty handling AT command.
• idx – [in] used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)

Send response and hold action command (Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**
btrh – [in] response and hold action to send

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_answer_call (void)

Answer an incoming call (send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

*esp_err_t* esp_hf_client_reject_call (void)

Reject an incoming call (send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.
Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_calls (void)`
Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_operator_name (void)`
Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_retrieve_subscriber_info (void)`
Get subscriber information number from AG (send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_dtmf (char code)`
Transmit DTMF codes during an ongoing call (use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters code – [in] dtmf code, single ascii character in the set 0-9, #, *, A-D

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_xapl (char* information, uint32_t features)`
Send command to enable Vendor specific feature to indicate battery level and docker status This is Apple-specific commands, but used by most device, including Android and Windows.

Parameters
- information – [in] XAPL vendorID-productID-version, such as “0505-1995-0610”
  vendorID: A string representation of the hex value of the vendor ID from the manufacturer, without the 0x prefix. productID: A string representation of the hex value of the product ID from the manufacturer, without the 0x prefix. version: The revision of the software
- features – [in] A base-10 representation of a bit field. such as ESP_HF_CLIENT_XAPL_FEAT_BATTERY_REPORT

Returns
- ESP_OK: Feature enable request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_iphoneaccev (uint32_t bat_level, bool docked)`
Send Battery level and docker status Enable this feature using XAPL command first This is Apple-specific commands, but used by most device, including Android and Windows.

Parameters
Chapter 2. API Reference

- `bat_level` - [in] Battery Level: value between 0 and 9
- `docked` - [in] Dock State: false = undocked, true = docked

**Returns**
- ESP_OK: battery level is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_request_last_voice_tag_number (void)`
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precaution to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_send_nrec (void)`
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precaution to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)`
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Parameters**
- `recv` - [in] HFP client incoming data callback function
- `send` - [in] HFP client outgoing data callback function

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

`void esp_hf_client_outgoing_data_ready (void)`
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precaution to use this API, Service Level Connection shall exist with AG.

`void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)`
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- `src_sps` - [in] original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- `bits` - [in] number of bits per pcm sample (16)
- `channels` - [in] number of channels (i.e. mono(1), stereo(2)…)

`void esp_hf_client_pcm_resample_deinit (void)`
Deinitialize the down sampling converter.

`int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)`
Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- `src` - [in] pointer to the buffer where the original sampling PCM are stored
Chapter 2. API Reference

- **in_bytes** - [in] length of the input PCM sample buffer in byte
- **dst** - [in] pointer to the buffer which is to be used to store the converted PCM samples

**Returns** number of samples converted

### Unions

Union `esp_hf_client_cb_param_t`

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

  Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer
  is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
  finished.
  Param len [in] : size(in bytes) in buf

typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio
connection is set up and the application layer has prepared data to send, the lower layer will call this function
to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not
enough, return value 0 is supposed.

  Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer
  is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
  finished.
  Param len [in] : size(in bytes) in buf
  Return length of data successfully read

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
HFP client callback function type.

  Param event : Event type
  Param param : Pointer to callback parameter

Enumerations

enum esp_hf_client_connection_state_t
  Bluetooth HFP RFCOMM connection and service level connection status.
  Values:

  enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED
    RFCOMM data link channel released

  enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING
    connecting remote device on the RFCOMM data link

  enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED
    RFCOMM connection established

  enumerator ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED
    service level connection established

  enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING
    disconnecting with remote device on the RFCOMM dat link

enum esp_hf_client_audio_state_t
  Bluetooth HFP audio connection status.
  Values:
enumerator **ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED**
  audio connection released

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTING**
  audio connection has been initiated

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED**
  audio connection is established

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC**
  mSBC audio connection is established

enum **esp_hf_client_in_band_ring_state_t**
  in-band ring tone state
  
  Values:
  
  enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED**
  enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED**

enum **esp_hf_client_cb_event_t**
  HF CLIENT callback events.
  
  Values:
  
  enumerator **ESP_HF_CLIENT_CONNECTION_STATE_EVT**
    connection state changed event
  
  enumerator **ESP_HF_CLIENT_AUDIO_STATE_EVT**
    audio connection state change event
  
  enumerator **ESP_HF_CLIENT_BVRA_EVT**
    voice recognition state change event
  
  enumerator **ESP_HF_CLIENT_CIND_CALL_EVT**
    call indication
  
  enumerator **ESP_HF_CLIENT_CIND_CALL_SETUP_EVT**
    call setup indication
  
  enumerator **ESP_HF_CLIENT_CIND_CALL_HELD_EVT**
    call held indication
  
  enumerator **ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT**
    network service availability indication
  
  enumerator **ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT**
    signal strength indication
enumerator ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
   roaming status indication
enumerator ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
   battery level indication
enumerator ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
   current operator information
enumerator ESP_HF_CLIENT_BTRH_EVT
   call response and hold event
enumerator ESP_HF_CLIENT_CLIP_EVT
   Calling Line Identification notification
enumerator ESP_HF_CLIENT_CCWA_EVT
   call waiting notification
enumerator ESP_HF_CLIENT_CLCC_EVT
   list of current calls notification
enumerator ESP_HF_CLIENT_VOLUME_CONTROL_EVT
   audio volume control command from AG, provided by +VGM or +VGS message
enumerator ESP_HF_CLIENT_AT_RESPONSE_EVT
   AT command response event
enumerator ESP_HF_CLIENT_CNUM_EVT
   subscriber information response from AG
enumerator ESP_HF_CLIENT_BSIR_EVT
   setting of in-band ring tone
enumerator ESP_HF_CLIENT_BINP_EVT
   requested number of last voice tag from AG
enumerator ESP_HF_CLIENT_RING_IND_EVT
   ring indication event

HFP AG API

API Reference

Header File
- components(bt/host/bluedroid/api/include/api/esp_hf_ag_api.h
Functions

`esp_err_t esp_hf_ag_register_callback(esp_hf_cb_t callback)`
Register application callback function to HFP AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Parameters**
- `callback` – [in] HFP AG event callback function

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

`esp_err_t esp_hf_ag_init()`
Initialize the bluetooth HF AG module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Returns**
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_ag_deinit()`
De-initialize for HF AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Returns**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_ag_slc_connect(esp_bd_addr_t remote_bda)`
To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after `esp_hf_ag_init()` and before `esp_hf_ag_deinit()`.

**Parameters**
- `remote_bda` – [in] remote bluetooth HFP client device address

**Returns**
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_ag_slc_disconnect(esp_bd_addr_t remote_bda)`
Disconnect from the remote HFP client. This function must be called after `esp_hf_ag_init()` and before `esp_hf_ag_deinit()`.

**Parameters**
- `remote_bda` – [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_ag_audio_connect(esp_bd_addr_t remote_bda)`
Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_bda` – [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_ag_audio_disconnect(esp_bd_addr_t remote_bda)`
Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_bda` – [in] remote bluetooth device address
Chapter 2. API Reference

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp\_hf\_ag\_vra\_control(esp\_bd\_addr\_t remote\_bda, esp\_hf\_vr\_state\_t value)}

Response of Volume Recognition Command (AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- \texttt{remote\_bda \textasciitilde [in]} the device address of voice recognition initiator
- \texttt{value \textasciitilde [in]} 0 - voice recognition disabled, 1 - voice recognition enabled

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp\_hf\_ag\_volume\_control(esp\_bd\_addr\_t remote\_bda, esp\_hf\_volume\_control\_target\_t type, int volume)}

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- \texttt{remote\_bda \textasciitilde [in]} remote bluetooth device address
- \texttt{type \textasciitilde [in]} volume control target, speaker or microphone
- \texttt{volume \textasciitilde [in]} gain of the speaker or microphone, ranges 0 to 15

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp\_hf\_ag\_unknown\_at\_send(esp\_bd\_addr\_t remote\_addr, char\* unk\_at)}

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- \texttt{remote\_addr \textasciitilde [in]} remote bluetooth device address
- \texttt{unk\_at \textasciitilde [in]} User AT command response to HF Client. It will response “ERROR” by default if unk\_at is NULL.

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp\_hf\_ag\_cmee\_send(esp\_bd\_addr\_t remote\_bda, esp\_hf\_at\_response\_code\_t response\_code, esp\_hf\_cme\_err\_t error\_code)}

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters

- \texttt{remote\_bda \textasciitilde [in]} remote bluetooth device address
- \texttt{response\_code \textasciitilde [in]} AT command response code
- \texttt{error\_code \textasciitilde [in]} CME error code

Returns

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\texttt{esp_err_t esp\_hf\_ag\_devices\_status\_ind\_change(esp\_bd\_addr\_t remote\_addr, esp\_hf\_call\_status\_t call\_state, esp\_hf\_call\_setup\_status\_t call\_setup\_state, esp\_hf\_network\_state\_t ntk\_state, int signal)}
Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
- `remote_addr` - [in] remote bluetooth device address
- `call_state` - [in] call state
- `call_setup_state` - [in] call setup state
- `ntk_state` - [in] network service state
- `signal` - [in] signal strength from 0 to 5

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state,
                                  esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state,
                                  int signal, esp_hf_roaming_status_t roam, int batt_lev,
                                  esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
- `remote_addr` - [in] remote bluetooth device address
- `call_state` - [in] call state
- `call_setup_state` - [in] call setup state
- `ntk_state` - [in] network service state
- `signal` - [in] signal strength from 0 to 5
- `roam` - [in] roam state
- `batt_lev` - [in] battery level from 0 to 5
- `call_held_status` - [in] call held status

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cops_response(esp_bd_addr_t remote_addr, char *name)
```

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
- `remote_addr` - [in] remote bluetooth device address
- `name` - [in] current operator name

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_clcc_response(esp_bd_addr_t remote_addr, int index,
                                  esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state,
                                  esp_hf_current_call_mode_t mode,
                                  esp_hf_current_call_mpty_type_t mpty, char *number,
                                  esp_hf_call_addr_type_t type)
```

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
- `remote_addr` - [in] remote bluetooth device address
- `index` - [in] the index of current call
- `dir` - [in] call direction (incoming/outgoing)
- `current_call_state` - [in] current call state
Chapter 2. API Reference

- **mode**  - [in] current call mode (voice/data/fax)
- **mpty**  - [in] single or multi type
- **number**  - [in] current call number
- **type**  - [in] international type or unknown

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_cnum_response*(esp_bd_addr_t remote_addr, char *number, esp_hf_subscriber_service_type_t type)

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr**  - [in] remote bluetooth device address
- **number**  - [in] registration number
- **type**  - [in] service type (unknown/voice/fax)

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_bsir*(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr**  - [in] remote bluetooth device address
- **state**  - [in] in-band ring tone state

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_answer_call*(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr**  - [in] remote bluetooth device address
- **num_active**  - [in] the number of active call
- **num_held**  - [in] the number of held call
- **call_state**  - [in] call state
- **call_setup_state**  - [in] call setup state
- **number**  - [in] number of the incoming call
- **call_addr_type**  - [in] call address type

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

*esp_err_t esp_hf_ag_reject_call*(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.
**Parameters**

- `remote_addr` - [in] remote bluetooth device address
- `num_active` - [in] the number of active call
- `num_held` - [in] the number of held call
- `call_state` - [in] call state
- `call_setup_state` - [in] call setup state
- `number` - [in] number of the incoming call
- `call_addr_type` - [in] call address type

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                            esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                            char *number, esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- `remote_addr` - [in] remote bluetooth device address
- `num_active` - [in] the number of active call
- `num_held` - [in] the number of held call
- `call_state` - [in] call state
- `call_setup_state` - [in] call setup state
- `number` - [in] number of the outgoing call
- `call_addr_type` - [in] call address type

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                            esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                            char *number, esp_hf_call_addr_type_t call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- `remote_addr` - [in] remote bluetooth device address
- `num_active` - [in] the number of active call
- `num_held` - [in] the number of held call
- `call_state` - [in] call state
- `call_setup_state` - [in] call setup state
- `number` - [in] number of the call
- `call_addr_type` - [in] call address type

**Returns**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_register_data_callback(esp_hf_incoming_data_cb_t recv,
                                           esp_hf_outgoing_data_cb_t send)
```

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

**Parameters**

- `recv` - [in] HFP client incoming data callback function
- `send` - [in] HFP client outgoing data callback function

**Returns**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
void esp_hf_ag_outgoing_data_ready (void)

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is
 enabled. As a precondition to use this API, Service Level Connection shall
 exist with HFP client.

After this function is called, lower layer will invoke esp_hf_
 client_outgoing_data_cb_t to fetch data

Unions

**Type Definitions**

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

  **Param buf [in]**: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

  **Param len [in]**: size(in bytes) in buf

typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

  **Param buf [in]**: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

  **Param len [in]**: size(in bytes) in buf

  **Return** length of data successfully read
typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)

HF AG callback function type.

- **Param event**: Event type
- **Param param**: Pointer to callback parameter

### Enumerations

```
enum esp_hf_cb_event_t

HF callback events.

**Values:**
```

eenumerator ESP_HF_CONNECTION_STATE_EVT
  Connection state changed event

eenumerator ESP_HF_AUDIO_STATE_EVT
  Audio connection state change event

eenumerator ESP_HF_BVRA_RESPONSE_EVT
  Voice recognition state change event

eenumerator ESP_HF_VOLUME_CONTROL_EVT
  Audio volume control command from HF Client, provided by +VGM or +VGS message

eenumerator ESP_HF_UNAT_RESPONSE_EVT

enumerator **ESP_HF_DIAL_EVT**
   Origin an outgoing call with specific number or the dial the last number

enumerator **ESP_HF_WBS_RESPONSE_EVT**
   Codec Status

enumerator **ESP_HF_BCS_RESPONSE_EVT**
   Final Codec Choice

**Bluetooth HID Device API**

**Overview**  A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

**Application Example**  Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - `bluetooth/bluedroid/classic_bt/bt_hid_mouse_device`

**API Reference**

**Header File**

- `components/bt/host/bluedroid/api/include/api/esp_hidd_api.h`

**Functions**

```c
esp_err_t esp_bt_hid_device_register_callback(esp_hd_cb_t callback)
```

This function is called to init callbacks with HID device module.

**Parameters** `callback` - [in] pointer to the init callback function.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_init(void)
```

This function initializes HIDD. This function should be called after `esp_bluedroid_enable` and `esp_bluedroid_init` success, and should be called after `esp_bt_hid_device_register_callback`. When the operation is complete the callback function will be called with ESP_HIDD_INIT_EVT.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_deinit(void)
```

This function de-initializes HIDD interface. This function should be called after `esp_bluedroid_enable()` and `esp_bluedroid_init()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete the callback function will be called with ESP_HIDD_DEINIT_EVT.

**Returns**  ESP_OK: success
Chapter 2. API Reference

• other: failed

**esp_err_t esp_bt_hid_device_register_app**(esp_hidd_app_param_t \*app_param,

\[ \text{\textit{esp_hidd_qos_param_t \*in_qos, esp_hidd_qos_param_t \*out_qos}} \]

Registers HIDD parameters with SDP and sets l2cap Quality of Service. This function should be called after esp_bluedroid_enable and esp_bluedroid_init success, and must be done after esp_bt_hid_device_init. When the operation is complete the callback function will be called with ESP_HIDD_REGISTER_APP_EVT.

**Parameters**
- \textit{app_param} - [\textit{in}] HIDD parameters
- \textit{in_qos} - [\textit{in}] incoming QoS parameters
- \textit{out_qos} - [\textit{in}] outgoing QoS parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_unregister_app**(void)
Removes HIDD parameters from SDP and resets l2cap Quality of Service. This function should be called after esp_bluedroid_enable and esp_bluedroid_init success, and should be called after esp_BT_hid_device_init. When the operation is complete the callback function will be called with ESP_HIDD_UNREGISTER_APP_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_connect**(esp_bd_addr_t bd_addr)
This function connects HIDD interface to connected bluetooth device, if not done already. When the operation is complete the callback function will be called with ESP_HIDD_OPEN_EVT.

**Parameters**
- \textit{bd_addr} - [\textit{in}] Remote host bluetooth device address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_disconnect**(void)
This function disconnects HIDD interface. When the operation is complete the callback function will be called with ESP_HIDD_CLOSE_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_send_report**(esp_hidd_report_type_t \textit{type}, uint8_t \textit{tid}, uint16_t \textit{len},

\[ \text{\textit{uint8_t \*data}} \]

Send HIDD report. When the operation is complete the callback function will be called with ESP_HIDD_SEND_REPORT_EVT.

**Parameters**
- \textit{type} - [\textit{in}] type of report
- \textit{id} - [\textit{in}] report id as defined by descriptor
- \textit{len} - [\textit{in}] length of report
- \textit{data} - [\textit{in}] report data

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_report_error**(esp_hidd_handshake_error_t \textit{error})
Sends HIDD handshake with error info for invalid set_report. When the operation is complete the callback function will be called with ESP_HIDD_REPORT_ERR_EVT.

**Parameters**
- \textit{error} - [\textit{in}] type of error

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_virtual_cable_unplug**(void)

Unplug virtual cable of HIDD. When the operation is complete the callback function will be called with ESP_HIDD_VC_UNPLUG_EVT.

- **Returns**
  - ESP_OK: success
  - other: failed

### Unions

union **esp_hidd_cb_param_t**

`#include <esp_hidd_api.h>` HID device callback parameters union.

#### Public Members

- `struct esp_hidd_cb_param_t::hidd_init_evt_param` init
  - HIDD callback param of ESP_HIDD_INIT_EVT

```
connection status

**Structures**

```c
struct esp_hidd_app_param_t
```
HID device characteristics for SDP server.

**Public Members**

const char *`name`
service name

const char *`description`
service description

const char *`provider`
provider name

uint8_t *`subclass`
HID device subclass

uint8_t *`desc_list`
HID descriptor list

int `desc_list_len`
size in bytes of HID descriptor list

**Public Members**

```c
struct esp_hidd_qos_param_t
```
HIDD Quality of Service parameters negotiated over L2CAP.
uint8_t service_type
  the level of service, 0 indicates no traffic

uint32_t token_rate
  token rate in bytes per second, 0 indicates “don’t care”

uint32_t token_bucket_size
  limit on the burstness of the application data

uint32_t peak_bandwidth
  bytes per second, value 0 indicates “don’t care”

uint32_t access_latency
  maximum acceptable delay in microseconds

uint32_t delay_variation
  the difference in microseconds between the max and min delay

Macros

ESP_HID_CLASS_UNKNOWN
  subclass of hid device
  unknown HID device subclass

ESP_HID_CLASS_JOS
  joystick

ESP_HID_CLASS_GPD
  game pad

  keyboard

ESP_HID_CLASS_MIC
  pointing device

ESP_HID_CLASS_COM
  combo keyboard/pointing
Type Definitions

typedef void (*esp_hd_cb_t)(esp_hidd_cb_event_t event, esp_hidd_cb_param_t *param)

HID device callback function type.

Param event Event type
Param param Point to callback parameter, currently is union type

Enumerations

enum esp_hidd_handshake_error_t
  
HIDD handshake result code.

Values:

enumerator ESP_HID_PAR_HANDSHAKE_RSP_SUCCESS
  successful

denumerator ESP_HID_PAR_HANDSHAKE_RSP_NOT_READY
  not ready, device is too busy to accept data

denumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_REP_ID
  invalid report ID

denumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNSUPPORTED_REQ
  device does not support the request

denumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_PARAM
  parameter value is out of range or inappropriate

denumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNKNOWN
  device could not identify the error condition

denumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_FATAL
  restart is essential to resume functionality

enum esp_hidd_report_type_t

HIDD report types.

Values:

enumerator ESP_HIDD_REPORT_TYPE_OTHER
  unknown report type

denumerator ESP_HIDD_REPORT_TYPE_INPUT
  input report

denumerator ESP_HIDD_REPORT_TYPE_OUTPUT
  output report

denumerator ESP_HIDD_REPORT_TYPE_FEATURE
  feature report
Special value for reports to be sent on interrupt channel, INPUT is assumed.

```c
enum esp_hidd_connection_state_t
HID connection state.

Values:
```

```c
enumerator ESP_HIDD_CONN_STATE_CONNECTED
HID connection established
```

```c
enumerator ESP_HIDD_CONN_STATE_CONNECTING
connection to remote Bluetooth device
```

```c
enumerator ESP_HIDD_CONN_STATE_DISCONNECTED
connection released
```

```c
enumerator ESP_HIDD_CONN_STATE_DISCONNECTING
disconnecting to remote Bluetooth device
```

```c
enumerator ESP_HIDD_CONN_STATE_UNKNOWN
unknown connection state
```

```c
enum esp_hidd_protocol_mode_t
HID device protocol modes.

Values:
```
```

```c
enumerator ESP_HIDD_REPORT_MODE
Report Protocol Mode
```

```c
enumerator ESP_HIDD_BOOT_MODE
Boot Protocol Mode
```

```c
enumerator ESP_HIDD_UNSUPPORTED_MODE
unsupported
```

```c
enum esp_hidd_boot_report_id_t
HID Boot Protocol report IDs.

Values:
```
```

```c
enumerator ESP_HIDD_BOOT_REPORT_ID_KEYBOARD
report ID of Boot Protocol keyboard report
```

```c
enumerator ESP_HIDD_BOOT_REPORT_ID_MOUSE
report ID of Boot Protocol mouse report
```

```c
enum [anonymous]
HID Boot Protocol report size including report ID.

Values:
```
```
enumerator **ESP_HIDD_BOOT_REPORT_SIZE_KEYBOARD**
    report size of Boot Protocol keyboard report

enumerator **ESP_HIDD_BOOT_REPORT_SIZE_MOUSE**
    report size of Boot Protocol mouse report

enum **esp_hidd_cb_event_t**
    HID device callback function events.
    
    *Values:*

    enumerator **ESP_HIDD_INIT_EVT**
        When HID device is initialized, the event comes

    enumerator **ESP_HIDD_DEINIT_EVT**
        When HID device is deinitialized, the event comes

    enumerator **ESP_HIDD_REGISTER_APP_EVT**
        When HID device application registered, the event comes

    enumerator **ESP_HIDD_UNREGISTER_APP_EVT**
        When HID device application unregistered, the event comes

    enumerator **ESP_HIDD_OPEN_EVT**
        When HID device connection to host opened, the event comes

    enumerator **ESP_HIDD_CLOSE_EVT**
        When HID device connection to host closed, the event comes

    enumerator **ESP_HIDD_SEND_REPORT_EVT**
        When HID device send report to lower layer, the event comes

    enumerator **ESP_HIDD_REPORT_ERR_EVT**
        When HID device report handshake error to lower layer, the event comes

    enumerator **ESP_HIDD_GET_REPORT_EVT**
        When HID device receives GET_REPORT request from host, the event comes

    enumerator **ESP_HIDD_SET_REPORT_EVT**
        When HID device receives SET_REPORT request from host, the event comes

    enumerator **ESP_HIDD_SET_PROTOCOL_EVT**
        When HID device receives SET_PROTOCOL request from host, the event comes

    enumerator **ESP_HIDD_INTR_DATA_EVT**
        When HID device receives DATA from host on intr, the event comes

    enumerator **ESP_HIDD_VC_UNPLUG_EVT**
        When HID device initiates Virtual Cable Unplug, the event comes
enumerator **ESP_HIDD_API_ERR_EVT**
When HID device has API error, the event comes

enum **esp_hidd_status_t**
Values:

enumerator **ESP_HIDD_SUCCESS**

eumerator **ESP_HIDD_ERROR**
   general ESP HD error

eumerator **ESP_HIDD_NO_RES**
   out of system resources

eumerator **ESP_HIDD_BUSY**
   Temporarily can not handle this request.

eumerator **ESP_HIDD_NO_DATA**
   No data.

eumerator **ESP_HIDD_NEED_INIT**
   HIDD module shall init first

eumerator **ESP_HIDD_NEED_DEINIT**
   HIDD module shall deinit first

eumerator **ESP_HIDD_NEED_REG**
   HIDD module shall register first

eumerator **ESP_HIDD_NEED_DEREG**
   HIDD module shall deregister first

eumerator **ESP_HIDD_NO_CONNECTION**
   connection may have been closed

**Classic Bluetooth L2CAP API**

**Application Example** Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a BT_L2CAP demo. This demo can connect, send and receive L2CAP data bluetooth/bluedroid/classic_bt/bt_l2cap_client, bluetooth/bluedroid/classic_bt/bt_l2cap_server

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_l2cap_bt_api.h
Chapter 2. API Reference

Functions

`esp_err_t esp_bt_l2cap_register_callback (esp_bt_l2cap_cb_t callback)`

This function is called to init callbacks with L2CAP module.

Parameters

- `callback` - [in] pointer to the init callback function.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_bt_l2cap_init (void)`

This function is called to init L2CAP module. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_bt_l2cap_deinit (void)`

This function is called to uninit l2cap module. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_UNINIT_EVT. This function should be called after esp_bt_l2cap_init() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_bt_l2cap_connect (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t remote_psm, esp_bd_addr_t peer_bd_addr)`

This function makes an L2CAP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_BT_L2CAP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters

- `cntl_flag` - [in] Lower 16-bit security settings mask.
- `remote_psm` - [in] Remote device bluetooth Profile PSM.
- `peer_bd_addr` - [in] Remote device bluetooth device address.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_bt_l2cap_start_srv (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t local_psm)`

This function create a L2CAP server and starts listening for an L2CAP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_BT_L2CAP_START_EVT. When the connection is established, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters

- `cntl_flag` - [in] Lower 16-bit security settings mask.
- `local_psm` - [in] Dynamic PSM.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_bt_l2cap_stop_all_srv (void)`

This function stops all L2CAP servers. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of
ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_stop_srv(uint16_t local_psm)
```
This function stops a specific L2CAP server. The operation will close all active L2CAP connection first on the specific L2CAP server, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Parameters**
- local_psm - [in] Dynamic PSM.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_register(void)
```
This function is used to register VFS. Only supports write, read and close. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_unregister(void)
```
This function is used to unregister VFS. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

**Returns**
- ESP_OK: success
- other: failed

**Unions**

```c
union esp_bt_l2cap_cb_param_t
#include <esp_l2cap_bt_api.h> L2CAP callback parameters union.
```

**Public Members**

```c
struct esp_bt_l2cap_cb_param_t::l2cap_init_evt_param init
L2CAP callback param of ESP_BT_L2CAP_INIT_EVT
```

```c
struct esp_bt_l2cap_cb_param_t::l2cap_uninit_evt_param uninit
L2CAP callback param of ESP_BT_L2CAP_UNINIT_EVT
```

```c
struct esp_bt_l2cap_cb_param_t::l2cap_open_evt_param open
L2CAP callback param of ESP_BT_L2CAP_OPEN_EVT
```

```c
struct esp_bt_l2cap_cb_param_t::l2cap_close_evt_param close
L2CAP callback param of ESP_BT_L2CAP_CLOSE_EVT
```
struct esp_bt_l2cap_cb_param_t::l2cap_start_evt_param start
L2CAP callback param of ESP_BT_L2CAP_START_EVT

struct esp_bt_l2cap_cb_param_t::l2cap_cl_init_evt_param cl_init
L2CAP callback param of ESP_BT_L2CAP_CL_INIT_EVT

Type Definitions

typedef uint32_t \textit{esp\_bt\_l2cap\_cntl\_flags\_t}

typedef void (*\textit{esp\_bt\_l2cap\_cb\_t})(\textit{esp\_bt\_l2cap\_cb\_event\_t} event, \textit{esp\_bt\_l2cap\_cb\_param\_t} *param)

L2CAP callback function type.

\textbf{Param event} Event type

\textbf{Param param} Point to callback parameter, currently is union type

Enumerations

enum \textit{esp\_bt\_l2cap\_status\_t}

L2CAP operation success and failure codes.

\textit{Values}:

\textit{enumerator ESP\_BT\_L2CAP\_SUCCESS}
Successful operation.

\textit{enumerator ESP\_BT\_L2CAP\_FAILURE}
Generic failure.

\textit{enumerator ESP\_BT\_L2CAP\_BUSY}
Temporarily can not handle this request.

\textit{enumerator ESP\_BT\_L2CAP\_NO\_RESOURCE}
No more resource
enumerator ESP_BT_L2CAP_NEED_INIT
  L2CAP module shall init first

enumerator ESP_BT_L2CAP_NEED_DEINIT
  L2CAP module shall deinit first

enumerator ESP_BT_L2CAP_NO_CONNECTION
  Connection may have been closed

enumerator ESP_BT_L2CAP_NO_SERVER
  No server

enum esp_bt_l2cap_cb_event_t
  L2CAP callback function events.
  Values:

  enumerator ESP_BT_L2CAP_INIT_EVT
    When L2CAP is initialized, the event comes

  enumerator ESP_BT_L2CAP_UNINIT_EVT
    When L2CAP is deinitialized, the event comes

  enumerator ESP_BT_L2CAP_OPEN_EVT
    When L2CAP Client connection open, the event comes

  enumerator ESP_BT_L2CAP_CLOSE_EVT
    When L2CAP connection closed, the event comes

BT SDP APIs

Overview  Bluetooth SDP reference APIs.

API Reference

Header File
  • components/bt/host/bluedroid/api/include/api/esp_sdp_api.h
Functions

```c
esp_err_t esp_sdp_register_callback (esp_sdp_cb_t callback)
```

This function is called to init callbacks with SDP module.

Parameters

- `callback` - [in] pointer to the init callback function.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_sdp_init (void)
```

This function is called to init SDP module. When the operation is completed, the callback function will be called with ESP_SDP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_sdp_deinit (void)
```

This function is called to de-initialize SDP module. The operation will remove all SDP records, then the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT, and the number of ESP_SDP_REMOVE_RECORD_COMP_EVT is equal to the number of SDP records. When the operation is completed, the callback function will be called with ESP_SDP_DEINIT_EVT. This function should be called after esp_sdp_init() completes successfully.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_sdp_search_record (esp_bd_addr_t bd_addr, esp_bt_uuid_t uuid)
```

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SDP_SEARCH_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `bd_addr` - [in] Remote device bluetooth device address.
- `uuid` - [in] Service UUID of the remote device.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_sdp_create_record (esp_bluetooth_sdp_record_t *record)
```

This function is called to create SDP records. When the operation is completed, the callback function will be called with ESP_SDP_CREATE_RECORD_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `record` - [in] The SDP record to create.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_sdp_remove_record (int record_handle)
```

This function is called to remove a SDP record. When the operation is completed, the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `record_handle` - [in] The SDP record handle.

Returns

- ESP_OK: success
- other: failed

Unions
union esp_bluetooth_sdp_record_t

enum `esp.sdp.status_t` Values:

enumerator `ESP.SDP.SUCCESS` Successful operation.

enumerator `ESP.SDP.FAILURE` Generic failure.

enumerator `ESP.SDP.NO_RESOURCE` No more resource

enumerator `ESP.SDP.NEED_INIT` SDP module shall init first

enumerator `ESP.SDP.NEED_DEINIT` SDP module shall deinit first

enumerator `ESP.SDP.NO_CREATE_RECORD` No record created

enum `esp.sdp.cb.event_t` SDP callback function events. Values:

enumerator `ESP.SDP.INIT_EVT` When SDP is initialized, the event comes

enumerator `ESP.SDP.DEINIT_EVT` When SDP is deinitialized, the event comes

enumerator `ESP.SDP.SEARCH.COMP_EVT` When SDP search complete, the event comes

enumerator `ESP.SDP.CREATE.RECORD.COMP_EVT` When create SDP records complete, the event comes
\end{verbatim}
Chapter 2. API Reference

enumerator ESP_SDP_REMOVE_RECORD_COMP_EVT
    When remove a SDP record complete, the event comes

denum esp.bluetooth.sdp.types_t
    SDP record type.
    Values:

enumerator ESP_SDP_TYPE_RAW
    Used to carry raw SDP search data for unknown UUIDs

enumerator ESP_SDP_TYPE_MAP_MAS
    Message Access Profile - Server

enumerator ESP_SDP_TYPE_MAP_MNS
    Message Access Profile - Client (Notification Server)

enumerator ESP_SDP_TYPE_PBAP_PSE
    Phone Book Profile - Server

enumerator ESP_SDP_TYPE_PBAP_PCE
    Phone Book Profile - Client

enumerator ESP_SDP_TYPE_OPP_SERVER
    Object Push Profile

enumerator ESP_SDP_TYPE_SAP_SERVER
    SIM Access Profile

2.3.4 Controller & VHCI

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

• This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

• components/bt/include/esp32/include/esp_bt.h

Functions

esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power. Connection Tx power should only be set after connection created.

Parameters

• power_type: The type of which tx power, could set Advertising/Connection/Default and etc
**Chapter 2. API Reference**

- **power_level** – Power level(index) corresponding to absolute value(dbm)

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_power_level_t esp_ble_tx_power_get (esp_power_type_t power_type)}
  \]

  Get BLE TX power Connection Tx power should only be get after connection created.

  Parameters **power_type** – The type of which tx power, could set Advertising/Connection/Default and etc

  Returns >= 0 - Power level, < 0 - Invalid

  \[
  \text{esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)}
  \]

  Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

  Parameters

  - **min_power_level** – The minimum power level
  - **max_power_level** – The maximum power level

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_err_t esp_bredr_tx_power_get (esp_power_level_t **min_power_level, esp_power_level_t **max_power_level)}
  \]

  Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

  Parameters

  - **min_power_level** – The minimum power level
  - **max_power_level** – The maximum power level

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)}
  \]

  Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

  Parameters **data_path** – SCO data path

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)}
  \]

  Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

  Parameters **cfg** – Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_err_t esp_bt_controller_deinit (void)}
  \]

  De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

  This function should be called only once, after any other BT functions are called.

  Returns ESP_OK - success, other - failed

  \[
  \text{esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)}
  \]

  Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

  Parameters **mode** – the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().
Returns ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_disable (void)
```
Disable BT controller.

Returns ESP_OK - success, other - failed

```c
esp_bt_controller_status_t esp_bt_controller_get_status (void)
```
Get BT controller is initialised/de-initialised/enabled/disabled.

Returns status value

```c
bool esp_vhci_host_check_send_available (void)
```
esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Returns true for ready to send, false means cannot send packet

```c
void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
```
esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

- `data` - the packet point
- `len` – the packet length

```c
esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
```
esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Parameters `callback` - esp_vhci_host_callback type variable

Returns ESP_OK - success, ESP_FAIL - failed

```c
esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
```
esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Parameters `mode` - : the mode want to release memory

Returns ESP_OK - success, other - failed

```c
esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
```
esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode
This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

### Parameters

- **mode**: the mode whose memory is to be released

### Returns

- ESP_OK - success, other - failed

### esp_err_t esp_bt_sleep_enable(void)

Enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

### Returns

- ESP_OK : success
- other : failed

### esp_err_t esp_bt_sleep_disable(void)

Disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

### Returns

- ESP_OK : success
- other : failed
### esp_err_t esp_ble_scan_duplicate_list_flush (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Returns**
- ESP_OK: success
- other: failed

### void esp_wifi_bt_power_domain_on (void)

bt Wi-Fi power domain power on

### void esp_wifi_bt_power_domain_off (void)

bt Wi-Fi power domain power off

### Structures

**struct esp bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

#### Public Members

- **uint16_t controller_task_stack_size**
  
  Bluetooth controller task stack size

- **uint8_t controller_task_prio**

  Bluetooth controller task priority

- **uint8_t hci_uart_no**

  If use UART1/2 as HCI IO interface, indicate UART number

- **uint32_t hci_uart_baudrate**

  If use UART1/2 as HCI IO interface, indicate UART baudrate

- **uint8_t scan_duplicate_mode**

  scan duplicate mode

- **uint8_t scan_duplicate_type**

  scan duplicate type

- **uint16_t normal_adv_size**

  Normal adv size for scan duplicate

- **uint16_t mesh_adv_size**

  Mesh adv size for scan duplicate
uint16_t send_adv_reserved_size
    Controller minimum memory value

guint32_t controller_debug_flag
    Controller debug log flag

guint8_t mode
    Controller mode: BR/EDR, BLE or Dual Mode

guint8_t ble_max_conn
    BLE maximum connection numbers

guint8_t bt_max_acl_conn
    BR/EDR maximum ACL connection numbers

guint8_t bt_sco_datapath
    SCO data path, i.e. HCI or PCM module

gbool auto_latency
    BLE auto latency, used to enhance classic BT performance

gbool bt_legacy_auth_vs_evt
    BR/EDR Legacy auth complete event required to protect from BIAS attack

guint8_t bt_max_sync_conn
    BR/EDR maximum ACL connection numbers. Effective in menuconfig

guint8_t ble_sca
    BLE low power crystal accuracy index

guint8_t pcm_role
    PCM role (master & slave)

guint8_t pcm_polar
    PCM polar trig (falling clk edge & rising clk edge)

gbool hli
    Using high level interrupt or not

guint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members
void (*notify_host_send_available)(void)
callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

**Macros**

```
ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()
```

**Type Definitions**

```
typedef struct esp_vhci_host_callback esp_vhci_host_callback_t

esp_vhci_host_callback used for vhci call host function to notify what host need to do
```

**Enumerations**

```
enum esp_bt_mode_t

    Bluetooth mode for controller enable/disable.
    
    Values:
    
    enumerator ESP_BT_MODE_IDLE
        Bluetooth is not running
    
    enumerator ESP_BT_MODE_BLE
        Run BLE mode
    
    enumerator ESP_BT_MODE_CLASSIC_BT
        Run Classic BT mode
    
    enumerator ESP_BT_MODE_BTDM
        Run dual mode

enum [anonymous]

    BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
    
    Values:
    
    enumerator ESP_BLE_SCA_500PPM
        BLE SCA at 500ppm
    
    enumerator ESP_BLE_SCA_250PPM
        BLE SCA at 250ppm
    
    enumerator ESP_BLE_SCA_150PPM
        BLE SCA at 150ppm
```
enumerator **ESP_BLE_SCA_100PPM**
BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**
BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**
BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**
BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**
BLE SCA at 20ppm

enum **esp_bt_controller_status_t**
Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

enum **esp_ble_power_type_t**
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. When disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV: for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN: for scan. ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value. If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

*Values:*

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL0**
For connection handle 0

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL1**
For connection handle 1

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL2**
For connection handle 2

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL3**
For connection handle 3
Chapter 2. API Reference

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4}  
For connection handle 4

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5}  
For connection handle 5

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6}  
For connection handle 6

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7}  
For connection handle 7

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8}  
For connection handle 8

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_ADV}  
For advertising

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_SCAN}  
For scan

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_DEFAULT}  
For default, if not set other, it will use default value

enumerator \texttt{ESP\_BLE\_PWR\_TYPE\_NUM}  
TYPE numbers

enum \texttt{esp\_power\_level\_t}  
Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

enumerator \texttt{ESP\_PWR\_LVL\_N12}  
Corresponding to -12dbm

enumerator \texttt{ESP\_PWR\_LVL\_N9}  
Corresponding to -9dbm

enumerator \texttt{ESP\_PWR\_LVL\_N6}  
Corresponding to -6dbm

enumerator \texttt{ESP\_PWR\_LVL\_N3}  
Corresponding to -3dbm

enumerator \texttt{ESP\_PWR\_LVL\_N0}  
Corresponding to 0dbm

enumerator \texttt{ESP\_PWR\_LVL\_P3}  
Corresponding to +3dbm
Chapter 2. API Reference

enumerator ESP_PWR_LVL_P6
   Corresponding to +6dbm

enumerator ESP_PWR_LVL_P9
   Corresponding to +9dbm

enumerator ESP_PWR_LVL_N14
   Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator ESP_PWR_LVL_N11
   Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator ESP_PWR_LVL_N8
   Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator ESP_PWR_LVL_N5
   Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator ESP_PWR_LVL_N2
   Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator ESP_PWR_LVL_P1
   Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator ESP_PWR_LVL_P4
   Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator ESP_PWR_LVL_P7
   Backward compatibility! Setting to +7dbm will actually result to +9dbm

default

enum esp_sco_data_path_t
   Bluetooth audio data transport path.
   Values:

   enumerator ESP_SCO_DATA_PATH_HCI
      data over HCI transport

   enumerator ESP_SCO_DATA_PATH_PCM
      data over PCM interface

2.3.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.
Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

Public Members

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param prov_register_comp

Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param
node_set_unprov_dev_name_comp

Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param
node_prov_enable_comp

Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param
define node_prov_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param
define node_prov_link_open
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param
define node_prov_link_close
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param
define node_prov_output_num
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param
define node_prov_output_str
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param
define node_prov_input
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_complete_evt_param
define node_prov_complete
Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_reset_param
define node_prov_reset
Event parameter of ESP_BLE_MESH_NODE_PROV_RESET_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_oob_pub_key_comp_param
define node_prov_set_oob_pub_key_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_number_comp_param
define node_prov_input_num_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_string_comp_param
define node_prov_input_str_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_identity_enable_comp_param
define node_proxy_identity_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_enable_comp_param
define node_proxy_gatt_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_disable_comp_param
define node_proxy_gatt_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param
    node_add_net_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param
    node_add_app_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_comp_param
    node_bind_app_key_to_model_comp
    Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param
    provisioner_recv_unprov_adv_pkt
    Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param
    provisioner_prov_enable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param
    provisioner_prov_disable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param
    provisioner_prov_link_open
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_evt_param
    provisioner_prov_read_oob_pub_key
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_evt_param
    provisioner_prov_input
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_output_evt_param
    provisioner_prov_output
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_close_evt_param
    provisioner_prov_link_close
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_comp_param
    provisioner_prov_complete
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param
    provisioner_add_unprov_dev_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param
provisioner_prov_dev_with_addr_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_dev_comp_param
provisioner_delete_dev_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_uuid_match_comp_param
provisioner_set_dev_uuid_match_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_prov_data_info_comp_param
provisioner_set_dev_prov_data_info_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_PROV_DATA_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param
provisioner_set_static_oob_val_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primary_elem_addr_comp_param
provisioner_set_primary_elem_addr_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
provisioner_prov_read_oob_pub_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
provisioner_prov_input_num_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
provisioner_prov_input_str_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
provisioner_set_node_name_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
provisioner_add_local_app_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
provisioner_update_local_app_key_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param
provisioner_bind_app_key_to_model_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param
provisioner_add_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param
provisioner_update_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param
provisioner_store_node_comp_data_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param
provisioner_delete_node_with_uuid_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
provisioner_delete_node_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Chapter 2. API Reference

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_direct_erase_settings_comp
ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_open_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
Provisioner settings user id
struct esp_ble_mesh_prov_cb_param_t::[anonymous]  
provisioner_open_settings_with_uid_comp  
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.  
Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

  Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.

Public Members

int err_code
  Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
  Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
  This enum value is the reason of friendship termination on the friend node side

Values:

type ENUMERATOR ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
  Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

type ENUMERATOR ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
  Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**  
Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**  
Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**  
Friend feature disabled or corresponding NetKey is deleted

**Public Members**

```c
uint16_t lpn_addr  
Low Power Node unicast address
```

```c
enum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason
```

uint8_t status_action
Indicate the result of setting action of fast provisioning

struct ble_mesh_set_fast_prov_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.

Public Members

uint8_t status_unicast
Indicate the result of setting unicast address range of fast provisioning

uint8_t status_net_idx
Indicate the result of setting NetKey Index of fast provisioning

uint8_t status_match
Indicate the result of setting matching Device UUID of fast provisioning

struct ble_mesh_set_oob_pub_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int err_code
Indicate the result of setting OOB Public Key

struct ble_mesh_set_unprov_dev_name_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int err_code
Indicate the result of setting BLE Mesh device name

union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members
```
uint8_t onoff
  The value of the Generic OnOff state
  The value of the Light LC Light OnOff state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_onoff
  The Generic OnOff state

int16_t level
  The value of the Generic Level state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_level
  The Generic Level state

uint8_t onpowerup
  The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_onpowerup
  The Generic OnPowerUp state

uint16_t power
  The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_power_actual
  The Generic Power Actual state

uint16_t lightness
  The value of the Light Lightness Actual state
  The value of the Light Lightness Linear state
  The value of the Light CTL Lightness state
  The value of the Light HSL Lightness state
  The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::{anonymous} light_lightness_actual
  The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::{anonymous} light_lightness_linear
  The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::{anonymous} light_ctl_lightness
  The Light CTL Lightness state

uint16_t temperature
  The value of the Light CTL Temperature state

int16_t delta_uv
  The value of the Light CTL Delta UV state
struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
    The Light CTL Temperature & Delta UV states

tuint16_t hue
    The value of the Light HSL Hue state

tuint16_t saturation
    The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
    The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
    The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
    The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
    The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
    The Light xyl Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
    The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t
    #include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

    **Public Members**

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
    Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
    Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param client_recv_publish_msg
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param
model_publish_update
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param
server_model_update_state
Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode
Opcode of the previously sent message

esp_ble_mesh_model_t *model
Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode
Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the message

uint16_t length
Length of the received message

uint8_t *msg
Value of the received message

struct ble_mesh_model_operation_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
**Public Members**

`uint32_t opcode`  
Opcode of the received message

`esp_ble_mesh_model_t *model`  
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`  
Pointer to the context of the received message

`uint16_t length`  
Length of the received message

`uint8_t *msg`  
Value of the received message

```
struct ble_mesh_model_publish_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.
```

**Public Members**

`int err_code`  
Indicate the result of publishing a message

`esp_ble_mesh_model_t *model`  
Pointer to the model which publishes the message

```
struct ble_mesh_model_publish_update_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.
```

**Public Members**

`espble_mesh_model_t *model`  
Pointer to the model which is going to update its publish message

```
struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.
```

**Public Members**

`int err_code`  
Indicate the result of sending a message

`uint32_t opcode`  
Opcode of the message
Chapter 2. API Reference

```c
esp_ble_mesh_model_t *model

Pointer to the model which sends the message
```

```c
esp_ble_mesh_msg_ctx_t *ctx

Context of the message
```

```c
struct ble_mesh_server_model_update_state_comp_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
```

### Public Members

```c
int err_code

Indicate the result of updating server model state
```

```c
esp_ble_mesh_model_t *model

Pointer to the server model which state value is updated
```

```c
esp_ble_mesh_server_state_type_t type

Type of the updated server state
```

### Structures

```c
struct esp_ble_mesh_deinit_param_t

BLE Mesh deinit parameters
```

### Public Members

```c
bool erase_flash

Indicate if erasing flash when deinit mesh stack
```

```c
struct esp_ble_mesh_elem_t

Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h
```

### Public Members

```c
uint16_t element_addr

Element Address, assigned during provisioning.
```

```c
const uint16_t location

Location Descriptor (GATT Bluetooth Namespace Descriptors)
```

```c
const uint8_t sig_model_count

SIG Model count
```

```c
const uint8_t vnd_model_count

Vendor Model count
```
struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
Publish Address.

uint16_t app_idx
Publish AppKey Index.

uint16_t cred
Friendship Credentials Flag.

uint16_t send_rel
Force reliable sending (segment acks)

uint8_t ttl
Publish Time to Live.

uint8_t retransmit
Retransmit Count & Interval Steps.

uint8_t period
Publish Period.

uint8_t period_div
Divisor for the Period.

uint8_t fast_period
Use FastPeriodDivisor

uint8_t count
Retransmissions left.

uint32_t period_start
Start of the current period.
struct net_buf_simple *msg

Publication buffer, containing the publication message.
This will get correctly created when the publication context has been defined using the
ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update

Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer

Publish Period Timer. Initialized by the stack.

uint8_t dev_role

Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t

Abstraction that describes a model operation context. This structure is associated with struct
bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode

Message opcode

const size_t min_len

Message minimum length

esp_ble_mesh_cb_t param_cb

Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t

Abstraction that describes a model callback structure. This structure is associated with struct
bt_mesh_model_cbs in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb

Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model

Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in
mesh_access.h

Public Members
const uint16_t model_id
   16-bit model identifier

uint16_t company_id
   16-bit company identifier

uint16_t model_id
   16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
   Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
   Model ID

uint8_t element_idx
   Internal information, mainly for persistent storage. Belongs to Nth element

uint8_t model_idx
   Is the Nth model in the element

uint16_t flags
   Information about what has changed

esp_ble_mesh_elem_t *element
   The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
   Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
   AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
   Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
   Model operation context

esp_ble_mesh_model_cbs_t *cb
   Model callback structure

void *user_data
   Model-specific user data

struct esp_ble_mesh_msg_ctx_t
   Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h
Public Members

uint16_t **net_idx**
NetKey Index of the subnet through which to send the message.

uint16_t **app_idx**
AppKey Index for message encryption.

uint16_t **addr**
Remote address.

uint16_t **recv_dst**
Destination address of a received message. Not used for sending.

int8_t **recv_rssi**
RSSI of received packet. Not used for sending.

uint8_t **recv_ttl**
Received TTL value. Not used for sending.

uint8_t **send_rel**
Force sending reliably by using segment acknowledgement

uint8_t **send_ttl**
TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t **recv_op**
Opcode of a received message. Not used for sending message.

*esp_ble_mesh_model_t* **model**
Model corresponding to the message, no need to be initialized before sending message

bool **srv_send**
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp_ble_mesh_prov_t**
Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct **esp_ble_mesh_comp_t**
Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t **cid**
16-bit SIG-assigned company identifier

uint16_t **pid**
16-bit vendor-assigned product identifier
uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

**Public Members**

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both
    PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer
    Provisioning Bearer

struct esp_ble_mesh_device_delete_t
    Information of the device which is going to be deleted.

**Public Members**

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint8_t flag
    BIT0: device address; BIT1: device UUID
struct esp_ble_mesh_prov_data_info_t
   Information of the provisioner which is going to be updated.

   Public Members

   uint16_t net_idx
      NetKey Index

   uint8_t flags
      Flags

   uint32_t iv_index
      IV Index

   uint8_t flag
      BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
   Information of the provisioned node

   Public Members

   esp_ble_mesh_bd_addr_t addr
      Node device address

   esp_ble_mesh_addr_type_t addr_type
      Node device address type

   uint8_t dev_uuid[16]
      Device UUID

   uint16_t oob_info
      Node OOB information

   uint16_t unicast_addr
      Node unicast address

   uint8_t element_num
      Node element number

   uint16_t net_idx
      Node NetKey Index

   uint8_t flags
      Node key refresh flag and iv update flag
uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t *comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
    Context of Provisioner heartbeat filter information to be set
Chapter 2. API Reference

Public Members

```c
uint16_t hb_src
   Heartbeat source address (unicast address)

uint16_t hb_dst
   Heartbeat destination address (unicast address or group address)
```

```c
struct esp_ble_mesh_client_op_pair_t
   BLE Mesh client models related definitions.
   Client model Get/Set message opcode and corresponding Status message opcode
```

Public Members

```c
uint32_t cli_op
   The client message opcode

uint32_t status_op
   The server status opcode corresponding to the client message opcode
```

```c
struct esp_ble_mesh_client_t
   Client Model user data context.
```

Public Members

```c
exp_ble_mesh_model_t *model
   Pointer to the client model. Initialized by the stack.

int op_pair_size
   Size of the op_pair

const exp_ble_mesh_client_op_pair_t *op_pair
   Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
   Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
   Pointer to the internal data of client model

uint8_t msg_role
   Role of the device (Node/Provisioner) that is going to send messages
```

```c
struct esp_ble_mesh_client_common_param_t
   Common parameters of the messages sent by Client Model.
```
Public Members

```c
typedef enum esp_ble_mesh_opcode_t {
    esp_ble_mesh_opcode_t
    Message opcode
}
```

```c
typedef enum esp_ble_mesh_model_t *model
    Pointer to the client model structure
```

```c
typedef struct esp_ble_mesh_msg_ctx_t {
    The context used to send message
    int32_t msg_timeout
    Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0
}
```

```c
typedef struct esp_ble_mesh_state_transition_t {
    Parameters of the server model state transition
    bool just_started
    Indicate if the state transition has just started
    uint8_t trans_time
    State transition time
    uint8_t remain_time
    Remaining time of state transition
    uint8_t delay
    Delay before starting state transition
    uint32_t quot_t
    Duration of each divided transition step
```
Chapter 2. API Reference

```c
uint32_t counter
    Number of steps which the transition duration is divided

uint32_t total_duration
    State transition total duration

int64_t start_timestamp
    Time when the state transition is started

struct k_delayed_work timer
    Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
    Parameters of the server model received last same set message.

Public Members

uint8_t tid
    Transaction number of the last message

uint16_t src
    Source address of the last message

uint16_t dst
    Destination address of the last message

int64_t timestamp
    Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
    Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp
    BLE Mesh Server Response Option.

i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages
```
Chapter 2. API Reference

```c
uint8_t set_auto_rsp
    Response control for Client Set messages
```

```c
uint8_t status_auto_rsp
    Response control for Server Status messages
```

### Macros

**ESP_BLE_MESH_SDU_MAX_LEN**

- The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

**ESP_BLE_MESH_MIC_SHORT**

- Length of a long Mesh MIC.

**ESP_BLE_MESH_MIC_LONG**

- The maximum length of a BLE Mesh provisioned node name

**ESP_BLE_MESH_NODE_NAME_MAX_LEN**

- The maximum length of a BLE Mesh unprovisioned device name

**ESP_BLE_MESH_DEVICE_NAME_MAX_LEN**

- The maximum length of settings user id

**ESP_BLE_MESH_SETTINGS_UID_SIZE**

- Invalid settings index

**ESP_BLE_MESH_INVALID_SETTINGS_IDX**

- Define the BLE Mesh octet 16 bytes size

**ESP_BLE_MESH_OCTET16_LEN**

**ESP_BLE_MESH_OCTET8_LEN**

**ESP_BLE_MESH_CID_NVAL**

- Special TTL value to request using configured default TTL

**ESP_BLE_MESH_TTL_DEFAULT**

- Maximum allowed TTL value

**ESP_BLE_MESH_TTL_MAX**

**ESP_BLE_MESH_ADDR_UNASSIGNED**

**ESP_BLE_MESH_ADDR_ALL_NODES**

**ESP_BLE_MESH_ADDR_PROXIES**

ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)

ESP_BLE_MESH_ADDR_IS_RFU (addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)

Encode transmission count & interval steps.

Note: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Parameters

- count – Number of retransmissions (first transmission is excluded).
- int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

Parameters

- transmit – Encoded transmit count & interval value.

Returns Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

Parameters

- transmit – Encoded transmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

Parameters

- count – Number of retransmissions (first transmission is excluded).
- int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.
Chapter 2. API Reference

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

Parameters
- **transmit** – Encoded Publish Retransmit count & interval value.

Returns Retransmission count (actual transmissions equal to \(N + 1\)).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Parameters
- **transmit** – Encoded Publish Retransmit count & interval value.

Returns Transmission interval in milliseconds.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**
Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.
In case the element has no SIG or Vendor models, the helper macro **ESP_BLE_MESH_MODEL_NONE** can be given instead.

**Note:** This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
- **_loc** – Location Descriptor.
- **_mods** – Array of SIG models.
- **_vnd_mods** – Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**
BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
• _name  – Variable name given to the context.
• _msg_len – Length of the publication message.
• _role – Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
• _opcode – Message opcode.
• _min_len – Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

PROV_DATA_FLAGS_FLAG

PROV_DATA_IV_INDEX_FLAG

typedef uint8_t \texttt{esp\_ble\_mesh\_addr\_type\_t}

\begin{verbatim}
    BLE device address type.
\end{verbatim}

typedef struct \texttt{esp\_ble\_mesh\_model} \texttt{esp\_ble\_mesh\_model\_t}

typedef uint8_t \texttt{esp\_ble\_mesh\_dev\_add\_flag\_t}

typedef uint32_t \texttt{esp\_ble\_mesh\_opcode\_config\_client\_get\_t}

\begin{verbatim}
    esp\_ble\_mesh\_opcode\_config\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_get\_state function.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_opcode\_config\_client\_set\_t}

\begin{verbatim}
    esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_opcode\_config\_status\_t}

\begin{verbatim}
    esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.
\end{verbatim}

typedef uint8_t \texttt{esp\_ble\_mesh\_cfg\_status\_t}

\begin{verbatim}
    This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_opcode\_health\_client\_get\_t}

\begin{verbatim}
    esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_get\_state function.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_opcode\_health\_client\_set\_t}

\begin{verbatim}
    esp\_ble\_mesh\_opcode\_health\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_set\_state function.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_health\_model\_status\_t}

\begin{verbatim}
    esp\_ble\_mesh\_health\_model\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.
\end{verbatim}

typedef uint32_t \texttt{esp\_ble\_mesh\_generic\_message\_opcode\_t}

\begin{verbatim}
    esp\_ble\_mesh\_generic\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_generic\_client\_get\_state & esp\_ble\_mesh\_generic\_client\_set\_state. Generic OnOff Message Opcode
\end{verbatim}
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
    esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
    esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t
    esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t
    End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t
    This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t
    Values:

    enumerator ESP_BLE_MESH_TYPE_PROV_CB

    enumerator ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB

    enumerator ESP_BLE_MESH_TYPE_OUTPUT_STR_CB

    enumerator ESP_BLE_MESH_TYPE_INPUT_CB

    enumerator ESP_BLE_MESH_TYPE_LINK_OPEN_CB

    enumerator ESP_BLE_MESH_TYPE_LINK_CLOSE_CB

    enumerator ESP_BLE_MESH_TYPE_COMPLETE_CB

    enumerator ESP_BLE_MESH_TYPE_RESET_CB

enum esp_ble_mesh_oob_method_t
    Values:

    enumerator ESP_BLE_MESH_NO_OOB

    enumerator ESP_BLE_MESH_STATIC_OOB
## Chapter 2. API Reference

### Values:

**enumerator** `ESP_BLE_MESH_OUTPUT_OOB`  
**enumerator** `ESP_BLE_MESH_INPUT_OOB`

**enum** `esp_ble_mesh_output_action_t`

**Values:**

**enumerator** `ESP_BLE_MESH_NO_OUTPUT`  
**enumerator** `ESP_BLE_MESH_BLINK`  
**enumerator** `ESP_BLE_MESH_BEEP`  
**enumerator** `ESP_BLE_MESH_VIBRATE`  
**enumerator** `ESP_BLE_MESH_DISPLAY_NUMBER`  
**enumerator** `ESP_BLE_MESH_DISPLAY_STRING`

**enum** `esp_ble_mesh_input_action_t`

**Values:**

**enumerator** `ESP_BLE_MESH_NO_INPUT`  
**enumerator** `ESP_BLE_MESH_PUSH`  
**enumerator** `ESP_BLE_MESH_TWIST`  
**enumerator** `ESP_BLE_MESH_ENTER_NUMBER`  
**enumerator** `ESP_BLE_MESH_ENTER_STRING`

**enum** `esp_ble_mesh_prov_bearer_t`

**Values:**

**enumerator** `ESP_BLE_MESH_PROV_ADV`  
**enumerator** `ESP_BLE_MESH_PROV_GATT`

**enum** `esp_ble_mesh_prov_oob_info_t`

**Values:**

**enumerator** `ESP_BLE_MESH_PROV_OOB_OTHER`  
**enumerator** `ESP_BLE_MESH_PROV_OOB_URI`
Chapter 2. API Reference

enumerator ESP_BLE_MESH_PROV_OOB_2D_CODE
enumerator ESP_BLE_MESH_PROV_OOB_BAR_CODE
enumerator ESP_BLE_MESH_PROV_OOB_NFC

enumerator ESP_BLE_MESH_PROV_OOB_IN_MANUAL
enumerator ESP_BLE_MESH_PROV_OOB_ON_DEV

enum esp_ble_mesh_dev_role_t
    Values:
        enumerator ROLE_NODE
        enumerator ROLE_PROVISIONER
        enumerator ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
    Values:
        enumerator FAST_PROV_ACT_NONE
        enumerator FAST_PROV_ACT_ENTER
        enumerator FAST_PROV_ACT_SUSPEND
        enumerator FAST_PROV_ACT_EXIT
        enumerator FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
    Values:
        enumerator PROXY_FILTER_WHITELIST
enumerator **PROXY_FILTER_BLACKLIST**

enum **esp_ble_mesh_prov_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_PROV_REGISTER_COMP_EVT**
Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT**
Set the unprovisioned device name completion event

enumerator **ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT**
Enable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT**
Disable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT**
Establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT**
Close a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT**
Generate Node input OOB public key event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT**
Generate Node Output Number event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT**
Generate Node Output String event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_EVT**
Event requiring the user to input a number or string

enumerator **ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT**
Provisioning done event

enumerator **ESP_BLE_MESH_NODE_PROV_RESET_EVT**
Provisioning reset event

enumerator **ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT**
Node set oob public key completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**
Node input number completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**
Node input string completion event

Provisioner input number completion event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

denumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

denumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

denumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

denumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

denumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event

denumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

denumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event
enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event

enumerator **ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**
Set fast provisioning action completion event

enumerator **ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**
Receive Heartbeat message event
enumerator **ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**
Enable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**
Disable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_POLL_COMP_EVT**
Low Power Node send Friend Poll completion event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**
Low Power Node establishes friendship event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**
Low Power Node terminates friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**
Friend Node establishes friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT**
Friend Node terminates friendship event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT**
Proxy Client receives Network ID advertising packet event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT**
Proxy Client establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT**
Proxy Client terminates connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT**
Proxy Client receives Proxy Filter Status event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT**
Proxy Client connect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT**
Proxy Client disconnect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT**
Proxy Client set filter type completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**
Proxy Client add filter address completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**
Proxy Client remove filter address completion event
Chapter 2. API Reference

enumerator ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
    Proxy Server establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT
    Proxy Server terminates connection successfully event

enumerator ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model subscribes group address completion event

enumerator ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model unsubscribes group address completion event

enumerator ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
    De-initialize BLE Mesh stack completion event

enumerator ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
    BLE Mesh server models related definitions.
    This enum value is the flag of transition timer operation
    Values:

    enumerator ESP_BLE_MESH_SERVER_TRANS_TIMER_START

    enumerator ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
    This enum value is the type of server model states
    Values:

    enumerator ESP_BLE_MESH_GENERIC_ONOFF_STATE

    enumerator ESP_BLE_MESH_GENERIC_LEVEL_STATE

    enumerator ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE

    enumerator ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE

    enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE

    enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE

    enumerator ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE

    enumerator ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
Chapter 2. API Reference

enumerator **ESP_BLE_MESH_LIGHT_HSL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_HUE_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE**

enumerator **ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE**

enumerator **ESP_BLE_MESH_SERVER_MODEL_STATE_MAX**

enum **esp_ble_mesh_model_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_MODEL_OPERATION_EVT**
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP_BLE_MESH_MODEL_SEND_COMP_EVT**
User-defined models send messages completion event

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT**
User-defined models publish messages completion event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT**
User-defined client models receive publish messages event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT**
Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT**
When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT**
Server models update state value completion event

enumerator **ESP_BLE_MESH_MODEL_EVT_MAX**

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- **ESP-BLE-MESH Stack Initialization**
Chapter 2. API Reference

- **Reading of Local Data Information**
- **Low Power Operation (Updating)**
- **Sending/Publishing Messages, add Local AppKey, etc.**
- **ESP-BLE-MESH Node/Provisioner Provisioning**
- **ESP-BLE-MESH GATT Proxy Server**

ESP-BLE-MESH Stack Initialization

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Parameters**

- `prov` - [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- `comp` - [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**Returns**

- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)
```

De-initialize BLE Mesh module.

**Note:** This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Parameters**

- `param` - [in] Pointer to the structure of BLE Mesh deinit parameters.

**Returns**

- ESP_OK on success or error code otherwise.

**Reading of Local Data Information**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

**Functions**

```c
int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

**Parameters**

**Returns**

- Publish period value on success, 0 or (negative) error code from errno.h on failure.

```c
uint16_t esp_ble_mesh_get_primary_element_address(void)
```

Get the address of the primary element.

**Returns**

- Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.
**Chapter 2. API Reference**

```c
uint16_t* esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)
```

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Parameters**
- `model` - [in] Pointer to the model.
- `group_addr` - [in] Group address.

**Returns**
- Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

```c
esp_ble_mesh_elem_t* esp_ble_mesh_find_element (uint16_t element_addr) 
```

Find the BLE Mesh element pointer via the element address.

**Parameters**
- `element_addr` - [in] Element address.

**Returns**
- Pointer to the element on success, or NULL on failure.

```c
uint8_t esp_ble_mesh_get_element_count (void) 
```

Get the number of elements that have been registered.

**Returns**
- Number of elements.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t* element, uint16_t company_id, uint16_t model_id) 
```

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Parameters**
- `element` - [in] Element to which the model belongs.
- `company_id` - [in] A 16-bit company identifier assigned by the Bluetooth SIG.

**Returns**
- Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t* element, uint16_t model_id) 
```

Find the SIG model with the given element and Model id.

**Parameters**
- `element` - [in] Element to which the model belongs.
- `model_id` - [in] SIG model identifier.

**Returns**
- Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

```c
const esp_ble_mesh_comp_t* esp_ble_mesh_get_composition_data (void) 
```

Get the Composition data which has been registered.

**Returns**
- Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

```c
esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr) 
```

A local model of node or Provisioner subscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**
- `element_addr` - [in] Unicast address of the element to which the model belongs.
Chapter 2. API Reference

- `group_addr` - [in] The group address to be subscribed.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_model_unsubscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
```

A local model of node or Provisioner unsubscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**
- `element_addr` - [in] Unicast address of the element to which the model belongs.
- `group_addr` - [in] The subscribed group address.

**Returns** ESP_OK on success or error code otherwise.

```c
const uint8_t* esp_ble_mesh_node_get_local_net_key(uint16_t net_idx)
```

This function is called by Node to get the local NetKey.

**Parameters** `net_idx` - [in] NetKey index.

**Returns** NetKey on success, or NULL on failure.

```c
const uint8_t* esp_ble_mesh_node_get_local_app_key(uint16_t app_idx)
```

This function is called by Node to get the local AppKey.

**Parameters** `app_idx` - [in] AppKey index.

**Returns** AppKey on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_node_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Node to add a local NetKey.

**Note:** This function can only be called after the device is provisioned.

**Parameters**
- `net_key` - [in] NetKey to be added.
- `net_idx` - [in] NetKey Index.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is called by Node to add a local AppKey.

**Note:** The `net_idx` must be an existing one. This function can only be called after the device is provisioned.

**Parameters**
- `app_key` - [in] AppKey to be added.
- `net_idx` - [in] NetKey Index.
- `app_idx` - [in] AppKey Index.

**Returns** ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

**Note:** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

### Parameters
- **element_addr** - [in] Node local element address
- **company_id** - [in] Node local company id
- **model_id** - [in] Node local model id
- **app_idx** - [in] Node local appkey index

**Returns** ESP_OK on success or error code otherwise.

---

**Low Power Operation (Updating)**

### Header File
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

### Functions

**esp_err_t esp_ble_mesh_lpn_enable** (void)

Enable BLE Mesh device LPN functionality.

**Note:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_lpn_disable** (bool force)

Disable BLE Mesh device LPN functionality.

**Parameters**
- **force** - [in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_lpn_poll** (void)

LPN tries to poll messages from the Friend Node.

**Note:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Returns** ESP_OK on success or error code otherwise.

---

**Send/Publish Messages, add Local AppKey, etc.**
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

**esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)**

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Parameters**

- **callback** - [in] Pointer to the callback function.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t* data, uint32_t opcode)**

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note:** This API is only used to set the opcode of the message.

**Parameters**

- **data** - [in] Pointer to the message data.
- **opcode** - [in] The message opcode.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)**

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

**Parameters**

- **model** - [in] BLE Mesh Client model to which the message belongs.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)**

De-initialize the user-defined client model.

**Note:** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Parameters**

- **model** - [in] Pointer of the Client model.
- **Returns** ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_server_model_send_msg**

```c
esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model,
   esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
   uint16_t length, uint8_t *data)
```

Send server model messages (such as server model status messages).

**Parameters**

- `model` - [in] BLE Mesh Server Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of Access Payload (exclude the message opcode) to be sent.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_send_msg**

```c
esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
   esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
   uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp,
   esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

**Parameters**

- `model` - [in] BLE Mesh Client Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `msg_timeout` - [in] Time to get response to the message (in milliseconds).
- `need_rsp` - [in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- `device_role` - [in] Role of the device (Node/Provisioner) that sends the message.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_publish**

```c
esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note:** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Parameters**

- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `device_role` - [in] Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_server_model_update_state**

```c
esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model,
   esp_ble_mesh_server_state_type_t type,
   esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.
Chapter 2. API Reference

**Note:** Currently this API is used to update bound state value, not for all server model states.

**Parameters**
- **model** [-in] Server model which is going to update the state.
- **type** [-in] Server model state type.
- **value** [-in] Server model state value.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_local_reset (void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note:** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Parameters**
- **index** [-in] Index of the node in the node queue.
- **name** [-in] Name (end by `\0`) to be set for the node.

**Returns** ESP_OK on success or error code otherwise.

```c
const char *esp_ble_mesh_provisioner_get_node_name (uint16_t index)
```

This function is called to get the node (provisioned device) name.

**Parameters**
- **index** [in] Index obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

```c
uint16_t esp_ble_mesh_provisioner_get_node_index (const char *name)
```

This function is called to get the node (provisioned device) index.

**Parameters**
- **name** [in] Name of the node (end by `\0`).

**Returns** Node index on success, or an invalid value (0xFFFF) on failure.

```c
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)
```

This function is called to store the Composition Data of the node.

**Parameters**
- **unicast_addr** [-in] Element address of the node
- **data** [-in] Pointer of Composition Data
- **length** [-in] Length of Composition Data

**Returns** ESP_OK on success or error code otherwise.
**esp_ble_mesh_node_t** *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

**Parameters**
- **uuid** – [in] Device UUID of the node

**Returns**
- Pointer of the node info struct or NULL on failure.

**esp_ble_mesh_node_t** *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

**Parameters**
- **unicast_addr** – [in] Unicast address of the node

**Returns**
- Pointer of the node info struct or NULL on failure.

**esp_ble_mesh_node_t** *esp_ble_mesh_provisioner_get_node_with_name (const char *name)

This function is called to get the provisioned node information with the node name.

**Parameters**
- **name** – [in] Name of the node (end by '\0').

**Returns**
- Pointer of the node info struct or NULL on failure.

**uint16_t** esp_ble_mesh_provisioner_get_prov_node_count (void)

This function is called by Provisioner to get provisioned node count.

**Returns**
- Number of the provisioned nodes.

**const esp_ble_mesh_node_t** **esp_ble_mesh_provisioner_get_node_table_entry (void)

This function is called by Provisioner to get the entry of the node table.

**Note:** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node)* is NULL. For example: ```
const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry();
for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) {
    const esp_ble_mesh_node_t *node = entry[i];
    if (node) {
        // ...}
```  

**Returns**
- Pointer to the start of the node table.

**esp_err_t** esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

**Parameters**
- **uuid** – [in] Device UUID of the node

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t** esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

**Parameters**
- **unicast_addr** – [in] Unicast address of the node

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t** esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

**Note:** app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Parameters**
- **app_key** – [in] The app key to be set for the local BLE Mesh stack.
**app_idx** – [in] The app key index.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

**Parameters**

- **app_key** – [in] Value of the AppKey.
- **net_idx** – [in] Corresponding NetKey Index.
- **app_idx** – [in] The AppKey Index

**Returns** ESP_OK on success or error code otherwise.

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

**Parameters**

- **app_idx** – [in] Application key index.

**Returns** App key on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

**Note:** company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

**Parameters**

- **element_addr** – [in] Provisioner local element address
- **app_idx** – [in] Provisioner local appkey index
- **model_id** – [in] Provisioner local model id
- **company_id** – [in] Provisioner local company id

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

**Note:** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Parameters**

- **net_key** – [in] The network key to be added to the Provisioner local BLE Mesh stack.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Parameters**

- **net_key** – [in] Value of the NetKey.
• net_idx  [in]  The NetKey Index.

Returns  ESP_OK on success or error code otherwise.

const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Returns  Network key on success, or NULL on failure.

esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note:  If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Parameters  enable  [in]  Enable or disable receiving heartbeat messages.

Returns  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

Note:  1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

   a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Parameters  type  [in]  Heartbeat filter type (acceptlist or rejectlist).

Returns  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info (uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

a. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

   • The filter entry with the same SRC or DST will be removed.

Note:  1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

   • If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.

   • If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.

   • If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Parameters

• op  [in]  Add or REMOVE
• **info**  [in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

Returns ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_direct_erase_settings**(void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Returns ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_open_settings_with_index**(uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **index**  [in] Settings index.

Returns ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid**(const char* uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **uid**  [in] Settings user id.

Returns ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_close_settings_with_index**(uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ...

Parameters

• **index**  [in] Settings index.

• **erase**  [in] Indicate if erasing mesh information.

Returns ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid** (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides being cleaned from the mesh stack.

b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) … ...

**Parameters**
- **uid** [in] Settings user id.
- **erase** [in] Indicate if erasing mesh information.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** index [in] Settings index.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** uid [in] Settings user id.

**Returns** ESP_OK on success or error code otherwise.

**const char *esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

**Parameters** index [in] Settings index.

**Returns** Setting user id on success or NULL on failure.

**uint8_t esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

**Parameters** uid [in] Settings user id.

**Returns** Settings index.

**uint8_t esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

**Returns** Number of free settings user id.
const uint8_t* esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)
This function is called to get fast provisioning application key.

Parameters
• app_idx – [in] Application key index.

Returns Application key on success, or NULL on failure.

Type Definitions
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)
: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions
esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)
Register BLE Mesh provisioning callback.

Parameters callback – [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

bool esp_ble_mesh_node_is_provisioned(void)
Check if a device has been provisioned.

Returns TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable specific provisioning bearers to get the device ready for provisioning.

Note: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Parameters bearers – Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable specific provisioning bearers to make a device inaccessible for provisioning.

Parameters bearers – Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])
Unprovisioned device set own oob public key & private key pair.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
Chapter 2. API Reference

Parameters

- **pub_key_x** [in] Unprovisioned device’s Public Key X
- **pub_key_y** [in] Unprovisioned device’s Public Key Y
- **private_key** [in] Unprovisioned device’s Private Key

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_input_number(uint32_t number)
```

Provide provisioning input OOB number.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT
with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**

- **number** [in] Number input by device.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_input_string(const char* string)
```

Provide provisioning input OOB string.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT
with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**

- **string** [in] String input by device.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char* name)
```

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its
advertising data.

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Parameters**

- **name** [in] Unprovisioned device name

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t* pub_key_x[32],
                                                   uint8_t* pub_key_y[32])
```

Provisioner inputs unprovisioned device’s oob public key.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Parameters**

- **link_idx** [in] The provisioning link index
- **pub_key_x** [in] Unprovisioned device’s Public Key X
- **pub_key_y** [in] Unprovisioned device’s Public Key Y

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_input_string(const char* string, uint8_t link_idx)
```

Provide provisioning input OOB string.
This is intended to be called after the esp_ble_mesh_prov_t prov_→input_num
callback has been called with ESP_BLE_MESH_ENTER_STRING as the...

Parameters
• string [in] String input by Provisioner.
• link_idx [in] The provisioning link index.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)`
Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_→input_num
callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the...

Parameters
• number [in] Number input by Provisioner.
• link_idx [in] The provisioning link index.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)`
Enable one or more provisioning bearers.

Note: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

Parameters bearers [in] Bit-wise OR of provisioning bearers.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)`
Disable one or more provisioning bearers.

Note: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

Parameters bearers [in] Bit-wise OR of provisioning bearers.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)`
Add unprovisioned device info to the unprov_dev queue.

Note: 1. Currently address type only supports public address and static random address.
   a. If device UUID and/or device address as well as address type already exist in the device queue, but the
      bearer is different from the existing one, add operation will also be successful and it will update the
      provision bearer supported by the device.
   b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovi-
      sioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add
the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.

- If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
- If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
- If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

---

**Parameters**

- **add_dev** – [in] Pointer to a struct containing the device information
- **flags** – [in] Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
            esp_ble_mesh_bd_addr_t addr,
            esp_ble_mesh_addr_type_t addr_type,
            esp_ble_mesh_prov_bearer_t bearer,
            uint16_t oob_info,        
            uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Note:** 1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

c. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

---

**Parameters**

- **uuid** – [in] Device UUID of the unprovisioned device
Chapter 2. API Reference

- **addr** - [in] Device address of the unprovisioned device
- **addr_type** - [in] Device address type of the unprovisioned device
- **bearer** - [in] Provisioning bearer going to be used by Provisioner
- **oob_info** - [in] OOB info of the unprovisioned device
- **unicast_addr** - [in] Unicast address going to be allocated for the unprovisioned device

Returns: Zero on success or (negative) error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note:** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters: del_dev - [in] Pointer to a struct containing the device information.

Returns: ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t*match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Parameters:
- **match_val** - [in] Value to be compared with the part of the device UUID.
- **match_len** - [in] Length of the compared match value.
- **offset** - [in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** - [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

Returns: ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

Parameters: prov_data_info - [in] Pointer to a struct containing net_idx or flags or iv_index.

Returns: ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t*value, uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Parameters:
- **value** - [in] Pointer to the static oob value.
- **length** - [in] Length of the static oob value.
Chapter 2. API Reference

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr:uint16_t addr
```
This function is called by Provisioner to set own Primary element address.

**Note:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Parameters `addr` - [in] Unicast address of the Primary element of Provisioner.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info:esp_ble_mesh_fast_prov_info_t *fast_prov_info
```
This function is called to set provisioning data information before starting fast provisioning.

Parameters `fast_prov_info` - [in] Pointer to a struct containing unicast address range, net_idx, etc.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_action:esp_ble_mesh_fast_prov_action_t action
```
This function is called to start/suspend/exit fast provisioning.

Parameters `action` - [in] fast provisioning action (i.e. enter, suspend, exit).

Returns ESP_OK on success or error code otherwise.

**Type Definitions**

```c
typedef void(*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
  esp_ble_mesh_prov_cb_param_t *param)
```
: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void(*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr,
  const esp_ble_mesh_addr_type_t addr_type,
  const uint8_t adv_type,
  const uint8_t *dev_uuid,
  uint16_t oob_info,
  esp_ble_mesh_prov_bearer_t bearer)
```
Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters `addr` - [in] Pointer to the unprovisioned device address.

Parameters `addr_type` - [in] Unprovisioned device address type.

Parameters `adv_type` - [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).

Parameters `dev_uuid` - [in] Unprovisioned device UUID pointer.

Parameters `oob_info` - [in] OOB information of the unprovisioned device.

Parameters `bearer` - [in] Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h
Chapter 2. API Reference

Functions

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
```
Enable advertising with Node Identity.

**Note:** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable(void)
```
Enable BLE Mesh GATT Proxy Service.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable(void)
```
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(esp_ble_mesh_bd_addr_t addr,
                                          esp_ble_mesh_addr_type_t addr_type,
                                          uint16_t net_idx)
```
Proxy Client creates a connection with the Proxy Server.

**Parameters**
- `addr` - [in] Device address of the Proxy Server.
- `addr_type` - [in] Device address type (public or static random).
- `net_idx` - [in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
```
Proxy Client terminates a connection with the Proxy Server.

**Parameters** `conn_handle` - [in] Proxy connection handle.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle,
                                                     uint16_t net_idx,
                                                     esp_ble_mesh_proxy_filter_type_t filter_type)
```
Proxy Client sets the filter type of the Proxy Server.

**Parameters**
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `filter_type` - [in] whitelist or blacklist.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle,
                                                     uint16_t net_idx,
                                                     uint16_t *addr,
                                                     uint16_t addr_num)
```
Proxy Client adds address to the Proxy Server filter list.

**Parameters**
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `addr` - [in] Pointer to the filter address.
- `addr_num` - [in] Number of the filter address.

**Returns** ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr** (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

**Parameters**
- **conn_handle** - [in] Proxy connection handle.
- **net_idx** - [in] Corresponding NetKey Index.
- **addr** - [in] Pointer to the filter address.
- **addr_num** - [in] Number of the filter address.

**Returns** ESP_OK on success or error code otherwise.

---

**ESP-BLE-MESH Models API Reference**

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
- **Configuration Client/Server Models**
- **Health Client/Server Models**
- **Generic Client/Server Models**
- **Sensor Client/Server Models**
- **Time and Scenes Client/Server Models**
- **Lighting Client/Server Models**

**Note:** Definitions related to Server Models are being updated, and will be released soon.

---

**Configuration Client/Server Models**

**Header File**
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

**Functions**

**esp_err_t esp_ble_mesh_register_config_client_callback** *(esp_ble_mesh_cfg_client_cb_t callback)*

Register BLE Mesh Config Client Model callback.

- **Parameters**
  - callback - [in] Pointer to the callback function.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_config_server_callback** *(esp_ble_mesh_cfg_server_cb_t callback)*

Register BLE Mesh Config Server Model callback.

- **Parameters**
  - callback - [in] Pointer to the callback function.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_config_client_get_state** *(esp_ble_mesh_cfg_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)*

Get the value of Config Server Model states using the Config Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

Parameters

- **params** [in] Pointer to BLE Mesh common client parameters.
- **get_state** [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`.

Unions

```c

esp_ble_mesh_cfg_app_key_list_cb_t appkey_list
The application key index list value

esp_ble_mesh_cfg_node_id_status_cb_t node_identity_status
The node identity status value

esp_ble_mesh_cfg_model_app_list_cb_t model_app_list
The model application key index list value

esp_ble_mesh_cfg_kr_phase_status_cb_t kr_phase_status
The key refresh phase status value

esp_ble_mesh_cfg_lpn_pollto_status_cb_t lpn_timeout_status
The low power node poll timeout status value

union esp_ble_mesh_cfg_server_state_change_t
#include <esp_ble_mesh_config_model_api.h> Configuration Server model state change value union.

Public Members

esp_ble_mesh_state_change_cfg_mod_pub_set_t mod_pub_set
The recv_op in ctx can be used to decide which state is changed. Config Model Publication Set

esp_ble_mesh_state_change_cfg_model_sub_add_t mod_sub_add
Config Model Subscription Add

esp_ble_mesh_state_change_cfg_model_sub_delete_t mod_sub_delete
Config Model Subscription Delete

esp_ble_mesh_state_change_cfg_netkey_add t netkey_add
Config NetKey Add
Chapter 2. API Reference

`esp_ble_mesh_state_change_cfg_netkey_update_t netkey_update`
Config NetKey Update

`esp_ble_mesh_state_change_cfg_netkey_delete_t netkey_delete`
Config NetKey Delete

`esp_ble_mesh_state_change_cfg_appkey_add_t appkey_add`
Config AppKey Add

`esp_ble_mesh_state_change_cfg_appkey_update_t appkey_update`
Config AppKey Update

`esp_ble_mesh_state_change_cfg_appkey_delete_t appkey_delete`
Config AppKey Delete

`esp_ble_mesh_state_change_cfg_model_app_bind_t mod_app_bind`
Config Model App Bind

`esp_ble_mesh_state_change_cfg_model_app_unbind_t mod_app_unbind`
Config Model App Unbind

`esp_ble_mesh_state_change_cfg_kr_phase_set_t kr_phase_set`
Config Key Refresh Phase Set

union `esp_ble_mesh_cfg_server_cb_value_t`

#include `<esp_ble_mesh_config_model_api.h>` Configuration Server model callback value union.

Public Members

`esp_ble_mesh_cfg_server_state_change_t state_change`
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures

struct `esp_ble_mesh_cfg_srv`
Configuration Server Model context

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Configuration Server Model

`uint8_t net_transmit`
Network Transmit state

`uint8_t relay`
Relay Mode state
uint8_t relay_retransmit
    Relay Retransmit state

uint8_t beacon
    Secure Network Beacon state

uint8_t gatt_proxy
    GATT Proxy state

uint8_t friend_state
    Friend state

uint8_t default_ttl
    Default TTL

struct k_delayed_work timer
    Heartbeat Publication timer

uint16_t dst
    Destination address for Heartbeat messages

uint16_t count
    Number of Heartbeat messages to be sent
    Number of Heartbeat messages received

uint8_t period
    Period for sending Heartbeat messages

uint8_t ttl
    TTL to be used when sending Heartbeat messages

uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
    NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
    Heartbeat Publication

int64_t expiry
    Timestamp when Heartbeat subscription period is expired

uint16_t src
    Source address for Heartbeat messages

uint8_t min_hops
    Minimum hops when receiving Heartbeat messages
uint8_t `max_hops`

Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`

Optional heartbeat subscription tracking function

struct `esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub`

Heartbeat Subscription

struct `esp_ble_mesh_cfg_composition_data_get_t`

Parameters of Config Composition Data Get.

**Public Members**

uint8_t `page`

Page number of the Composition Data.

struct `esp_ble_mesh_cfg_model_pub_get_t`

Parameters of Config Model Publication Get.

**Public Members**

uint16_t `element_addr`

The element address

uint16_t `model_id`

The model id

uint16_t `company_id`

The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_sig_model_sub_get_t`

Parameters of Config SIG Model Subscription Get.

**Public Members**

uint16_t `element_addr`

The element address

uint16_t `model_id`

The model id

struct `esp_ble_mesh_cfg_vnd_model_sub_get_t`

Parameters of Config Vendor Model Subscription Get.
Chapter 2. API Reference

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_app_key_get_t
    Parameters of Config AppKey Get.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
struct esp_ble_mesh_cfg_node_identity_get_t
    Parameters of Config Node Identity Get.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
struct esp_ble_mesh_cfg_sig_model_app_get_t
    Parameters of Config SIG Model App Get.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_id
    The model id
```

```c
struct esp_ble_mesh_cfg_vnd_model_app_get_t
    Parameters of Config Vendor Model App Get.
```

Public Members

```c
uint16_t element_addr
    The element address
```
**Chapter 2. API Reference**

```c
uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_get_t**

Parameters of Config Key Refresh Phase Get.

**Public Members**

```c
uint16_t net_idx
   The network key index
```

```c
 struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.
```

**Public Members**

```c
uint16_t lpn_addr
   The unicast address of the Low Power node
```

**struct esp_ble_mesh_cfg_beacon_set_t**

Parameters of Config Beacon Set.

**Public Members**

```c
uint8_t beacon
   New Secure Network Beacon state
```

**struct esp_ble_mesh_cfg_default_ttl_set_t**

Parameters of Config Default TTL Set.

**Public Members**

```c
uint8_t ttl
   The default TTL state value
```

**struct esp_ble_mesh_cfg_friend_set_t**

Parameters of Config Friend Set.

**Public Members**

```c
uint8_t friend_state
   The friend state value
```
struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value

uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.
Public Members

```
uint16_t element_addr
    The element address

uint16_t model_app_idx
    Index of the app key to bind with the model

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.

Public Members

```
uint16_t element_addr
    The element address

uint16_t publish_addr
    Value of the publish address

uint16_t publish_app_idx
    Index of the application key

bool cred_flag
    Value of the Friendship Credential Flag

uint8_t publish_ttl
    Default TTL value for the publishing messages

uint8_t publish_period
    Period for periodic status publishing

uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.
Chapter 2. API Reference

Public Members

uint16_t `element_addr`
  The element address

uint16_t `sub_addr`
  The address to be added to the Subscription List

uint16_t `model_id`
  The model id

uint16_t `company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_delete_t`
  Parameters of Config Model Subscription Delete.

Public Members

uint16_t `element_addr`
  The element address

uint16_t `sub_addr`
  The address to be removed from the Subscription List

uint16_t `model_id`
  The model id

uint16_t `company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_overwrite_t`
  Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t `element_addr`
  The element address

uint16_t `sub_addr`
  The address to be added to the Subscription List

uint16_t `model_id`
  The model id

uint16_t `company_id`
  The company id, if not a vendor model, shall set to 0xFFFF
struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

**Public Members**

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List
uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

**Public Members**

uint16_t element_addr
The element address

uint8_t label_uuid[16]
Value of the Label UUID publish address

uint16_t publish_app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t publish_ttl
Default TTL value for the publishing messages

uint8_t publish_period
Period for periodic status publishing

uint8_t publish_retransmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
Parameters of Config Model Subscription Delete All.

**Public Members**

uint16_t element_addr
The element address
uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_net_key_update_t**
Parameters of Config NetKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint8_t **net_key[16]**
The network key value

struct **esp_ble_mesh_cfg_net_key_delete_t**
Parameters of Config NetKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index

struct **esp_ble_mesh_cfg_app_key_update_t**
Parameters of Config AppKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint16_t **app_idx**
The app key index

uint8_t **app_key[16]**
The app key value

struct **esp_ble_mesh_cfg_app_key_delete_t**
Parameters of Config AppKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index
uint16_t app_idx
    The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
    Parameters of Config Node Identity Set.

Public Members

uint16_t net_idx
    The network key index

uint8_t identity
    New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind.

Public Members

uint16_t element_addr
    The element address

uint16_t model_app_idx
    Index of the app key to bind with the model

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set.

Public Members

uint16_t net_idx
    The network key index

uint8_t transition
    New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t
    Parameters of Config Network Transmit Set.
Public Members

uint8_t net_transmit
    Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t
    Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t dst
    Destination address for Heartbeat messages

uint8_t count
    Number of Heartbeat messages to be sent

uint8_t period
    Period for sending Heartbeat messages

uint8_t ttl
    TTL to be used when sending Heartbeat messages

uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
    NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
    Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
    Parameter of Config Beacon Status
Public Members

uint8_t \texttt{beacon} \\
Secure Network Beacon state value

struct \texttt{esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t} \\
Parameters of Config Composition Data Status

Public Members

uint8_t \texttt{page} \\
Page number of the Composition Data

struct net\_buf\_simple *\texttt{composition\_data} \\
Pointer to Composition Data for the identified page

struct \texttt{esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t} \\
Parameter of Config Default TTL Status

Public Members

uint8_t \texttt{default\_ttl} \\
Default TTL state value

struct \texttt{esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t} \\
Parameter of Config GATT Proxy Status

Public Members

uint8_t \texttt{gatt\_proxy} \\
GATT Proxy state value

struct \texttt{esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t} \\
Parameters of Config Relay Status

Public Members

uint8_t \texttt{relay} \\
Relay state value

uint8_t \texttt{retransmit} \\
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct \texttt{esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t} \\
Parameters of Config Model Publication Status
Chapter 2. API Reference

**Public Members**

```c
uint8_t status
  Status Code for the request message

uint16_t element_addr
  Address of the element

uint16_t publish_addr
  Value of the publish address

uint16_t app_idx
  Index of the application key

bool cred_flag
  Value of the Friendship Credential Flag

uint8_t ttl
  Default TTL value for the outgoing messages

uint8_t period
  Period for periodic status publishing

uint8_t transmit
  Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
  Company ID

uint16_t model_id
  Model ID
```

```
struct esp_ble_mesh_cfg_model_sub_status_cb_t
  Parameters of Config Model Subscription Status
```

**Public Members**

```c
uint8_t status
  Status Code for the request message

uint16_t element_addr
  Address of the element

uint16_t sub_addr
  Value of the address

uint16_t company_id
  Company ID
```
uint16_t model_id
    Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
    Parameters of Config NetKey Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
    Parameters of Config AppKey Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

    uint16_t app_idx
        Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
    Parameters of Config Model App Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t element_addr
        Address of the element

    uint16_t app_idx
        Index of the application key

    uint16_t company_id
        Company ID
uint16_t model_id
  Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
  Parameter of Config Friend Status

  **Public Members**

  uint8_t friend_state
    Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t
  Parameters of Config Heartbeat Publication Status

  **Public Members**

  uint8_t status
    Status Code for the request message

  uint16_t dst
    Destination address for Heartbeat messages

  uint8_t count
    Number of Heartbeat messages remaining to be sent

  uint8_t period
    Period for sending Heartbeat messages

  uint8_t ttl
    TTL to be used when sending Heartbeat messages

  uint16_t features
    Features that trigger Heartbeat messages when changed

  uint16_t net_idx
    Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
  Parameters of Config Heartbeat Subscription Status

  **Public Members**

  uint8_t status
    Status Code for the request message
uint16_t src  
Source address for Heartbeat messages

uint16_t dst  
Destination address for Heartbeat messages

uint8_t period  
Remaining Period for processing Heartbeat messages

uint8_t count  
Number of Heartbeat messages received

uint8_t min_hops  
Minimum hops when receiving Heartbeat messages

uint8_t max_hops  
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t  
Parameters of Config Network Transmit Status

**Public Members**

uint8_t net_trans_count  
Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step  
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t  
Parameters of Config SIG/Vendor Subscription List

**Public Members**

uint8_t status  
StatusCode for the request message

uint16_t element_addr  
Address of the element

uint16_t company_id  
Company ID

uint16_t model_id  
Model ID
Chapter 2. API Reference

struct net_buf_simple *sub_addr
A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
Parameter of Config NetKey List

Public Members

struct net_buf_simple *net_idx
A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
Parameters of Config AppKey List

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
A list of AppKey indexes that are bound to the NetKey identified by NetKeyId

struct esp_ble_mesh_cfg_node_id_status_cb_t
Parameters of Config Node Identity Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t identity
Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
Status Code for the request message
uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

    uint8_t phase
        Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
    Parameters of Config Low Power Node PollTimeout Status

    Public Members

    uint16_t lpn_addr
        The unicast address of the Low Power node

    int32_t poll_timeout
        The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
    Configuration Client Model callback parameters

    Public Members

    int error_code
        Appropriate error code
\textit{esp_ble_mesh_client_common_param_t *params}

The client common parameters

\textit{esp_ble_mesh_cfg_client_common_cb_param_t status_cb}

The config status message callback values

\textbf{Public Members}

\begin{verbatim}
uint16_t element_addr
    Element Address

uint16_t pub_addr
    Publish Address

uint16_t app_idx
    AppKey Index

bool cred_flag
    Friendship Credential Flag

uint8_t pub_ttl
    Publish TTL

uint8_t pub_period
    Publish Period

uint8_t pub_retransmit
    Publish Retransmit

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID
\end{verbatim}

\text{Value of the received configuration messages}
\end{align*}

\textbf{Macros}

\begin{align*}
\text{ESP\_BLE\_MESH\_MODEL\_CFG\_SRV}(\text{srv\_data})
\end{align*}

Define a new Config Server Model.

\textbf{Note:} The Config Server Model can only be included by a Primary Element.

\begin{align*}
\text{Parameters} & \\
\text{• srv\_data} & \text{– Pointer to a unique Config Server Model user\_data.}
\end{align*}

Returns New Config Server Model instance.

\begin{align*}
\text{ESP\_BLE\_MESH\_MODEL\_CFG\_CLI}(\text{cli\_data})
\end{align*}

Define a new Config Client Model.

\textbf{Note:} The Config Client Model can only be included by a Primary Element.

\begin{align*}
\text{Parameters} & \\
\text{• cli\_data} & \text{– Pointer to a unique struct } \text{esp\_ble\_mesh\_client\_t}. \\
\text{Returns} & \text{New Config Client Model instance.}
\end{align*}

\textbf{Type Definitions}

typedef struct \textbf{esp\_ble\_mesh\_cfg\_srv} \textbf{esp\_ble\_mesh\_cfg\_srv\_t}

Configuration Server Model context

typedef void (*\textbf{esp\_ble\_mesh\_cfg\_client\_cb\_t})(\textbf{esp\_ble\_mesh\_cfg\_client\_cb\_event\_t} \text{event, esp\_ble\_mesh\_cfg\_client\_cb\_param\_t} *\text{param})

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

\begin{align*}
\text{Param event} & \text{ Event type} \\
\text{Param param} & \text{ Pointer to callback parameter}
\end{align*}
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

- **Param event**: Event type
- **Param param**: Pointer to callback parameter

### Enumerations

**enum esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

**Values:**

- enumerator ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
- enumerator ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
- enumerator ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
- enumerator ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
- enumerator ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

**enum esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

**Values:**

- enumerator ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
- enumerator ESP_BLE_MESH_CFG_SERVER_EVT_MAX

### Health Client/Server Models

### Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

### Functions

**esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)**

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Parameters**

- **callback** – [in] Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)**

Register BLE Mesh Health Server Model callback.

**Parameters**

- **callback** – [in] Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.
\textit{esp_err_t} \textbf{esp_ble_mesh_health_client_get_state}\( \text{\( (\text{esp_ble_mesh_client_common_param_t}\)}\ \\
\text{\( *params, \text{ \text{esp_ble_mesh_health_client_get_state_t}\)}\ \\
\text{\( *get\_state)\))}\)

This function is called to get the Health Server states using the Health Client Model get messages.

\textbf{Note:} If you want to find the opcodes and corresponding meanings accepted by this API, please refer to \text{esp_ble_mesh_opcode_health_client_get_t} in \text{esp_ble_mesh_defs.h}\n
\textbf{Parameters}
\begin{itemize}
\item \textbf{params} – [in] Pointer to BLE Mesh common client parameters.
\item \textbf{get\_state }–[in] Pointer to a union, each kind of opcode corresponds to one structure
inside. Shall not be set to NULL.
\end{itemize}

\textbf{Returns} ESP_OK on success or error code otherwise.

\textit{esp_err_t} \textbf{esp_ble_mesh_health_client_set_state}\( \text{\( (\text{esp_ble_mesh_client_common_param_t}\)}\ \\
\text{\( *params, \text{ \text{esp_ble_mesh_health_client_set_state_t}\)}\ \\
\text{\( *set\_state)\))}\)

This function is called to set the Health Server states using the Health Client Model set messages.

\textbf{Note:} If you want to find the opcodes and corresponding meanings accepted by this API, please refer to \text{esp_ble_mesh_opcode_health_client_set_t} in \text{esp_ble_mesh_defs.h}\n
\textbf{Parameters}
\begin{itemize}
\item \textbf{params} – [in] Pointer to BLE Mesh common client parameters.
\item \textbf{set\_state }–[in] Pointer to a union, each kind of opcode corresponds to one structure
inside. Shall not be set to NULL.
\end{itemize}

\textbf{Returns} ESP_OK on success or error code otherwise.

\textit{esp_err_t} \textbf{esp_ble_mesh_health_server_fault_update}\( \text{\( (\text{esp_ble_mesh_elem_t}\)}\ \\
\text{\( *element)\))}\)

This function is called by the Health Server Model to update the context of its Health Current status.

\textbf{Returns} ESP_OK on success or error code otherwise.

\textbf{Unions}
\begin{itemize}
\item \textbf{esp_ble_mesh_health_client_get_state_t}
\end{itemize}

\#include \textless \textit{esp_ble_mesh_health_model_api.h}\textgreater For \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET} \textit{ESP_BLE_MESH_MODEL_OP_ATTENTION_GET} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET} the \textit{get\_state} parameter in the \text{esp_ble_mesh_health_client_get_state} function should not be set to NULL.

\textbf{Public Members}
\begin{itemize}
\item \textbf{esp_ble_mesh_health_fault_get_t} \textbf{fault\_get}
\end{itemize}

For \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET}.

\begin{itemize}
\item \textbf{esp_ble_mesh_health_client_set_state_t}
\end{itemize}

\#include \textless \textit{esp_ble_mesh_health_model_api.h}\textgreater For \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST} \textit{ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK} \textit{ESP_BLE_MESH_MODEL_OP_ATTENTION_SET} \textit{ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK} the \textit{set\_state} parameter in the \text{esp_ble_mesh_health_client_set_state} function should not be set to NULL.

Parameters of Health Fault Clear event

**Public Members**

**esp_ble_mesh_model_t** `*model`  
Pointer to the Health Server Model
uint16_t **_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event

Public Members

*esp_ble_mesh_model_t* model
Pointer to the Health Server Model

uint8_t **_test_id
ID of a specific test to be performed

uint16_t **_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
Parameter of Health Attention On event

Public Members

*esp_ble_mesh_model_t* model
Pointer to the Health Server Model

uint8_t **_time
Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
Parameter of Health Attention Off event

Public Members

*esp_ble_mesh_model_t* model
Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
Define a new Health Server Model.

Note: The Health Server Model can only be included by a Primary Element.

Parameters

* srv – Pointer to the unique struct esp_ble_mesh_health_srv_t.
* pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.

Returns New Health Server Model instance.
**ESP_BLE_MESH_MODEL_HEALTH_CLI** (cli_data)

Define a new Health Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Parameters**
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Health Client Model instance.

**ESP_BLE_MESH_HEALTH_PUB_DEFINE** (_name, _max, _role)

A helper to define a health publication context

**Parameters**
- **_name** - Name given to the publication context variable.
- **_max** - Maximum number of faults the element can have.
- **_role** - Role of the device which contains the model.

**ESP_BLE_MESH_HEALTH_STANDARD_TEST**

SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

**ESP_BLE_MESH_NO_FAULT**

Fault values of Health Fault Test. 0x33~0x7F: Reserved for Future Use. 0x80~0xFF: Vendor Specific Warning/Error.

enumerator ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)
Register BLE Mesh Generic Client Model callback.

Parameters

callback – [in] Pointer to the callback function.

Returns

ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t *params,
esp_ble_mesh_generic_client_get_state_t *get_state)
Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_tinesp_ble_mesh_defs.h

### Parameters
- **params** - [in] Pointer to BLE Mesh common client parameters.
- **get_state** - [in] Pointer to generic get message value. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_tinesp_ble_mesh_defs.h

### Parameters
- **params** - [in] Pointer to BLE Mesh common client parameters.
- **set_state** - [in] Pointer to generic set message value. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Parameters**
- **callback** - [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

### Unions

```c
union esp_ble_mesh_generic_client_get_state_t

Structures

struct esp_ble_mesh_gen_onoff_set_t
Bluetooth Mesh Generic Client Model Get and Set parameters structure.
Parameters of Generic OnOff Set.

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
Parameters of Generic Level Set.

Public Members

bool op_en
Indicate if optional parameters are included

int16_t level
Target value of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
Parameters of Generic Delta Set.
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

int32_t level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
   Parameters of Generic Move Set.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set.
Chapter 2. API Reference

Public Members

```c
uint8_t onpowerup
```

The value of the Generic OnPowerUp state

```c
struct esp_ble_mesh_gen_power_level_set_t
```

Parameters of Generic Power Level Set.

Public Members

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint16_t power
```

Target value of Generic Power Actual state

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_gen_power_default_set_t
```

Parameter of Generic Power Default Set.

Public Members

```c
uint16_t power
```

The value of the Generic Power Default state

```c
struct esp_ble_mesh_gen_power_range_set_t
```

Parameters of Generic Power Range Set.

Public Members

```c
uint16_t range_min
```

Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```

Value of Range Max field of Generic Power Range state

```c
struct esp_ble_mesh_gen_loc_global_set_t
```

Parameters of Generic Location Global Set.
Public Members

int32_t `global_latitude`
Global Coordinates (Latitude)

int32_t `global_longitude`
Global Coordinates (Longitude)

int16_t `global_altitude`
Global Altitude

struct `esp_ble_mesh_gen_loc_local_set_t`
Parameters of Generic Location Local Set.

Public Members

int16_t `local_north`
Local Coordinates (North)

int16_t `local_east`
Local Coordinates (East)

int16_t `local_altitude`
Local Altitude

uint8_t `floor_number`
Floor Number

uint16_t `uncertainty`
Uncertainty

struct `esp_ble_mesh_gen_user_property_get_t`
Parameter of Generic User Property Get.

Public Members

uint16_t `property_id`
Property ID identifying a Generic User Property

struct `esp_ble_mesh_gen_user_property_set_t`
Parameters of Generic User Property Set.

Public Members

uint16_t `property_id`
Property ID identifying a Generic User Property
struct **property_value**
Raw value for the User Property

struct **esp_ble_mesh_gen_admin_property_get_t**
Parameter of Generic Admin Property Get.

Public Members

uint16_t **property_id**
Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_gen_admin_property_set_t**
Parameters of Generic Admin Property Set.

Public Members

uint16_t **property_id**
Property ID identifying a Generic Admin Property

uint8_t **user_access**
Enumeration indicating user access

struct **property_value**
Raw value for the Admin Property

struct **esp_ble_mesh_gen_manufacturer_property_get_t**
Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t **property_id**
Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_gen_manufacturer_property_set_t**
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t **property_id**
Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**
Enumeration indicating user access

struct **esp_ble_mesh_gen_client_properties_get_t**
Parameter of Generic Client Properties Get.
Chapter 2. API Reference

**Public Members**

```c
uint16_t property_id
```

A starting Client Property ID present within an element

**struct esp_ble_mesh_gen_onoff_status_cb_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

**Public Members**

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint8_t present_onoff
```

Current value of Generic OnOff state

```c
uint8_t target_onoff
```

Target value of Generic OnOff state (optional)

```c
uint8_t remain_time
```

Time to complete state transition (C.1)

**struct esp_ble_mesh_gen_level_status_cb_t**

Parameters of Generic Level Status.

**Public Members**

```c
bool op_en
```

Indicate if optional parameters are included

```c
int16_t present_level
```

Current value of Generic Level state

```c
int16_t target_level
```

Target value of the Generic Level state (optional)

```c
uint8_t remain_time
```

Time to complete state transition (C.1)

**struct esp_ble_mesh_gen_def_trans_time_status_cb_t**

Parameter of Generic Default Transition Time Status.
uint8_t \texttt{trans\_time}  
The value of the Generic Default Transition Time state

\textbf{Public Members}

uint8_t \texttt{onpowerup}  
The value of the Generic OnPowerUp state

\textbf{Public Members}

bool \texttt{op\_en}  
Indicate if optional parameters are included

uint16_t \texttt{present\_power}  
Current value of Generic Power Actual state

uint16_t \texttt{target\_power}  
Target value of Generic Power Actual state (optional)

uint8_t \texttt{remain\_time}  
Time to complete state transition (C.1)

\textbf{Public Members}

uint16_t \texttt{power}  
The value of the Generic Power Last state

\textbf{Public Members}

uint16_t \texttt{power}  
The value of the Generic Default Last state

\textbf{Public Members}

uint16_t \texttt{power}  
The value of the Generic Default Last state

struct \texttt{esp\_ble\_mesh\_gen\_onpowerup\_status\_cb\_t}  
Public Members

`uint8_t status_code`
Status Code for the request message

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_gen_battery_status_cb_t`
Parameters of Generic Battery Status.

Public Members

`uint32_t battery_level`
Value of Generic Battery Level state

`uint32_t time_to_discharge`
Value of Generic Battery Time to Discharge state

`uint32_t time_to_charge`
Value of Generic Battery Time to Charge state

`uint32_t flags`
Value of Generic Battery Flags state

`struct esp_ble_mesh_gen_loc_global_status_cb_t`
Parameters of Generic Location Global Status.

Public Members

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

`struct esp_ble_mesh_gen_loc_local_status_cb_t`
Parameters of Generic Location Local Status.
Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)

int16_t local_altitude
   Local Altitude

uint8_t floor_number
   Floor Number

uint16_t uncertainty
   Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
   Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
   Parameters of Generic User Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic User Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
   Parameter of Generic Admin Properties Status.
Chapter 2. API Reference

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
    Parameters of Generic Admin Property Status.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID identifying a Generic Admin Property

uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
    Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
    Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID identifying a Generic Manufacturer Property

uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)
struct `esp_ble_mesh_gen_client_properties_status_cb_t`
Parameter of Generic Client Properties Status.

**Public Members**

`struct net_buf_simple *property_ids`
Buffer contains a sequence of N Client Property IDs

struct `esp_ble_mesh_generic_client_cb_param_t`
Generic Client Model callback parameters

**Public Members**

`int error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_gen_client_status_cb_t status_cb`
The generic status message callback values

struct `esp_ble_mesh_gen_onoff_state_t`
Parameters of Generic OnOff state

**Public Members**

`uint8_t onoff`
The present value of the Generic OnOff state

`uint8_t target_onoff`
The target value of the Generic OnOff state

struct `esp_ble_mesh_gen_onoff_srv_t`
User data of Generic OnOff Server Model

**Public Members**

`esp_ble_model_t *model`
Pointer to the Generic OnOff Server Model. Initialized internally.

`esp_ble_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_onoff_state_t state`
Parameters of the Generic OnOff state
Chapter 2. API Reference

```c
esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```

```c
esp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```c
struct esp_ble_mesh_gen_level_state_t
Parameters of Generic Level state
```

**Public Members**

```c
int16_t level
The present value of the Generic Level state
```

```c
int16_t target_level
The target value of the Generic Level state
```

```c
int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state
```

```c
int32_t last_delta
The last delta change of the Generic Level state
```

```c
bool move_start
Indicate if the transition of the Generic Level state has been started
```

```c
bool positive
Indicate if the transition is positive or negative
```

```c
struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_level_state_t state
Parameters of the Generic Level state
```

```c
esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```
Chapter 2. API Reference

```c
esp_ble_mesh_state_transition_t transition
    Parameters of state transition

int32_t tt_delta_level
    Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
    Parameter of Generic Default Transition Time state

Public Members

uint8_t trans_time
    The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
    User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t state
    Parameters of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_state_t
    Parameter of Generic OnPowerUp state

Public Members

uint8_t onpowerup
    The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_srv_t
    User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages
```
struct esp_ble_mesh_gen_onpowerup_state_t *

state

Parameters of the Generic OnPowerUp state

Public Members

struct esp_ble_mesh_gen_power_onoff_setup_srv_t

User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t *

model

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *

rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *

state

Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t

Parameters of Generic Power Level state

Public Members

uint16_t power_actual

The present value of the Generic Power Actual state

uint16_t target_power_actual

The target value of the Generic Power Actual state

uint16_t power_last

The value of the Generic Power Last state

uint16_t power_default

The value of the Generic Power Default state

uint8_t status_code

The status code of setting Generic Power Range state

uint16_t power_range_min

The minimum value of the Generic Power Range state

uint16_t power_range_max

The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t

User data of Generic Power Level Server Model
Public Members

`esp_ble_mesh_model_t *model`
Point to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_level`
Delta change value of level state transition

`struct esp_ble_mesh_gen_power_level_setup_srv_t`
User data of Generic Power Level Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
Parameters of the Generic Power Level state

`struct esp_ble_mesh_gen_power_level_setup_srv_t`
User data of Generic Power Level Setup Server Model

Public Members

`uint32_t battery_level`
The value of the Generic Battery Level state

`uint32_t time_to_discharge`
The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge`
The value of the Generic Battery Time to Charge state

### Chapter 2. API Reference

#### Public Members

- **esp_ble_mesh_genbattery_srv_t**
  User data of Generic Battery Server Model

- **esp_ble_mesh_gen_location_srv_t**
  User data of Generic Location Server Model

- `uint32_t battery_flags`
  The value of the Generic Battery Flags state

- **struct esp_ble_mesh_gen_battery_srv_t**
  User data of Generic Battery Server Model

#### Public Members

  Parameters of Generic Location state

#### Public Members

- **int32_t global_latitude**
  The value of the Global Latitude field

- **int32_t global_longitude**
  The value of the Global Longitude field

- **int16_t global_altitude**
  The value of the Global Altitude field

- **int16_t local_north**
  The value of the Local North field

- **int16_t local_east**
  The value of the Local East field

- **int16_t local_altitude**
  The value of the Local Altitude field

- **uint8_t floor_number**
  The value of the Floor Number field

- **uint16_t uncertainty**
  The value of the Uncertainty field
Public Members

```
*esp_ble_mesh_model_t* model
```
Pointer to the Generic Location Server Model. Initialized internally.

```
*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
```
Response control of the server model received messages

```
*esp_ble_mesh_gen_location_state_t* state
```
Parameters of the Generic Location state

User data of Generic User Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`uint8_t property_count`
- Generic User Property count

`esp_ble_mesh_generic_property_t *properties`
- Parameters of the Generic User Property state

struct `esp_ble_mesh_gen_admin_prop_srv_t`
- User data of Generic Admin Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`uint8_t property_count`
- Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`
- Parameters of the Generic Admin Property state

struct `esp_ble_mesh_gen_manu_prop_srv_t`
- User data of Generic Manufacturer Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`uint8_t property_count`
- Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
- Parameters of the Generic Manufacturer Property state
Chapter 2. API Reference

```c
struct esp_ble_mesh_gen_client_prop_srv_t
    User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

uint8_t id_count
    Generic Client Property ID count

uint16_t *property_ids
    Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
    Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
    The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
    Parameter of Generic Level Set state change event

Public Members

int16_t level
    The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
    Parameter of Generic Delta Set state change event

Public Members

int16_t level
    The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
    Parameter of Generic Move Set state change event
```
Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_def_trans_time_set_t`
Parameter of Generic Default Transition Time Set state change event

Public Members

`uint8_t trans_time`
The value of Generic Default Transition Time state

`struct esp_ble_mesh_state_change_gen_onpowerup_set_t`
Parameter of Generic OnPowerUp Set state change event

Public Members

`uint8_t onpowerup`
The value of Generic OnPowerUp state

`struct esp_ble_mesh_state_change_gen_power_level_set_t`
Parameter of Generic Power Level Set state change event

Public Members

`uint16_t power`
The value of Generic Power Actual state

`struct esp_ble_mesh_state_change_gen_power_default_set_t`
Parameter of Generic Power Default Set state change event

Public Members

`uint16_t power`
The value of Generic Power Default state

`struct esp_ble_mesh_state_change_gen_power_range_set_t`
Parameters of Generic Power Range Set state change event

Public Members

`uint16_t range_min`
The minimum value of Generic Power Range state

**uint16_t** range_max

The maximum value of Generic Power Range state

**struct esp_ble_mesh_state_change_gen_loc_global_set_t**

Parameters of Generic Location Global Set state change event

**Public Members**

**int32_t latitude**

The Global Latitude value of Generic Location state

**int32_t longitude**

The Global Longitude value of Generic Location state

**int16_t altitude**

The Global Altitude value of Generic Location state

**struct esp_ble_mesh_state_change_gen_loc_local_set_t**

Parameters of Generic Location Local Set state change event

**Public Members**

**int16_t north**

The Local North value of Generic Location state

**int16_t east**

The Local East value of Generic Location state

**int16_t altitude**

The Local Altitude value of Generic Location state

**uint8_t floor_number**

The Floor Number value of Generic Location state

**uint16_t uncertainty**

The Uncertainty value of Generic Location state

**struct esp_ble_mesh_state_change_gen_user_property_set_t**

Parameters of Generic User Property Set state change event

**Public Members**

**uint16_t id**

The property id of Generic User Property state
struct net_buf_simple *value
    The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
    Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
    Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
    Context of the received Generic User Property Get message

Public Members

uint16_t property_id
    Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
    Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
    Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
    Context of the received Generic Manufacturer Property message
Public Members

```c
uint16_t property_id
```

Property ID identifying a Generic Manufacturer Property

```c
struct esp_ble_mesh_server_recv_gen_client_properties_get_t
```

Context of the received Generic Client Properties Get message

Public Members

```c
uint16_t property_id
```

A starting Client Property ID present within an element

```c
struct esp_ble_mesh_server_recv_gen_onoff_set_t
```

Context of the received Generic OnOff Set message

Public Members

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint8_t onoff
```

Target value of Generic OnOff state

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_gen_level_set_t
```

Context of the received Generic Level Set message

Public Members

```c
bool op_en
```

Indicate if optional parameters are included

```c
int16_t level
```

Target value of Generic Level state

```c
uint8_t tid
```

Transaction ID
Chapter 2. API Reference

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
Context of the received Generic Delta Set message

Public Members

bool op_en
Indicate if optional parameters are included

int32_t delta_level
Delta change of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
Context of the received Generic Move Set message

Public Members

bool op_en
Indicate if optional parameters are included

int16_t delta_level
Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
Context of the received Generic Default Transition Time Set message
## Chapter 2. API Reference

### Public Members

**uint8_t** `trans_time`

The value of the Generic Default Transition Time state

**struct esp_ble_mesh_server_recv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

### Public Members

**uint8_t** `onpowerup`

The value of the Generic OnPowerUp state

**struct esp_ble_mesh_server_recv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

### Public Members

**bool** `op_en`

Indicate if optional parameters are included

**uint16_t** `power`

Target value of Generic Power Actual state

**uint8_t** `tid`

Transaction ID

**uint8_t** `trans_time`

Time to complete state transition (optional)

**uint8_t** `delay`

Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_power_default_set_t**

Context of the received Generic Power Default Set message

### Public Members

**uint16_t** `power`

The value of the Generic Power Default state

**struct esp_ble_mesh_server_recv_gen_power_range_set_t**

Context of the received Generic Power Range Set message
Chapter 2. API Reference

Public Members

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_server_recv_gen_loc_global_set_t`
Context of the received Generic Location Global Set message

Public Members

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

`struct esp_ble_mesh_server_recv_gen_loc_local_set_t`
Context of the received Generic Location Local Set message

Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

`struct esp_ble_mesh_server_recv_gen_user_property_set_t`
Context of the received Generic User Property Set message
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
    Raw value for the User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
    Context of the received Generic Admin Property Set message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
    Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
    Raw value for the Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
    Context of the received Generic Manufacturer Property Set message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic Manufacturer Property
```

```c
uint8_t user_access
    Enumeration indicating user access
```

```c
struct esp_ble_mesh_generic_server_cb_param_t
    Generic Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Generic Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_generic_server_cb_value_t value
    Value of the received Generic Messages
```
Chapter 2. API Reference

Macros

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Parameters**
- cli_pub – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Generic OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Parameters**
- cli_pub – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Generic Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Parameters**
- cli_pub – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Generic Default Transition Time Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Parameters**
- cli_pub – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Generic Power OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.
Parameters

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns
New Generic Power Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)

Define a new Generic Battery Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Parameters

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns
New Generic Battery Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)

Define a new Generic Location Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Parameters

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns
New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)

Define a new Generic Property Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Parameters

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns
New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note:** 1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

Parameters

- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

Returns
New Generic OnOff Server Model instance.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note:** 1. The Generic Level Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**Returns** New Generic Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note:** 1. The Generic Default Transition Time Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**Returns** New Generic Default Transition Time Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note:** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
   b. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

**Returns** New Generic Power OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

Define a new Generic Power Level Server Model.

**Note:** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

**Returns** New Generic Power Level Server Model instance.

Define a new Generic Power Level Setup Server Model.

**Note:** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

**Returns** New Generic Power Level Setup Server Model instance.

Define a new Generic Battery Server Model.

**Note:** 1. The Generic Battery Server Model is a root model.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that is powered by a battery.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**Returns** New Generic Battery Server Model instance.

Define a new Generic Location Server Model.

**Note:** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that knows its location (global or local).

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**Returns** New Generic Location Server Model instance.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

*Note:* 1. The Generic Location Setup Server model extends the Generic Location Server model.
   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**Returns** New Generic Location Setup Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV** (srv_pub, srv_data)
Define a new Generic User Property Server Model.

*Note:* 1. The Generic User Property Server model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**Returns** New Generic User Property Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV** (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

*Note:* 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**Returns** New Generic Admin Property Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV** (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV** (srv_pub, srv_data)
Define a new Generic User Property Server Model.

*Note:* 1. The Generic Client Property Server model is a root model.
This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** - Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Returns** New Generic Client Property Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event, esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event, esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

**Values:**

- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX**

```c
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

**Values:**

- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT**
- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_READ**
- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_WRITE**
Chapter 2. API Reference

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_admin_prop_access_t**
This enum value is the access value of Generic Admin Property
Values:
- enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**
- enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**
- enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**
- enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**
This enum value is the access value of Generic Manufacturer Property
Values:
- enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**
- enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**
This enum value is the event of Generic Server Model
Values:
- enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**
  i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.
  ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.
- enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.
- enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.
- enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

**Sensor Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h
Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback(esp_ble_mesh_sensor_client_cb_t callback)`

Register BLE Mesh Sensor Client Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)`

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- `params` - [in] Pointer to BLE Mesh common client parameters.
- `get_state` - [in] Pointer to sensor get message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)`

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- `params` - [in] Pointer to BLE Mesh common client parameters.
- `set_state` - [in] Pointer to sensor set message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)`

Register BLE Mesh Sensor Server Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

Unions

`union esp_ble_mesh_sensor_client_get_state_t`  

Include `<esp_ble_mesh_sensor_model_api.h>` Sensor Client Model get message union.

Public Members

`esp_ble_mesh_sensor_descriptor_get_t descriptor_get`  

For ESP_BLE_MESH_MODEL_OP_SENSOR_DESCRIPTOR_GET

`esp_ble_mesh_sensor_cadence_get_t cadence_get`  

For ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_GET

Structures

struct \textit{esp\_ble\_mesh\_sensor\_descriptor\_get\_t}
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
Parameters of Sensor Descriptor Get

Public Members

bool \textbf{op\_en}
Indicate if optional parameters are included

\textit{uint16\_t} \textbf{property\_id}
Property ID of a sensor (optional)

struct \textit{esp\_ble\_mesh\_sensor\_cadence\_get\_t}
Parameter of Sensor Cadence Get

Public Members

\textit{uint16\_t} \textbf{property\_id}
Property ID of a sensor

struct \textit{esp\_ble\_mesh\_sensor\_cadence\_set\_t}
Parameters of Sensor Cadence Set
Public Members

uint16_t **property_id**
Property ID for the sensor

uint8_t **fastCadence_period_divisor**
Divisor for the publish period

uint8_t **status_trigger_type**
The unit and format of the Status Trigger Delta fields

struct net_buf_simple **status_trigger_delta_down**
Delta down value that triggers a status message

struct net_buf_simple **status_trigger_delta_up**
Delta up value that triggers a status message

uint8_t **status_min_interval**
Minimum interval between two consecutive Status messages

struct net_buf_simple **fast_cadence_low**
Low value for the fast cadence range

struct net_buf_simple **fast_cadence_high**
Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
Parameter of Sensor Settings Get

Public Members

uint16_t **sensor_property_id**
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t **sensor_property_id**
Property ID of a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set
Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)
struct net_buf_simple *raw_value_x2
    Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
    Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
    Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
    Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
    Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
    Property for the sensor

struct net_buf_simple *sensor_cadence_value
    Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
    Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
    Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
    A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
    Parameters of Sensor Setting Status

Public Members

bool op_en
    Indicate id optional parameters are included

uint16_t sensor_property_id
    Property ID identifying a sensor
uint16_t \textit{sensor\_setting\_property\_id}
Setting ID identifying a setting within a sensor

uint8_t \textit{sensor\_setting\_access}
Read/Write access rights for the setting (optional)

struct net_buf_simple *\textit{sensor\_setting\_raw}
Raw value for the setting

\textbf{Public Members}

struct \textit{esp\_ble\_mesh\_sensor\_status\_cb\_t}
Parameter of Sensor Status

\textbf{Public Members}

struct net_buf_simple *\textit{marshalled\_sensor\_data}
Value of sensor data state (optional)

\textbf{Public Members}

\textbf{Public Members}

uint16_t \textit{property\_id}
Property identifying a sensor and the Y axis

struct net_buf_simple *\textit{sensor\_column\_value}
Left values of sensor column status

\textbf{Public Members}

struct \textit{esp\_ble\_mesh\_sensor\_series\_status\_cb\_t}
Parameters of Sensor Series Status

\textbf{Public Members}

uint16_t \textit{property\_id}
Property identifying a sensor and the Y axis

struct net_buf_simple *\textit{sensor\_series\_value}
Left values of sensor series status

\textbf{Public Members}

struct \textit{esp\_ble\_mesh\_sensor\_client\_cb\_param\_t}
Sensor Client Model callback parameters

\textbf{Public Members}
**Chapter 2. API Reference**

```c
int error_code
```

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

```c
esp_ble_mesh_client_common_param_t *params
```

The client common parameters.

```c
esp_ble_mesh_sensor_client_status_cb_t status_cb
```

The sensor status message callback values

```c
struct esp_ble_mesh_sensor_descriptor_t
```

Parameters of Sensor Descriptor state

**Public Members**

```c
uint32_t positive_tolerance
```

The value of Sensor Positive Tolerance field

```c
uint32_t negative_tolerance
```

The value of Sensor Negative Tolerance field

```c
uint32_t sampling_function
```

The value of Sensor Sampling Function field

```c
uint8_t measure_period
```

The value of Sensor Measurement Period field

```c
uint8_t update_interval
```

The value of Sensor Update Interval field

```c
struct esp_ble_mesh_sensor_setting_t
```

Parameters of Sensor Setting state

**Public Members**

```c
uint16_t property_id
```

The value of Sensor Setting Property ID field

```c
uint8_t access
```

The value of Sensor Setting Access field

```c
struct net_buf_simple *raw
```

The value of Sensor Setting Raw field

```c
struct esp_ble_mesh_sensor_cadence_t
```

Parameters of Sensor Cadence state
Public Members

uint8_t period_divisor
The value of Fast Cadence Period Divisor field

uint8_t trigger_type
The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up field

uint8_t min_interval
The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length
The value of the Sensor Data length

struct net_buf_simple *raw_value
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members
struct net_buf_simple *raw_value_x
The value of Sensor Raw Value X field

struct net_buf_simple *column_width
The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t sensor_property_id
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state

const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

exp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state

exp_ble_mesh_sensor_cadence_t *cadence
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

exp_ble_mesh_sensor_data_t sensor_data
Parameters of the Sensor Data state

exp_ble_mesh_sensor_series_column_t series_column
Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Sensor Server Model. Initialized internally.

desp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
const uint8_t state_count
    Sensor state count

    exp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
    User data of Sensor Setup Server Model

Public Members

    exp_ble_mesh_model_t *model
        Pointer to the Sensor Setup Server Model. Initialized internally.

    exp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

const uint8_t state_count
    Sensor state count

    exp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
    Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id
    The value of Sensor Property ID state

uint8_t period_divisor
    The value of Fast Cadence Period Divisor state

uint8_t trigger_type
    The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
    The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state
Chapter 2. API Reference

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
    Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
    The value of Sensor Property ID state

uint16_t setting_property_id
    The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
    The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
    Property ID of a sensor
Chapter 2. API Reference

**struct esp_ble_mesh_server_recv_sensor_setting_get_t**
Context of the received Sensor Setting Get message

**Public Members**

- `uint16_t property_id`
  Property ID of a sensor

- `uint16_t setting_property_id`
  Setting ID identifying a setting within a sensor

**struct esp_ble_mesh_server_recv_sensor_get_t**
Context of the received Sensor Get message

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included

- `uint16_t property_id`
  Property ID for the sensor (optional)

**struct esp_ble_mesh_server_recv_sensor_column_get_t**
Context of the received Sensor Column Get message

**Public Members**

- `uint16_t property_id`
  Property identifying a sensor

- `struct net_buf_simple *raw_value_x`
  Raw value identifying a column

**struct esp_ble_mesh_server_recv_sensor_series_get_t**
Context of the received Sensor Series Get message

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included

- `uint16_t property_id`
  Property identifying a sensor

- `struct net_buf_simple *raw_value`
  Raw value containing X1 and X2 (optional)
struct `esp_ble_mesh_server_recv_sensor_cadence_set_t`

Context of the received Sensor Cadence Set message

**Public Members**

`uint16_t property_id`

Property ID for the sensor

`struct net_buf_simple *cadence`

Value of Sensor Cadence state

struct `esp_ble_mesh_server_recv_sensor_setting_set_t`

Context of the received Sensor Setting Set message

**Public Members**

`uint16_t property_id`

Property ID identifying a sensor

`uint16_t setting_property_id`

Setting ID identifying a setting within a sensor

`struct net_buf_simple *setting_raw`

Raw value for the setting

struct `esp_ble_mesh_sensor_server_cb_param_t`

Sensor Server Model callback parameters

**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to Sensor Server Models

`esp_ble_mesh_msg_ctx_t ctx`

Context of the received messages

`esp_ble_mesh_sensor_server_cb_value_t value`

Value of the received Sensor Messages

**Macros**

`ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)`

Define a new Sensor Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Sensor Client Model.
### Chapter 2. API Reference

**Parameters**
- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Sensor Client Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)
Sensor Server Models related context.
Define a new Sensor Server Model.

**Note:**
1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

**Returns**
New Sensor Server Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

**Note:**
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

**Returns**
New Sensor Setup Server Model instance.

**ESP_BLE_MESH_INVALIDSENSOR_PROPERTY_ID**
Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**
Length of Sensor Property ID

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval
Chapter 2. API Reference

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
**ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT** (_data_

Get format of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data_ pointer is updated before getting the format of the corresponding sensor data.

**Parameters**

- _data_ – Pointer to the start of the sensor data.

**Returns** Format of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH** (_data_, _fmt_

Get length of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data_ pointer is updated before getting the length of the corresponding sensor data.

**Parameters**

- _data_ – Pointer to the start of the sensor data.
- _fmt_ – Format of the sensor data.

**Returns** Length (zero-based) of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID** (_data_, _fmt_

Get Sensor Property ID of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data_ pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Parameters**

- _data_ – Pointer to the start of the sensor data.
- _fmt_ – Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID** (_len_, _id_

Generate a MPID value for sensor data with Format A.

**Note:** 1. The Format field is 0b0 and indicates that Format A is used.

   a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x800.

**Parameters**

- _len_ – Length of Sensor Raw value.
- _id_ – Sensor Property ID.

**Returns** 2-octet MPID value for sensor data with Format A.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID** (_len_, _id_

Generate a MPID value for sensor data with Format B.

**Note:** 1. The Format field is 0b1 and indicates Format B is used.
Chapter 2. API Reference

a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
b. The Property ID is a 16-bit bit field representing a Property ID.
c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Parameters
- **_len** - Length of Sensor Raw value.
- **_id** - Sensor Property ID.

Returns 3-octet MPID value for sensor data with Format B.

Type Definitions
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,
    esp_ble_mesh_sensor_client_cb_param_t *param)

    Bluetooth Mesh Sensor Client Model function.
    Sensor Client Model callback function type

    **Param event** Event type
    **Param param** Pointer to callback parameter
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,
    esp_ble_mesh_sensor_server_cb_param_t *param)

    Bluetooth Mesh Sensor Server Model function.
    Sensor Server Model callback function type

    **Param event** Event type
    **Param param** Pointer to callback parameter

Enumerations
enum esp_ble_mesh_sensor_client_cb_event_t

    This enum value is the event of Sensor Client Model

    **Values:**

    enumerator ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
    enumerator ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
    enumerator ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
    enumerator ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
    enumerator ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func

    This enum value is value of Sensor Sampling Function

    **Values:**

    enumerator ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS

enumerator ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN

enumerator ESP_BLE_MESH_SAMPLE_FUNC_RMS

enumerator ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM

enumerator ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM

enumerator ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED

enumerator ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

enumerator ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback (esp_ble_mesh_time_scene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

Parameters callback –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.
### Chapter 2. API Reference

**esp_err_t esp_ble_mesh_time_scene_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)**

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- **params** - [in] Pointer to BLE Mesh common client parameters.
- **get_state** - [in] Pointer to time scene get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_time_scene_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state)**

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- **params** - [in] Pointer to BLE Mesh common client parameters.
- **set_state** - [in] Pointer to time scene set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_time_scene_server_callback (esp_ble_mesh_time_scene_server_cb_t callback)**

Register BLE Mesh Time and Scenes Server Model callback.

**Parameters**
- **callback** - [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

**union esp_ble_mesh_time_scene_client_get_state_t**

Structures

struct esp_ble_mesh_time_set_t
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
Parameters of Time Set

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t sub_second
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_zone_set_t
Parameters of Time Zone Set

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_set_t
Parameters of TAI-UTC Delta Set

Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds
uint16_t padding
   Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
   TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
   Parameter of Time Role Set

   Public Members

   uint8_t time_role
      The Time Role for the element

struct esp_ble_mesh_scene_store_t
   Parameter of Scene Store

   Public Members

   uint16_t scene_number
      The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
   Parameters of Scene Recall

   Public Members

   bool op_en
      Indicate if optional parameters are included

   uint16_t scene_number
      The number of scenes to be recalled

   uint8_t tid
      Transaction ID

   uint8_t trans_time
      Time to complete state transition (optional)

   uint8_t delay
      Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
   Parameter of Scene Delete
Public Members

uint16_t \texttt{scene\_number}

The number of scenes to be deleted

struct \texttt{esp\_ble\_mesh\_scheduler\_act\_get\_t}

Parameter of Scheduler Action Get

Public Members

uint8_t \texttt{index}

Index of the Schedule Register entry to get

struct \texttt{esp\_ble\_mesh\_scheduler\_act\_set\_t}

Parameters of Scheduler Action Set

Public Members

uint64_t \texttt{index}

Index of the Schedule Register entry to set

uint64_t \texttt{year}

Scheduled year for the action

uint64_t \texttt{month}

Scheduled month for the action

uint64_t \texttt{day}

Scheduled day of the month for the action

uint64_t \texttt{hour}

Scheduled hour for the action

uint64_t \texttt{minute}

Scheduled minute for the action

uint64_t \texttt{second}

Scheduled second for the action

uint64_t \texttt{day\_of\_week}

Schedule days of the week for the action

uint64_t \texttt{action}

Action to be performed at the scheduled time

uint64_t \texttt{trans\_time}

Transition time for this action
Chapter 2. API Reference

\texttt{uint16_t scene_number}
Transition time for this action

\textbf{struct esp_ble_mesh_time_status_cb_t}
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
Parameters of Time Status

\textbf{Public Members}

\texttt{uint8_t tai_seconds[5]}
The current TAI time in seconds

\texttt{uint8_t sub_second}
The sub-second time in units of 1/256 second

Current difference between TAI and UTC in seconds

\texttt{uint8_t time_zone_offset}
The local time zone offset in 15-minute increments

\textbf{struct esp_ble_mesh_time_zone_status_cb_t}
Parameters of Time Zone Status

\textbf{Public Members}

\texttt{uint8_t time_zone_offset_curr}
Current local time zone offset

\texttt{uint8_t time_zone_offset_new}
Upcoming local time zone offset

\texttt{uint8_t tai_zone_change[5]}
TAI Second time of the upcoming Time Zone Offset change

\textbf{struct esp_ble_mesh_tai_utc_delta_status_cb_t}
Parameters of TAI-UTC Delta Status
Chapter 2. API Reference

Public Members

`uint16_t tai_utc_delta_curr`
Current difference between TAI and UTC in seconds

`uint16_t padding_1`
Always 0b0. Other values are Prohibited.

`uint16_t tai_utc_delta_new`
Upcoming difference between TAI and UTC in seconds

`uint16_t padding_2`
Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change[5]`
TAI Seconds time of the upcoming TAI-UTC Delta change

struct `esp_ble_mesh_time_role_status_cb_t`
Parameter of Time Role Status

Public Members

`uint8_t time_role`
The Time Role for the element

struct `esp_ble_mesh_scene_status_cb_t`
Parameters of Scene Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint8_t status_code`
Status code of the last operation

`uint16_t current_scene`
Scene Number of the current scene

`uint16_t target_scene`
Scene Number of the target scene (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

struct `esp_ble_mesh_scene_register_status_cb_t`
Parameters of Scene Register Status
Public Members

uint8_t status_code
    Status code for the previous operation

uint16_t current_scene
    Scene Number of the current scene

struct net_buf_simple *scenes
    A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
    Parameter of Scheduler Status

Public Members

uint16_t schedules
    Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
    Parameters of Scheduler Action Status

Public Members

uint64_t index
    Enumerates (selects) a Schedule Register entry

uint64_t year
    Scheduled year for the action

uint64_t month
    Scheduled month for the action

uint64_t day
    Scheduled day of the month for the action

uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Schedule days of the week for the action
uint64_t \texttt{action} \\
Action to be performed at the scheduled time

uint64_t \texttt{trans\_time} \\
Transition time for this action

uint16_t \texttt{scene\_number} \\
Transition time for this action

The value of the Time Zone Offset Current field

uint8_t \texttt{time\_zone\_offset\_new} \\
The value of the Time Zone Offset New state

uint8_t \texttt{tai\_zone\_change}\texttt{[5]} \\
The value of the TAI of Zone Chaneg field
uint16_t `time_authority`
   The value of the Time Authority bit

uint16_t `tai_utc_delta_curr`
   The value of the TAI-UTC Delta Current state

uint16_t `tai_utc_delta_new`
   The value of the TAI-UTC Delta New state

uint8_t `tai_delta_change[5]`
   The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::{anonymous} `time`
   Parameters of the Time state

uint8_t `time_role`
   The value of the Time Role state

struct esp_ble_mesh_time_srv_t
   User data of Time Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
   Pointer to the Time Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_time_state_t *state`
   Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
   User data of Time Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
   Pointer to the Time Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_time_state_t *state`
   Parameters of the Time state
struct **esp_ble_mesh_scene_register_t**

- Scene Store is an operation of storing values of a present state of an element.
- The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

**Public Members**

uint16_t **scene_number**
- The value of the Scene Number

uint8_t **scene_type**
- The value of the Scene Type

struct net_buf_simple **scene_value**
- Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

**Public Members**

const uint16_t **scene_count**
- The Scenes state’s scene count

**esp_ble_mesh_scene_register_t** * **scenes**
- Parameters of the Scenes state

uint16_t **current_scene**
- The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.
When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

```c
uint16_t target_scene
```

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

```c
uint8_t status_code
```

The status code of the last scene operation

```c
bool in_progress
```

Indicate if the scene transition is in progress

```c
struct esp_ble_mesh_scene_srv_t
```

User data of Scene Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```

Pointer to the Scene Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```c
esp_ble_mesh_scenes_state_t *state
```

Parameters of the Scenes state

```c
esp_ble_mesh_last_msg_info_t last
```

Parameters of the last received set message

```c
esp_ble_mesh_state_transition_t *transition
```

Parameters of state transition

```c
struct esp_ble_mesh_scene_setup_srv_t
```

User data of Scene Setup Server Model
Public Members

\texttt{esp\_ble\_mesh\_model\_t *model}

Pointer to the Scene Setup Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_scenes\_state\_t *state}

Parameters of the Scenes state

\texttt{struct esp\_ble\_mesh\_schedule\_register\_t}

Parameters of Scheduler Register state

Public Members

\texttt{bool in\_use}

Indicate if the registered schedule is in use

\texttt{uint64\_t year}

The value of Scheduled year for the action

\texttt{uint64\_t month}

The value of Scheduled month for the action

\texttt{uint64\_t day}

The value of Scheduled day of the month for the action

\texttt{uint64\_t hour}

The value of Scheduled hour for the action

\texttt{uint64\_t minute}

The value of Scheduled minute for the action

\texttt{uint64\_t second}

The value of Scheduled second for the action

\texttt{uint64\_t day\_of\_week}

The value of Schedule days of the week for the action

\texttt{uint64\_t action}

The value of Action to be performed at the scheduled time

\texttt{uint64\_t trans\_time}

The value of Transition time for this action

\texttt{uint16\_t scene\_number}

The value of Scene Number to be used for some actions
struct esp_ble_mesh_scheduler_state_t  
Parameters of Scheduler state

Public Members

const uint8_t schedule_count  
Scheduler count

esp_ble_mesh_schedule_register_t *schedules  
Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t  
User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t *model  
Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl  
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state  
Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t  
User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t *model  
Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl  
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state  
Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t  
Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]  
The current TAI time in seconds
uint8_t subsecond
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
   Current difference between TAI and UTC in seconds

uint8_t timezone_offset_curr
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
   Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
   The current TAI time in seconds

uint8_t subsecond
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
   Current difference between TAI and UTC in seconds

uint8_t timezone_offset_curr
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
   Parameters of Time Zone Set state change event

Public Members

uint8_t timezone_offset_new
   Upcoming local time zone offset
uint8_t tai_zone_change[5]
  TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
  Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new
  Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5]
  TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
  Parameter of Time Role Set state change event

Public Members

uint8_t time_role
  The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
  Parameter of Scene Store state change event

Public Members

uint16_t scene_number
  The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
  Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
  The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
  Parameter of Scene Delete state change event

Public Members

uint16_t scene_number
  The number of scenes to be deleted
struct esp_ble_mesh_state_change_scheduler_act_set_t

Parameter of Scheduler Action Set state change event

Public Members

uint64_t index
Index of the Schedule Register entry to set

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action

uint64_t hour
Scheduled hour for the action

uint64_t minute
Scheduled minute for the action

uint64_t second
Scheduled second for the action

uint64_t day_of_week
Schedule days of the week for the action

uint64_t action
Action to be performed at the scheduled time

uint64_t trans_time
Transition time for this action

uint16_t scene_number
Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
Context of the received Time Set message
Public Members

```c
uint8_t *tai_seconds[5]
The current TAI time in seconds
```

```c
uint8_t *subsecond
The sub-second time in units of 1/256 second
```

```c
uint8_t *uncertainty
The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t *time_authority
0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t *tai_utc_delta
Current difference between TAI and UTC in seconds
```

```c
uint8_t *time_zone_offset
The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_server_recv_time_zone_set_t
Context of the received TimeZoneSet message
```

Public Members

```c
uint8_t *time_zone_offset_new
Upcoming local time zone offset
```

```c
uint8_t *tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message
```

Public Members

```c
uint16_t *tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t *padding
Always 0b0. Other values are Prohibited.
```

```c
uint8_t *tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change
```

```c
struct esp_ble_mesh_server_recv_time_role_set_t
Context of the received Time Role Set message
```
Public Members

```c
uint8_t time_role
The Time Role for the element
```

```c
struct esp_ble_mesh_server_recv_scene_store_t
Context of the received Scene Store message
```

Public Members

```c
uint16_t scene_number
The number of scenes to be stored
```

```c
struct esp_ble_mesh_server_recv_scene_recall_t
Context of the received Scene Recall message
```

Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t scene_number
The number of scenes to be recalled
```

```c
uint8_t tid
Transaction ID
```

```c
uint8_t trans_time
Time to complete state transition (optional)
```

```c
uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_scene_delete_t
Context of the received Scene Delete message
```

Public Members

```c
uint16_t scene_number
The number of scenes to be deleted
```

```c
struct esp_ble_mesh_server_recv_scheduler_act_set_t
Context of the received Scheduler Action Set message
```
Public Members

uint64_t **index**
Index of the Schedule Register entry to set

uint64_t **year**
Scheduled year for the action

uint64_t **month**
Scheduled month for the action

uint64_t **day**
Scheduled day of the month for the action

uint64_t **hour**
Scheduled hour for the action

uint64_t **minute**
Scheduled minute for the action

uint64_t **second**
Scheduled second for the action

uint64_t **day_of_week**
Scheduled day of the week for the action

uint64_t **action**
Action to be performed at the scheduled time

uint64_t **trans_time**
Transition time for this action

uint16_t **scene_number**
Scene number to be used for some actions

struct **esp_ble_mesh_server_recv_time_status_t**
Context of the received Time Status message

Public Members

uint8_t **tai_seconds**[5]
The current TAI time in seconds

uint8_t **subsecond**
The sub-second time in units of 1/256 second

uint8_t **uncertainty**
The estimated uncertainty in 10-millisecond steps
# Chapter 2. API Reference

uint16_t `time_authority`
0 = No Time Authority, 1 = Time Authority

uint16_t `tai_utc_delta`
Current difference between TAI and UTC in seconds

uint8_t `time_zone_offset`
The local time zone offset in 15-minute increments

```
struct esp_ble_mesh_time_scene_server_cb_param_t
Time Scene Server Model callback parameters
```

## Public Members

```
esp_ble_mesh_model_t *model
Pointer to Time and Scenes Server Models
```

```
esp_ble_mesh_msg_ctx_t ctx
Context of the received messages
```

```
esp_ble_mesh_time_scene_server_cb_value_t value
Value of the received Time and Scenes Messages
```

## Macros

```
ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.
```

**Note:** This API needs to be called for each element on which the application needs to have a Time Client Model.

```
Parameters
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.
```

```
Returns
New Time Client Model instance.
```

```
ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.
```

**Note:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

```
Parameters
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.
```

```
Returns
New Scene Client Model instance.
```
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)

Define a new Scheduler Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Parameters
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

Note: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

Parameters
- srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data – Pointer to the unique struct esp_ble_mesh_time_srv_t.

Returns New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)

Define a new Time Setup Server Model.

Note: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   b. This model does not support subscribing nor publishing.

Parameters
- srv_data – Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)

Define a new Scene Server Model.

Note: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
- srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data – Pointer to the unique struct esp_ble_mesh_scene_srv_t.
Returns New Scene Server Model instance.

**ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV** *(srv_pub, srv_data)*

Define a new Scene Setup Server Model.

**Note:** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**Parameters**

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**Returns** New Scene Setup Server Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_SRV** *(srv_pub, srv_data)*

Define a new Scheduler Server Model.

**Note:** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

**Parameters**

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

**Returns** New Scheduler Server Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV** *(srv_pub, srv_data)*

Define a new Scheduler Setup Server Model.

**Note:** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**Parameters**

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**Returns** New Scheduler Setup Server Model instance.

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**

Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**

Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**

Unknown TAI of Delta Change
Chapter 2. API Reference

**ESP_BLE_MESH_TAI.UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI.SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH_TAI.OF_ZONE.CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH_TAI.OF_DELTA.CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH.INVALID_SCENE.NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE.NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDUL.YEAR.ANY.YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDUL.DAY.ANY.DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDUL.HOUR.ANY.HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDUL.HOUR.ONCE.A.DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDUL.SEC.ANY.OF.HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDUL.SEC.EVERY.15.MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDUL.SEC.EVERY.20.MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDUL.SEC.ONCE.AN.HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDUL.SEC.ANY.OF.MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDUL.SEC.EVERY.15.SEC**
Every 15 seconds of the Scheduled minute
Chapter 2. API Reference

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
  Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
  Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
  Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
  Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
  Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
  Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
  Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
  Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
  Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
  Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
  Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
  Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
  Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
  Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
  Scene operation - Scene Not Found

Type Definitions
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_time_scene_client_cb_event_t

This enum value is the event of Time Scene Client Model

- **Values:**

  - enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

typedef void (*esp_ble_mesh_time_scene_server_cb_event_t)

This enum value is the event of Time Scene Server Model

- **Values:**

  - enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
  - enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT

  i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.

  ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

  - enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT

  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

  - enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT

  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

## Lighting Client/Server Models

### Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

### Functions

**esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)**

Register BLE Mesh Light Client Model callback.

**Parameters**

- `callback` - [in] pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)**

Get the value of Light Server Model states using the Light Client Model get messages.

**Parameters**

- `params` - [in] Pointer to BLE Mesh common client parameters.
- `get_state` - [in] Pointer of light get message value. Shall not be set to NULL.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)**

Set the value of Light Server Model states using the Light Client Model set messages.

**Parameters**

- `params` - [in] Pointer to BLE Mesh common client parameters.
- `set_state` - [in] Pointer of light set message value. Shall not be set to NULL.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)**

Register BLE Mesh Lighting Server Model callback.

**Parameters**

- `callback` - [in] Pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state
```

```c
struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set
```

**Public Members**
bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The target value of the Light xyL Lightness state

uint16_t xyl_x
The target value of the Light xyL x state

uint16_t xyl_y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t \texttt{xyl\_y\_range\_min}  
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t \texttt{xyl\_y\_range\_max}  
The value of the xyL y Range Max field of the Light xyL y Range state

\textbf{struct esp\_ble\_mesh\_light\_lc\_mode\_set\_t}  
Parameter of Light LC Mode Set

\textbf{Public Members}

uint8_t \texttt{mode}  
The target value of the Light LC Mode state

\textbf{struct esp\_ble\_mesh\_light\_lc\_om\_set\_t}  
Parameter of Light LC OM Set

\textbf{Public Members}

uint8_t \texttt{mode}  
The target value of the Light LC Occupancy Mode state

\textbf{struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t}  
Parameters of Light LC Light OnOff Set

\textbf{Public Members}

bool \texttt{op\_en}  
Indicate whether optional parameters included

uint8_t \texttt{light\_onoff}  
The target value of the Light LC Light OnOff state

uint8_t \texttt{tid}  
Transaction Identifier

uint8_t \texttt{trans\_time}  
Time to complete state transition (optional)

uint8_t \texttt{delay}  
Indicate message execution delay (C.1)

\textbf{struct esp\_ble\_mesh\_light\_lc\_property\_get\_t}  
Parameter of Light LC Property Get
Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct esp_ble_mesh_light_lc_property_set_t`
Parameters of Light LC Property Set

Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_light_lightness_status_cb_t`
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
Parameters of Light Lightness Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_lightness`
Current value of light lightness actual state

`uint16_t target_lightness`
Target value of light lightness actual state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_lightness_linear_status_cb_t`
Parameters of Light Lightness Linear Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_lightness`
Current value of light lightness linear state
Chapter 2. API Reference

`uint16_t target_lightness`
Target value of light lightness linear state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_lightness_last_status_cb_t`
Parameter of Light Lightness Last Status

**Public Members**

`uint16_t lightness`
The value of the Light Lightness Last state

`struct esp_ble_mesh_light_lightness_default_status_cb_t`
Parameter of Light Lightness Default Status

**Public Members**

`uint16_t lightness`
The value of the Light Lightness default State

`struct esp_ble_mesh_light_lightness_range_status_cb_t`
Parameters of Light Lightness Range Status

**Public Members**

`uint8_t status_code`
Status Code for the request message

`uint16_t range_min`
Value of range min field of light lightness range state

`uint16_t range_max`
Value of range max field of light lightness range state

`struct esp_ble_mesh_light_ctl_status_cb_t`
Parameters of Light CTL Status

**Public Members**

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_ctl_lightness`
Current value of light ctl lightness state
Chapter 2. API Reference

  The value of the Light xyL x Default state

uint16_t \texttt{xyl\_y}
  The value of the Light xyL y Default state
\end{verbatim}

\textbf{struct esp\_ble\_mesh\_light\_xyl\_range\_status\_cb\_t}

Parameters of Light xyL Range Status

\textbf{Public Members}

\begin{verbatim}
uint8_t \texttt{status\_code}
  Status Code for the requesting message
\end{verbatim}
uint16_t `xyl_x_range_min`
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t `xyl_x_range_max`
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t `xyl_y_range_min`
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t `xyl_y_range_max`
The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_light_lc_mode_status_cb_t`
Parameter of Light LC Mode Status

**Public Members**

uint8_t `mode`
The present value of the Light LC Mode state

struct `esp_ble_mesh_light_lc_om_status_cb_t`
Parameter of Light LC OM Status

**Public Members**

uint8_t `mode`
The present value of the Light LC Occupancy Mode state

struct `esp_ble_mesh_light_lc_light_onoff_status_cb_t`
Parameters of Light LC Light OnOff Status

**Public Members**

bool `op_en`
Indicate whether optional parameters included

uint8_t `present_light_onoff`
The present value of the Light LC Light OnOff state

uint8_t `target_light_onoff`
The target value of the Light LC Light OnOff state (Optional)

uint8_t `remain_time`
Time to complete state transition (C.1)

struct `esp_ble_mesh_light_lc_property_status_cb_t`
Parameters of Light LC Property Status
Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_light_client_cb_param_t
    Lighting Client Model callback parameters
```

Public Members

```c
int error_code
    Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
    The client common parameters.
```

```c
esp_ble_mesh_light_client_status_cb_t status_cb
    The light status message callback values
```

Public Members

```c
uint16_t lightness_linear
    The present value of Light Lightness Linear state
```

```c
uint16_t target_lightness_linear
    The target value of Light Lightness Linear state
```

```c
uint16_t lightness_actual
    The present value of Light Lightness Actual state
```

```c
uint16_t target_lightness_actual
    The target value of Light Lightness Actual state
```

```c
uint16_t lightness_last
    The value of Light Lightness Last state
```

```c
uint16_t lightness_default
    The value of Light Lightness Default state
```

```c
uint8_t status_code
    The status code of setting Light Lightness Range state
```
uint16_t lightness_range_min
The minimum value of Light Lightness Range state

uint16_t lightness_range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
Chapter 2. API Reference

```

`esp_ble_mesh_light_lightness_state_t *state`
Parameters of the Light Lightness state

struct `esp_ble_mesh_light_ctl_state_t`
Parameters of Light CTL state

**Public Members**

`uint16_t lightness`
The present value of Light CTL Lightness state

`uint16_t target_lightness`
The target value of Light CTL Lightness state

`uint16_t temperature`
The present value of Light CTL Temperature state

`uint16_t target_temperature`
The target value of Light CTL Temperature state

`int16_t delta_uv`
The present value of Light CTL Delta UV state

`int16_t target_delta_uv`
The target value of Light CTL Delta UV state

`uint8_t status_code`
The status code of setting Light CTL Temperature Range state

`uint16_t temperature_range_min`
The minimum value of Light CTL Temperature Range state

`uint16_t temperature_range_max`
The maximum value of Light CTL Temperature Range state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t temperature_default`
The value of Light CTL Temperature Default state

`int16_t delta_uv_default`
The value of Light CTL Delta UV Default state

struct `esp_ble_mesh_light_ctl_srv_t`
User data of Light CTL Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_setup_srv_t`
User data of Light CTL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.
Chapter 2. API Reference

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_temperature
    Delta change value of temperature state transition

int32_t tt_delta_delta_uv
    Delta change value of delta uv state transition

struct esp_ble_mesh_light_hsl_state_t
    Parameters of Light HSL state

Public Members

uint16_t lightness
    The present value of Light HSL Lightness state

uint16_t target_lightness
    The target value of Light HSL Lightness state

uint16_t hue
    The present value of Light HSL Hue state

uint16_t target_hue
    The target value of Light HSL Hue state

uint16_t saturation
    The present value of Light HSL Saturation state

uint16_t target_saturation
    The target value of Light HSL Saturation state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t hue_default
    The value of Light HSL Hue Default state
```
Chapter 2. API Reference

```
uint16_t saturation_default
    The value of Light HSL Saturation Default state

uint8_t status_code
    The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
    The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
    The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
    The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
    The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
    User data of Light HSL Server Model
```

**Public Members**

```
exp_ble_mesh_model_t *model
    Pointer to the Lighting HSL Server Model. Initialized internally.

exp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

exp_ble_mesh_light_hsl_state_t *state
    Parameters of the Light HSL state

exp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

exp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`struct esp_ble_mesh_light_hsl_hue_srv_t`
User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t * state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t * state`
Parameters of the Light HSL state
**Chapter 2. API Reference**

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

*struct esp_ble_mesh_light_xyl_state_t*
Parameters of Light xyL state

**Public Members**

`uint16_t lightness`
The present value of Light xyL Lightness state

`uint16_t target_lightness`
The target value of Light xyL Lightness state

`uint16_t x`
The present value of Light xyL x state

`uint16_t target_x`
The target value of Light xyL x state

`uint16_t y`
The present value of Light xyL y state

`uint16_t target_y`
The target value of Light xyL y state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t x_default`
The value of Light xyL x Default state

`uint16_t y_default`
The value of Light xyL y Default state

`uint8_t status_code`
The status code of setting Light xyL x & y Range state

`uint16_t x_range_min`
The minimum value of Light xyL x Range state
uint16_t \textbf{x\_range\_max}  
The maximum value of Light x y L Range state

uint16_t \textbf{y\_range\_min}  
The minimum value of Light x y L Range state

uint16_t \textbf{y\_range\_max}  
The maximum value of Light x y L Range state

\textbf{struct esp\_ble\_mesh\_light\_xyl\_srv\_t}  
User data of Light x y L Server Model

\textbf{Public Members}

\textbf{esp\_ble\_mesh\_model\_t \textit{\_model}}  
Pointer to the Lighting x y L Server Model. Initialized internally.

\textbf{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \textit{\_rsp\_ctrl}}  
Response control of the server model received messages

\textbf{esp\_ble\_mesh\_light\_xyl\_state\_t \textit{\_state}}  
Parameters of the Light x y L state

\textbf{esp\_ble\_mesh\_last\_msg\_info\_t \textit{\_last}}  
Parameters of the last received set message

\textbf{esp\_ble\_mesh\_state\_transition\_t \textit{\_transition}}  
Parameters of state transition

int32_t \textbf{tt\_delta\_lightness}  
Delta change value of lightness state transition

int32_t \textbf{tt\_delta\_x}  
Delta change value of x state transition

int32_t \textbf{tt\_delta\_y}  
Delta change value of y state transition

\textbf{struct esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t}  
User data of Light x y L Setup Server Model

\textbf{Public Members}

\textbf{esp\_ble\_mesh\_model\_t \textit{\_model}}  
Pointer to the Lighting x y L Setup Server Model. Initialized internally.
**Chapter 2. API Reference**

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_light_xyl_state_t* `state`
Parameters of the Light xyl state

```c
struct esp_ble_mesh_light_xyl_state_t {
    # Parameters of the Light xyl state
}
```

**Public Members**

```c
uint32_t mode
```
0b0 The controller is turned off.
- The binding with the Light Lightness state is disabled.
- 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

```c
uint32_t occupancy_mode
```
The value of Light LC Occupancy Mode state

```c
uint32_t light_onoff
```
The present value of Light LC Light OnOff state

```c
uint32_t target_light_onoff
```
The target value of Light LC Light OnOff state

```c
uint32_t occupancy
```
The value of Light LC Occupancy state

```c
uint32_t ambient_luxlevel
```
The value of Light LC Ambient LuxLevel state

```c
uint16_t linear_output
```
i. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
ii. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
iii. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

```c
struct esp_ble_mesh_light_lc_property_state_t {
    # Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.
    # Public Members
    #
}:
```

```c
```
**Chapter 2. API Reference**

**uint32_t time_occupancy_delay**
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32_t time_fade_on**
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32_t time_run_on**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32_t time_fade**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

**uint32_t time_prolong**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32_t time_fade_standby_auto**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32_t time_fade_standby_manual**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light On Off state. The value of Light LC Time Fade Standby Manual state

**uint16_t lightness_on**
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16_t lightness_prolong**
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16_t lightness_standby**
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16_t ambient_luxlevel_on**
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16_t ambient_luxlevel_prolong**
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
```c
struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
```

- **uint16_t ambient_luxlevel_standby**
  A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

- **float regulator_kiu**
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

- **float regulator_kid**
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

- **float regulator_kpu**
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

- **float regulator_kpd**
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

- **int8_t regulator_accuracy**
  A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

- **uint32_t set_occupancy_to_1_delay**
  If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

```
uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define
the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of
the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC
Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine

struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t state
Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t prop_state
Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t state_machine
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
\text{\texttt{esp\_ble\_mesh\_state\_transition\_t}} \texttt{transition}
Parameters of state transition

\text{\texttt{struct esp\_ble\_mesh\_light\_lc\_setup\_srv\_t}}
User data of Light LC Setup Server Model

**Public Members**

\text{\texttt{esp\_ble\_mesh\_model\_t \*model}}
Pointer to the Lighting LC Setup Server Model. Initialized internally.

\text{\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \*rsp\_ctrl}}
Response control of the server model received messages

\text{\texttt{esp\_ble\_mesh\_light\_control\_t \*lc}}
Parameters of the Light controller

\text{\texttt{struct esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t}}
Parameter of Light Lightness Actual state change event

**Public Members**

\text{uint16\_t \texttt{lightness}}
The value of Light Lightness Actual state

\text{\texttt{struct esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t}}
Parameter of Light Lightness Linear state change event

**Public Members**

\text{uint16\_t \texttt{lightness}}
The value of Light Lightness Linear state

\text{\texttt{struct esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t}}
Parameter of Light Lightness Default state change event

**Public Members**

\text{uint16\_t \texttt{lightness}}
The value of Light Lightness Default state

\text{\texttt{struct esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t}}
Parameters of Light Lightness Range state change event
Chapter 2. API Reference

Public Members

uint16_t range_min
The minimum value of Light Lightness Range state

uint16_t range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event

Public Members

uint16_t lightness
The value of Light CTL Lightness state

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event
Chapter 2. API Reference

uint16_t **lightness**
The value of Light Lightness Default state

uint16_t **x**
The value of Light xyL x Default state

uint16_t **y**
The value of Light xyL y Default state

struct **esp_ble_mesh_state_change_light_xyl_range_set_t**
Parameters of Light xyL Range state change event

Public Members

uint16_t **x_range_min**
The minimum value of Light xyL x Range state

uint16_t **x_range_max**
The maximum value of Light xyL x Range state

uint16_t **y_range_min**
The minimum value of Light xyL y Range state

uint16_t **y_range_max**
The maximum value of Light xyL y Range state

struct **esp_ble_mesh_state_change_light_lc_mode_set_t**
Parameter of Light LC Mode state change event

Public Members

uint8_t **mode**
The value of Light LC Mode state

struct **esp_ble_mesh_state_change_light_lc_om_set_t**
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t **mode**
The value of Light LC Occupancy Mode state

struct **esp_ble_mesh_state_change_light_lc_light_onoff_set_t**
Parameter of Light LC Light OnOff state change event
Public Members

uint8_t \texttt{onoff}\[1.5ex]
The value of Light LC Light OnOff state

\begin{verbatim}
struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event
\end{verbatim}

\begin{verbatim}
Public Members

uint16_t \texttt{property_id}\[2ex]
The property id of Light LC Property state

struct net_buf_simple *\texttt{property_value}\[2ex]
The property value of Light LC Property state

\end{verbatim}

\begin{verbatim}
Public Members

uint16_t \texttt{property_id}\[2ex]
The value of Sensor Property ID

uint8_t \texttt{occupancy}\[2ex]
The value of Light LC Occupancy state

uint32_t \texttt{set_occupancy_to_1_delay}\[2ex]
The value of Light LC Set Occupancy to 1 Delay state

uint32_t \texttt{ambient_luxlevel}\[2ex]
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] \texttt{state}\[2ex]
Parameters of Sensor Status related state

\end{verbatim}

\begin{verbatim}
Public Members

uint16_t \texttt{property_id}\[2ex]
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message
\end{verbatim}
Public Members

bool op_en  
Indicate if optional parameters are included

uint16_t lightness  
Target value of light lightness actual state

uint8_t tid  
Transaction ID

uint8_t trans_time  
Time to complete state transition (optional)

uint8_t delay  
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t  
Context of the received Light Lightness Linear Set message

Public Members

bool op_en  
Indicate if optional parameters are included

uint16_t lightness  
Target value of light lightness linear state

uint8_t tid  
Transaction ID

uint8_t trans_time  
Time to complete state transition (optional)

uint8_t delay  
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t  
Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness  
The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t  
Context of the received Light Lightness Range Set message
Public Members

`uint16_t range_min`
Value of range min field of light lightness range state

`uint16_t range_max`
Value of range max field of light lightness range state

`struct esp_ble_mesh_server_recv_light_ctl_set_t`
Context of the received Light CTL Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t lightness`
Target value of light ctl lightness state

`uint16_t temperature`
Target value of light ctl temperature state

`int16_t delta_uv`
Target value of light ctl delta UV state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t`
Context of the received Light CTL Temperature Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t temperature`
Target value of light ctl temperature state

`int16_t delta_uv`
Target value of light ctl delta UV state
uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
  Context of the received Light CTL Temperature Range Set message

  **Public Members**

  uint16_t range_min
    Value of temperature range min field of light ctl temperature range state

  uint16_t range_max
    Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_recv_light_ctl_default_set_t
  Context of the received Light CTL Default Set message

  **Public Members**

  uint16_t lightness
    Value of light lightness default state

  uint16_t temperature
    Value of light temperature default state

  int16_t delta_uv
    Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
  Context of the received Light HSL Set message

  **Public Members**

  bool op_en
    Indicate if optional parameters are included

  uint16_t lightness
    Target value of light hsl lightness state
uint16_t hue
  Target value of light hsl hue state

uint16_t saturation
  Target value of light hsl saturation state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
  Context of the received Light HSL Hue Set message

  Public Members

  bool op_en
    Indicate if optional parameters are included

  uint16_t hue
    Target value of light hsl hue state

  uint8_t tid
    Transaction ID

  uint8_t trans_time
    Time to complete state transition (optional)

  uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
  Context of the received Light HSL Saturation Set message

  Public Members

  bool op_en
    Indicate if optional parameters are included

  uint16_t saturation
    Target value of light hsl hue state
uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
Context of the received Light HSL Default Set message

**Public Members**

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
Context of the received Light HSL Range Set message

**Public Members**

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xYL Set message

**Public Members**
bool op_en
   Indicate whether optional parameters included

uint16_t lightness
   The target value of the Light xyL Lightness state

uint16_t x
   The target value of the Light xyL x state

uint16_t y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
   Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t x
   The value of the Light xyL x Default state

uint16_t y
   The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
   Context of the received Light xyL Range Set message

Public Members

uint16_t x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t y_range_min
   The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
   The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
   Context of the received Light LC Mode Set message

Public Members
   
uint8_t mode
   The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
   Context of the received Light OM Set message

Public Members
   
uint8_t mode
   The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
   Context of the received Light LC Light OnOff Set message

Public Members
   
bool op_en
   Indicate whether optional parameters included

uint8_t light_onoff
   The target value of the Light LC Light OnOff state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
   Context of the received Light LC Property Set message
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_server_recv_sensor_status_t
    Context of the received Sensor Status message
```

Public Members

```c
struct net_buf_simple *data
    Value of sensor data state (optional)
```

```c
struct esp_ble_mesh_lighting_server_cb_param_t
    Lighting Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
    Value of the received Lighting Messages
```

Macros

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
    Define a new Light Lightness Client Model.
```

**Note:** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Parameters**

- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**

New Light Lightness Client Model instance.

```c
ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)
    Define a new Light CTL Client Model.
```

**Note:** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Chapter 2. API Reference

Parameters

- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light CTL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)

Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters

- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light HSL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)

Define a new Light xyL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters

- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light xyL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)

Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters

- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light LC Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`. 
Returns New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

Note: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
   a. This model shall support model subscription.

Parameters
• srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data – Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.
Returns New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)
Define a new Light CTL Server Model.

Note: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Parameters
• srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.
Returns New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

Note: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

Parameters
• srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.
Returns New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

Note: 1. The Light CTL Temperature Server model extends the Generic Level Server model.
   a. This model shall support model publication and model subscription.
Chapter 2. API Reference

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**Returns**
New Light CTL Temperature Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (srv_pub, srv_data)
Define a new Light HSL Server Model.

**Note:**
1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

**Returns**
New Light HSL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV** (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

**Note:**
1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**Returns**
New Light HSL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV** (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

**Note:**
1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   a. This model shall support model publication and model subscription.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**Returns**
New Light HSL Hue Server Model instance.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

**Note:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**Returns** New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xYL Server Model.

**Note:** 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_BLE_mesh_light_xyl_srv_t`.

**Returns** New Light xYL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.

**Note:** 1. The Light xYL Setup Server model extends the Light xYL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_BLE_mesh_light_xyl_setup_srv_t`.

**Returns** New Light xYL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)
Define a new Light LC Server Model.

**Note:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_BLE_mesh_light_lc_srv_t`.
Chapter 2. API Reference

**Returns** New Light LC Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV** (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

**Note:** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   a. This model shall support model publication and model subscription.
   b. This model may be used to configure setup parameters for the Light LC Server model.

**Parameters**
- **srv_pub** – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **srv_data** – Pointer to the unique struct esp_ble_mesh_light_lc_setup_srv_t.

**Returns** New Light LC Setup Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,
                                             esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,
                                                  esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

- **Values:**

  - **enumerator ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**
  - **enumerator ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**
  - **enumerator ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**
  - **enumerator ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**
  - **enumerator ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

```c
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

- **Values:**
enumerator ESP_BLE_MESH_LC_OFF
enumerator ESP_BLE_MESH_LC_STANDBY
enumerator ESP_BLE_MESH_LC_FADE_ON
enumerator ESP_BLE_MESH_LC_RUN
enumerator ESP_BLE_MESH_LC_FADE
enumerator ESP_BLE_MESH_LC_PROLONG
enumerator ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
enumerator ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

enum esp_ble_mesh_lighting_server_cb_event_t

This enum value is the event of Lighting Server Model

Values:

enumerator ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

2.3.6 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCl interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features
of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks(initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

Functions
Esp_err_t esp_nimble_hci_init(void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Returns

• ESP_OK if the initialization is successful
• Appropriate error code from esp_err_t in case of an error

Esp_err_t esp_nimble_hci_deinit(void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note: This function should be called after the NimBLE host is deinitialized.

Returns

• ESP_OK if the deinitialization is successful
• Appropriate error codes from esp_err_t in case of an error

Macros

BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4SCO
BLE_HCI_UART_H4_EVT

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

• For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
• For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

• ESP32 Bluetooth Architecture (PDF)

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

• GATT Client Example Walkthrough
• GATT Server Service Table Example Walkthrough
• GATT Server Example Walkthrough
• GATT Security Client Example Walkthrough
• GATT Security Server Example Walkthrough
• GATT Client Multi-connection Example Walkthrough

### 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*. 
**ESP_FAIL** (-1): Generic esp_err_t code indicating failure

**ESP_OK** (0): esp_err_t value indicating success (no error)

**ESP_ERR_NO_MEM** (0x101): Out of memory

**ESP_ERR_INVALID_ARG** (0x102): Invalid argument

**ESP_ERR_INVALID_STATE** (0x103): Invalid state

**ESP_ERR_INVALID_SIZE** (0x104): Invalid size

**ESP_ERR_NOT_FOUND** (0x105): Requested resource not found

**ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported

**ESP_ERR_TIMEOUT** (0x107): Operation timed out

**ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid

**ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid

**ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (0x10c): There are items remained to retrieve

**ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (0x1102): A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry
ESP_ERR_NVS_XTS_CFG_FAILED (0x1113): XTS configuration setting failed
ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114): XTS configuration not found
ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version
ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized
ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt
ESP_ERR_NVS_CONTENT_DIFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison
ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.
ESP_ERR_U LP_BASE (0x1200): Offset for ULP-related error codes
ESP_ERR_U LP_SIZE_TOO_BIG (0x1201): Program doesn’t fit into RTC memory reserved for the ULP
ESP_ERR_U LP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_U LP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_U LP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_U LP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)
ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
**ESPErr_WiFi_Not_Started (0x3002):** WiFi driver was not started by esp_wifi_start

**ESPErr_WiFi_Not_Stopped (0x3003):** WiFi driver was not stopped by esp_wifi_stop

**ESPErr_WiFi_IF (0x3004):** WiFi interface error

**ESPErr_WiFi_Mode (0x3005):** WiFi mode error

**ESPErr_WiFi_State (0x3006):** WiFi internal state error

**ESPErr_WiFi_Conn (0x3007):** WiFi internal control block of station or soft-AP error

**ESPErr_WiFi_NVs (0x3008):** WiFi internal NVS module error

**ESPErr_WiFi_MAC (0x3009):** MAC address is invalid

**ESPErr_WiFi_SSID (0x300a):** SSID is invalid

**ESPErr_WiFi_Password (0x300b):** Password is invalid

**ESPErr_WiFi_Timeout (0x300c):** Timeout error

**ESPErr_WiFi_Wake_Fail (0x300d):** WiFi is in sleep state (RF closed) and wakeup fail

**ESPErr_WiFi_Would_Block (0x300e):** The caller would block

**ESPErr_WiFi_Not_Connect (0x300f):** Station still in disconnect status

**ESPErr_WiFi_Post (0x3012):** Failed to post the event to WiFi task

**ESPErr_WiFi_Init_State (0x3013):** Invalid WiFi state when init/deinit is called

**ESPErr_WiFi_Stop_State (0x3014):** Returned when WiFi is stopping

**ESPErr_WiFi_Not_Assoc (0x3015):** The WiFi connection is not associated

**ESPErr_WiFi_TX_Disallow (0x3016):** The WiFi TX is disallowed

**ESPErr_WiFi_Registrar (0x3033):** WPS registrar is not supported

**ESPErr_WiFi_WPS_Type (0x3034):** WPS type error

**ESPErr_WiFi_WPS_SM (0x3035):** WPS state machine is not initialized

**ESPErr_ESPNOW_Base (0x3064):** ESPNOW error number base.

**ESPErr_ESPNOW_Not_Init (0x3065):** ESPNOW is not initialized.

**ESPErr_ESPNOW_Arg (0x3066):** Invalid argument

**ESPErr_ESPNOW_No_Mem (0x3067):** Out of memory

**ESPErr_ESPNOW_Full (0x3068):** ESPNOW peer list is full

**ESPErr_ESPNOW_Not_Found (0x3069):** ESPNOW peer is not found

**ESPErr_ESPNOW_Internal (0x306a):** Internal error

**ESPErr_ESPNOW_Exist (0x306b):** ESPNOW peer has existed

**ESPErr_ESPNOW_IF (0x306c):** Interface error

**ESPErr_DPP_Failure (0x3097):** Generic failure during DPP Operation

**ESPErr_DPP_TX_Failure (0x3098):** DPP Frame Tx failed OR not Acked

**ESPErr_DPP_Invalid_Attr (0x3099):** Encountered invalid DPP Attribute

**ESPErr_Mesh_Base (0x4000):** Starting number of MESH error codes

**ESPErr_Mesh_Wifi_Not_Start (0x4001):**

**ESPErr_Mesh_Not_Init (0x4002):**

**ESPErr_Mesh_Not_Config (0x4003):**

**ESPErr_Mesh_Not_Start (0x4004):**

ESP_ERR_PING_INVALID_PARAMS (0xa001)
ESP_ERR_PING_NO_MEM (0xa002)
ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated
ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread
ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes
ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem
ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)
ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)
ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)
ESP_ERR_MEMPROT_BASE (0xd000): Starting number of Memory Protection API error codes
ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)
ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)
ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)
ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)
ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)
ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)
ESP_ERR_MEMPROT_AREA_INVALID (0xd007)
ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)
ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes
ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out
ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)
ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer
ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed
2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor specific Content</th>
<th>FCS</th>
</tr>
</thead>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value filed is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
• LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization**  
Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device**  
Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 16, the default is 6.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data**  
Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data**  
Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate**  
Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Application Examples**

• Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.

• For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**
Chapter 2. API Reference

Header File

- components/esp_wifi/include/esp_now.h

Functions

```c
esp_err_t esp_now_init (void)
```
Initialize ESPNOW function.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

```c
esp_err_t esp_now_deinit (void)
```
De-initialize ESPNOW function.

Returns

- ESP_OK : succeed

```c
esp_err_t esp_now_get_version (uint32_t *version)
```
Get the version of ESPNOW.

Parameters

- version - ESPNOW version

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
```
Register callback function of receiving ESPNOW data.

Parameters

- cb - callback function of receiving ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

```c
esp_err_t esp_now_unregister_recv_cb (void)
```
Unregister callback function of receiving ESPNOW data.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
```
Register callback function of sending ESPNOW data.

Parameters

- cb - callback function of sending ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

```c
esp_err_t esp_now_unregister_send_cb (void)
```
Unregister callback function of sending ESPNOW data.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)
```
Send ESPNOW data.

Attention
1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Chapter 2. API Reference

**Attention** 3. The maximum length of data must be less than \texttt{ESP_NOW\_MAX\_DATA\_LEN}

**Attention** 4. The buffer pointed to by data argument does not need to be valid after \texttt{esp\_now\_send} returns

### Parameters
- \texttt{peer\_addr} – peer MAC address
- \texttt{data} – data to send
- \texttt{len} – length of data

### Returns
- ESP\_OK: succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT: ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG: invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL: internal error
- ESP\_ERR\_ESPNOW\_NO\_MEM: out of memory, when this happens, you can delay a while before sending the next data
- ESP\_ERR\_ESPNOW\_NOT\_FOUND: peer is not found
- ESP\_ERR\_ESPNOW\_IF: current WiFi interface doesn’t match that of peer

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)
```

Add a peer to peer list.

**Parameters** peer – peer information

**Returns**
- ESP\_OK: succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT: ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG: invalid argument
- ESP\_ERR\_ESPNOW\_FULL: peer list is full
- ESP\_ERR\_ESPNOW\_NO\_MEM: out of memory
- ESP\_ERR\_ESPNOW\_EXIST: peer has existed

```c
esp_err_t esp_now_del_peer (const uint8_t *peer_addr)
```

Delete a peer from peer list.

**Parameters** peer\_addr – peer MAC address

**Returns**
- ESP\_OK: succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT: ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG: invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND: peer is not found

```c
esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)
```

Modify a peer.

**Parameters** peer – peer information

**Returns**
- ESP\_OK: succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT: ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG: invalid argument
- ESP\_ERR\_ESPNOW\_FULL: peer list is full

```c
esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after \texttt{esp\_wifi\_start}.

**Parameters**
- \texttt{ifx} – Interface to be configured.
- \texttt{rate} – Phy rate to be configured.

**Returns**
- ESP\_OK: succeed
Chapter 2. API Reference

- others: failed

```c
esp_err_t esp_now_get_peer (const uint8_t* peer_addr, esp_now_peer_info_t *peer)
```

Get a peer whose MAC address matches `peer_addr` from peer list.

**Parameters**
- `peer_addr` — peer MAC address
- `peer` — peer information

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

```c
esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)
```

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**
- `from_head` — fetch from head of list or not
- `peer` — peer information

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

```c
bool esp_now_is_peer_exist (const uint8_t* peer_addr)
```

Peer exists or not.

**Parameters**
- `peer_addr` — peer MAC address

**Returns**
- true: peer exists
- false: peer not exists

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t *num)
```

Get the number of peers.

**Parameters**
- `num` — number of peers

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_set_pmk (const uint8_t* pmk)
```

Set the primary master key.

**Attention**

1. primary master key is used to encrypt local master key

**Parameters**
- `pmk` — primary master key

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_set_wake_window (uint16_t window)
```

Set wake window for esp_now to wake up in interval unit.
Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

Parameters window – Milliseconds would the chip keep waked each interval, from 0 to 65535.

Returns
  • ESP_OK : succeed
  • ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

struct esp_now_peer_info
  ESPNOW peer information parameters.

Public Members

uint8_t peer_addr[ESP_NOW_ETH_ALEN]
  ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]
  ESPNOW peer local master key that is used to encrypt data

uint8_t channel
  Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx
  Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt
  ESPNOW data that this peer sends/receives is encrypted or not

void *priv
  ESPNOW peer private data

struct esp_now_peer_num
  Number of ESPNOW peers which exist currently.

Public Members

int total_num
  Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num
  Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
Chapter 2. API Reference

Macros

ESP_ERR_ESPNOW_BASE
ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG
Invalid argument

ESP_ERR_ESPNOW_NO_MEM
Out of memory

ESP_ERR_ESPNOW_FULL
ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
Internal error

ESP_ERR_ESPNOW_EXIST
ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
Interface error

ESP_NOW_ETH_ALEN
Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t*mac_addr, const uint8_t*data, int data_len)
    Callback function of receiving ESPNOW data.
    
    **Param mac_addr** peer MAC address
    **Param data** received data
    **Param data_len** length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t*mac_addr, esp_now_send_status_t status)
    Callback function of sending ESPNOW data.
    
    **Param mac_addr** peer MAC address
    **Param status** status of sending ESPNOW data (succeed or fail)

**Enumerations**

enum esp_now_send_status_t
    Status of sending ESPNOW data .
    
    Values:
    
    enumerator ESP_NOW_SEND_SUCCESS
        Send ESPNOW data successfully
    
    enumerator ESP_NOW_SEND_FAIL
        Send ESPNOW data fail

**ESP-WIFI-MESH Programming Guide**

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. **ESP-WIFI-MESH Programming Model**
2. **Writing an ESP-WIFI-MESH Application**
3. **Self Organized Networking**
4. **Application Examples**
5. **API Reference**

For documentation regarding the ESP-WIFI-MESH protocol, please see the **ESP-WIFI-MESH API Guide**. For more information about ESP-WIFI-MESH Development Framework, please see **ESP-WIFI-MESH Development Framework**.

**ESP-WIFI-MESH Programming Model**

**Software Stack**  The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

**System Events**  An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The mesh_event_id_t defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register
a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

---

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

---

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from
the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application**  The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

### Initialize Mesh

The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
```

### Configuring an ESP-WIFI-MESH Network

ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
```

(continues on next page)
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */

//cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

Start Mesh

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using esp_mesh_send() and esp_mesh_recv().

Self Organized Networking  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking  Self organized networking can be enabled or disabled by the application at runtime by calling the esp_mesh_set_self_organized() function. The function has the two following parameters:

- bool enable specifies whether to enable or disable self organized networking.
- bool select_parent specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

Disabling self organized networking

//Disable self organized networking
esp_mesh_set_self_organized(false, false);

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
### Select Parent | Is Root Node | Effects
--- | --- | ---
N | N | • Nodes already connected to a parent node will remain connected.  
   • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart.
Y |  | • A root node already connected to router will stay connected.  
   • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect.
Y | N | • Nodes without a parent node will automatically select a preferred parent and connect.  
   • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.
Y |  | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.

The following code snippet demonstrates how to enable self organized networking.

```c
// Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

// Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs.** This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using...
ESP-WIFI-MESH.

// Disable self organized networking
esp_mesh_set_self_organized(0, 0);

// Stop any scans already in progress
esp_wifi_scan_stop();
// Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

// Process scan results
...

// Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

// Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

// Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); // Don't select new parent
esp_mesh_connect(); // Manually reconnect to router

Application Examples ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

`esp_err_t esp_mesh_init (void)`

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

Returns

- ESP_OK
- ESP_FAIL
### esp_err_t esp_mesh_deinit (void)
Mesh de-initialization.

- Release resources and stop the mesh

**Returns**
- ESP_OK
- ESP_FAIL

### esp_err_t esp_mesh_start (void)
Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

### esp_err_t esp_mesh_stop (void)
Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Returns**
- ESP_OK
- ESP_FAIL

### esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.
Attention This API is not reentrant.

Parameters

• **to** - [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.

• **data** - [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

• **flag** - [in] bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

• **opt** - [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

• **opt_count** - [in] option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

Returns

• ESP_OK
• ESP_FAIL
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_DISCONNECTED
• ESP_ERR_MESH_OPT_UNKNOWN
• ESP_ERR_MESH_EXCEED_MTU
• ESP_ERR_MESH_NO_MEMORY
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_NO_ROUTE_FOUND
• ESP_ERR_MESH_DISCARD

`esp_err_t esp_mesh_send_block_time (uint32_t time_ms)`
Set blocking time of `esp_mesh_send()`

**Attention** This API shall be called before mesh is started.

**Parameters** `time_ms` [in] blocking time of `esp_mesh_send()`, unit: ms

**Returns**
- ESP_OK

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

`flag` could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**Parameters**
- `from` [out] the address of the original source of the packet
- `data` [out] pointer to the received mesh packet
  - Field `proto` is the data protocol in use. Should follow it to parse the received data.
  - Field `tos` is the transmission `tos` (type of service) in use.
- `timeout_ms` [in] wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- `flag` [out] bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- `opt` [out] options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- `opt_count` [in] option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` hasn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.
Chapter 2. API Reference

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Parameters

- **from** - [out] the address of the original source of the packet
- **to** - [out] the address contains remote IP address and port (IPv4:PORT)
- **data** - [out] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout** - [in] wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY:wait forever)
- **flag** - [out] bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** - [out] options desired to receive
- **opt_count** - [in] option count desired to receive

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max: 10).

Attention This API shall be called before mesh is started after mesh is initialized.

Parameters **config** - [in] pointer to mesh stack configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

Get mesh stack configuration.
**Parameters** config **-[out]** pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters** router **-[in]** pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```

Get router configuration.

**Parameters** router **-[out]** pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters** id **-[in]** pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

Get mesh network ID.

**Parameters** id **-[out]** pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_type(mesh_type_t type)
```

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters** type **-[in]** device type

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
**mesh_type_t** `esp_mesh_get_type` (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** mesh type

**esp_err_t** `esp_mesh_set_max_layer` (int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters** max_layer - [in] max layer value

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**int** `esp_mesh_get_max_layer` (void)

Get max layer value.

**Returns** max layer value

**esp_err_t** `esp_mesh_set_ap_password` (const uint8_t *pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**
- pwd - [in] pointer to the password
- len - [in] password length

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**esp_err_t** `esp_mesh_set_ap_authmode` (wifi_auth_mode_t authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** authmode - [in] authentication mode

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
**warm_auth_mode_t esp_mesh_get_ap_authmode (void)**

Get mesh softAP authentication mode.

**Returns**

authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention**

This API shall be called before mesh is started.

**Parameters**

connections [in] the number of max connections

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**int esp_mesh_get_ap_connections (void)**

Get mesh max connection configuration.

**Returns**

the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**

Get non-mesh max connection configuration.

**Returns**

the number of non-mesh max connections

**int esp_mesh_get_layer (void)**

Get current layer value over the mesh network.

**Attention**

This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns**

layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**

Get the parent BSSID.

**Attention**

This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Parameters**

bssid [out] pointer to parent BSSID

**Returns**

- ESP_OK
- ESP_FAIL

**bool esp_mesh_is_root (void)**

Return whether the device is the root node of the network.

**Returns**

true/false

**esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)**

Enable/disable self-organized networking.
• Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
• Self-organized networking is enabled by default.
• If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

Attention This API is used to dynamically modify whether to enable the self organizing.

Parameters
• `enable` - [in] enable or disable self-organized networking
• `select_parent` - [in] Only valid when self-organized networking is enabled.
  – if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

Returns
• ESP_OK
• ESP_FAIL

bool `esp_mesh_get_self_organized` (void)
Return whether enable self-organized networking or not.

Returns true/false

`esp_err_t esp_mesh_waive_root` (const `mesh_vote_t` *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Parameters
• `vote` - [in] vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is_rc_specified shall be false.
  – Field attempts shall be at least 15 times.
• `reason` - [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

Returns
• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

`esp_err_t esp_mesh_set_vote_percentage` (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)
• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention**  This API shall be called before mesh is started.

**Parameters**  percentage – [in] vote percentage threshold  
**Returns**  
• ESP_OK  
• ESP_FAIL

```c
float esp_mesh_get_vote_percentage (void)
```
Get vote percentage threshold for approval of being a root.

**Returns**  percentage threshold

```c
esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
```
Set mesh softAP associate expired time (default:10 seconds)

• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.  
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters**  seconds – [in] the expired time  
**Returns**  
• ESP_OK  
• ESP_FAIL

```c
int esp_mesh_get_ap_assoc_expire (void)
```
Get mesh softAP associate expired time.

**Returns**  seconds

```c
int esp_mesh_get_total_node_num (void)
```
Get total number of devices in current network (including the root)

**Attention**  The returned value might be incorrect when the network is changing.

**Returns**  total number of devices (including the root)

```c
int esp_mesh_get_routing_table_size (void)
```
Get the number of devices in this device’s sub-network (including self)

**Returns**  the number of devices over this device’s sub-network (including self)

```c
esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
```
Get routing table of this device’s sub-network (including itself)

**Parameters**  
• mac – [out] pointer to routing table  
• len – [in] routing table size (in bytes)  
• size – [out] pointer to the number of devices in routing table (including itself)

**Returns**  
• ESP_OK  
• ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_post_toDS_state (bool reachable)
```
Post the toDS state to the mesh stack.
Attention  This API is only for the root.

Parameters  reachable  [in] this state represents whether the root is able to access external IP network

Returns
• ESP_OK
• ESP_FAIL

```c
esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.
```

Parameters  pending  [out] pointer to the TX pending

Returns
• ESP_OK
• ESP_FAIL

```c
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.
```

Parameters  pending  [out] pointer to the RX pending

Returns
• ESP_OK
• ESP_FAIL

```c
int esp_mesh_available_txuPQ_num (const mesh_addr_t *addr,uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.
```

Parameters
• addr  [in] self address or an associate children address
• xseqno_in  [out] sequence number of the last received packet from the specified address

Returns  the number of upQ for a certain address

```c
esp_err_t esp_mesh_set_xon_qsize (int qsize)
Set the number of queue.
```

Attention  This API shall be called before mesh is started.

Parameters  qsize  [in] default:32 (min:16)

Returns
• ESP_OK
• ESP_FAIL

```c
int esp_mesh_get_xon_qsize (void)
Get queue size.
```

Returns  the number of queue

```c
esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.
```

Parameters  allowed  [in] allow or not

Returns
• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START

```c
bool esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.
```

Returns  true/false
**esp_err_t esp_mesh_set_group_id** (const mesh_addr_t *addr, int num)

Set group ID addresses.

**Parameters**
- `addr` - [in] pointer to new group ID addresses
- `num` - [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**esp_err_t esp_mesh_delete_group_id** (const mesh_addr_t *addr, int num)

Delete group ID addresses.

**Parameters**
- `addr` - [in] pointer to deleted group ID addresses
- `num` - [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_group_num**(void)

Get the number of group ID addresses.

**Returns**
- the number of group ID addresses

**esp_err_t esp_mesh_get_group_list** (mesh_addr_t *addr, int num)

Get group ID addresses.

**Parameters**
- `addr` - [out] pointer to group ID addresses
- `num` - [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**bool esp_mesh_is_my_group** (const mesh_addr_t *addr)

Check whether the specified group address is my group.

**Returns**
- true/false

**esp_err_t esp_mesh_set_capacity_num** (int num)

Set mesh network capacity (max: 1000, default: 300)

**Attention**  This API shall be called before mesh is started.

**Parameters**
- `num` - [in] mesh network capacity

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_capacity_num**(void)

Get mesh network capacity.

**Returns**
- mesh network capacity

**esp_err_t esp_mesh_set_ie_crypto_funcs** (const mesh_crypto_funcs_t *crypto_funcs)

Set mesh IE crypto functions.

**Attention**  This API can be called at any time after mesh is initialized.
Chapter 2. API Reference

Parameters  crypto_funcs  -[in] crypto functions for mesh IE
  • If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

Returns
  • ESP_OK

*esp_err_t* esp_mesh_set_ie_crypto_key (const char *key, int len)
Set mesh IE crypto key.

Attention  This API can be called at any time after mesh is initialized.

Parameters
  • key –[in] ASCII crypto key
  • len –[in] length in bytes, range:8~64

Returns
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

*esp_err_t* esp_mesh_get_ie_crypto_key (char *key, int len)
Get mesh IE crypto key.

Parameters
  • key –[out] ASCII crypto key
  • len –[in] length in bytes, range:8~64

Returns
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

*esp_err_t* esp_mesh_set_root_healing_delay (int delay_ms)
Set delay time before starting root healing.

Parameters  delay_ms –[in] delay time in milliseconds

Returns
  • ESP_OK

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

Returns  delay time in milliseconds

*esp_err_t* esp_mesh_fix_root (bool enable)
Enable network Fixed Root Setting.

• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters  enable –[in] enable or not

Returns
  • ESP_OK

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Returns  true/false
**esp_err_t esp_mesh_set_parent** (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Parameters**
- **parent** [in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** [in] parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- **my_type** [in] mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- **my_layer** [in] mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

**Returns**
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

**esp_err_t esp_mesh_scan_get_ap_ie_len** (int *len)

Get mesh networking IE length of one AP.

**Parameters**
- **len** [out] mesh networking IE length

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**esp_err_t esp_mesh_scan_get_ap_record** (wifi_ap_record_t *ap_record, void *buffer)

Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Parameters**
- **ap_record** [out] pointer to one AP record
- **buffer** [out] pointer to the mesh networking IE of this AP

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**esp_err_t esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Returns**
- ESP_OK
**esp_err_t esp_mesh_get_subnet_nodes_num** (const mesh_addr_t *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**
- child_mac – [in] an associated child address of this device
- nodes_num – [out] pointer to the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**esp_err_t esp_mesh_get_subnet_nodes_list** (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

**Parameters**
- child_mac – [in] an associated child address of this device
- nodes – [out] pointer to nodes in the subnet of a specific child
- nodes_num – [in] the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**esp_err_t esp_mesh_disconnect** (void)

Disconnect from current parent.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_connect** (void)

Connect to current parent.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_flush_scan_result** (void)

Flush scan result.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**
- new_bssid – [in] the new router BSSID if the router changes
- csa_newchan – [in] the new channel number to which the whole network is moving
- csa_count – [in] channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**
- ESP_OK
Chapter 2. API Reference

```c
esp_err_t esp_mesh_get_router_bssid(uint8_t* router_bssid)

Get the router BSSID.

Parameters router_bssid - [out] pointer to the router BSSID

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
```

```c
int64_t esp_mesh_get_tsf_time(void)

Get the TSF time.

Returns the TSF time
```

```c
esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Parameters topo - [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
```

```c
esp_mesh_topology_t esp_mesh_get_topology(void)

Get mesh topology.

Returns MESH_TOPO_TREE or MESH_TOPO_CHAIN
```

```c
esp_err_t esp_mesh_enable_ps(void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED
```

```c
esp_err_t esp_mesh_disable_ps(void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED
```

```c
bool esp_mesh_is_ps_enabled(void)

Check whether the mesh Power Save function is enabled.

Returns true/false
```
bool esp_mesh_is_device_active (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters
- dev_duty - [in] device duty cycle
- dev_duty_type - [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

Returns
- ESP_OK
- ESP_FAIL

esp_err_t esp_mesh_get_active_duty_cycle (int* dev_duty, int* dev_duty_type)

Get device duty cycle and type.

Parameters
- dev_duty - [out] device duty cycle
- dev_duty_type - [out] device PS duty cycle type

Returns
- ESP_OK

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
• The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
• A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

• In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
• If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
• After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nwk_duty</td>
<td>network duty cycle</td>
</tr>
<tr>
<td>duration_mins</td>
<td>duration (unit: minutes)</td>
</tr>
<tr>
<td>applied_rule</td>
<td>only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE</td>
</tr>
</tbody>
</table>

**Returns**

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nwk_duty</td>
<td>[out] current network duty cycle</td>
</tr>
<tr>
<td>duration_mins</td>
<td>[out] the duration of current nwk_duty</td>
</tr>
<tr>
<td>dev_duty_type</td>
<td>[out] if it includes MESH_PS_DEVICE_DUTY_MASTER,</td>
</tr>
<tr>
<td></td>
<td>this device is the current NWK-DUTY-MASTER.</td>
</tr>
<tr>
<td>applied_rule</td>
<td>[out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE</td>
</tr>
</tbody>
</table>

**Returns**

- ESP_OK

```c
int esp_mesh_get_running_active_duty_cycle(void)
```

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev._duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Returns** the running active duty cycle
**Chapter 2. API Reference**

**esp_err_t esp_mesh_ps_duty_signaling** (int fwd_times)
Duty signaling.

- Parameters: `fwd_times` [in] the times of forwarding duty signaling packets
- Returns:
  - ESP_OK

**Unions**

- `union mesh_addr_t`
  
  > #include <esp_mesh.h> Mesh address.

  **Public Members**

  - `uint8_t addr[6]`
    
    mac address
  
  - `mip_t mip`
    
    mip address

- `union mesh_event_info_t`
  
  > #include <esp_mesh.h> Mesh event information.

  **Public Members**

  - `mesh_event_channel_switch_t channel_switch`
    
    channel switch
  
  - `mesh_event_child_connected_t child_connected`
    
    child connected
  
  - `mesh_event_child_disconnected_t child_disconnected`
    
    child disconnected
  
  - `mesh_event_routing_table_change_t routing_table`
    
    routing table change
  
  - `mesh_event_connected_t connected`
    
    parent connected
  
  - `mesh_event_disconnected_t disconnected`
    
    parent disconnected
  
  - `mesh_event_no_parent_found_t no_parent`
    
    no parent found
  
  - `mesh_event_layer_change_t layer_change`
    
    layer change
mesh_event_toDS_state_t toDS_state

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started

vote started

mesh_event_root_address_t root_addr

root address

mesh_event_root_switch_req_t switch_req

root switch request

mesh_event_root_conflict_t root_conflict

other powerful root

mesh_event_root_fixed_t root_fixed

fixed root

mesh_event_scan_done_t scan_done

scan done

mesh_event_network_state_t network_state

network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network

network found that can join

mesh_event_router_switch_t router_switch

new router information

mesh_event_ps_duty_t ps_duty

PS duty information

union mesh_rc_config_t

#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr

a new root address specified by users for API esp_mesh_waive_root()
Structures

struct mip_t
    IP address and port.

    Public Members

    ip4_addr_t ip4
        IP address

    uint16_t port
        port

struct mesh_event_channel_switch_t
    Channel switch information.

    Public Members

    uint8_t channel
        new channel

struct mesh_event_connected_t
    Parent connected information.

    Public Members

    wifi_event_sta_connected_t connected
        parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

    uint16_t self_layer
        layer

    uint8_t duty
        parent duty

struct mesh_event_no_parent_found_t
    No parent found information.

    Public Members

    int scan_times
        scan times being through

struct mesh_event_layer_change_t
    Layer change information.
Public Members

```
uint16_t new_layer
new layer
```

```
struct mesh_event_vote_started_t
vote started information
```

Public Members

```
int reason
vote reason, vote could be initiated by children or by the root itself
```

```
int attempts
max vote attempts before stopped
```

```
mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()
```

```
struct mesh_event_find_network_t
find a mesh network that this device can join
```

Public Members

```
uint8_t channel
channel number of the new found network
```

```
uint8_t router_bssid[6]
router BSSID
```

```
struct mesh_event_root_switch_req_t
Root switch request information.
```

Public Members

```
int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()
```

```
mesh_addr_t rc_addr
the address of root switch requester
```

```
struct mesh_event_root_conflict_t
Other powerful root address.
```
Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value

struct mesh_event_root_fixed_t
Root fixed.

Public Members

bool is_fixed
status

struct mesh_event_scan_done_t
Scan done event information.

Public Members

uint8_t number
the number of APs scanned

struct mesh_event_network_state_t
Network state information.

Public Members

bool is_rootless
whether current mesh network has a root
struct *mesh_event_ps_duty_t*
    PS duty information.

    **Public Members**

    uint8_t *duty
        parent or child duty

    *mesh_event_child_connected_t* child_connected
        child info

struct *mesh_opt_t*
    Mesh option.

    **Public Members**

    uint8_t *type
        option type

    uint16_t *len
        option length

    uint8_t *val
        option value

struct *mesh_data_t*
    Mesh data for esp_mesh_send() and esp_mesh_recv()

    **Public Members**

    uint8_t *data
        data

    uint16_t *size
        data size

    *mesh_proto_t* proto
        data protocol

    *mesh_tos_t* tos
        data type of service

struct *mesh_router_t*
    Router configuration.
Chapter 2. API Reference

Public Members

uint8_t ssid[32]
SSID

uint8_t ssid_len
length of SSID

uint8_t bssid[6]
BSSID, if this value is specified, users should also specify “allow_router_switch”.

uint8_t password[64]
password

bool allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct mesh_ap_cfg_t
Mesh softAP configuration.

Public Members

uint8_t password[64]
mesh softAP password

uint8_t max_connection
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t nonmesh_max_connection
max non-mesh connections

struct mesh_cfg_t
Mesh initialization configuration.

Public Members

uint8_t channel
channel, the mesh network on

bool allow_channel_switch
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.
Chapter 2. API Reference

mesh_addr_t mesh_id
mesh network identification

mesh_router_t router
router configuration

mesh_ap_cfg_t mesh_ap
mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
crypto functions

struct mesh_vote_t
Vote.

Public Members

float percentage
vote percentage threshold for approval of being a root

bool is_rc_specified
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t config
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
to parent queue

int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue
int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS

int toSelf
    to self

Macros

MESH_ROOT_LAYER
    root layer value

MESH_MTU
    max transmit unit(in bytes)

MESH_MPS
    max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured

ESP_ERR_MESH_NOT_START
    mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
    not supported yet

ESP_ERR_MESH_NOT_ALLOWED
    operation is not allowed

ESP_ERR_MESH_NO_MEMORY
    out of memory
ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT
ESP_ERR_MESH_QUEUE_READ
   error in reading queue

ESP_ERR_MESH_PS
   mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
   release esp_mesh_recv_toDS

MESH_DATA_ENC
   Flags bitmap for esp_mesh_send() and esp_mesh_recv()
   data encrypted (Unimplemented)

MESH_DATA_P2P
   point-to-point delivery over the mesh network

MESH_DATA_FROMDS
   receive from external IP network

MESH_DATA_TODS
   identify this packet is target to external IP network

MESH_DATA_NONBLOCK
   esp_mesh_send() non-block

MESH_DATA_DROP
   in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
   identify this packet is target to a group address

MESH_OPT_SEND_GROUP
   Option definitions for esp_mesh_send() and esp_mesh_recv()
   data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
   return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
   Flag of mesh networking IE.
   vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
   no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
   root conflict is found
Chapter 2. API Reference

**MESH_ASSOC_FLAG_ROOT_FIXED**

fixed root

**MESH_PS_DEVICE_DUTY_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED.Entire**

Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED.Uplink**

**MESH_INIT_CONFIG_DEFAULT**

**Type Definitions**

typedef `mesh_addr_t` _mesh_event_root_address_t

Root address.

typedef `wifi_event_sta_disconnected_t` _mesh_event_disconnected_t

Parent disconnected information.

typedef `wifi_event_ap_staconnected_t` _mesh_event_child_connected_t

Child connected information.

typedef `wifi_event_ap_stadisconnected_t` _mesh_event_child_disconnected_t

Child disconnected information.

typedef `wifi_event_sta_connected_t` _mesh_event_router_switch_t

New router information.

**Enumerations**

enum _mesh_event_id_t

Enumerated list of mesh event id.

*Values:*

enumerator **MESH_EVENT_STARTED**

mesh is started

enumerator **MESH_EVENT_STOPPED**

mesh is stopped
enumerator **MESH_EVENT_CHANNEL_SWITCH**
channel switch

denumerator **MESH_EVENT_CHILD_CONNECTED**
a child is connected on softAP interface

denumerator **MESH_EVENT_CHILD_DISCONNECTED**
a child is disconnected on softAP interface

denumerator **MESH_EVENT_ROUTING_TABLE_ADD**
routing table is changed by adding newly joined children

denumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**
routing table is changed by removing leave children

denumerator **MESH_EVENT_PARENT_CONNECTED**
parent is connected on station interface

denumerator **MESH_EVENT_PARENT_DISCONNECTED**
parent is disconnected on station interface

denumerator **MESH_EVENT_NO_PARENT_FOUND**
no parent found

denumerator **MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

denumerator **MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network

denumerator **MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root

denumerator **MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped

denumerator **MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

denumerator **MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

denumerator **MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

denumerator **MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.
enumerator **MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**

e num **mesh_type_t**

Device type.

*Values*:

enumerator **MESH_IDLE**

hasn’t joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability
enumerator **MESH_STA**
   connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**
   Protocol of transmitted application data.
   
   Values:
   
   enumerator **MESH_PROTO_BIN**
      binary
   
   enumerator **MESH_PROTO_HTTP**
      HTTP protocol
   
   enumerator **MESH_PROTO_JSON**
      JSON format
   
   enumerator **MESH_PROTO_MQTT**
      MQTT protocol
   
   enumerator **MESH_PROTO_AP**
      IP network mesh communication of node’s AP interface
   
   enumerator **MESH_PROTO_STA**
      IP network mesh communication of node’s STA interface

enum **mesh_tos_t**
   For reliable transmission, mesh stack provides three type of services.
   
   Values:
   
   enumerator **MESH_TOS_P2P**
      provide P2P (point-to-point) retransmission on mesh stack by default
   
   enumerator **MESH_TOS_E2E**
      provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
   
   enumerator **MESH_TOS_DEF**
      no retransmission on mesh stack

enum **mesh_vote_reason_t**
   Vote reason.
   
   Values:
   
   enumerator **MESH_VOTE_REASON_ROOT_INITIATED**
      vote is initiated by the root
   
   enumerator **MESH_VOTE_REASON_CHILD_INITIATED**
      vote is initiated by children
enum **mesh_disconnect_reason_t**
    Mesh disconnect reason code.
    
    **Values:**
    
    enumerator **MESH_REASON_CYCLIC**
        cyclic is detected
    
    enumerator **MESH_REASON_PARENT_IDLE**
        parent is idle
    
    enumerator **MESH_REASON_LEAF**
        the connected device is changed to a leaf
    
    enumerator **MESH_REASON_DIFF_ID**
        in different mesh ID
    
    enumerator **MESH_REASON_ROOTS**
        root conflict is detected
    
    enumerator **MESH_REASON_PARENT_STOPPED**
        parent has stopped the mesh
    
    enumerator **MESH_REASON_SCAN_FAIL**
        scan fail
    
    enumerator **MESH_REASON_IE_UNKNOWN**
        unknown IE
    
    enumerator **MESH_REASON_WAIVE_ROOT**
        waive root
    
    enumerator **MESH_REASON_PARENT_WORSE**
        parent with very poor RSSI
    
    enumerator **MESH_REASON_EMPTY_PASSWORD**
        use an empty password to connect to an encrypted parent
    
    enumerator **MESH_REASON_PARENT_UNENCRYPTED**
        connect to an unencrypted parent/router

enum **esp_mesh_topology_t**
    Mesh topology.
    
    **Values:**
    
    enumerator **MESH_TOPO_TREE**
        tree topology
Chapter 2. API Reference

enumerator MESH_TOPO_CHAIN
    chain topology

enum mesh_event_toDS_state_t
    The reachability of the root to a DS (distribute system)
    Values:
    enumerator MESH_TODS_UNREACHABLE
        the root isn’t able to access external IP network
    enumerator MESH_TODS_REACHABLE
        the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check Provisioning API.

Application Example  Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
    Get the version of SmartConfig.

Returns
    • SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
    Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Parameters config - pointer to smartconfig start configure structure

Returns
    • ESP_OK: succeed
    • others: fail
**esp_err_t esp_smartconfig_stop** (void)
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention**  Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config_start.

**Returns**  
* ESP_OK: succeed  
* others: fail

**esp_err_t esp_esptouch_set_timeout** (uint8_t time_s)
Set timeout of SmartConfig process.

**Attention**  Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Parameters**  
* time_s –range 15s~255s, offset:45s.
**Returns**  
* ESP_OK: succeed  
* others: fail

**esp_err_t esp_smartconfig_set_type** (smartconfig_type_t type)
Set protocol type of SmartConfig.

**Attention**  If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

**Parameters**  
* type –Choose from the smartconfig_type_t.
**Returns**  
* ESP_OK: succeed  
* others: fail

**esp_err_t esp_smartconfig_fast_mode** (bool enable)
Set mode of SmartConfig. default normal mode.

**Attention**  
1. Please call it before API esp_smartconfig_start.  
2. Fast mode have corresponding APP(phone).  
3. Two mode is compatible.

**Parameters**  
* enable –false-disable(default); true-enable;
**Returns**  
* ESP_OK: succeed  
* others: fail

**esp_err_t esp_smartconfig_get_rvd_data** (uint8_t *rvd_data, uint8_t len)
Get reserved data of ESPTouch v2.

**Parameters**  
* rvd_data –reserved data  
* len –length of reserved data
**Returns**  
* ESP_OK: succeed  
* others: fail
Chapter 2. API Reference

Structures

struct **smartconfig_event_got_ssid_pswd_t**
Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

- `uint8_t ssid[32]`
  SSID of the AP. Null terminated string.

- `uint8_t password[64]`
  Password of the AP. Null terminated string.

- `bool bssid_set`
  whether set MAC address of target AP or not.

- `uint8_t bssid[6]`
  MAC address of target AP.

- `smartconfig_type_t type`
  Type of smartconfig(ESPTouch or AirKiss).

- `uint8_t token`
  Token from cellphone which is used to send ACK to cellphone.

- `uint8_t cellphone_ip[4]`
  IP address of cellphone.

struct **smartconfig_start_config_t**
Configure structure for esp_smartconfig_start

**Public Members**

- `bool enable_log`
  Enable smartconfig logs.

- `bool esp_touch_v2_enable_crypt`
  Enable ESPTouch v2 crypt.

- `char *esp_touch_v2_key`
  ESPTouch v2 crypt key, len should be 16.

**Macros**

**SMARTCONFIG_START_CONFIG_DEFAULT** ()
Chapter 2. API Reference

Enumerations

```c
enum smartconfig_type_t
{
    SC_TYPE_ESPTOUCH,
    SC_TYPE_AIRKISS,
    SC_TYPE_ESPTOUCH_AIRKISS,
    SC_TYPE_ESPTOUCH_V2,
}
```

Values:

- enumerator `SC_TYPE_ESPTOUCH`
  - protocol: ESPTouch
- enumerator `SC_TYPE_AIRKISS`
  - protocol: AirKiss
- enumerator `SC_TYPE_ESPTOUCH_AIRKISS`
  - protocol: ESPTouch and AirKiss
- enumerator `SC_TYPE_ESPTOUCH_V2`
  - protocol: ESPTouch v2

```c
enum smartconfig_event_t
{
    SC_EVENT_SCAN_DONE,
    SC_EVENT_FOUND_CHANNEL,
    SC_EVENT_GOT_SSID_PSWD,
    SC_EVENT_SEND_ACK_DONE,
}
```

Smartconfig event declarations

Values:

- enumerator `SC_EVENT_SCAN_DONE`
  - ESP32 station smartconfig has finished to scan for APs
- enumerator `SC_EVENT_FOUND_CHANNEL`
  - ESP32 station smartconfig has found the channel of the target AP
- enumerator `SC_EVENT_GOT_SSID_PSWD`
  - ESP32 station smartconfig got the SSID and password
- enumerator `SC_EVENT_SEND_ACK_DONE`
  - ESP32 station smartconfig has sent ACK to cellphone

Wi-Fi

Introduction  The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Station/AP-coexistence mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples  The wifi directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple esp-idf-template application to demonstrate a minimal IDF project structure.
API Reference

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t esp_wifi_init (const wifi_init_config_t *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Parameters config --pointer to WiFi initialized configuration structure; can point to a temporary variable.

Returns

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

esp_err_t esp_wifi_deinit (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_set_mode (wifi_mode_t mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

Parameters mode --WiFi operating mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)

Get current operating mode of WiFi.

Parameters mode --[out] store current WiFi mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_start (void)`
Start WiFi according to current configuration. If mode is WIFI_MODE_STA, it create station control block and start station. If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP. If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_stop (void)`
Stop WiFi. If mode is WIFI_MODE_STA, it stop station and free station control block. If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_restore (void)`
Restore WiFi stack persistent settings to default values.
This function will reset settings made using the following APIs:
- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_connect (void)`
Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect (void)`
Disconnect the ESP32 WiFi station from the AP.
## Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_clear_fast_connect (void)
```

Currently this API is just a stub API.

### Returns

- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_wifi_deauth_sta (uint16_t aid)
```

deauthenticate all stations or associated id equals to aid

#### Parameters

- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

#### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

```c
esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)
```

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

#### Parameters

- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

#### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

```c
esp_err_t esp_wifi_scan_stop (void)
```

Stop the scan in process.

### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

```c
esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)
```

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.
### Parameters

- **number** - [out] store number of APIs found in last scan

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
```

Get AP list found in last scan.

### Parameters
- **number** - [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** - [in] wifi_ap_record_t array to hold the found APs

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

```c
esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

### Attention
When the obtained country information is empty, it means that the AP does not carry country information

### Parameters
- **ap_info** - the wifi_ap_record_t to hold AP information

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

```c
esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)
```

Set current WiFi power save type.

### Attention
Default power save type is WIFI_PS_MIN_MODEM.

### Parameters
- **type** - power save type

### Returns
- ESP_OK: succeed

```c
esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)
```

Get current WiFi power save type.

### Attention
Default power save type is WIFI_PS_MIN_MODEM.

### Parameters
- **type** - [out] store current power save type

### Returns
- ESP_OK: succeed

```c
esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)
```

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)
**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

**Parameters**
- `ifx` – interfaces
- `protocol_bitmap` – WiFi protocol bitmap

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Parameters**
- `ifx` – interface
- `protocol_bitmap` – [out] store current WiFi protocol bitmap of interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
**Attention** 2. WIFI_BW_HT40 is supported only when the interface support 11N

**Parameters**
- `ifx` – interface to be configured
- `bw` – bandwidth

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
```
Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enabled

**Parameters**
- `ifx` – interface to be configured
- `bw` – [out] store bandwidth of interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t esp_wifi_set_channel**

(uint8_t primary, wifi_second_chan_t second)

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()
**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Parameters**
- **primary** – for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** – for HT20, second is ignored, for HT40, second is the second channel

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_get_channel**

(uint8_t *primary, wifi_second_chan_t *second)

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**
- **primary** – store current primary channel
- **second** – [out] store current second channel

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_country**

(const wifi_country_t *country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.
**Attention** 2. The default country is CHINA {.cc=”CN” , .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}
**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=”USA” , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=”JP” , .schan=1, .nchan=14} then the country info that will be used is {.cc=”JP” , .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=”US” , .schan=1, .nchan=11} in the example.
**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.
**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
**Attention** 6. The country configuration is stored into flash.
**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
**Parameters** `country` - the configured country info

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country (wifi_country_t *country)
```

Get the current country info

**Parameters** `country` - country info

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled
2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.
3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX”.

**Parameters**
- `ifx` - interface
- `mac` - the MAC address

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

**Parameters**
- `ifx` - interface
- `mac` - [out] store mac of the interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters** `cb` - callback

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
**esp_err_t** esp_wifi_set_promiscuous (bool en)

Enable the promiscuous mode.

**Parameters**
- **en** – false - disable, true - enable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t** esp_wifi_get_promiscuous (bool *en)

Get the promiscuous mode.

**Parameters**
- **en** – [out] store the current status of promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t** esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)

Enable the promiscuous mode packet type filter.

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC

**Parameters**
- **filter** – the packet type filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t** esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)

Get the promiscuous filter.

**Parameters**
- **filter** – [out] store the current status of promiscuous filter

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t** esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note:** The default filter is to filter none control packet.

**Parameters**
- **filter** – the subtype of the control packet filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t** esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters**
- **filter** – [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument
\texttt{esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t \*conf)}

Set the configuration of the ESP32 STA or AP.

\textbf{Attention 1.} This API can be called only when specified interface is enabled, otherwise, API fail
\textbf{Attention 2.} For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
\textbf{Attention 3.} ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Parameters**
- \texttt{interface} – interface
- \texttt{conf} – station or soft-AP configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NV: WiFi internal NVS error
- others: refer to the error code in esp_err.h

\texttt{esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t \*conf)}

Get configuration of specified interface.

**Parameters**
- \texttt{interface} – interface
- \texttt{conf} – [out] station or soft-AP configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

\texttt{esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t \*sta)}

Get STAs associated with soft-AP.

**Parameters**
- \texttt{sta} – [out] station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

\texttt{esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t \*aid)}

Get AID of STA connected with soft-AP.

**Parameters**
- \texttt{mac} – STA’s mac address
- \texttt{aid} – [out] Store the AID corresponding to STA mac

**Returns**
- ESP_OK: succeed
Chapter 2. API Reference

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t esp_wifi_set_storage (wifi_storage_t storage)
Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Parameters
storage :: storage type

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
Set 802.11 Vendor-Specific Information Element.

Parameters
- enable :: If true, specified IE is enabled. If false, specified IE is removed.
- type :: Information Element type. Determines the frame type to associate with the IE.
- idx :: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie :: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

esp_err_t esp_wifi_set_vendor_ie_cb (esp_vendor_ie_cb_t cb, void *ctx)
Register Vendor-Specific Information Element monitoring callback.

Parameters
- cb :: Callback function
- ctx :: Context argument, passed to callback function.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_set_max_tx_power (int8_t power)
Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.
Attention 2. The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.
Attention 3. Mapping Table 
\[ \{ \text{Power}, \text{max tx power}\} = \{\{18, 2\}, \{20, 5\}, \{28, 7\}, \{34, 8\}, \{44, 11\}, \{52, 13\}, \{56, 14\}, \{60, 15\}, \{66, 16\}, \{72, 18\}, \{80, 20\}\} \]
Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
Attention 5. Relationship between set value and actual value. As follows: [set value range, actual value] = 
\[ \{\{18, 19\}, \{20, 27\}, \{28, 33\}, \{34, 43\}, \{44, 51\}, \{52, 55\}, \{56, 59\}, \{60, 65\}, \{66, 71\}, \{72, 79\}, \{80, 84\}\} \]
**Parameters** power – Maximum WiFi transmitting power.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

```c
esp_err_t esp_wifi_get_max_tx_power (int8_t *power)
```

Get maximum transmitting power after WiFi start.

**Parameters** power – Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_set_event_mask (uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention**
1. Mask can be created by logical OR of various WIFI_EVENT_MASK constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Parameters** mask – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```

Get mask of WiFi events.

**Parameters** mask – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**
- ifx – interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer – raw ieee80211 buffer
- len – the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq – indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are
However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

**Returns**
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

```c
esp_err_t esp_wifi_set_csi_rx_cb(wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data. Each time a CSI data is received, the callback function will be called.

**Parameters**
- `cb` - callback
- `ctx` - context argument, passed to callback function

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Parameters**
- `config` - configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_csi(bool en)
```

Enable or disable CSI.

**Parameters**
- `en` - true - enable, false - disable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

**Parameters**
- `config` - Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc
**esp_err_t** **esp_wifi_get_ant_gpio** (*wifi_ant_gpio_config_t* *config*)

Get current antenna GPIO configuration.

**Parameters**
- *config* – Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**esp_err_t** **esp_wifi_set_ant** (const *wifi_ant_config_t* *config*)

Set antenna configuration.

**Parameters**
- *config* – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

**esp_err_t** **esp_wifi_get_ant** (*wifi_ant_config_t* *config*)

Get current antenna configuration.

**Parameters**
- *config* – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**int64_t** **esp_wifi_get_tsf_time** (*wifi_interface_t* *interface*)

Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters**
- *interface* – The interface whose tsf_time is to be retrieved.

**Returns**
- 0 or the TSF time

**esp_err_t** **esp_wifi_set_inactive_time** (*wifi_interface_t* *ifx*, uint16_t *sec*)

Set the inactive time of the ESP32 STA or AP.

**Attention**
1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
3. The inactive time configuration is not stored into flash

**Parameters**
- *ifx* – interface to be configured.
- *sec* – Inactive time. Unit seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.
**esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)**

Get inactive time of specified interface.

**Parameters**
- ifx – Interface to be configured.
- sec – Inactive time. Unit seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**esp_err_t esp_wifi_stats_dump (uint32_t modules)**

Dump WiFi statistics.

**Parameters**
- modules – statistic modules to be dumped

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)**

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Parameters**
- rssi – threshold value in dbm between -100 to 0

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)**

Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Parameters**
- cfg – FTM Initiator session configuration

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_end_session (void)**

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)**

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).
Chapter 2. API Reference

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters**
- **offset_cm** – T1 Offset to be added in centimeters

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_config_11b_rate (wifi_interface_t ifx, bool disable)
```
Enable or disable 11b rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Parameters**
- **ifx** – Interface to be configured.
- **disable** – true means disable 11b rate while false means enable 11b rate.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_connectionless_module_set_wake_interval (uint16_t wake_interval)
```
Set wake interval for connectionless modules to wake up periodically.

**Attention**
1. Only one wake interval for all connectionless modules.
2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Parameters**
- **wake_interval** – Milliseconds after would the chip wake up, from 1 to 65535.

```c
esp_err_t esp_wifi_set_country_code (const char* country, bool ieee80211d_enabled)
```
configure country

**Attention**
1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
2. When ieee80211d_enabled is disabled, then the configured country info is used always.
3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
4. The country configuration is stored into flash.
5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
8. The default country is “01” (world safe mode) and ieee80211d_enabled is TRUE.
Chapter 2. API Reference

Parameters

- **country** - the configured country ISO code
- **ieee80211d_enabled** - 802.11d is enabled or not

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country_code(char *country)
```
get the current country code

**Parameters**

- **country** - country code

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Parameters**

- **ifx** - Interface to be configured.
- **rate** - Phy rate to be configured.

**Returns**

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_disable_pmf_config(wifi_interface_t ifx)
```
Disable PMF configuration for specified interface.

**Attention** This API should be called after esp_wifi_set_config() and before esp_wifi_start().

**Parameters**

- **ifx** - Interface to be configured.

**Returns**

- ESP_OK: succeed
- others: failed

**Structures**

```c
struct wifi_init_config_t
```
WiFi stack configuration parameters passed to esp_wifi_init call.

**Public Members**

```c
wifi_osi_funcs_t *osi_funcs
```
WiFi OS functions

```c
wpa_crypto_funcs_t wpa_crypto_funcs
```
WiFi station crypto functions when connect
int static_rx_buf_num
    WiFi static RX buffer number

int dynamic_rx_buf_num
    WiFi dynamic RX buffer number

int tx_buf_type
    WiFi TX buffer type

int static_tx_buf_num
    WiFi static TX buffer number

int dynamic_tx_buf_num
    WiFi dynamic TX buffer number

int cache_tx_buf_num
    WiFi TX cache buffer number

int csi_enable
    WiFi channel state information enable flag

int ampdu_rx_enable
    WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
    WiFi AMPDU TX feature enable flag

int amsvdu_tx_enable
    WiFi AMSDU TX feature enable flag

int nvs_enable
    WiFi NVS flash enable flag

int nano_enable
    Nano option for printf/scan family enable flag

int rx_ba_win
    WiFi Block Ack RX window size

int wifi_task_core_id
    WiFi Task Core ID

int beacon_max_len
    WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32
uint64_t `feature_caps`
   Enables additional WiFi features and capabilities

`bool sta_disconnected_pm`
   WiFi Power Management for station at disconnected status

`int magic`
   WiFi init magic number, it should be the last field

**Macros**

`ESP_ERR_WIFI_NOT_INIT`
   WiFi driver was not installed by esp_wifi_init

`ESP_ERR_WIFI_NOT_STARTED`
   WiFi driver was not started by esp_wifi_start

`ESP_ERR_WIFI_NOT_STOPPED`
   WiFi driver was not stopped by esp_wifi_stop

`ESP_ERR_WIFI_IF`
   WiFi interface error

`ESP_ERR_WIFI_MODE`
   WiFi mode error

`ESP_ERR_WIFI_STATE`
   WiFi internal state error

`ESP_ERR_WIFI_CONN`
   WiFi internal control block of station or soft-AP error

`ESP_ERR_WIFI_NVS`
   WiFi internal NVS module error

`ESP_ERR_WIFI_MAC`
   MAC address is invalid

`ESP_ERR_WIFI_SSID`
   SSID is invalid

`ESP_ERR_WIFI_PASSWORD`
   Password is invalid

`ESP_ERR_WIFI_TIMEOUT`
   Timeout error

`ESP_ERR_WIFI_WAKE_FAIL`
   WiFi is in sleep state(RF closed) and wakeup fail
Chapter 2. API Reference

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

WIFI_STATIC_TX_BUFFER_NUM

WIFI_CACHE_TX_BUFFER_NUM

WIFI_DYNAMIC_TX_BUFFER_NUM

CONFIG_FEATURE_FTM_RESPONDER_BIT

WIFI_INIT_CONFIG_DEFAULT()

Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

- **Param buf** Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
- **Param type** promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd.ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

- **Param ctx** Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
- **Param type** Information element type, based on frame type received.
- **Param sa** Source 802.11 address.
- **Param vnd.ie** Pointer to the vendor specific element data received.
- **Param rssi** Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information (CSI) data.

- **Param ctx** context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- **Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

Each time a CSI data is received, the callback function will be called.

Header File

- components/esp_wifi/include/esp_wifi_types.h
Unions

union \texttt{wifi\_config\_t}

\texttt{#include <esp\_wifi\_types\_h>} Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to \texttt{esp\_wifi\_set\_config()} or \texttt{esp\_wifi\_get\_config()}

Public Members

\texttt{wifi\_ap\_config\_t ap}

configuration of AP

\texttt{wifi\_sta\_config\_t sta}

configuration of STA

Structures

\texttt{struct wifi\_country\_t}

Structure describing WiFi country-based regional restrictions.

Public Members

\texttt{char cc[3]}

country code string

\texttt{uint8\_t schan}

start channel

\texttt{uint8\_t nchan}

total channel number

\texttt{int8\_t max\_tx\_power}

This field is used for getting WiFi maximum transmitting power, call \texttt{esp\_wifi\_set\_max\_tx\_power} to set the maximum transmitting power.

\texttt{wifi\_country\_policy\_t policy}

country policy

\texttt{struct wifi\_active\_scan\_time\_t}

Range of active scan times per channel.

Public Members

\texttt{uint32\_t min}

minimum active scan time per channel, units: millisecond
uint32_t max
    maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to
    disconnect from AP and are not recommended.

struct wifi_scan_time_t
    Aggregate of active & passive scan time per channel.

    Public Members

    wifi_active_scan_time_t active
        active scan time per channel, units: millisecond.

    uint32_t passive
        passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect
        from AP and are not recommended.

struct wifi_scan_config_t
    Parameters for an SSID scan.

    Public Members

    uint8_t *ssid
        SSID of AP

    uint8_t *bssid
        MAC address of AP

    uint8_t channel
        channel, scan the specific channel

    bool show_hidden
        enable to scan AP whose SSID is hidden

    wifi_scan_type_t scan_type
        scan type, active or passive

    wifi_scan_time_t scan_time
        scan time per channel

struct wifi_ap_record_t
    Description of a WiFi AP.

    Public Members

    uint8_t bssid[6]
        MAC address of AP
uint8_t ssid[33]
SSID of AP

uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
bit: 3 flag to identify if low rate is enabled or not

uint32_t wps
bit: 4 flag to identify if WPS is supported or not

uint32_t ftmResponder
bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftmInitiator
bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved
bit: 7..31 reserved

```c

wifi_country_t country
    country information of AP

struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.

Public Members

int8_t rssi
    The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t authmode
    The weakest authmode to accept in the fast scan mode
    Note: Incase this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won’t connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame

Public Members

bool capable
    Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool required
    Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
    SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t password[64]
    Password of ESP32 soft-AP.

uint8_t ssid_len
    Optional length of SSID field.

uint8_t channel
    Channel of ESP32 soft-AP
```
**Chapter 2. API Reference**

`wifi_auth_mode_t authmode`
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

`uint8_t ssid_hidden`
Broadcast SSID or not, default 0, broadcast the SSID

`uint8_t max_connection`
Max number of stations allowed to connect in, default 4, max 10

`uint16_t beacon_interval`
Beacon interval which should be multiples of 100. Unit: TU (time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

`wifi_cipher_type_t pairwise_cipher`
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites (TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_TYPE_CCMP and WIFI_CIPHER_TYPE_TYPE_TKIP_CCMP.

`bool ftm_responder`
Enable FTM Responder mode

`wifi_pmf_config_t pmf_cfg`
Configuration for Protected Management Frame

`struct wifi_sta_config_t`
STA configuration settings for the ESP32.

**Public Members**

`uint8_t ssid[32]`
SSID of target AP.

`uint8_t password[64]`
Password of target AP.

`wifi_scan_method_t scan_method`
do all channel scan or fast scan

`bool bssid_set`
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

`uint8_t bssid[6]`
MAC address of target AP.
**uint8_t channel**
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16_t listen_interval**
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi_sort_method_t sort_method**
sort the connect AP in the list by rssi or security mode

**wifi_scan_threshold_t threshold**
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi_pmf_config_t pmf_cfg**
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

**uint32_t rm_enabled**
Whether Radio Measurements are enabled for the connection

**uint32_t btm_enabled**
Whether BSS Transition Management is enabled for the connection

**uint32_t mbo_enabled**
Whether MBO is enabled for the connection

**uint32_t ft_enabled**
Whether FT is enabled for the connection

**uint32_t owe_enabled**
Whether OWE is enabled for the connection

**uint32_t reserved**
Reserved for future feature set

**wifi_sae_h2e**
Whether SAE hash to element is enabled

**struct wifi_sta_info_t**
Description of STA associated with AP.

**Public Members**

**uint8_t mac[6]**
mac address
int8_t rssi
    current average rssi of sta connected

uint32_t phy_11b
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child
    bit: 4 flag to identify mesh child

uint32_t reserved
    bit: 5..31 reserved

struct wifi_sta_list_t
    List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
    station list

int num
    number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
    Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
    Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
    Vendor identifier (OUI).

uint8_t vendor_oui_type
    Vendor-specific OUI type.

uint8_t payload[0]
    Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
    Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

signed rssi
    Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate
    PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
    reserved

unsigned sig_mode
    0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
    reserved

unsigned mcs
    Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb
    Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__
    reserved

unsigned smoothing
    reserved

unsigned not_sounding
    reserved

unsigned __pad3__
    reserved

unsigned aggregation
    Aggregation. 0: MPDU packet; 1: AMPDU packet
unsigned stbc
    Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding
    Flag is set for 11n packets which are LDPC

unsigned sgi
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed noise_floor
    noise floor of Radio Frequency Module(RF). unit: dBm

unsigned ampdu_cnt
    ampdu cnt

unsigned channel
    primary channel on which this packet is received

unsigned secondary_channel
    secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad4__
    reserved

unsigned timestamp
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
    is not enabled. unit: microsecond

unsigned __pad5__
    reserved

unsigned __pad6__
    reserved

unsigned ant
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned sig_len
    length of packet including Frame Check Sequence(FCS)

unsigned __pad7__
    reserved

unsigned rx_state
    state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
    Payload passed to ‘buf’ parameter of promiscuous mode RX callback.
Public Members

`wifi_pkt_rx_ctrl_t rx_ctrl`
metadata header

uint8_t `payload[0]`
Data or management payload. Length of payload is described by `rx_ctrl.sig_len`. Type of content determined by packet type argument of callback.

struct `wifi_promiscuous_filter_t`
Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t `filter_mask`
OR of one or more filter values WIFI_PROMIS_FILTER_*

struct `wifi_csi_config_t`
Channel state information (CSI) configuration type.

Public Members

bool `lltf_en`
enable to receive legacy long training field (lltf) data. Default enabled

bool `htltf_en`
enable to receive HT long training field (htltf) data. Default enabled

bool `stbc_htltf2_en`
enable to receive space time block code HT long training field (stbc-htltf2) data. Default enabled

bool `ltf_merge_en`
enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool `channel_filter_en`
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool `manu_scale`
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t `shift`
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct `wifi_csi_info_t`
CSI data type.
Public Members

\texttt{wifi_pkt_rx_ctrl_t rx_ctrl}

received packet radio metadata header of the CSI data

uint8_t \texttt{mac}[6]

source MAC address of the CSI data

bool \texttt{first_word_invalid}

first four bytes of the CSI data is invalid or not

int8_t* \texttt{buf}

buffer of CSI data

uint16_t \texttt{len}

length of CSI data

\textbf{struct wifi_ant_gpio_t}

WiFi GPIO configuration for antenna selection.

Public Members

uint8_t \texttt{gpio_select}

Whether this GPIO is connected to external antenna switch

uint8_t \texttt{gpio_num}

The GPIO number that connects to external antenna switch

\textbf{struct wifi_ant_gpio_config_t}

WiFi GPIOs configuration for antenna selection.

Public Members

\texttt{wifi_ant_mode_t rx_ant_mode}

WiFi antenna mode for receiving

\texttt{wifi_ant_t rx_ant_default}

Default antenna mode for receiving, it’s ignored if \texttt{rx_ant_mode} is not WIFI_ANT_MODE_AUTO

Espressif Systems

Submit Document Feedback
**wifi_ant_mode_t tx_ant_mode**

WiFi antenna mode for transmission, it can be set to WIFI ANT MODE AUTO only if rx_ant_mode is set to WIFI ANT MODE AUTO

**uint8_t enabled_ant0**

Index (in antenna GPIO configuration) of enabled WIFI ANT_MODE_ANT0

**uint8_t enabled_ant1**

Index (in antenna GPIO configuration) of enabled WIFI ANT_MODE_ANT1

**struct wifi_action_tx_req_t**

Action Frame Tx Request.

**Public Members**

**wifi_interface_t ifx**

WiFi interface to send request to

**uint8_t dest_mac[6]**

Destination MAC address

**bool no_ack**

Indicates no ack required

**wifi_action_rx_cb_t rx_cb**

Rx Callback to receive any response

**uint32_t data_len**

Length of the appended Data

**uint8_t data[0]**

Appended Data payload

**struct wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

**Public Members**

**uint8_t resp_mac[6]**

MAC address of the FTM Responder

**uint8_t channel**

Primary channel of the FTM Responder

**uint8_t frm_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)
Chapter 2. API Reference

```c
uint16_t burst_period
    Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)
```

```c
struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event
```

**Public Members**

```c
uint32_t status
    status of scanning APs: 0 — success, 1 - failure
```

```c
uint8_t number
    number of scan results
```

```c
uint8_t scan_id
    scan sequence number, used for block scan
```

```c
struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event
```

**Public Members**

```c
uint8_t ssid[32]
    SSID of connected AP
```

```c
uint8_t ssid_len
    SSID length of connected AP
```

```c
uint8_t bssid[6]
    BSSID of connected AP
```

```c
uint8_t channel
    channel of connected AP
```

```c
wifi_auth_mode_t authmode
    authentication mode used by AP
```

```c
struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event
```

**Public Members**

```c
uint8_t ssid[32]
    SSID of disconnected AP
```
uint8_t ssid_len
SSID length of disconnected AP

uint8_t bssid[6]
BSSID of disconnected AP

uint8_t reason
reason of disconnection

struct wifi_event_sta_authmode_change_t
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
Number of AP credentials received

uint8_t ssid[MAX_SSID_LEN]
SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
Argument structure for WIFI_EVENT_AP_STACONNECTED event
Chapter 2. API Reference

Public Members

uint8_t mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for
Chapter 2. API Reference

**Public Members**

```c
uint8_t dlog_token  // Dialog Token of the FTM frame
int8_t rssi       // RSSI of the FTM frame received
uint32_t rtt      // Round Trip Time in pSec with a peer
uint64_t t1       // Time of departure of FTM frame from FTM Responder in pSec
uint64_t t2       // Time of arrival of FTM frame at FTM Initiator in pSec
uint64_t t3       // Time of departure of ACK from FTM Initiator in pSec
uint64_t t4       // Time of arrival of ACK at FTM Responder in pSec
```

```c
struct wifi_event_ftm_report_t
Argument structure for WIFI_EVENT_FTM_REPORT event
```

**Public Members**

```c
uint8_t peer_mac[6]  // MAC address of the FTM Peer

wifi_ftm_status_t status  // Status of the FTM operation

uint32_t rtt_raw  // Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est  // Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est  // Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t *ftm_report_data  // Pointer to FTM Report with multiple entries, should be freed after use

uint8_t ftm_report_num_entries  // Number of entries in the FTM Report data
```
struct wifi_event_action_tx_status_t
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

**Public Members**

* wifi_interface_t ifx
  WiFi interface to send request to

* uint32_t context
  Context to identify the request

* uint8_t da[6]
  Destination MAC address

* uint8_t status
  Status of the operation

struct wifi_event_roc_done_t
Argument structure for WIFI_EVENT_ROC_DONE event

**Public Members**

* uint32_t context
  Context to identify the request

**Macros**

WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
  max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
   filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
   filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
   filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
   filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
   filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDUI
   filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
   filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
   filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
   filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
   filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
   filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
   filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
   filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
   filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
   filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
   filter the control packets with subtype of ACK
**Chapter 2. API Reference**

- **WIFI_PROMIS_CTRL_FILTER_MASK_CFEND**: filter the control packets with subtype of CF-END
- **WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK**: filter the control packets with subtype of CF-END+CF-ACK
- **WIFI_EVENT_MASK_ALL**: mask all WiFi events
- **WIFI_EVENT_MASK_NONE**: mask none of the WiFi events
- **WIFI_EVENT_MASK_AP_PROBEREQRECVED**: mask SYSTEM_EVENT_AP_PROBEREQRECVED event

**Type Definitions**

typedef int (*wifi_action_rx_cb_t)(uint8_t*hdr,uint8_t*payload,size_tlen,uint8_tchannel)

The Rx callback function of Action Tx operations.

- **Param hdr**: pointer to the IEEE 802.11 Header structure
- **Param payload**: pointer to the Payload following 802.11 Header
- **Param len**: length of the Payload
- **Param channel**: channel number the frame is received on

**Enumerations**

enum wifi_mode_t

Values:
enumerator WIFI_MODE_NULL
   null mode

enumerator WIFI_MODE_STA
   WiFi station mode

enumerator WIFI_MODE_AP
   WiFi soft-AP mode

enumerator WIFI_MODE_APSTA
   WiFi station + soft-AP mode

enumerator WIFI_MODE_MAX

enum wifi_interface_t
   Values:

   enumerator WIFI_IF_STA

   enumerator WIFI_IF_AP

enum wifi_country_policy_t
   Values:

   enumerator WIFI_COUNTRY_POLICY_AUTO
      Country policy is auto, use the country info of AP to which the station is connected

   enumerator WIFI_COUNTRY_POLICY_MANUAL
      Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
   Values:

   enumerator WIFI_AUTH_OPEN
      authenticate mode: open

   enumerator WIFI_AUTH_WEP
      authenticate mode: WEP

   enumerator WIFI_AUTH_WPA_PSK
      authenticate mode: WPA_PSK

   enumerator WIFI_AUTH_WPA2_PSK
      authenticate mode: WPA2_PSK

   enumerator WIFI_AUTH_WPA_WPA2_PSK
      authenticate mode: WPA_WPA2_PSK
enumerator WIFI_AUTH_WPA2_ENTERPRISE
   authenticate mode: WPA2_ENTERPRISE

enumerator WIFI_AUTH_WPA3_PSK
   authenticate mode: WPA3_PSK

enumerator WIFI_AUTH_WPA2_WPA3_PSK
   authenticate mode: WPA2_WPA3_PSK

enumerator WIFI_AUTH_WAPI_PSK
   authenticate mode: WAPI_PSK

enumerator WIFI_AUTH_OWE
   authenticate mode: OWE

enumerator WIFI_AUTH_MAX

enum wifi_err_reason_t
   
Values:

enumerator WIFI_REASON_UNSPECIFIED

enumerator WIFI_REASON_AUTH_EXPIRE

enumerator WIFI_REASON_AUTH_LEAVE

enumerator WIFI_REASON_ASSOC_EXPIRE

enumerator WIFI_REASON_ASSOC_TOOMANY

enumerator WIFI_REASON_NOT_AUTHED

enumerator WIFI_REASON_NOT_ASSOCED

enumerator WIFI_REASON_ASSOC_LEAVE

enumerator WIFI_REASON_ASSOC_NOT_AUTHED

enumerator WIFI_REASON_DISASSOC_PWRCAP_BAD

enumerator WIFI_REASON_DISASSOC_SUPCHAN_BAD

enumerator WIFI_REASON_BSS_TRANSITION_DISASSOC

enumerator WIFI_REASON_IE_INVALID
enumerator WIFI_REASON_MIC_FAILURE

everenumerator WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT

everenumerator WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT

everenumerator WIFI_REASON_IE_IN_4WAY_DIFFERS

everenumerator WIFI_REASON_GROUP_CIPHER_INVALID

everenumerator WIFI_REASON_PAIRWISE_CIPHER_INVALID

everenumerator WIFI_REASON_AKMP_INVALID

everenumerator WIFI_REASON_UNSUPP_RSN_IE_VERSION

everenumerator WIFI_REASON_INVALID_RSN_IE_CAP

everenumerator WIFI_REASON_802_1X_AUTH_FAILED

everenumerator WIFI_REASON_CIPHER_SUITE_REJECTED

everenumerator WIFI_REASON_INVALID_PMKID

everenumerator WIFI_REASON_BEACON_TIMEOUT

everenumerator WIFI_REASON_NO_AP_FOUND

everenumerator WIFI_REASON_AUTH_FAIL

everenumerator WIFI_REASON_ASSOC_FAIL

everenumerator WIFI_REASON_HANDSHAKE_TIMEOUT

everenumerator WIFI_REASON_CONNECTION_FAIL

everenumerator WIFI_REASON_AP_TSF_RESET

everenumerator WIFI_REASON_ROAMING

enum wifi_second_chan_t

    Values:

everenumerator WIFI_SECOND_CHAN_NONE

    the channel width is HT20
enumerator WIFI_SECOND_CHAN_ABOVE
    the channel width is HT40 and the secondary channel is above the primary channel

enumerator WIFI_SECOND_CHAN_BELOW
    the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
    Values:
    enumerator WIFI_SCAN_TYPE_ACTIVE
        active scan
    enumerator WIFI_SCAN_TYPE_PASSIVE
        passive scan

enum wifi_cipher_type_t
    Values:
    enumerator WIFI_CIPHER_TYPE_NONE
        the cipher type is none
    enumerator WIFI_CIPHER_TYPE_WEP40
        the cipher type is WEP40
    enumerator WIFI_CIPHER_TYPE_WEP104
        the cipher type is WEP104
    enumerator WIFI_CIPHER_TYPE_TKIP
        the cipher type is TKIP
    enumerator WIFI_CIPHER_TYPE_CCMP
        the cipher type is CCMP
    enumerator WIFI_CIPHER_TYPE_TKIP_CCMP
        the cipher type is TKIP and CCMP
    enumerator WIFI_CIPHER_TYPE_AES_CMAC128
        the cipher type is AES-CMAC-128
    enumerator WIFI_CIPHER_TYPE_SMS4
        the cipher type is SMS4
    enumerator WIFI_CIPHER_TYPE_GCMP
        the cipher type is GCMP
    enumerator WIFI_CIPHER_TYPE_GCMP256
        the cipher type is GCMP-256
enumerator `WIFI_CIPHER_TYPE_AES_GMAC128`
the cipher type is AES-GMAC-128

enumerator `WIFI_CIPHER_TYPE_AES_GMAC256`
the cipher type is AES-GMAC-256

enumerator `WIFI_CIPHER_TYPE_UNKNOWN`
the cipher type is unknown

enum `wifi_ant_t`
WiFi antenna.
Values:

enumerator `WIFI_ANT_ANT0`
WiFi antenna 0

enumerator `WIFI_ANT_ANT1`
WiFi antenna 1

enumerator `WIFI_ANT_MAX`
Invalid WiFi antenna

enum `wifi_scan_method_t`
Values:

enumerator `WIFI_FAST_SCAN`
Do fast scan, scan will end after find SSID match AP

enumerator `WIFI_ALL_CHANNEL_SCAN`
All channel scan, scan will end after scan all the channel

enum `wifi_sort_method_t`
Values:

enumerator `WIFI_CONNECT_AP_BY_SIGNAL`
Sort match AP in scan list by RSSI

enumerator `WIFI_CONNECT_AP_BY_SECURITY`
Sort match AP in scan list by security mode

enum `wifi_ps_type_t`
Values:

enumerator `WIFI_PS_NONE`
No power save

enumerator `WIFI_PS_MIN_MODEM`
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period
enumerator **WIFI_PS_MAX_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in `wifi_sta_config_t`.

```c
enum wifi_bandwidth_t
{ Values:
  enumerator WIFI_BW_HT20,
  enumerator WIFI_BW_HT40,
}
```

```c
enum wifi_sae_pwe_method_t
{ Configuration for SAE PWE derivation
  Values:
  enumerator WPA3_SAE_PWE_UNSPECIFIED,
  enumerator WPA3_SAE_PWE_HUNT_AND_PECK,
  enumerator WPA3_SAE_PWE_HASH_TO_ELEMENT,
  enumerator WPA3_SAE_PWE_BOTH,
}
```

```c
enum wifi_storage_t
{ Values:
  enumerator WIFI_STORAGE_FLASH
    all configuration will store in both memory and flash,
  enumerator WIFI_STORAGE_RAM
    all configuration will only store in the memory,
}
```

```c
enum wifi_vendor_ie_type_t
{ Vendor Information Element type.
  Determines the frame type that the IE will be associated with.
  Values:
  enumerator WIFI_VND_IE_TYPE_BEACON,
  enumerator WIFI_VND_IE_TYPE_PROBE_REQ,
  enumerator WIFI_VND_IE_TYPE_PROBE_RESP,
  enumerator WIFI_VND_IE_TYPE_ASSOC_REQ,
  enumerator WIFI_VND_IE_TYPE_ASSOC_RESP,
}
enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:

enumerator WIFI_VND_IE_ID_0

enumerator WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:

enumerator WIFI_PKT_MGMT
Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_CTRL
Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_DATA
Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_MISC
Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
WiFi antenna mode.
Values:

enumerator WIFI_ANT_MODE_ANT0
Enable WiFi antenna 0 only

enumerator WIFI_ANT_MODE_ANT1
Enable WiFi antenna 1 only

enumerator WIFI_ANT_MODE_AUTO
Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator WIFI_ANT_MODE_MAX
Invalid WiFi enabled antenna

enum wifi_phy_rate_t
WiFi PHY rate encodings.
Values:
enumerator WIFI_PHY_RATE_1M_L
    1 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_L
    2 Mbps with long preamble

enumerator WIFI_PHY_RATE_5M_L
    5.5 Mbps with long preamble

enumerator WIFI_PHY_RATE_11M_L
    11 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_S
    2 Mbps with short preamble

enumerator WIFI_PHY_RATE_5M_S
    5.5 Mbps with short preamble

enumerator WIFI_PHY_RATE_11M_S
    11 Mbps with short preamble

enumerator WIFI_PHY_RATE_48M
    48 Mbps

enumerator WIFI_PHY_RATE_24M
    24 Mbps

enumerator WIFI_PHY_RATE_12M
    12 Mbps

enumerator WIFI_PHY_RATE_6M
    6 Mbps

enumerator WIFI_PHY_RATE_54M
    54 Mbps

enumerator WIFI_PHY_RATE_36M
    36 Mbps

enumerator WIFI_PHY_RATE_18M
    18 Mbps

enumerator WIFI_PHY_RATE_9M
    9 Mbps

enumerator WIFI_PHY_RATE_MCS0_LGI
    MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
enumerator **WIFI_PHY_RATE_MCS1_LGI**
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS2_LGI**
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS3_LGI**
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS4_LGI**
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS5_LGI**
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS6_LGI**
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS7_LGI**
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS0_SGI**
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS1_SGI**
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS2_SGI**
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS3_SGI**
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS4_SGI**
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS5_SGI**
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS6_SGI**
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_MCS7_SGI**
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

denumerator **WIFI_PHY_RATE_LORA_250K**
250 Kbps
enumerator WIFI_PHY_RATE_LORA_500K
    500 Kbps

enumerator WIFI_PHY_RATE_MAX

enum wifi_event_t
    WiFi event declarations
    Values:

    enumerator WIFI_EVENT_WIFI_READY
        ESP32 WiFi ready

    enumerator WIFI_EVENT_SCAN_DONE
        ESP32 finish scanning AP

    enumerator WIFI_EVENT_STA_START
        ESP32 station start

    enumerator WIFI_EVENT_STA_STOP
        ESP32 station stop

    enumerator WIFI_EVENT_STA_CONNECTED
        ESP32 station connected to AP

    enumerator WIFI_EVENT_STA_DISCONNECTED
        ESP32 station disconnected from AP

    enumerator WIFI_EVENT_STA_AUTHMODE_CHANGE
        the auth mode of AP connected by ESP32 station changed

    enumerator WIFI_EVENT_STA_WPS_ER_SUCCESS
        ESP32 station wps succeeds in enrollee mode

    enumerator WIFI_EVENT_STA_WPS_ER_FAILED
        ESP32 station wps fails in enrollee mode

    enumerator WIFI_EVENT_STA_WPS_ER_TIMEOUT
        ESP32 station wps timeout in enrollee mode

    enumerator WIFI_EVENT_STA_WPS_ER_PIN
        ESP32 station wps pin code in enrollee mode

    enumerator WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
        ESP32 station wps overlap in enrollee mode

    enumerator WIFI_EVENT_AP_START
        ESP32 soft-AP start
enumerator WIFI_EVENT_AP_STOP
    ESP32 soft-AP stop

enumerator WIFI_EVENT_AP_STACONNECTED
    a station connected to ESP32 soft-AP

enumerator WIFI_EVENT_AP_STADISCONNECTED
    a station disconnected from ESP32 soft-AP

enumerator WIFI_EVENT_AP_PROBEREQRECVED
    Receive probe request packet in soft-AP interface

enumerator WIFI_EVENT_FTM_REPORT
    Receive report of FTM procedure

enumerator WIFI_EVENT_STA_BSS_RSSI_LOW
    AP’s RSSI crossed configured threshold

enumerator WIFI_EVENT_ACTION_TX_STATUS
    Status indication of Action Tx operation

enumerator WIFI_EVENT_ROC_DONE
    Remain-on-Channel operation complete

enumerator WIFI_EVENT_STA_BEACON_TIMEOUT
    ESP32 station beacon timeout

enumerator WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START
    ESP32 connectionless module wake interval start

enumerator WIFI_EVENT_MAX
    Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
    
    Values:

    enumerator WPS_FAIL_REASON_NORMAL
        ESP32 WPS normal fail reason

    enumerator WPS_FAIL_REASON_RECV_M2D
        ESP32 WPS receive M2D frame

    enumerator WPS_FAIL_REASON_MAX

enum wifi_ftm_status_t
    FTM operation status types.
    
    Values:
enumerator **FTM_STATUS_SUCCESS**
FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**
Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**
Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**
Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**
Unknown error during FTM exchange

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on **Easy Connect** for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```
Initialize DPP Supplicant.
Chapter 2. API Reference

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

Parameters **evt_cb** – Callback function to receive DPP related events

void esp_supp_dpp_deinit (void)
De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

```c
esp_err_t esp_supp_dpp_bootstrap_gen (const char* chan_list, esp_supp_dpp_bootstrap_t type, const char* key, const char* info)
```
Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Parameters

- **chan_list** – List of channels device will be available on for listening
- **type** – Bootstrap method type, only QR Code method is supported for now.
- **key** – (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** – (Optional) Ancilliary Device Information like Serial Number

Returns

- ESP_OK: Success
- ESP_FAIL: Failure

```c
esp_err_t esp_supp_dpp_start_listen (void)
```
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

Returns

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

**Macros**
**ESP_ERR_DPP_FAILURE**

Generic failure during DPP Operation

**ESP_ERR_DPP_TX_FAILURE**

DPP Frame Tx failed OR not Acked

**ESP_ERR_DPP_INVALID_ATTR**

Encountered invalid DPP Attribute

**Type Definitions**

typedef enum *dpp_bootstrap_type* **esp_supp_dpp_bootstrap_t**

Types of Bootstrap Methods for DPP.

typedef void (***esp_supp_dpp_event_cb_t**) (**esp_supp_dpp_event_t** **evt**, void **data**) (*esp_supp_dpp_event_t** **evt**, void **data**)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

**Param evt**  
DPP event ID

**Param data**  
Event data payload

**Enumerations**

enum **dpp_bootstrap_type**

Types of Bootstrap Methods for DPP.

**Values:**

enumerator **DPP_BOOTSTRAP_QR_CODE**

QR Code Method

enumerator **DPP_BOOTSTRAP_PKEX**

Proof of Knowledge Method

enumerator **DPP_BOOTSTRAP_NFC_URI**

NFC URI record Method

enum **esp_supp_dpp_event_t**

Types of Callback Events received from DPP Supplicant.

**Values:**

enumerator **ESP_SUPP_DPP_URI_READY**

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure
Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

2.5.2 Ethernet

Overview

ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver

Basic Ethernet Concepts

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SFD) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

Preamble and Start-of-Frame Delimiter

The preamble contains seven bytes of \( 55H \), it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence \( 10101011 \) (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

Destination Address

The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.
Source Address  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see MAC Address Allocation.

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

Type / Length  The type/length field is a 2-byte field, if the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

Payload  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

Padding and FCS  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller
than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

---

**Configure MAC and PHY**

Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface) and etc.

One of the obvious difference between MII and RMII is the signal consumption. For MII, it usually costs up to 18 signals. Instead, RMII interface can reduce the consumption to 9.

In RMII mode, both the receiver and transmitter signals are referenced to the **REF_CLK**. **REF_CLK must be stable during any access to PHY and MAC.** Generally there’re three ways to generate the **REF_CLK** depending on the PHY device in your design:

- Some PHY chip can derive the **REF_CLK** from its external connected 25MHz crystal oscillator (as seen the option a in the picture). In this case, you should select **CONFIG_ETH_RMII_CLK_INPUT** in **CONFIG_ETH_RMII_CLK_MODE**.
- Some PHY chip uses an external connected 50MHz crystal oscillator or other clock source, which can also be used as the **REF_CLK** for MAC side (as seen the option b in the picture). In this case, you still need to select **CONFIG_ETH_RMII_CLK_INPUT** in **CONFIG_ETH_RMII_CLK_MODE**.
- Some EMAC controller can generate the **REF_CLK** using its internal high precision PLL (as seen the option c in the picture). In this case, you should select **CONFIG_ETH_RMII_CLK_OUTPUT** in **CONFIG_ETH_RMII_CLK_MODE**.

**Note:** **REF_CLK** is configured via Project Configuration as described above by default. However, it can be overwritten from user application code by appropriately setting **eth esp32_emac config t::interface** and **eth esp32_emac config t::clock config** members. See **emac_rmii_clock_mode_t** and **emac_rmii_clock_gpio_t** for more details.

---

**Warning:** If the RMII clock mode is selected to **CONFIG_ETH_RMII_CLK_OUTPUT**, then GPIO0 can be used to output the **REF_CLK** signal. See **CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0** for more information. What’s more, if you’re not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock. See **CONFIG_ETH_RMII_CLK_OUT_GPIO** for more information.

If the RMII clock mode is selected to **CONFIG_ETH_RMII_CLK_INPUT**, then GPIO0 is the only choice to input the **REF_CLK** signal. Please note that, GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround of this issue is disabling the **REF_CLK** in hardware by default, so that the strapping pin won’t be interfered by other signals in boot stage. Then re-enable the **REF_CLK** in Ethernet driver installation stage. The ways to disable the **REF_CLK** signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
Chapter 2. API Reference

Fig. 5: Ethernet RMII Interface
For the PHY device in reset status (as the case a in the picture). This could fail for some PHY device (i.e. it still outputs signal to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of REF_CLK in your hardware design! Keep the trace as short as possible. Keep it away from RF devices. Keep it away from inductor elements.

Note: ESP-IDF only supports the RMII interface (i.e. always select CONFIG_ETH_PHY_INTERFACE_RMII in Kconfig option CONFIG_ETH_PHY_INTERFACE).

Signals used in data plane are fixed to specific GPIOs via MUX, they can’t be modified to other GPIOs. Signals used in control plane can be routed to any free GPIOs via Matrix. Please refer to ESP32-Ethernet-Kit for hardware design example.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’ed with macros prefixed with ETH_MAC_FLAG_. For example, if the MAC driver should work when cache is disabled, then you should configure this field with ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE.
- `ethesp32_emac_config_t::smi_mdc_gpio_num` and `ethesp32_emac_config_t::smi_mdio_gpio_num`: the GPIO number used to connect the SMI signals.
- `ethesp32_emac_config_t::interface`: configuration of MAC Data interface to PHY (MII/RMII).
- `ethesp32_emac_config_t::clock_config`: configuration of EMAC Interface clock (REF_CLK mode and GPIO number in case of RMII).

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `ethphy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro ETH_MAC_DEFAULT_CONFIG and ETH_PHY_DEFAULT_CONFIG.

Create MAC and PHY Instance   Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.
Internal EMAC + External PHY

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
mac_config.sm_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO used for MDC signal
mac_config.sm_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDI0_GPIO; // alter the GPIO used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance
```

```c
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
```

Optional Runtime MAC Clock Configuration

EMAC REF_CLK can be optionally configured from user application code.

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
// ...
mac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
mac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
mac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number used to input/output EMAC REF_CLK
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance
```

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
.clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
.spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
.queue_size = 20;
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don’t have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module’s spec and the examples in esp-idf.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    // we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
```

(continues on next page)
### Chapter 2. API Reference

(continued from previous page)

```c
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", 
            mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
            addr[4], mac_addr[5]);
        break;
    case ETHERNET_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "Ethernet Link Down");
        break;
    case ETHERNET_EVENT_START:
        ESP_LOGI(TAG, "Ethernet Started");
        break;
    case ETHERNET_EVENT_STOP:
        ESP_LOGI(TAG, "Ethernet Stopped");
        break;
    default:
        break;
}
}
esp_event_loop_create_default(); // create a default event loop that running in-

### Connect Driver to TCP/IP Stack

Up until now, we have installed the Ethernet driver. From the view of OSI
(Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event,
we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP
stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to Network Interface.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
    int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP: " IPSTR(ToString(ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK: " IPSTR(ToString(ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW: " IPSTR(ToString(ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~~~");
}
```

(continues on next page)
esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

Warning: It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.

Misc control of Ethernet driver The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: esp_eth_stop()
- Update Ethernet data input path: esp_eth_update_input_path()
- Misc get/set of Ethernet driver attributes: esp_eth_ioctl()

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

Flow control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.
Application Examples

- Ethernet basic example: ethernet/basic.
- Ethernet iperf example: ethernet/iperf.
- Ethernet to Wi-Fi AP “router”: ethernet/eth2ap.
- Most of protocol examples should also work for Ethernet: protocols.

Advanced Topics

Custom PHY Driver There are multiple PHY manufactures with their wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies user’s actual needs due to either price, features, stock availability etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in 22.2.4 Management functions section. It defines provisions of so called “MII Management Interface” for the purposes of controlling the PHY and gathering status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration etc. This basic management functionality is addressed by esp_eth/src/esp_eth_phy_802_3.c in ESP-IDF and so it makes a creation of new custom PHY chip driver quite a simple task.

Note: Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

Majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the esp_eth/src/esp_eth_phy_802_3.c however, the following may require developing chip specific management functions:

- link status which is almost always chip specific,
- chip initialization, even though it is not strictly required, should be customized to at least ensure that expected chip is used and
- chip specific features configuration.

Steps to create custom PHY driver:

1. Define vendor specific registry layout based on PHY datasheet. See esp_eth/src/esp_eth_phy_ip101.c as an example.
2. Prepare derived PHY management object infostructure which
   - must contain at least parent IEEE 802.3 phy_802_3_t object and
   - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See esp_eth/src/esp_eth_phy_ksz80xx.c as an example.
3. Define chip specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among with other users via IDF Component Registry.

API Reference

Header File

- components/esp_eth/include/esp_eth.h

Header File

- components/esp_eth/include/esp_eth_driver.h
Functions

**esp_err_t esp_eth_driver_install** (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)

Install Ethernet driver.

**Parameters**
- **config** [in] configuration of the Ethernet driver
- **out_hdl** [out] handle of Ethernet driver

**Returns**
- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**esp_err_t esp_eth_driver_uninstall** (esp_eth_handle_t hdl)

Uninstall Ethernet driver.

**Note:** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Parameters**
- **hdl** [in] handle of Ethernet driver

**Returns**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**esp_err_t esp_eth_start** (esp_eth_handle_t hdl)

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note:** This API will start driver state machine and internal software timer (for checking link status).

**Parameters**
- **hdl** [in] handle of Ethernet driver

**Returns**
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**esp_err_t esp_eth_stop** (esp_eth_handle_t hdl)

Stop Ethernet driver.

**Note:** This function does the opposite operation of esp_eth_start.

**Parameters**
- **hdl** [in] handle of Ethernet driver

**Returns**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
Chapter 2. API Reference

• ESP_FAIL: stop esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note:** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Parameters**
- **hdl** – [in] handle of Ethernet driver
- **stack_input** – [in] function pointer, which does the actual process on incoming packets
- **priv** – [in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

```c
esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void* buf, size_t length)
```

General Transmit.

**Parameters**
- **hdl** – [in] handle of Ethernet driver
- **buf** – [in] buffer of the packet to transfer
- **length** – [in] length of the buffer to transfer

**Returns**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_STATE: invalid driver state (i.e. driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

```c
esp_err_t esp_eth_transmit_vargs (esp_eth_handle_t hdl, uint32_t argc, ...
```

Special Transmit with variable number of arguments.

**Parameters**
- **hdl** – [in] handle of Ethernet driver
- **argc** – [in] number variable arguments
- ... –variable arguments

**Returns**
- ESP_OK: transmit successfull
- ESP_ERR_INVALID_STATE: invalid driver state (i.e. driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

```c
esp_err_t esp_eth_ioctl (esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- ETH_CMD_S_MAC_ADDR sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
• **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.

• **ETH_CMD_S_PHY_ADDR** sets PHY address in range of `<0-31>`. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.

• **ETH_CMD_G_PHY_ADDR** gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.

• **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.

• **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.

• **ETH_CMD_S_SPEED** sets the Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• **ETH_CMD_G_SPEED** gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.

• **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

• **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

• **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.

• **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

• Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

### Parameters

- **hd1** – [in] handle of Ethernet driver
- **cmd** – [in] IO control command
- **data** – [inout] address of data for set command or address where to store the data when used with get command

### Returns

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

### Example

```
esp_err_t esp_eth_increase_reference (esp_eth_handle_t hd1)
```
Increase Ethernet driver handle reference.

### Note:
Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

### Parameters

- **hd1** – [in] handle of Ethernet driver

### Returns

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument
Chapter 2. API Reference

**esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)**

Decrease Ethernet driver reference.

**Parameters**
- **hdl** [in] handle of Ethernet driver

**Returns**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Structures**

struct esp_eth_config_t
Configuration of Ethernet driver.

**Public Members**

*esp_eth_mac_t *mac*
Ethernet MAC object.

*esp_eth_phy_t *phy*
Ethernet PHY object.

uint32_t **check_link_period_ms**
Period time of checking Ethernet link status.

*esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t*buffer, uint32_t length, void *priv)*
Input frame buffer to user’s stack.

  **Param**
  - **eth_handle** [in] handle of Ethernet driver
  - **buffer** [in] frame buffer that will get input to upper stack
  - **length** [in] length of the frame buffer

  **Return**
  - ESP_OK: input frame buffer to upper stack successfully
  - ESP_FAIL: error occurred when inputting buffer to upper stack

*esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)*
Callback function invoked when lowlevel initialization is finished.

  **Param**
  - **eth_handle** [in] handle of Ethernet driver

  **Return**
  - ESP_OK: process extra lowlevel initialization successfully
  - ESP_FAIL: error occurred when processing extra lowlevel initialization

*esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)*
Callback function invoked when lowlevel deinitialization is finished.

  **Param**
  - **eth_handle** [in] handle of Ethernet driver

  **Return**
  - ESP_OK: process extra lowlevel deinitialization successfully
  - ESP_FAIL: error occurred when processing extra lowlevel deinitialization

*esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)*
Read PHY register.
Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param eth_handle [in]** handle of Ethernet driver  
**Param phy_addr [in]** PHY chip address (0~31)  
**Param phy_reg [in]** PHY register index code  
**Param reg_value [out]** PHY register value  

**Return**  
- ESP_OK: read PHY register successfully  
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument  
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout  
- ESP_FAIL: read PHY register failed because some other error occurred

```c
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param eth_handle [in]** handle of Ethernet driver  
**Param phy_addr [in]** PHY chip address (0~31)  
**Param phy_reg [in]** PHY register index code  
**Param reg_value [in]** PHY register value  

**Return**  
- ESP_OK: write PHY register successfully  
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument  
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout  
- ESP_FAIL: write PHY register failed because some other error occurred

**Macros**

```c
ETH_DEFAULT_CONFIG (emac, ephy)
```

Default configuration for Ethernet driver.

**Type Definitions**

typedef void *esp_eth_handle_t

Handle of Ethernet driver.

**Enumerations**

enum esp_eth_io_cmd_t

Command list for ioctl API.  

**Values:**

- enumerator ETH_CMD_G_MAC_ADDR  
   Get MAC address
enumerator ETH_CMD_S_MAC_ADDR
    Set MAC address

eumerator ETH_CMD_G_PHY_ADDR
    Get PHY address

eumerator ETH_CMD_S_PHY_ADDR
    Set PHY address

eumerator ETH_CMD_G_AUTONEGO
    Get PHY Auto Negotiation

eumerator ETH_CMD_S_AUTONEGO
    Set PHY Auto Negotiation

eumerator ETH_CMD_G_SPEED
    Get Speed

eumerator ETH_CMD_S_SPEED
    Set Speed

eumerator ETH_CMD_S_PROMISCUOUS
    Set promiscuous mode

eumerator ETH_CMD_S_FLOW_CTRL
    Set flow control

eumerator ETH_CMD_G_DUPLEX_MODE
    Get Duplex mode

eumerator ETH_CMD_S_DUPLEX_MODE
    Set Duplex mode

eumerator ETH_CMD_S_PHY_LOOPBACK
    Set PHY loopback

eumerator ETH_CMD_CUSTOM_MAC_CMDS

eumerator ETH_CMD_CUSTOM_PHY_CMDS

**Header File**

- `components/esp_eth/include/esp_eth_com.h`

**Structures**

struct esp_eth_mediator_s
    Ethernet mediator.
Public Members

\texttt{esp_err_t(*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)}

Read PHY register.

\textbf{Param eth} [in] mediator of Ethernet driver
\textbf{Param phy_addr} [in] PHY Chip address (0~31)
\textbf{Param phy_reg} [in] PHY register index code
\textbf{Param reg_value} [out] PHY register value

\textbf{Return}
\begin{itemize}
  \item ESP\_OK: read PHY register successfully
  \item ESP\_FAIL: read PHY register failed because some error occurred
\end{itemize}

\texttt{esp_err_t(*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)}

Write PHY register.

\textbf{Param eth} [in] mediator of Ethernet driver
\textbf{Param phy_addr} [in] PHY Chip address (0~31)
\textbf{Param phy_reg} [in] PHY register index code
\textbf{Param reg_value} [in] PHY register value

\textbf{Return}
\begin{itemize}
  \item ESP\_OK: write PHY register successfully
  \item ESP\_FAIL: write PHY register failed because some error occurred
\end{itemize}

\texttt{esp_err_t(*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)}

Deliver packet to upper stack.

\textbf{Param eth} [in] mediator of Ethernet driver
\textbf{Param buffer} [in] packet buffer
\textbf{Param length} [in] length of the packet

\textbf{Return}
\begin{itemize}
  \item ESP\_OK: deliver packet to upper stack successfully
  \item ESP\_FAIL: deliver packet failed because some error occurred
\end{itemize}

\texttt{esp_err_t(*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)}

Callback on Ethernet state changed.

\textbf{Param eth} [in] mediator of Ethernet driver
\textbf{Param state} [in] new state
\textbf{Param args} [in] optional argument for the new state

\textbf{Return}
\begin{itemize}
  \item ESP\_OK: process the new state successfully
  \item ESP\_FAIL: process the new state failed because some error occurred
\end{itemize}

Type Definitions

\texttt{typedef struct esp_eth_mediator_s esp_eth_mediator_t}

Ethernet mediator.

Enumerations

\texttt{enum esp_eth_state_t}

Ethernet driver state.

\textbf{Values}:
enumerator `ETH_STATE_LLINIT`  
Low level init done

denumerator `ETH_STATE_DEINIT`  
Deinit done

denumerator `ETH_STATE_LINK`  
Link status changed

denumerator `ETH_STATE_SPEED`  
Speed updated

denumerator `ETH_STATE_DUPLEX`  
Duplex updated

denumerator `ETH_STATE_PAUSE`  
Pause ability updated

enum `eth_event_t`  
Ethernet event declarations.

Values:

denumerator `ETHERNET_EVENT_START`  
Ethernet driver start

denumerator `ETHERNET_EVENT_STOP`  
Ethernet driver stop

denumerator `ETHERNET_EVENT_CONNECTED`  
Ethernet got a valid link

denumerator `ETHERNET_EVENT_DISCONNECTED`  
Ethernet lost a valid link

**Header File**

- components/esp_eth/include/esp_eth_mac.h

**Functions**

```c
esp_eth_mac_t *esp_eth_mac_new_esp32 (const eth_esp32_emac_config_t *esp32_config, const eth_mac_config_t *config)
```

Create ESP32 Ethernet MAC instance.

**Parameters**

- `esp32_config` - EMAC specific configuration
- `config` - Ethernet MAC configuration

**Returns**

- `instance`: create MAC instance successfully
- `NULL`: create MAC instance failed because some error occurred
Unions

union **eth_mac_clock_config_t**

```
#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.
```

Public Members

```

    EMAC RMII Clock Configuration
```

Structures

```
struct **esp_eth_mac_s**
    Ethernet MAC.
```

Public Members

```
**esp_err_t** (*set_mediator*) (**esp_eth_mac_t** *mac, **esp_eth_mediator_t** *eth)
    Set mediator for Ethernet MAC.
    **Param** mac [in] Ethernet MAC instance
    **Param** eth [in] Ethernet mediator
    **Return**
    • ESP_OK: set mediator for Ethernet MAC successfully
    • ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

**esp_err_t** (*init*) (**esp_eth_mac_t** *mac)
    Initialize Ethernet MAC.
    **Param** mac [in] Ethernet MAC instance
    **Return**
    • ESP_OK: initialize Ethernet MAC successfully
    • ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
    • ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

**esp_err_t** (*deinit*) (**esp_eth_mac_t** *mac)
    Deinitialize Ethernet MAC.
    **Param** mac [in] Ethernet MAC instance
    **Return**
    • ESP_OK: deinitialize Ethernet MAC successfully
    • ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred
Chapter 2. API Reference

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
Start Ethernet MAC.

Param mac [in] Ethernet MAC instance
Return
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred
```

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance
Return
• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some error occurred
```

```c
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
Transmit packet from Ethernet MAC.

Note: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance
Param buf [in] packet buffer to transmit
Param length [in] length of packet
Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred
```

```c
esp_err_t (*transmit_vargs)(esp_eth_mac_t *mac, uint32_t argc, va_list args)
Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

Note: Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

Note: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance
Param argc [in] number variable arguments
Param args [in] variable arguments
Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred
```

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
Receive packet from Ethernet MAC.

Note: Memory of buf is allocated in the Layer2, make sure it get free after process.
```
**Note:** Before this function got invoked, the value of “length” should be set by the user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Param** mac [in] Ethernet MAC instance  
**Param** buf [out] packet buffer which will preserve the received frame  
**Param** length [out] length of the received packet  
**Return**  
- ESP_OK: receive packet successfully  
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument  
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. In this case, value of returned “length” indicates the real size of incoming data.  
- ESP_FAIL: receive packet failed because some other error occurred

`esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`  
Read PHY register.  
**Param** mac [in] Ethernet MAC instance  
**Param** phy_addr [in] PHY chip address (0~31)  
**Param** phy_reg [in] PHY register index code  
**Param** reg_value [out] PHY register value  
**Return**  
- ESP_OK: read PHY register successfully  
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument  
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC  
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout  
- ESP_FAIL: read PHY register failed because some other error occurred

`esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`  
Write PHY register.  
**Param** mac [in] Ethernet MAC instance  
**Param** phy_addr [in] PHY chip address (0~31)  
**Param** phy_reg [in] PHY register index code  
**Param** reg_value [in] PHY register value  
**Return**  
- ESP_OK: write PHY register successfully  
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC  
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout  
- ESP_FAIL: write PHY register failed because some other error occurred

`esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)`  
Set MAC address.  
**Param** mac [in] Ethernet MAC instance  
**Param** addr [in] MAC address  
**Return**  
- ESP_OK: set MAC address successfully  
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument  
- ESP_FAIL: set MAC address failed because some other error occurred

`esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)`
Get MAC address.

```c
esp_err_t(*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```
Set speed of MAC.

```c
esp_err_t(*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

```c
esp_err_t(*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

```c
esp_err_t(*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

```c
esp_err_t(*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```
Enable flow control on MAC layer or not.
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
Set the PAUSE ability of peer node.

**Param**
- **mac** [in] Ethernet MAC instance
- **ability** [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

**Param**
- **mac** [in] Ethernet MAC instance
- **cmd** [in] IO control command
- **data** [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (*del)(esp_eth_mac_t *mac)
Free memory of Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**struct eth_mac_config_t**
Configuration of Ethernet MAC object.

**Public Members**

uint32_t **sw_reset_timeout_ms**
Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**
Stack size of the receive task

uint32_t **rx_task_prio**
Priority of the receive task

uint32_t **flags**
Flags that specify extra capability for mac driver
struct eth_esp32_emac_config_t
    EMAC specific configuration.

Public Members

int smi_mdc_gpio_num
    SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int smi_mdio_gpio_num
    SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

eth_data_interface_t interface
    EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t clock_config
    EMAC Interface clock configuration

dma_burst_len
    DMA burst length for both Tx and Rx

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
    MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
    Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
    Default configuration for Ethernet MAC object.

ETH_ESP32_EMAC_DEFAULT_CONFIG()
    Default ESP32’s EMAC specific configuration.

Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.

Enumerations

eenum emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    Values:

    enumerator EMAC_CLK_DEFAULT
        Default values configured using Kconfig are going to be used when “Default” selected.
enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

**Note:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**

RMII Clock GPIO number Options.

**Values:**

enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

**Note:** ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

**Header File**

- components/esp_eth/include/esp_eth_phy.h

**Functions**

```c
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
```

Create a PHY instance of IP101.

**Parameters** `config` - [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred
Chapter 2. API Reference

`esp_eth_phy_t *esp_eth_phy_new_rtl8201 (const eth_phy_config_t *config)`
Create a PHY instance of RTL8201.

**Parameters**
- `config` – [in] configuration of PHY

**Returns**
- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_lan87xx (const eth_phy_config_t *config)`
Create a PHY instance of LAN87xx.

**Parameters**
- `config` – [in] configuration of PHY

**Returns**
- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)`
Create a PHY instance of DP83848.

**Parameters**
- `config` – [in] configuration of PHY

**Returns**
- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz80xx (const eth_phy_config_t *config)`
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters**
- `config` – [in] configuration of PHY

**Returns**
- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

**Structures**

`struct esp_eth_phy_s`  Ethernet PHY.

**Public Members**

`esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)`
Set mediator for PHY.

- **Param** `phy` – [in] Ethernet PHY instance
- **Param** `mediator` – [in] mediator of Ethernet driver

**Return**
- `ESP_OK`: set mediator for Ethernet PHY instance successfully
- `ESP_ERR_INVALID_ARG`: set mediator for Ethernet PHY instance failed because of some invalid arguments

`esp_err_t (*reset)(esp_eth_phy_t *phy)`
Software Reset Ethernet PHY.

- **Param** `phy` – [in] Ethernet PHY instance

**Return**
Chapter 2. API Reference

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t (*reset_hw)(esp_eth_phy_t *phy)`

Hardware Reset Ethernet PHY.

**Note:** Hardware reset is mostly done by pull down and up PHY’s nRST pin

**Param** phy [in] Ethernet PHY instance

**Return**
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t (*init)(esp_eth_phy_t *phy)`

Initialize Ethernet PHY.

**Param** phy [in] Ethernet PHY instance

**Return**
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

`esp_err_t (*deinit)(esp_eth_phy_t *phy)`

Deinitialize Ethernet PHY.

**Param** phy [in] Ethernet PHY instance

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

`esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)`

Configure auto negotiation.

**Param** phy [in] Ethernet PHY instance

**Param** cmd [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param** autonego_en_stat [out] Address where to store current status of auto negotiation configuration

**Return**
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

`esp_err_t (*get_link)(esp_eth_phy_t *phy)`

Get Ethernet PHY link status.

**Param** phy [in] Ethernet PHY instance

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

`esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)`

Power control of Ethernet PHY.

**Param** phy [in] Ethernet PHY instance

**Param** enable [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY
Chapter 2. API Reference

Return
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```
Set PHY chip address.

Param phy [in] Ethernet PHY instance
Param addr [in] PHY chip address

Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```
Get PHY chip address.

Param phy [in] Ethernet PHY instance
Param addr [out] PHY chip address

Return
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

```c
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
```
Advertise pause function supported by MAC layer.

Param phy [in] Ethernet PHY instance
Param addr [out] Pause ability

Return
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

```c
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
```
Sets the PHY to loopback mode.

Param phy [in] Ethernet PHY instance
Param enable [in] enables or disables PHY loopback

Return
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```
Sets PHY speed mode.

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance
Param speed [in] Speed mode to be set

Return
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.
Chapter 2. API Reference

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance  
**Param duplex** [in] Duplex mode to be set  
**Return**  
• ESP_OK: PHY instance duplex mode has been configured successfully  
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)
```

Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.

Note: This function may not be assigned when the PHY chip supports only most common set of configuration options.

**Param phy** [in] Ethernet PHY instance  
**Param cmd** [in] IO control command  
**Param data** [inout] address of data for set command or address where to store the data when used with get command  
**Return**  
• ESP_OK: process io command successfully  
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument  
• ESP_FAIL: process io command failed because some other error occurred  
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Param phy** [in] Ethernet PHY instance  
**Return**  
• ESP_OK: free PHY instance successfully  
• ESP_FAIL: free PHY instance failed because some error occurred

```c
struct eth_phy_config_t
```

Ethernet PHY configuration.

**Public Members**

```c
int32_t phy_addr
```

PHY address, set -1 to enable PHY address detection at initialization stage

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)
int reset_gpio_num
    Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
    Default configuration for Ethernet PHY object.

Type Definitions
typedef struct esp_eth_phy_s esp_eth_phy_t
    Ethernet PHY.

Enumerations
enum eth_phy_autoneg_cmd_t
    Auto-negotiation control commands.
    Values:
    enumerator ESP_ETH_PHY_AUTONEGO_RESTART
    enumerator ESP_ETH_PHY_AUTONEGO_EN
    enumerator ESP_ETH_PHY_AUTONEGO_DIS
    enumerator ESP_ETH_PHY_AUTONEGO_G_STAT

Header File
    • components/esp_eth/include/esp_eth_phy_802_3.h

Functions
esp_err_t esp_eth_phy_802_3_reset_hw(phy_802_3_t *phy_802_3, uint32_t reset_assert_us)
    Performs hardware reset with specific reset pin assertion time.
    Parameters
        • phy_802_3 – IEEE 802.3 PHY object infostructure
        • reset_assert_us – Hardware reset pin assertion time
    Returns
        • ESP_OK: reset Ethernet PHY successfully

esp_err_t esp_eth_phy_802_3_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)
    Detect PHY address.
    Parameters
        • eth – Mediator of Ethernet driver
        • detected_addr – [out] a valid address after detection
    Returns
        • ESP_OK: detect phy address successfully
        • ESP_ERR_INVALID_ARG: invalid parameter
        • ESP_ERR_NOT_FOUND: can’t detect any PHY device
        • ESP_FAIL: detect phy address failed because some error occurred
**esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)**

Performs basic PHY chip initialization.

**Note:** It should be called as the first function in PHY specific driver instance

**Parameters**
- `phy_802_3` – IEEE 802.3 PHY object infostructure

**Returns**
- **ESP_OK:** initialized Ethernet PHY successfully
- **ESP_FAIL:** initialization of Ethernet PHY failed because some error occurred
- **ESP_ERR_INVALID_ARG:** invalid argument
- **ESP_ERR_NOT_FOUND:** PHY device not detected
- **ESP_ERR_TIMEOUT:** MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE:** PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)**

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

**Parameters**
- `phy_802_3` – IEEE 802.3 PHY object infostructure

**Returns**
- **ESP_OK:** de-initialized Ethernet PHY successfully
- **ESP_FAIL:** de-initialization of Ethernet PHY failed because some error occurred
- **ESP_ERR_TIMEOUT:** MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE:** PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t *oui)**

Reads raw content of OUI field.

**Parameters**
- `phy_802_3` – IEEE 802.3 PHY object infostructure
- `oui` – [out] OUI value

**Returns**
- **ESP_OK:** OUI field read successfully
- **ESP_FAIL:** OUI field read failed because some error occurred
- **ESP_ERR_INVALID_ARG:** invalid `oui` argument
- **ESP_ERR_TIMEOUT:** MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE:** PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t *model, uint8_t *rev)**

Reads manufacturer’s model and revision number.

**Parameters**
- `phy_802_3` – IEEE 802.3 PHY object infostructure
- `model` – [out] Manufacturer’s model number (can be NULL when not required)
- `rev` – [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**
- **ESP_OK:** Manufacturer’s info read successfully
- **ESP_FAIL:** Manufacturer’s info read failed because some error occurred
- **ESP_ERR_TIMEOUT:** MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE:** PHY is in invalid state to perform requested operation

**esp_eth_phy_t *esp_eth_phy_into_phy_802_3 (esp_eth_phy_t *phy)**

Returns address to parent IEEE 802.3 PHY object infostructure.
**Parameters**
- **phy** - Ethernet PHY instance

**Returns**
- `phy_802_3_t*`
  - address to parent IEEE 802.3 PHY object infostructure

```c
esp_err_t esp_eth_phy_802_3_obj_config_init (phy_802_3_t *phy_802_3, const eth_phy_config_t *config)
```

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**
- **phy_802_3** - Address to IEEE 802.3 PHY object infostructure
- **config** - Configuration of the IEEE 802.3 PHY object

**Returns**
- **ESP_OK** - configuration initialized successfully
- **ESP_ERR_INVALID_ARG** - invalid `config` argument

**Structures**

```c
struct phy_802_3_t
```

IEEE 802.3 PHY object infostructure.

**Public Members**

```c
esp_eth_phy_t parent
```

Parent Ethernet PHY instance

```c
esp_eth_mediator_t *eth
```

Mediator of Ethernet driver

```c
int addr
```

PHY address

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
eth_link_t link_status
```

Current Link status

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset

**Header File**

- `components/esp_eth/include/esp_eth_netif_glue.h`

**Functions**
**esp_eth_netif_glue_handle_t esp_eth_new_netif_glue (esp_eth_handle_t eth_hdl)**

Create a netif glue for Ethernet driver.

**Note:** netif glue is used to attach io driver to TCP/IP netif

**Parameters**

- `eth_hdl` - Ethernet driver handle

**Returns**

- glue object, which inherits `esp_netif_driver_base_t`

**esp_err_t esp_eth_del_netif_glue (esp_eth_netif_glue_handle_t eth_netif_glue)**

Delete netif glue of Ethernet driver.

**Parameters**

- `eth_netif_glue` - netif glue

**Returns**

- ESP_OK: delete netif glue successfully

**Type Definitions**

typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

---

### 2.5.3 Thread

**Thread**

**Introduction**

Thread is an IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples**

The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

**API Reference**

For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

**Header File**

- `components/openthread/include/esp_openthread.h`

**Functions**

**esp_err_t esp_openthread_init (const esp_openthread_platform_config_t *init_config)**

Initializes the full OpenThread stack.

**Note:** The OpenThread instance will also be initialized in this function.

**Parameters**

- `init_config` - [in] The initialization configuration.

**Returns**

- ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**esp_err_t esp_openthread_launch_mainloop** (void)
Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

**esp_err_t esp_openthread_deinit** (void)
This function performs OpenThread stack and platform driver deinitialization.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

**otInstance* esp_openthread_get_instance** (void)
This function acquires the underlying OpenThread instance.

**Note:** This function can be called on other tasks without lock.

**Returns**  The OpenThread instance pointer

**Header File**
- components/openthread/include/esp_openthread_types.h

**Structures**

**struct esp_openthread_mainloop_context_t**
This structure represents a context for a select() based mainloop.

**Public Members**

`fd_set read_fds`
The read file descriptors

`fd_set write_fds`
The write file descriptors

`fd_set error_fds`
The error file descriptors

`int max_fd`
The max file descriptor
struct timeval timeout
   The timeout

struct esp_openthread_uart_config_t
   The uart port config for OpenThread.

**Public Members**

*uart_port_t port*
   UART port number

*uart_config_t uart_config*
   UART configuration, see *uart_config_t* docs

*int rx_pin*
   UART RX pin

*int tx_pin*
   UART TX pin

struct esp_openthread_radio_config_t
   The OpenThread radio configuration.

**Public Members**

*esp_openthread_radio_mode_t radio_mode*
   The radio mode

*esp_openthread_uart_config_t radio_uart_config*
   The uart configuration to RCP

struct esp_openthread_host_connection_config_t
   The OpenThread host connection configuration.

**Public Members**

*esp_openthread_host_connection_mode_t host_connection_mode*
   The host connection mode

*esp_openthread_uart_config_t host_uart_config*
   The uart configuration to host

struct esp_openthread_port_config_t
   The OpenThread port specific configuration.
Chapter 2. API Reference

Public Members

const char *storage_partition_name
  The partition for storing OpenThread dataset

uint8_t netif_queue_size
  The packet queue size for the network interface

uint8_t task_queue_size
  The task queue size

struct esp_openthread_platform_config_t
  The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t radio_config
  The radio configuration

esp_openthread_host_connection_config_t host_config
  The host connection configuration

esp_openthread_port_config_t port_config
  The port configuration

Type Definitions

typedef void (*esp_openthread_rcp_failure_handler)(void)

Enumerations

c enum esp_openthread_event_t
  OpenThread event declarations.
  Values:

  enumerator OPENTHREAD_EVENT_START
    OpenThread stack start

  enumerator OPENTHREAD_EVENT_STOP
    OpenThread stack stop

  enumerator OPENTHREAD_EVENT_IF_UP
    OpenThread network interface up

  enumerator OPENTHREAD_EVENT_IF_DOWN
    OpenThread network interface down
enumerator OPENTHREAD_EVENT_GOT_IP6
OpenThread stack added IPv6 address

enumerator OPENTHREAD_EVENT_LOST_IP6
OpenThread stack removed IPv6 address

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN
OpenThread stack joined IPv6 multicast group

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE
OpenThread stack left IPv6 multicast group

enumerator OPENTHREAD_EVENT_TREL_ADD_IP6
OpenThread stack added TREL IPv6 address

enumerator OPENTHREAD_EVENT_TREL_REMOVE_IP6
OpenThread stack removed TREL IPv6 address

enumerator OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN
OpenThread stack joined TREL IPv6 multicast group

enum esp_openthread_radio_mode_t
The radio mode of OpenThread.

Values:

enumerator RADIO_MODE_NATIVE
Use the native 15.4 radio

enumerator RADIO_MODE_UART_RCP
UART connection to a 15.4 capable radio co-processor (RCP)

enumerator RADIO_MODE_SPI_RCP
SPI connection to a 15.4 capable radio co-processor (RCP)

enum esp_openthread_host_connection_mode_t
How OpenThread connects to the host.

Values:

enumerator HOST_CONNECTION_MODE_NONE
Disable host connection

enumerator HOST_CONNECTION_MODE_CLI_UART
CLI UART connection to the host

enumerator HOST_CONNECTION_MODE_RCP_UART
RCP UART connection to the host

Header File
• components/openthread/include/esp_openthread_lock.h
Chapter 2. API Reference

Functions

`esp_err_t esp_openthread_lock_init(void)`

This function initializes the OpenThread API lock.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void `esp_openthread_lock_deinit(void)`

This function deinitializes the OpenThread API lock.

bool `esp_openthread_lock_acquire(TickType_t block_ticks)`

This function acquires the OpenThread API lock.

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Parameters `block_ticks` **[in]** The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void `esp_openthread_lock_release(void)`

This function releases the OpenThread API lock.

Header File

- components/openthread/include/esp_openthread_netif_glue.h

Functions

void `esp_openthread_netif_glue_init(const esp_openthread_platform_config_t *config)`

This function initializes the OpenThread network interface glue.

Parameters `config` **[in]** The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

void `esp_openthread_netif_glue_deinit(void)`

This function deinitializes the OpenThread network interface glue.

`esp_netif_t *esp_openthread_get_netif(void)`

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

Macros

ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD()

Default configuration reference of OT esp-netif.

ESP_NETIF_DEFAULT_OPENTHREAD()

Header File

- components/openthread/include/esp_openthread_border_router.h
Functions

void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.

Note: This function must be called before esp_openthread_init

Parameters backbone_netif [in] The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.

Note: Calling this function will make the device behave as an OpenThread border router. Kconfig option
CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Returns
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if feature not supported
• ESP_ERR_INVALID_STATE if already initialized
• ESP_FAIL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

Returns
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not initialized
• ESP_FAIL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
Gets the backbone interface of OpenThread border router.

Returns
The backbone interface or NULL if border router not initialized.

void esp_openthread_register_rcp_failure_handler (esp_openthread_rcp_failure_handler handler)
Registers the callback for RCP failure.

void esp_openthread_rcp_deinit (void)
Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in
the openthread directory of ESP-IDF examples.

2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:
• It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to
choose between IP stacks in the future.
• The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP
implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP
addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.
In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

### ESP-NETIF architecture

- --<--->-- Data packets going from communication media to TCP/IP stack and back
- ******** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code
1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver  Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF  ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   - Used for network interface lifecycle management
   - ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   - Set interface up or down
Chapter 2. API Reference

- DHCP server and client API
- DNS API

6) Driver conversion utilities

D) Network stack  Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETF API.

E) ESP-NETF L2 TAP Interface  The ESP-NETF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETF L2 TAP interface device (pathname) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by if_key (e.g. ETH_DEF) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETF L2 TAP Interface Usage Manual

Initialization  To be able to use the ESP-NETF L2 TAP interface, it needs to be enabled in Kconfig by CONFIG_ESP_NETIF_L2_TAP first and then registered by esp_vfs_l2tap_intf_register() prior usage of any VFS function.

open()  Once the ESP-NETF L2 TAP is registered, it can be opened at pathname “/dev/net/tap”. The same pathname can be opened multiple times up to CONFIG_ESP_NETIF_L2_TAP_MAX_FDS and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETF L2 TAP can be opened with O_NONBLOCK file status flag to the read() does not block. Note that the write() may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using fcntl().

On success, open() returns the new file descriptor (a nonnegative integer). On error, -1 is returned and errno is set to indicate the error.

ioctl()  The newly opened ESP-NETF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- L2TAP_S_INTF_DEVICE - bounds the file descriptor to specific Network Interface which is identified by its if_key. ESP-NETF Network Interface if_key is passed to ioctl() as the third parameter. Note that default Network Interfaces if_key’s used in ESP-IDF can be found in esp_netif/include/esp_netif_defaults.h.
- L2TAP_S_DEVICE_DRV_HNDL - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. esp_eth_handle_t in case of Ethernet). The IO Driver handle is passed to ioctl() as the third parameter.
Chapter 2. API Reference

- **L2TAP_S_RCV_FILTER** - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user’s application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

`fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- **F_GETFD** - the function returns the file descriptor flags, the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

`read()` Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).
On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

### write()

A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

<table>
<thead>
<tr>
<th>Destination MAC</th>
<th>Source MAC</th>
<th>Type/Length</th>
<th>Payload (protocol header/data) ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>6B</td>
<td>6B</td>
<td>2B</td>
<td>0-1486B</td>
</tr>
</tbody>
</table>

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

### close()

Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first task’s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

### select()

Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

### ESP-NETIF programmer’s manual

Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- L2 TAP: `protocols/l2tap/main/l2tap_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).
WiFi default initialization  The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`  
- `esp_netif_create_default_wifi_ap()`  

Please note that these functions return the `esp_netif` handle, i.e., a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- `components/esp_netif/include/esp_netif.h`

### Functions

#### `esp_err_t esp_netif_init (void)`
Initializes the network stack (TCP/IP).

**Note:** This function should be called exactly once from application code, when the application starts up.

**Returns**

- `ESP_OK` on success
- `ESP_FAIL` if initialization failed

#### `esp_err_t esp_netif_deinit (void)`
Deinitializes the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Returns**

- `ESP_ERR_INVALID_STATE` if esp_netif not initialized
- `ESP_ERR_NOT_SUPPORTED` otherwise

#### `esp_netif_t *esp_netif_new(const esp_netif_config_t *esp_netif_config)`
Creates an instance of new esp-netif object based on provided config.

**Parameters** `esp_netif_config` — pointer to esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

#### `void esp_netif_destroy(esp_netif_t *esp_netif)`
Destroys the esp_netif object.

**Parameters** `esp_netif` — pointer to the object to be deleted
**Chapter 2. API Reference**

---

`esp_err_t esp_netif_set_driver_config(esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`

Configures driver related options of esp_netif object.

**Parameters**
- `esp_netif` [inout] pointer to the object to be configured
- `driver_config` [in] pointer esp-netif io driver related configuration

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

`esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**
- `esp_netif` [inout] handle to esp_netif instance
- `driver_handle` [in] pointer to the driver handle

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

`esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void*buffer, size_t len, void *eb)`

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `buffer` [in] Received data
- `len` [in] Length of the data frame
- `eb` [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**
- ESP_OK

void `esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note:** This API can be directly used as event handler

---

void `esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver stop event.

**Note:** This API can be directly used as event handler

---
Chapter 2. API Reference

- esp_netif - [in] Handle to esp-netif instance
- base
- event_id
- data

```c
void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver connected event.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif - [in] Handle to esp-netif instance
- base
- event_id
- data

```c
void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver disconnected event.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif - [in] Handle to esp-netif instance
- base
- event_id
- data

```c
void esp_netif_action_got_ip(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon network got IP event.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif - [in] Handle to esp-netif instance
- base
- event_id
- data

```c
void esp_netif_action_join_ip6_multicast_group(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 multicast group join.

**Note:** This API can be directly used as event handler

**Parameters**
- esp_netif - [in] Handle to esp-netif instance
- base
- event_id
- data
void **esp_netif_action_leave_ip6_multicast_group**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** [in] Handle to esp-netif instance
- **base**
- **event_id**
- **data**

void **esp_netif_action_add_ip6_address**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** [in] Handle to esp-netif instance
- **base**
- **event_id**
- **data**

void **esp_netif_action_remove_ip6_address**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** [in] Handle to esp-netif instance
- **base**
- **event_id**
- **data**

**esp_err_t** **esp_netif_set_default_netif**(esp_netif_t *esp_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

**Parameters**

- **esp_netif** [in] Handle to esp-netif instance

**Returns** ESP_OK on success

**esp_err_t** **esp_netif_set_mac**(esp_netif_t *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

**Parameters**

- **esp_netif** [in] Handle to esp-netif instance
- **mac** [in] Desired mac address for the related network interface

**Returns**

- ESP_OK - success
Chapter 2. API Reference

- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_get_mac(esp_netif_t *esp_netif, uint8_t mac[])
```
Get the mac address for the interface instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `mac` - [out] Resultant mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_set_hostname(esp_netif_t *esp_netif, const char* hostname)
```
Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
esp_err_t esp_netif_get_hostname(esp_netif_t *esp_netif, const char** hostname)
```
Get interface hostname.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `hostname` - [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
bool esp_netif_is_netif_up(esp_netif_t *esp_netif)
```
Test if supplied interface is up or down.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- true - Interface is up
- false - Interface is down

```c
esp_err_t esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
```
Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `ip_info` - [out] If successful, IP information will be returned in this argument.

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
**esp_err_t esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)**

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `ip_info` [out] If successful, IP information will be returned in this argument.

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note:** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `ip_info` [in] IP information to set on the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `ip_info` [in] Store the old IP information for the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)
Get net interface index from network stack implementation.

Note: This index could be used in setsockopt() to bind socket with multicast interface

Parameters esp_netif – [in] Handle to esp-netif instance
Returns implementation specific index of interface represented with supplied esp_netif

esp_err_t esp_netif_get_netif_impl_name (esp_netif_t *esp_netif, char *name)
Get net interface name from network stack implementation.

Note: This name could be used in setsockopt() to bind socket with appropriate interface

Parameters
• esp_netif – [in] Handle to esp-netif instance
• name – [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP server option.

Parameters
• esp_netif – [in] Handle to esp-netif instance
• opt_op – [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
• opt_id – [in] Option index to get or set, must be one of the supported enum values.
• opt_val – [inout] Pointer to the option parameter.
• opt_len – [in] Length of the option parameter.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t esp_netif_dhcpclient_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP client option.

Parameters
• esp_netif – [in] Handle to esp-netif instance
• opt_op – [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
• opt_id – [in] Option index to get or set, must be one of the supported enum values.
• opt_val – [inout] Pointer to the option parameter.
• opt_len – [in] Length of the option parameter.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
**esp_err_t esp_netif_dhcpc_start (esp_netif_t *esp_netif)**

Start DHCP client (only if enabled in interface object)

**Note:** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCP_CLIENT_FAILED

**esp_err_t esp_netif_dhcpc_stop (esp_netif_t *esp_netif)**

Stop DHCP client (only if enabled in interface object)

**Note:** Calling action_netif_stop() will also stop the DHCP Client if it is running.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_CLIENT_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP client status.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance
- status – [out] If successful, the status of DHCP client will be returned in this argument.

**Returns**
- ESP_OK

**esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP Server status.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance
- status – [out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**
- ESP_OK

**esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)**

Start DHCP server (only if enabled in interface object)

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)**

Stop DHCP server (only if enabled in interface object)

**Parameters**
- esp_netif – [in] Handle to esp-netif instance
Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

`esp_err_t esp_netif_dhcps_get_clients_by_mac(esp_netif_t *esp_netif, int num, esp_netif_pair_mac_ip_t *mac_ip_pair)`

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

Parameters

- `esp_netif` [in] Handle to esp-netif instance
- `num` [in] Number of clients with specified MAC addresses in the array of pairs
- `mac_ip_pair` [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

`esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)`

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

Parameters

- `esp_netif` [in] Handle to esp-netif instance
- `type` [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` [in] DNS Server address to set

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

`esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)`

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Parameters

- `esp_netif` [in] Handle to esp-netif instance
- `type` [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` [out] DNS Server result is written here on success

Returns
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```
Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] IPv6 information will be returned in this argument if successful.

**Returns**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] IPv6 information will be returned in this argument if successful.

**Returns**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])```
Get all IPv6 addresses of the specified interface.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `if_ip6` [out] Array of IPv6 addresses will be copied to the argument

**Returns**
number of returned IPv6 addresses

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```
Sets IPv4 address to the specified octets.

**Parameters**
- `addr` [out] IP address to be set
- `a` – the first octet (127 for IP 127.0.0.1)
- `b`
- `c`
- `d`

```c
char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
```
Converts numeric IP address into decimal dotted ASCII representation.
Chapter 2. API Reference

Parameters
- **addr** - ip address in network order to convert
- **buf** - target buffer where the string is stored
- **buflen** - length of buf

Returns either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small.

```c
uint32_t esp_ip4addr_aton (const char *addr)
```

Ascii internet address interpretation routine. The value returned is in network order.

Parameters **addr** - IP address in ascii representation (e.g. "127.0.0.1")

Returns **addr** in network order

```c
esp_err_t esp_netif_str_to_ip4 (const char* src, esp_ip4_addr_t *dst)
```

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Parameters
- **src** - [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- **dst** - [out] Address of the target esp_ip4_addr_t structure to receive converted address

Returns
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

```c
esp_err_t esp_netif_str_to_ip6 (const char* src, esp_ip6_addr_t *dst)
```

Converts Ascii internet IPv6 address into esp_ip6_addr_t. Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

Parameters
- **src** - [in] IPv6 address in ascii representation (e.g. "2001:db8:85a3:0:0:0:0:0:0:0:0:0:0:0:0:0:0:2:1")
- **dst** - [out] Address of the target esp_ip6_addr_t structure to receive converted address

Returns
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

```c
esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
```

Gets media driver handle for this esp-netif instance.

Parameters **esp_netif** - [in] Handle to esp-netif instance

Returns opaque pointer of related IO driver

```c
esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)
```

Searches over a list of created objects to find an instance with supplied if key.

Parameters **if_key** - Textual description of network interface

Returns Handle to esp-netif instance

```c
esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)
```

Returns configured flags for this interface.

Parameters **esp_netif** - [in] Handle to esp-netif instance

Returns Configuration flags

```c
const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)
```

Returns configured interface key for this esp-netif instance.

Parameters **esp_netif** - [in] Handle to esp-netif instance

Returns Textual description of related interface

```c
const char *esp_netif_get_desc (esp_netif_t *esp_netif)
```

Returns configured interface type for this esp-netif instance.
**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

```c
int esp_netif_get_route_prio(esp_netif_t *esp_netif)
```

Returns configured routing priority number.

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns** Integer representing the instance’s route-prio, or -1 if invalid paramters

```c
int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
```

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `event_type` (either get or lost IP)

**Returns** Specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied `event_type` is not known

```c
esp_netif_t *esp_netif_next(esp_netif_t *esp_netif)
```

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

```c
size_t esp_netif_get_nr_of_ifs(void)
```

Returns number of registered esp_netif objects.

**Returns** Number of esp_netifs

```c
void esp_netif_netstack_buf_ref(void*netstack_buf)
```

Increase the reference counter of net stack buffer

**Parameters** `netstack_buf` [in] the net stack buffer

```c
void esp_netif_netstack_buf_free(void*netstack_buf)
```

Free the netstack buffer

**Parameters** `netstack_buf` [in] the net stack buffer

---

**Header File**

- `components/esp_netif/include/esp_netif_types.h`

**Structures**

`struct esp_netif_dns_info_t`

DNS server info.

**Public Members**

```c
esp_ip_addr_t ip
```

IPV4 address of DNS server

`struct esp_netif_ip_info_t`

Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events
Public Members

\textit{esp_ip4_addr_t} \texttt{ip}
Interface IPV4 address

\textit{esp_ip4_addr_t} \texttt{netmask}
Interface IPV4 netmask

\textit{esp_ip4_addr_t} \texttt{gw}
Interface IPV4 gateway address

\texttt{struct esp_netif_ip6_info_t}
IPV6 IP address information.

Public Members

\textit{esp_ip6_addr_t} \texttt{ip}
Interface IPV6 address

\texttt{struct ip_event_got_ip_t}
Event structure for IP\_EVENT\_GOT\_IP event.

Public Members

\texttt{esp_netif_t *} \texttt{esp_netif}
Pointer to corresponding esp-netif object

\texttt{esp_netif_ip_info_t} \texttt{ip_info}
IP address, netmask, gateway IP address

\texttt{bool} \texttt{ip_changed}
Whether the assigned IP has changed or not

\texttt{struct ip_event_got_ip6_t}
Event structure for IP\_EVENT\_GOT\_IP6 event

Public Members

\texttt{esp_netif_t *} \texttt{esp_netif}
Pointer to corresponding esp-netif object

\texttt{esp_netif_ip6_info_t} \texttt{ip6_info}
IPv6 address of the interface

\texttt{int} \texttt{ip_index}
IPv6 address index
struct **ip_event_add_ip6_t**
Event structure for ADD_IP6 event

**Public Members**

`esp_ip6_addr_t addr`
The address to be added to the interface

`bool preferred`
The default preference of the address

struct **ip_event_ap_staipassigned_t**
Event structure for IP_EVENT_AP_STAIPASSIGNED event

**Public Members**

`esp_netif_t *esp_netif`
Pointer to the associated netif handle

`esp_ip4_addr_t ip`
IP address which was assigned to the station

`uint8_t mac[6]`
MAC address of the connected client

struct **bridgeif_config**
LwIP bridge configuration

**Public Members**

`uint16_t max_fdb_dyn_entries`
maximum number of entries in dynamic forwarding database

`uint16_t max_fdb_sta_entries`
maximum number of entries in static forwarding database

`uint8_t max_ports`
maximum number of ports the bridge can consist of

struct **esp_netif_inherent_config**
ESP-netif inherent config parameters.

**Public Members**

`esp_netif_flags_t flags`
flags that define esp-netif behavior
uint8_t mac[6]
    initial mac address for this interface

const esp_netif_ip_info_t *ip_info
    initial ip address for this interface

uint32_t get_ip_event
    event id to be raised when interface gets an IP

uint32_t lost_ip_event
    event id to be raised when interface lost its IP

const char *if_key
    string identifier of the interface

const char *if_desc
    textual description of the interface

int route_prio
    numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t *bridge_info
    LwIP bridge configuration

struct esp_netif_driver_base_s
    ESP-netif driver base handle.

Public Members

esp_err_t (*post_attach)(esp_netif_t *netif, esp_netif_iodriver_handle h)
    post attach function pointer

esp_netif_t *netif
    netif handle

struct esp_netif_driver_ifconfig
    Specific IO driver configuration.

Public Members

esp_netif_iodriver_handle handle
    io-driver handle

esp_err_t (*transmit)(void *h, void *buffer, size_t len)
    transmit function pointer
Chapter 2. API Reference

```c
esp_err_t (transmit_wrap)(void *h, void *buffer, size_t len, void *netstack_buffer)
transmit wrap function pointer

void (*driver_free_rx_buffer)(void *h, void *buffer)
free rx buffer function pointer

struct esp_netif_config
Generic esp_netif configuration.

Public Members

const esp_netif_inherent_config_t *base
base config

const esp_netif_driver_ifconfig_t *driver
driver config

const esp_netif_netstack_config_t *stack
stack config

struct esp_netif_pair_mac_ip_t
DHCP client’s addr info (pair of MAC and IP address)

Public Members

uint8_t mac[6]
Clients MAC address

esp_ip4_addr_t ip
Clients IP address

Macros

ESP_ERR_ESP_NETIF_BASE
Definition of ESP-NETIF based errors.

ESP_ERR_ESP_NETIF_INVALID_PARAMS

ESP_ERR_ESP_NETIF_IF_NOT_READY

ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

ESP_ERR_ESP_NETIF_DHCPS_START_FAILED

ESP_NETIF_BR_FLOOD

Definition of ESP-NETIF bridge control.

ESP_NETIF_BR_DROP

ESP_NETIF_BR_FDW_CPU

Type Definitions
typedef struct esp_netif_obj esp_netif_t

typedef enum esp_netif_flags esp_netif_flags_t

typedef enum esp_netif_ip_event_type esp_netif_ip_event_type_t

typedef struct bridgeif_config bridgeif_config_t

LwIP bridge configuration

typedef struct esp_netif_inherent_config esp_netif_inherent_config_t

ESP-netif inherent config parameters.

typedef struct esp_netif_config esp_netif_config_t

typedef void *esp_netif_iodriver_handle

IO driver handle type.

typedef struct esp_netif_driver_base_s esp_netif_driver_base_t

ESP-netif driver base handle.

typedef struct esp_netif_driver_ifconfig esp_netif_driver_ifconfig_t

typedef struct esp_netif_netstack_config esp_netif_netstack_config_t

Specific L3 network stack configuration.
typedef esp_err_t (*esp_netif_receive_t)(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
ESP-NETIF Receive function type.

Enumerations

defined

enum esp_netif_dns_type_t
Type of DNS server.
Values:

enumerator ESP_NETIF_DNS_MAIN
DNS main server address

enumerator ESP_NETIF_DNS_BACKUP
DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_FALLBACK
DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_MAX

enum esp_netif_dhcp_status_t
Status of DHCP client or DHCP server.
Values:

enumerator ESP_NETIF_DHCP_INIT
DHCP client/server is in initial state (not yet started)

enumerator ESP_NETIF_DHCP_STARTED
DHCP client/server has been started

enumerator ESP_NETIF_DHCP_STOPPED
DHCP client/server has been stopped

enumerator ESP_NETIF_DHCP_STATUS_MAX

enum esp_netif_dhcp_option_mode_t
Mode for DHCP client or DHCP server option functions.
Values:

enumerator ESP_NETIF_OP_START

enumerator ESP_NETIF_OP_SET
Set option

enumerator ESP_NETIF_OP_GET
Get option

enumerator ESP_NETIF_OP_MAX
enum esp_netif_dhcp_option_id_t
    Supported options for DHCP client or DHCP server.
    Values:

enumerator ESP_NETIF_SUBNET_MASK
    Network mask

enumerator ESP_NETIF_DOMAIN_NAME_SERVER
    Domain name server

enumerator ESP_NETIF_ROUTER_SOLICITATION_ADDRESS
    Solicitation router address

enumerator ESP_NETIF_REQUESTED_IP_ADDRESS
    Request specific IP address

enumerator ESP_NETIF_IP_ADDRESSLEASE_TIME
    Request IP address lease time

enumerator ESP_NETIF_IP_REQUEST_RETRY_TIME
    Request IP address retry counter

enumerator ESP_NETIF_VENDOR_CLASS_IDENTIFIER
    Vendor Class Identifier of a DHCP client

enumerator ESP_NETIF_VENDOR_SPECIFIC_INFO
    Vendor Specific Information of a DHCP server

enum ip_event_t
    IP event declarations
    Values:

enumerator IP_EVENT_STA_GOT_IP
    station got IP from connected AP

enumerator IP_EVENT_STA_LOST_IP
    station lost IP and the IP is reset to 0

enumerator IP_EVENT_AP_STAIPASSIGNED
    soft-AP assign an IP to a connected station

enumerator IP_EVENT_GOT_IP6
    station or ap or ethernet interface v6IP addr is preferred

enumerator IP_EVENT_ETH_GOT_IP
    ethernet got IP from connected AP
enumerator **IP_EVENT_ETH_LOST_IP**
   ethernet lost IP and the IP is reset to 0

enumerator **IP_EVENT_PPP_GOT_IP**
   PPP interface got IP

enumerator **IP_EVENT_PPP_LOST_IP**
   PPP interface lost IP

enum **esp_netif_flags**
   Values:

enumerator **ESP_NETIF_DHCP_CLIENT**

enumerator **ESP_NETIF_DHCP_SERVER**

enumerator **ESP_NETIF_FLAG_AUTOUP**

enumerator **ESP_NETIF_FLAG_GARP**

enumerator **ESP_NETIF_FLAG_EVENT_IP_MODIFIED**

enumerator **ESP_NETIF_FLAG_IS_PPP**

enumerator **ESP_NETIF_FLAG_IS_SLIP**

enumerator **ESP_NETIF_FLAG_IS_BRIDGE**

enum **esp_netif_ip_event_type**
   Values:

enumerator **ESP_NETIF_IP_EVENT_GOT_IP**

enumerator **ESP_NETIF_IP_EVENT_LOST_IP**

**Header File**
* • components/esp_netif/include/esp_netif_ip_addr.h

**Functions**

```c
esp_ip6_addr_type_t esp_netif_ip6_get_addr_type(esp_ip6_addr_t *ip6_addr)
Get the IPv6 address type.
```

**Parameters**
- `ip6_addr` - [in] IPv6 type

**Returns**
IPv6 type in form of enum esp_ip6_addr_type_t

```c
static inline void esp_netif_ip_addr_copy(esp_ip_addr_t *dest, const esp_ip_addr_t *src)
Copy IP addresses.
```

**Parameters**
- `dest` - [out] destination IP
- `src` - [in] source IP
Structures

struct esp_ip6_addr
IPv6 address.

Public Members

uint32_t addr[4]
IPv6 address

    enumerator ESP_IP6_ADDR_IS_IPV4_MAPPED_IPV6
```

Header File

- components/esp_netif/include/esp_vfs_l2tap.h

Functions

```c
esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)
```

Add L2 TAP virtual filesystem driver.

This function must be called prior to usage of ESP-NETIF L2 TAP Interface

Parameters

- config – L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this parameter is NULL.

Returns

- esp_err_t
  - ESP_OK on success

```c
esp_err_t esp_vfs_l2tap_intf_unregister (const char* base_path)
```

Removes L2 TAP virtual filesystem driver.

Parameters

- base_path – Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

Returns

- esp_err_t
  - ESP_OK on success

```c
esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void *buff, size_t *size)
```

Filters received Ethernet L2 frames into L2 TAP infrastructure.

Parameters

- driver_handle – handle of driver at which the frame was received
  - buff – received L2 frame
  - size – input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

Returns

- esp_err_t
  - ESP_OK is always returned

Structures

```c
struct l2tap_vfs_config_t
```

L2Tap VFS config parameters.
Chapter 2. API Reference

Public Members

const char *base_path
    vfs base path

Macros

L2TAP_VFS_DEFAULT_PATH
L2TAP_VFS_CONFIG_DEFAULT()

Type Definitions

typedef void *l2tap_iodriver_handle

Enumerations

enum l2tap_ioctl_opt_t
    Values:
    enumerator L2TAP_S_RCV_FILTER
    enumerator L2TAP_G_RCV_FILTER
    enumerator L2TAP_S_INTF_DEVICE
    enumerator L2TAP_G_INTF_DEVICE
    enumerator L2TAP_SDEVICE_DRV_HNDL
    enumerator L2TAP_GDEVICE_DRV_HNDL

WiFi default API reference

Header File

• components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
    Attaches wifi station interface to supplied netif.
    Parameters esp_netif - instance to attach the wifi station to
    Returns
        • ESP_OK on success
        • ESP_FAIL if attach failed

esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
    Attaches wifi soft AP interface to supplied netif.
    Parameters esp_netif - instance to attach the wifi AP to
    Returns
• ESP_OK on success
• ESP_FAIL if attach failed

`esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`
Sets default wifi event handlers for STA interface.

Returns
• ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`
Sets default wifi event handlers for AP interface.

Returns
• ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_clear_default_wifi_driver_andHandlers(void*esp_netif)`
Clears default wifi event handlers for supplied network interface.

Parameters `esp_netif` – instance of corresponding if object

Returns
• ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_netif_t* esp_netif_create_default_wifi_ap(void)`
Creates default WIFI AP. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

`esp_netif_t* esp_netif_create_default_wifi_sta(void)`
Creates default WIFI STA. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

void `esp_netif_destroy_default_wifi(void*esp_netif)`
Destroys default WIFI netif created with esp_netif_create_default_wifi_…() API.

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

Parameters `esp_netif` – [in] object to detach from WiFi and destroy

`esp_netif_t* esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)`
Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Parameters
• `wifi_if` – [in] type of wifi interface
• `esp_netif_config` — inherent esp-netif configuration pointer

Returns pointer to esp-netif instance

`esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)`

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Parameters:
- `p_netif_sta` — [out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` — [out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success

2.5.5 IP Network Layer

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_iodriver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*! base structure reserved as */
    esp_netif * /*

    (continues on next page)"
with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_--EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop,  MY_DRV_--EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

**Header File**

- `components/esp_netif/include/esp_netif_net_stack.h`

**Functions**

`esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)`

Returns esp-netif handle.

**Parameters**

- `dev` - [in] opaque ptr to network interface of specific TCP/IP stack

**Returns**

- handle to related esp-netif instance

`void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode
### Chapter 2. API Reference

#### 2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

#### 2.6 Peripherals API

##### 2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.
**Introduction**

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.

**Functional Overview**

The following sections of this document cover the typical steps to install and operate an ADC:

- **Resource Allocation** - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- **Unit Configuration** - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- **Read Conversion Result** - covers how to get ADC conversion raw result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - describes tips on how to read ADC conversion raw result when cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**  
The ADC oneshot mode driver is implemented based on ESP32 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under super low power mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

**Create an ADC Unit Handle under Normal Oneshot Mode**

```c
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
   .unit_id = ADC_UNIT_1,
   .ulp_mode = false,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```
Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IO to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_oneshot_chan_cfg_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number. Check datasheet to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. Especially, this `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. Driver will save these per channel configurations internally.

**Configure Two ADC Channels**

```c
dc_oneshot_chan_cfg_t config = {
    .channel = EXAMPLE_ADC1_CHAN0,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));

cfg.channel = EXAMPLE_ADC1_CHAN1;
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safer. ADC(s) are shared by some other drivers / peripherals, see **Hardware Limitations**. This function takes some mutexes, to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

- \(V_{out}\) Digital output result, standing for the voltage.
- \(D_{out}\) ADC raw digital reading result.
- \(V_{max}\) Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
- \(D_{max}\) Maximum of the output ADC raw digital reading result, which is \(2^{bitwidth}\), where bitwidth is the `cpp:member::adc_oneshot_chan_cfg_t::bitwidth` configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter (ADC) Calibration Driver](https://docs.espressif.com/).
Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + i, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d",ADC_UNIT_1 + i, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. `adc_oneshot_read()` has provided the protection.
- ESP32 DevKitC: GPIO0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Power Management

When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won’t be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe

By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs execute when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in thread-safe APIs fail.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see IRAM Safe for more details.

Application Examples

- ADC oneshot mode example: `peripherals/adc/oneshot_read`.

API Reference

Header File

- `components/hal/include/hal/adc_types.h`
Chapter 2. API Reference

Structures

struct `adc_digi_pattern_config_t`
ADC digital controller pattern configuration.

Public Members

`uint8_t atten`
Attenuation of this ADC channel.

`uint8_t channel`
ADC channel.

`uint8_t unit`
ADC unit.

`uint8_t bit_width`
ADC output bit width.

struct `adc_digi_output_data_t`
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Note: ESP32: Only `type1` is valid. ADC2 does not support DMA mode.

Note: ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

Public Members

`uint16_t data`
ADC real output data info. Resolution: 12 bit.

ADC real output data info. Resolution: 11 bit.

`uint16_t channel`
ADC channel index info.

ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

struct `adc_digi_output_data_t::[anonymous]::[anonymous] type1`
ADC type1

`uint16_t unit`
ADC unit index info. 0: ADC1; 1: ADC2.

struct `adc_digi_output_data_t::[anonymous]::[anonymous] type2`
When the configured output format is 11bit.
uint16_t \textit{val}

Raw data value

**Enumerations**

\textbf{enum \textit{adc\_unit\_t}}

ADC unit.

\textit{Values:}

- enumerator \textit{ADC\_UNIT\_1}
  - SAR ADC 1.

- enumerator \textit{ADC\_UNIT\_2}
  - SAR ADC 2.

\textbf{enum \textit{adc\_channel\_t}}

ADC channels.

\textit{Values:}

- enumerator \textit{ADC\_CHANNEL\_0}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_1}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_2}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_3}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_4}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_5}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_6}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_7}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_8}
  - ADC channel.

- enumerator \textit{ADC\_CHANNEL\_9}
  - ADC channel.
**enum adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

*Values:*

- **enumerator** ADC_ATTEN_DB_0
  
  No input attenuation, ADC can measure up to approx.

- **enumerator** ADC_ATTEN_DB_2_5
  
  The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

- **enumerator** ADC_ATTEN_DB_6
  
  The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

- **enumerator** ADC_ATTEN_DB_11
  
  The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

**enum adc_bitwidth_t**

*Values:*

- **enumerator** ADC_BITWIDTH_DEFAULT
  
  Default ADC output bits, max supported width will be selected.

- **enumerator** ADC_BITWIDTH_9
  
  ADC output width is 9Bit.

- **enumerator** ADC_BITWIDTH_10
  
  ADC output width is 10Bit.

- **enumerator** ADC_BITWIDTH_11
  
  ADC output width is 11Bit.

- **enumerator** ADC_BITWIDTH_12
  
  ADC output width is 12Bit.

- **enumerator** ADC_BITWIDTH_13
  
  ADC output width is 13Bit.

**enum adc_ulp_mode_t**

*Values:*

- **enumerator** ADC_ULP_MODE_FSM
  
  ADC is controlled by ULP FSM.

- **enumerator** ADC_ULP_MODE_RISCV
  
  ADC is controlled by ULP RISCV.
enum `adc_digi_convert_mode_t`
ADC digital controller (DMA mode) work mode.

Values:

enumerator `ADC_CONV_SINGLE_UNIT_1`
Only use ADC1 for conversion.

enumerator `ADC_CONV_SINGLE_UNIT_2`
Only use ADC2 for conversion.

enumerator `ADC_CONV_BOTH_UNIT`
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator `ADC_CONV_ALTER_UNIT`
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum `adc_digi_output_format_t`
ADC digital controller (DMA mode) output data format option.

Values:

enumerator `ADC_DIGI_OUTPUT_FORMAT_TYPE1`
See `adc_digi_output_data_t.type1`

enumerator `ADC_DIGI_OUTPUT_FORMAT_TYPE2`
See `adc_digi_output_data_t.type2`

Header File
- components/esp_adc/include/esp_adc/adc_oneshot.h

Functions

`esp_err_t adc_oneshot_new_unit` (const `adc_oneshot_unit_init_cfg_t` *init_config, `adc_oneshot_unit_handle_t` *ret_unit)
Create a handle to a specific ADC unit.

Note: This API is thread-safe. For more details, see ADC programming guide

Parameters
- `init_config` [in] Driver initial configurations
- `ret_unit` [out] ADC unit handle

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use

`esp_err_t adc_oneshot_config_channel` (const `adc_oneshot_unit_handle_t` handle, `adc_channel_t` channel, `adc_oneshot_chan_cfg_t` *config)
Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

### Parameters
- `handle` - [in] ADC handle
- `channel` - [in] ADC channel to be configured
- `config` - [in] ADC configurations

### Returns
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments

```c
esp_err_t adc_oneshot_read(adc_oneshot_unit_handle_t handle, adc_channel_t chan, int *out_raw)
```

Get one ADC conversion raw result.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Note:** This API should NOT be called in an ISR context

### Parameters
- `handle` - [in] ADC handle
- `chan` - [in] ADC channel
- `out_raw` - [out] ADC conversion raw result

### Returns
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_TIMEOUT`: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit(adc_oneshot_unit_handle_t handle)
```

Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide

### Parameters
- `handle` - [in] ADC handle

### Returns
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_NOT_FOUND`: The ADC peripheral to be disclaimed isn’t in use

```c
esp_err_t adc_oneshot_io_to_channel(int io_num, adc_unit_t *unit_id, adc_channel_t *channel)
```

Get ADC channel from the given GPIO number.

### Parameters
- `io_num` - [in] GPIO number
- `unit_id` - [out] ADC unit
- `channel` - [out] ADC channel

### Returns
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: The IO is not a valid ADC pad
Get GPIO number from the given ADC channel.

Parameters
  • `unit_id` - [in] ADC unit
  • `channel` - [in] ADC channel
  • `io_num` - [out] GPIO number
  • ESP_OK: On success
  • ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct `adc_oneshot_unit_init_cfg_t`
  ADC oneshot driver initial configurations.

Public Members

`adc_unit_t unit_id`
  ADC unit.

`adc_ulp_mode_t ulp_mode`
  ADC controlled by ULP, see `adc_ulp_mode_t` struct

struct `adc_oneshot_chan_cfg_t`
  ADC channel configurations.

Public Members

`adc_atten_t atten`
  ADC attenuation.

`adc_bitwidth_t bitwidth`
  ADC conversion result bits.

Type Definitions

typedef struct `adc_oneshot_unit_ctx_t` *`adc_oneshot_unit_handle_t`
  Type of ADC unit handle for oneshot mode.

2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

The ADC on ESP32 can be used in scenario(s) like:
  • Generate one-shot ADC conversion result
  • Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.
Driver Concepts  ADC continuous mode conversion is made up with multiple Conversion Frames. - Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in \texttt{adc_continuous_new_handle()}, in bytes. - Conversion Result: One Conversion Result contains multiple bytes (see \texttt{SOC_ADC_DIGI_RESULT_BYTES}). Its structure is \texttt{adc_digi_output_data_t}, including ADC unit, ADC channel and raw data.

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- **Resource Allocation** - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations** - describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control** - describes ADC control functions.
- **Register Event Callbacks** - describes how to hook user specific code to an ADC continuous mode event callback function.
- **Read Conversion Result** - covers how to get ADC conversion result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - covers the IRAM safe functions.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation  The ADC continuous mode driver is implemented based on ESP32 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure \texttt{adc_continuous_handle_cfg_t}:

- \texttt{adc_continuous_handle_cfg_t::max_store_buf_size} set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- \texttt{adc_continuous_handle_cfg_t::conv_frame_size} set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call \texttt{adc_continuous_new_handle()} with the prepared \texttt{adc_continuous_handle_cfg_t}. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns \texttt{ESP_ERR_NOT_FOUND}, this means the I2S0 peripheral is in use. See Hardware Limitations for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling \texttt{adc_continuous_deinit()}. 

Initialize the ADC Continuous Mode Driver

```c
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
```

(continues on next page)
Recycle the ADC Unit

ESP_ERROR_CHECK(adc_continuous_deinit());

**ADC Configurations** After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number. Check datasheet to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t call this API at this moment.

See ADC continuous mode example `peripherals/adc/continuous_read` to see configuration codes.

**ADC Control**

**Start and Stop** Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

ESP_ERROR_CHECK(adc_continuous_stop());

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t`:

- `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes.
- `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`. 
You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren’t in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t add callback at this moment.

**Conversion Done Event** The driver will fill in the event data of an `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

---

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

---

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

---

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won’t fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn’t reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}}
\]

where:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V_{out}</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>D_{out}</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>V_{max}</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.</td>
</tr>
<tr>
<td>D_{max}</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^n)bitwidth, where bitwidth is the :cpp:member:<code>adc_digi_pattern_config_t::bit_width</code> configured before.</td>
</tr>
</tbody>
</table>
To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

**Hardware Limitations**

- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC continuous mode driver uses I2S0 peripheral as hardware DMA fifo. Therefore, if I2S0 is in use already, `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe** All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety** ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

**Application Examples**

- ADC continuous mode example: `peripherals/adc/continuous_read`.

**API Reference**

**Header File**

- `components/esp_adc/include/esp_adc/adc_continuous.h`

**Functions**

```c
esp_err_t adc_continuous_new_handle(const adc_continuous_handle_cfg_t *hdl_config, adc_continuous_handle_t *ret_handle)
```

Initialize ADC continuous driver and get a handle to it.

**Parameters**

- `hdl_config` ⚰ [in] Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- `ret_handle` ⚰ [out] ADC continuous mode driver handle

**Returns**

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags.
Chapter 2. API Reference

- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

```c
esp_err_t adc_continuous_config(adc_continuous_handle_t handle, const adc_continuous_config_t *config)
```

Set ADC continuous mode required configurations.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle
- **config** - [in] Refer to adc_digi_config_t.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_register_event_callbacks(adc_continuous_handle_t handle, const adc_continuous_evt_cbs_t *cbs, void *user_data)
```

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member int the cbs structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including user_data) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn’t started. Check return value to know this.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be delivered to the callback functions directly

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

```c
esp_err_t adc_continuous_start(adc_continuous_handle_t handle)
```

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_read(adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)
```

Read bytes from ADC under continuous mode.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle
**buf** - [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.

**length_max** - [in] Expected length of the Conversion Results read from the ADC, in bytes.

**out_length** - [out] Real length of the Conversion Results read from the ADC via this API, in bytes.

**timeout_ms** - [in] Time to wait for data via this API, in millisecond.

### Returns
- ESP_ERR_INVALID_STATE: Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT: Operation timed out
- ESP_OK: On success

```c
esp_err_t adc_continuous_stop(adc_continuous_handle_t handle)
```

Stop the ADC. After this, the hardware stops working.

**Parameters**
- `handle` - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_deinit(adc_continuous_handle_t handle)
```

Deinitialize the ADC continuous driver.

**Parameters**
- `handle` - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_io_to_channel(int io_num, adc_unit_t *unit_id, adc_channel_t *channel)
```

Get ADC channel from the given GPIO number.

**Parameters**
- `io_num` - [in] GPIO number
- `unit_id` - [out] ADC unit
- `channel` - [out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_continuous_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**
- `unit_id` - [in] ADC unit
- `channel` - [in] ADC channel
- `io_num` - [out] GPIO number
- `io_num` - [out] GPIO number

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

### Structures

```c
struct adc_continuous_handle_cfg_t
```

ADC continuous mode driver initial configurations.

### Public Members
uint32_t **max_store_buf_size**
Max length of the conversion Results that driver can store, in bytes.

uint32_t conv_frame_size
Conversion frame size, in bytes. This should be in multiples of SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

struct adc_continuous_config_t
ADC continuous mode driver configurations.

Public Members

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available sampling frequency range.

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

struct adc_continuous_evt_data_t
Event data structure.

Note: The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t *conv_frame_buffer
Pointer to conversion result buffer for one conversion frame.

uint32_t size
Conversion frame size.

struct adc_continuous_evt_cbs_t
Group of ADC continuous mode callbacks.

Note: These callbacks are all running in an ISR environment.
Chapter 2. API Reference

Note: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

`adc_continuous_callback_t on_conv_done`
Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

`adc_continuous_callback_t on_pool_ovf`
Event callback, invoked when the internal pool is full.

Macros

`ADC_MAX_DELAY`
Driver Backgrounds.

Type Definitions

typedef struct adc_continuous_ctx_t *adc_continuous_handle_t
Type of adc continuous mode driver handle.

typedef bool (*adc_continuous_callback_t)(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data)
Prototype of ADC continuous mode event callback.

Param handle [in] ADC continuous mode driver handle
Param edata [in] Pointer to ADC continuous mode event data
Param user_data [in] User registered context, registered when in adc_continuous_register_event_callbacks()
Return Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

Based on series of comparisons with the reference voltage, ESP32 ADC determines each bit of the output digital result. Per design the ESP32 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

• Calibration Scheme Creation - covers how to create a calibration scheme handle and delete the calibration scheme handle.
• Calibration Configuration - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
• Result Conversion - converts how to convert ADC raw result to calibrated result.
• Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.
• Minimize Noise - describes a general way to minimize the noise.
• **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From calibration driver’s point of view, an ADC calibration scheme is created to an ADC calibration handle `adc_cali_handle_t`. `adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

There is also a configuration `adc_cali_line_fitting_config_t::default_vref`. Normally this can be simply set to 0. Line Fitting scheme doesn’t rely on this value. However, if the Line Fitting scheme required eFuse bits are not burnt on your board, driver will rely on this value to do the calibration.

You can use `adc_cali_scheme_line_fitting_check_efuse()` to check the eFuse bits. Normally the Line Fitting scheme eFuse value will be `ADC_CALI_LINE_FITTING_efuse_val_efuse_tp` or `ADC_CALI_LINE_FITTING_efuse_val_efuse_vref`. This means Line Fitting scheme will use calibration parameters burnt in the eFuse to do the calibration.

When the Line Fitting scheme eFuse value is `ADC_CALI_LINE_FITTING_efuse_val_default_vref`, you need to set the `esp_adc_cali_line_fitting_init::default_vref`. Default vref is an estimate of the ADC reference voltage provided by the users as a parameter during calibration.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

**Delete Line Fitting Scheme**

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**Note:** For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in components/esp_adc/interface/adc_cali_interface.h to know the ESP ADC calibration interface.
Result Conversion

After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme isn’t created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + i, EXAMPLE_,
ADC1_CHAN0, voltage[0][0]);
```

Thread Safety

The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP` isn’t this one.
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF` isn’t this one.
- `CONFIG_ADC_CAL_LUT_ENABLE`, disable this to decrease the code size, if you don’t calibrate the ADC raw results under `ADC_ATTEN_DB_11`.

Minimize Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`

Functions

- `esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`
  
  Check the supported ADC calibration scheme.

  **Parameters**
  
  `scheme_mask` - [out] Supported ADC calibration scheme(s)

  **Returns**
  
  - `ESP_OK`: On success
  - `ESP_ERR_INVALID_ARG`: Invalid argument
  - `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

- `esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

  Convert ADC raw data to calibrated voltage.

  **Parameters**
  
  - `handle` - [in] ADC calibration handle
  - `raw` - [in] ADC raw data
  - `voltage` - [out] Calibrated ADC voltage (in mV)
Fig. 6: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered

Type Definitions

typedef struct adc_cali_scheme_t *adc_cali_handle_t
ADC calibration handle.

Enumerations

enum adc_cali_scheme_ver_t
ADC calibration scheme.

Values:

- enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
  Line fitting scheme.

- enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
  Curve fitting scheme.

Header File

- components/esp_adc/include/esp_adc/adc_cali_scheme.h
2.6.4 Clock Tree

This section lists definitions of the ESP32's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32’s root clocks are listed in `soc_root_clk_t`:

- Internal 8MHz RC Oscillator (RC_FAST)
  This RC oscillator generates a ~8.5MHz clock signal output as the RC_FAST_CLK. The ~8.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a RC_FAST_D256_CLK. The exact frequency of RC_FAST_CLK can be computed in runtime through calibration on the RC_FAST_D256_CLK.
- External 2~40MHz Crystal (XTAL)
- Internal 150kHz RC Oscillator (RC_SLOW)
  This RC oscillator generates a ~150kHz clock signal output as the RC_SLOW_CLK. The exact frequency of this clock can be computed in runtime through calibration.
- External 32kHz Crystal - optional (XTAL32K)
  The clock source for this XTAL32K_CLK can be either a 32kHz crystal connecting to the 32K_XP and 32K_XN pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the 32K_XN pin. Additionally, a 1nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin. XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to `RTC Timer Clock Sources` for more details).

Module Clocks

ESP32’s available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Reference

Header File

- components/soc/esp32/include/soc/clk_tree_defs.h

Macros

- `SOC_CLK_RC_FAST_FREQ_APPROX`
  Approximate RC_FAST_CLK frequency in Hz
- `SOC_CLK RC_SLOW_FREQ_APPROX`
  Approximate RC_SLOW_CLK frequency in Hz
Chapter 2. API Reference

**SOC_CLK_RC_FAST_D256_FREQ_APPROX**
Approximate RC_FAST_D256_CLK frequency in Hz

**SOC_CLK_XTAL32K_FREQ_APPROX**
Approximate XTAL32K_CLK frequency in Hz

**SOC_GPTIMER_CLKS**
Array initializer for all supported clock sources of GPTimer.
The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t *)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC_LCD_CLKS**
Array initializer for all supported clock sources of LCD.

**SOC_RMT_CLKS**
Array initializer for all supported clock sources of RMT.

**SOC_MCPWM_TIMER_CLKS**
Array initializer for all supported clock sources of MCPWM Timer.

**SOC_MCPWM_CAPTURE_CLKS**
Array initializer for all supported clock sources of MCPWM Capture Timer.

**SOC_I2S_CLKS**
Array initializer for all supported clock sources of I2S.

**SOC_I2C_CLKS**
Array initializer for all supported clock sources of I2C.

**SOC_SDM_CLKS**
Array initializer for all supported clock sources of SDM.

**Enumerations**

eenum soc_root_clk_t
Root clock.

- enumerator **SOC_ROOT_CLK_INT_RC_FAST**
  Internal 8MHz RC oscillator

- enumerator **SOC_ROOT_CLK_INT_RC_SLOW**
  Internal 150kHz RC oscillator
Chapter 2. API Reference

enumerator **SOC_ROOT_CLK_EXT_XTAL**
   External 2~40MHz crystal

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**
   External 32kHz crystal/clock signal

enum **soc_cpu_clk_src_t**
   CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

   **Note:** Enum values are matched with the register field values on purpose

   **Values:**

   enumerator **SOC_CPU_CLK_SRC_XTAL**
      Select XTAL_CLK as CPU_CLK source

   enumerator **SOC_CPU_CLK_SRC_PLL**
      Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

   enumerator **SOC_CPU_CLK_SRC_RC_FAST**
      Select RC_FAST_CLK as CPU_CLK source

   enumerator **SOC_CPU_CLK_SRC_APLL**
      Select APLL_CLK as CPU_CLK source

   enumerator **SOC_CPU_CLK_SRC_INVALID**
      Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**
   RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

   **Note:** Enum values are matched with the register field values on purpose

   **Values:**

   enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**
      Select RC_SLOW_CLK as RTC_SLOW_CLK source

   enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
      Select XTAL32K_CLK as RTC_SLOW_CLK source

   enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
      Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

   enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
      Invalid RTC_SLOW_CLK source
enum **soc rtc fast clk src t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D4**
Select XTAL_D4_CLK (may referred as XTAL_CLK_DIV_4) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D4**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

---

enum **soc module clk t**
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

**Values:**

counter
enumerator **SOC_MOD_CLK_CPU**
CPU_CLK can be sourced from XTAL, PLL, RC_FAST, or APLL by configuring soc_cpu_clk_src_t

counter
enumerator **SOC_MOD_CLK_RTC_FAST**
RTC_FAST_CLK can be sourced from XTAL_D4 or RC_FAST by configuring soc_rtc_fast_clk_src_t

counter
enumerator **SOC_MOD_CLK_RTC_SLOW**
RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

counter
enumerator **SOC_MOD_CLK_APB**
APB_CLK is highly dependent on the CPU_CLK source

counter
enumerator **SOC_MOD_CLK_PLL_D2**
PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

counter
enumerator **SOC_MOD_CLK_XTAL32K**
XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

counter
enumerator **SOC_MOD_CLK_RC_FAST**
RC_FAST_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals
Chapter 2. API Reference

enumerator **SOC_MOD_CLK_RC_FAST_D256**
RC_FAST_D256_CLK comes from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**
XTAL_CLK comes from the external crystal (2~40MHz)

enumerator **SOC_MOD_CLK_REF_TICK**
REF_TICK is derived from APB, it has a fixed frequency of 1MHz even when APB frequency changes

enumerator **SOC_MOD_CLK_APLL**
APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enum **soc_periph_gptimer_clk_src_t**
Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER_CLK_SRC_APB**
Select APB as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**
Select APB as the default choice

enum **soc_periph_tg_clk_src_legacy_t**
Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER_SRC_CLK_APB**
Timer group source clock is APB

enumerator **TIMER_SRC_CLK_DEFAULT**
Timer group source clock default choice is APB

enum **soc_periph_lcd_clk_src_t**
Type of LCD clock source.

*Values:*

enumerator **LCD_CLK_SRC_PLL160M**
Select PLL_D2 (default to 160MHz) as the source clock

enumerator **LCD_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **LCD_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **LCD_CLK_SRC_DEFAULT**
Select PLL_D2 (default to 160MHz) as the default choice
Chapter 2. API Reference

enum `soc_periph_rmt_clk_src_t`
Type of RMT clock source.

Values:

enumerator `RMT_CLK_SRC_APB`
Select APB as the source clock

enumerator `RMT_CLK_SRC_REF_TICK`
Select REF_TICK as the source clock

enumerator `RMT_CLK_SRC_DEFAULT`
Select APB as the default choice

enum `soc_periph_rmt_clk_src_legacy_t`
Type of RMT clock source, reserved for the legacy RMT driver.

Values:

enumerator `RMT_BASECLK_APB`
RMT source clock is APB CLK

enumerator `RMT_BASECLK_REF`
RMT source clock is REF_TICK

enumerator `RMT_BASECLK_DEFAULT`
RMT source clock default choice is APB

enum `soc_periph_uart_clk_src_legacy_t`
Type of UART clock source, reserved for the legacy UART driver.

Values:

enumerator `UART_SCLK_APB`
UART source clock is APB CLK

enumerator `UART_SCLK_REF_TICK`
UART source clock is REF_TICK

enumerator `UART_SCLK_DEFAULT`
UART source clock default choice is APB

enum `soc_periph_mcpwm_timer_clk_src_t`
Type of MCPWM timer clock source.

Values:

enumerator `MCPWM_TIMER_CLK_SRC_PLL160M`
Select PLL_D2 (160MHz) as the source clock

enumerator `MCPWM_TIMER_CLK_SRC_DEFAULT`
Select PLL_D2 as the default clock choice
enum `soc_periph_mcpwm_capture_clk_src_t`
Type of MCPWM capture clock source.

Values:

enumerator `MCPWM_CAPTURE_CLK_SRC_APB`
Select APB as the source clock

enumerator `MCPWM_CAPTURE_CLK_SRC_DEFAULT`
Select APB as the default clock choice

enum `soc_periph_i2s_clk_src_t`
I2S clock source enum.

Values:

enumerator `I2S_CLK_SRC_DEFAULT`
Select PLL_D2 as the default source clock

enumerator `I2S_CLK_SRC_PLL_160M`
Select PLL_D2 as the source clock

enumerator `I2S_CLK_SRC_APLL`
Select APLL as the source clock

enum `soc_periph_i2c_clk_src_t`
Type of I2C clock source.

Values:

enumerator `I2C_CLK_SRC_APB`

enumerator `I2C_CLK_SRC_DEFAULT`

enum `soc_periph_sdm_clk_src_t`
Sigma Delta Modulator clock source.

Values:

enumerator `SDM_CLK_SRC_APB`
Select APB as the source clock

enumerator `SDM_CLK_SRC_DEFAULT`
Select APB as the default clock choice

2.6.5 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).
The DAC driver allows these channels to be set to arbitrary voltages.
The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PDM/PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

**Application Example**

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V.

```c
#include <driver/dac.h>
...
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

**API Reference**

**Header File**

- components/driver/esp32/include/driver/dac.h

**Functions**

- `esp_err_t dac_i2s_enable (void)`
  
  Enable DAC output data from I2S.

  **Returns**
  
  - ESP_OK success

- `esp_err_t dac_i2s_disable (void)`

  Disable DAC output data from I2S.

  **Returns**
  
  - ESP_OK success

**Header File**

- components/driver/include/driver/dac_common.h

**Functions**

- `esp_err_t dac_pad_get_io_num (dac_channel_t channel, gpio_num_t *gpio_num)`

  Get the GPIO number of a specific DAC channel.

  **Parameters**
  
  - `channel` - Channel to get the gpio number
  - `gpio_num` - output buffer to hold the gpio number

  **Returns**
  
  - ESP_OK if success

- `esp_err_t dac_output_voltage (dac_channel_t channel, uint8_t dac_value)`

  Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.
Chapter 2. API Reference

**Note:** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Parameters**

- **channel** - DAC channel
- **dac_value** - DAC output value

**Returns**

- ESP_OK success

```c
esp_err_t dac_output_enable(dac_channel_t channel)
```

DAC pad output enable.

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26. I2S left channel will be mapped to DAC channel 2. I2S right channel will be mapped to DAC channel 1

**Parameters**

- **channel** - DAC channel

```c
esp_err_t dac_output_disable(dac_channel_t channel)
```

DAC pad output disable.

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Parameters**

- **channel** - DAC channel

```c
esp_err_t dac_cw_generator_enable(void)
```

Enable cosine wave generator output.

**Returns**

- ESP_OK success

```c
esp_err_t dac_cw_generator_disable(void)
```

Disable cosine wave generator output.

**Returns**

- ESP_OK success

```c
esp_err_t dac_cw_generator_config(dac_cw_config_t *cw)
```

Config the cosine wave generator function in DAC module.

**Parameters**

- **cw** - Configuration.

**Returns**

- ESP_OK success
- ESP_ERR_INVALID_ARG The parameter is NULL.

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. `DAC_CHANNEL_1_GPIO_NUM` is the GPIO number of channel 1 (GPIO25);
2. `DAC_GPIO26_CHANNEL` is the channel number of GPIO 26 (channel 2).
Header File

• components/soc/esp32/include/soc/dac_channel.h

Macros

DAC_GPIO25_CHANNEL

DAC_CHANNEL_1_GPIO_NUM

DAC_GPIO26_CHANNEL

DAC_CHANNEL_2_GPIO_NUM

Header File

• components/hal/include/hal/dac_types.h

Structures

struct dac_cw_config_t

Configure the cosine wave generator function in the DAC module.

Public Members

dac_channel_t en_ch

Enable the cosine wave generator of DAC channel.

dac_cw_scale_t scale

Set the amplitude of the cosine wave generator output.

dac_cw_phase_t phase

Set the phase of the cosine wave generator output.

uint32_t freq

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8_t offset

Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations

enum dac_channel_t

Values:

enumerator DAC_CHANNEL_1

DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)
enumerator DAC_CHANNEL_2

DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator DAC_CHANNEL_MAX

enum dac_cw_scale_t

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

enumerator DAC_CW_SCALE_1

1/1. Default.

enumerator DAC_CW_SCALE_2

1/2.

enumerator DAC_CW_SCALE_4

1/4.

enumerator DAC_CW_SCALE_8

1/8.

enum dac_cw_phase_t

Set the phase of the cosine wave generator output.

Values:

enumerator DAC_CW_PHASE_0

Phase shift +0°

enumerator DAC_CW_PHASE_180

Phase shift +180°

2.6.6 GPIO & RTC GPIO

Overview

The ESP32 chip features 34 physical GPIO pins (GPIO0 ~ GPIO19, GPIO21 ~ GPIO23, GPIO25 ~ GPIO27, and GPIO32 ~ GPIO39). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</tbody>
</table>

Note:

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to [ESP32 datasheet](#).
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you are having trouble getting the value from an ADC2 GPIO while using Wi-Fi, you may consider using an ADC1 GPIO instead, which should solve your problem. For more details, please refer to [ADC limitations](#).

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.
## Application Example

GPIO output and input interrupt example: `peripherals/gpio/generic_gpio`.

## API Reference - Normal GPIO

### Header File

- components/driver/include/driver/gpio.h

### Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)</code></td>
<td>GPIO common configuration.</td>
</tr>
<tr>
<td><code>esp_err_t gpio_reset_pin(gpio_num_t gpio_num)</code></td>
<td>Reset an gpio to default state (select gpio function, enable pullup and disable input and output).</td>
</tr>
<tr>
<td><code>esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)</code></td>
<td>GPIO set interrupt trigger type.</td>
</tr>
<tr>
<td><code>esp_err_t gpio_intr_enable(gpio_num_t gpio_num)</code></td>
<td>Enable GPIO module interrupt signal.</td>
</tr>
</tbody>
</table>

### Parameters

- `pGPIOConfig` - Pointer to GPIO configure struct
- `gpio_num` - GPIO number.
- `intr_type` - Interrupt type, select from gpio_int_type_t

### Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

### Notes

- ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.
Chapter 2. API Reference

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_intr_disable (gpio_num_t gpio_num)`

Disable GPIO module interrupt signal.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM

**Parameters**
- `gpio_num` - GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

GPIO set output level.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM

**Parameters**
- `gpio_num` - GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `level` - Output level. 0: low; 1: high

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

`int gpio_get_level (gpio_num_t gpio_num)`

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters**
- `gpio_num` - GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

`esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)`

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Parameters**
- `gpio_num` - Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `mode` - GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
**Chapter 2. API Reference**

**esp_err_t** `gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)`

Configure GPIO pull-up/pull-down resistors.

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Parameters**
- `gpio_num` - GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `pull` - GPIO pull up/down mode.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**esp_err_t** `gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

Enable GPIO wake-up function.

**Parameters**
- `gpio_num` - GPIO number.
- `intr_type` - GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `gpio_wakeup_disable(gpio_num_t gpio_num)`

Disable GPIO wake-up function.

**Parameters**
- `gpio_num` - GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `gpio_isr_register(void (*)(void*), void* arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**
- `fn` - Interrupt handler function.
- `arg` - Parameter for handler function
- `intr_alloc_flags` - Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle` - Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

**esp_err_t** `gpio_pullup_en(gpio_num_t gpio_num)`

Enable pull-up on GPIO.

**Parameters**
- `gpio_num` - GPIO number

**Returns**
- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)
```

Disable pull-up on GPIO.

**Parameters**
- `gpio_num` – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)
```

Enable pull-down on GPIO.

**Parameters**
- `gpio_num` – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)
```

Disable pull-down on GPIO.

**Parameters**
- `gpio_num` – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_install_isr_service(int intr_alloc_flags)
```

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters**
- `intr_alloc_flags` – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

```c
void gpio_uninstall_isr_service(void)
```

Uninstall the driver’s GPIO ISR service, freeing related resources.

```c
esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
```

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**
- `gpio_num` – GPIO number
- `isr_handler` – ISR handler function for the corresponding GPIO number.
- `args` – parameter for ISR handler.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)
```
Remove ISR handler for the corresponding GPIO pin.

**Parameters**
- *gpio_num* – GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
```
Set GPIO pad drive capability.

**Parameters**
- *gpio_num* – GPIO number, only support output GPIOs
- *strength* – Drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```
Get GPIO pad drive capability.

**Parameters**
- *gpio_num* – GPIO number, only support output GPIOs
- *strength* – Pointer to accept drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters**
- *gpio_num* – GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to hight level before calling `gpio_hold_dis`.

**Parameters**
- *gpio_num* – GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function
void gpio_deep_sleep_hold_en (void)
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is
woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip
is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this
function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as
long as the chip enter Deep-sleep.

void gpio_deep_sleep_hold_dis (void)
Disable all digital gpio pad hold function during Deep-sleep.

void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
Set pad input to a peripheral signal through the IOMUX.

Parameters
• gpio_num – GPIO number of the pad.
• signal_idx – Peripheral signal id to input. One of the *_IN_IDX signals in soc/
gpio_sig_map.h.

void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
Set peripheral output to an GPIO pad through the IOMUX.

Parameters
• gpio_num – gpio_num GPIO number of the pad.
• func – The function number of the peripheral pin to output pin. One of the FUNC_X_*
of specified pin (X) in soc/io_mux_reg.h.
• oen_inv – True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters gpio_num – GPIO number of the pad.
Returns
• ESP_OK Success

esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters gpio_num – GPIO number of the pad.
Returns
• ESP_OK Success

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

Parameters
• gpio_num – Configure GPIO pins number, it should be GPIO number. If you want to
set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode – GPIO direction

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
Configure GPIO pull-up/pull-down resistors at sleep.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors.
Input-only GPIOs 34-39 do not.
Chapter 2. API Reference

Parameters

- **gpio_num** - GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** - GPIO pull up/down mode.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Macros

- **GPIO_PIN_COUNT**
- **GPIO_IS_VALID_GPIO** (gpio_num)
  Check whether it is a valid GPIO number.
- **GPIO_IS_VALID_OUTPUT_GPIO** (gpio_num)
  Check whether it can be a valid GPIO number of output mode.

Type Definitions

typedef **intr_handle_t gpio_isr_handle_t**

API Reference - RTC GPIO

Header File
    • components/driver/include/driver/rtc_io.h
**Functions**

bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters**
- gpio_num – GPIO number

**Returns**
- true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get (gpio_num_t gpio_num)

Get RTC IO index number by gpio number.

**Parameters**
- gpio_num – GPIO number

**Returns**
- >=0: Index of rtcio. -1: The gpio is not rtcio.

**esp_err_t rtc_gpio_init (gpio_num_t gpio_num)**

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)**

Init a GPIO as digital GPIO.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)

Get the RTC IO input level.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- 1: High level
- 0: Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)**

Set the RTC IO output level.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)
- level – output level

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)**

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)
- mode – GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)**

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.
NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Parameters

- **gpio_num** - GPIO number (e.g. GPIO_NUM_12)
- **mode** - GPIO direction

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Parameters **gpio_num** - GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Parameters **gpio_num** - GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Parameters **gpio_num** - GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Parameters **gpio_num** - GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)

Set RTC GPIO pad drive capability.

Parameters

- **gpio_num** - GPIO number, only support output GPIOs
- **strength** - Drive capability of the pad

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
```c
esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get RTC GPIO pad drive capability.

Parameters
• gpio_num – GPIO number, only support output GPIOs
• strength – Pointer to accept drive capability of the pad

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
```

```c
esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

Parameters
• gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Parameters
• gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)
Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

Parameters
• gpio_num – GPIO number (e.g. GPIO_NUM_12).

Returns
• ESP_OK on success
• ESP_ERR_INVALID_ARG if GPIO is not an RTC IO
```

```c
esp_err_t rtc_gpio_force_hold_all (void)
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

esp_err_t rtc_gpio_force_hold_dis_all (void)
Disable force hold signal for all RTC IOs.
```

```c
esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)
Enable wakeup from sleep mode using specific GPIO.

Parameters
• gpio_num – GPIO number
• intr_type – Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

Returns
```

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

```c
esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)
```

Disable wakeup from sleep mode using specific GPIO.

**Parameters**
- `gpio_num` - GPIO number

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Macros**

```c
RTC_GPIO_IS_VALID_GPIO(gpio_num)
```

**Header File**

```c
• components/hal/include/hal/rtc_io_types.h
```

**Enumerations**

```c
cenum rtc_gpio_mode_t
```

RTCIO output/input mode type.

**Values:**

- enumerator `RTC_GPIO_MODE_INPUT_ONLY`
  - Pad input
- enumerator `RTC_GPIO_MODE_OUTPUT_ONLY`
  - Pad output
- enumerator `RTC_GPIO_MODE_INPUT_OUTPUT`
  - Pad input + output
- enumerator `RTC_GPIO_MODE_DISABLED`
  - Pad (output + input) disable
- enumerator `RTC_GPIO_MODE_OUTPUT_OD`
  - Pad open-drain output
- enumerator `RTC_GPIO_MODE_INPUT_OUTPUT_OD`
  - Pad input + open-drain output

### 2.6.7 General Purpose Timer (GPTimer)

**Introduction**

GPTimer (General Purpose Timer) is the driver of ESP32 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:
• Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
• Generate period alarms, trigger events periodically
• Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

• Resource Allocation - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
• Set and Get Count Value - covers how to force the timer counting from a start point and how to get the count value at anytime.
• Set up Alarm Action - covers the parameters that should be set up to enable the alarm event.
• Register Event Callbacks - covers how to hook user specific code to the alarm event callback function.
• Enable and Disable Timer - covers how to enable and disable the timer.
• Start and Stop Timer - shows some typical use cases that start the timer with different alarm behavior.
• Power Management - describes how different source clock selections can affect power consumption.
• IRAM Safe - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
• Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.
• Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation  Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.¹

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section Power Management.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to 1 / `resolution_hz` seconds.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to Interrupt Handling.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

¹ Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to ESP32 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).
Creating a GPTimer Handle with Resolution of 1 MHz

```c
# gptimer_handle_t gptimer = NULL;
# gptimer_config_t timer_config = {
#   .clk_src = GPTIMER_CLK_SRC_DEFAULT,
#   .direction = GPTIMER_COUNT_UP,
#   .resolution_hz = 1 * 1000 * 1000, // IMHz, 1 tick = 1us
# }
# ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value**  When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action**  For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to `NULL`, the alarm function will be disabled.

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

**Register Event Callbacks**  After the timer starts up, it can generate a specific event (e.g. the “Alarm Event”) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section *Enable and Disable Timer* for more information.
Enable and Disable Timer  Before doing IO control to the timer, you need to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from init to enable.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section Power Management for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the init state, disable the interrupts service and release the power management lock.

Start and Stop Timer  The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Start Timer as a Wall Clock

```c
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```
Trigger One-Shot Event

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback. by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

(continues on next page)
Power Management  When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into Light-sleep mode, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the driver creates a GPTimer instance that has selected GPTIMER_CLK_SRC_APB as its clock source, the driver will guarantee that the power management lock is acquired when enabling the timer by gptimer_enable(). Likewise, the driver releases the lock when gptimer_disable() is called for that timer.

If other gptimer clock sources are selected such as GPTIMER_CLK_SRC_XTAL, then the driver will not install power management lock. The XTAL clock source is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

IRAM Safe  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option CONFIG_GPTIMER_ISR_IRAM_SAFE that will:

• Enable the interrupt being serviced even when the cache is disabled
• Place all functions that used by the ISR into IRAM

2 gptimer_event_callbacks_t::on_alarm callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

• gptimer_start()
• gptimer_stop()
• gptimer_get_raw_count()
• gptimer_set_raw_count()
• gptimer_set_alarm_action()

Thread Safety  The factory function gptimer_new_timer() is guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

• gptimer_start()
Chapter 2. API Reference

- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Other functions that take `gptimer_handle_t` as the first positional parameter, are not treated as thread safe, which means you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash), see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Examples

- Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.

API Reference

Header File

- `components/driver/include/driver/gptimer.h`

Functions

```c
esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)
```

Create a new General Purpose Timer, and return the handle.

**Note:** The newly created timer is put in the init state.

**Parameters**

- `config` [in] GPTimer configuration
- `ret_timer` [out] Returned timer handle

**Returns**

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

```c
esp_err_t gptimer_del_timer(gptimer_handle_t timer)
```

Delete the GPTimer handle.

**Note:** A timer can’t be in the enable state when this function is invoked. See also `gptimer_disable()` for how to disable a timer.

**Parameters**

`timer` [in] Timer handle created by `gptimer_new_timer()`

**Returns**

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
• ESP_FAIL: Delete GPTimer failed because of other error

`esp_err_t gptimer_set_raw_count (gptimer_handle_t timer, uint64_t value)`
Set GPTimer raw count value.

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note:** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Parameters**
- `timer` - [in] Timer handle created by `gptimer_new_timer()`
- `value` - [in] Count value to be set

**Returns**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

`esp_err_t gptimer_get_raw_count (gptimer_handle_t timer, uint64_t *value)`
Get GPTimer raw count value.

**Note:** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

**Note:** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Parameters**
- `timer` - [in] Timer handle created by `gptimer_new_timer()`
- `value` - [out] Returned GPTimer count value

**Returns**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

`esp_err_t gptimer_register_event_callbacks (gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)`
Set callbacks for GPTimer.
Note: User registered callbacks are expected to be runnable within ISR context

Note: This function should be called when the timer is in the init state (i.e. before calling `gptimer_enable()`)

**Parameters**
- `timer` [in] Timer handle created by `gptimer_new_timer()`
- `cbs` [in] Group of callback functions
- `user_data` [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```
Set alarm event actions for GPTimer.

Note: This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

Note: This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Parameters**
- `timer` [in] Timer handle created by `gptimer_new_timer()`
- `config` [in] Alarm configuration, especially, set `config` to NULL means disabling the alarm function

**Returns**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

```c
esp_err_t gptimer_enable (gptimer_handle_t timer)
```
Enable GPTimer.

Note: This function will transit the timer state from init to enable.

Note: This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks()`.

Note: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.
Chapter 2. API Reference

Note: Enable a timer doesn’t mean to start it. See also gptimer_start() for how to make the timer start counting.

Parameters timer [in] Timer handle created by gptimer_new_timer()
Returns
- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

esp_err_t gptimer_disable (gptimer_handle_t timer)
Disable GPTimer.

Note: This function will do the opposite work to the gptimer_enable()

Note: Disable a timer doesn’t mean to stop it. See also gptimer_stop() for how to make the timer stop counting.

Parameters timer [in] Timer handle created by gptimer_new_timer()
Returns
- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

esp_err_t gptimer_start (gptimer_handle_t timer)
Start GPTimer (internal counter starts counting)

Note: This function should be called when the timer is in the enable state (i.e. after calling gptimer_enable())

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters timer [in] Timer handle created by gptimer_new_timer()
Returns
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Start GPTimer failed because of other error

esp_err_t gptimer_stop (gptimer_handle_t timer)
Stop GPTimer (internal counter stops counting)
Note: This function should be called when the timer is in the enable state (i.e. after calling gptimer_enable())

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters

| timer | [in] Timer handle created by gptimer_new_timer() |

Returns

- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct gptimer_alarm_event_data_t

GPTimer alarm event data.

Public Members

uint64_t count_value

Current count value

uint64_t alarm_value

Current alarm value

struct gptimer_event_callbacks_t

Group of supported GPTimer callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gmenter_alarm_cb_t on_alarm

Timer alarm callback

struct gptimer_config_t

General Purpose Timer configuration.
Public Members

```
gptimer_clock_source_t clk_src
GPTimer clock source

gptimer_count_direction_t direction
Count direction
```

```
uint32_t resolution_hz
Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds
```

```
uint32_t intr_shared
Set true, the timer interrupt number can be shared with other peripherals
```

```
struct gptimer_config_t::[anonymous] flags
GPTimer config flags
```

```
struct gptimer_alarm_config_t
General Purpose Timer alarm configuration.
```

Public Members

```
uint64_t alarm_count
Alarm target count value
```

```
uint64_t reload_count
Alarm reload count value, effect only when auto_reload_on_alarm is set to true
```

```
uint32_t auto_reload_on_alarm
Reload the count value by hardware, immediately at the alarm event
```

```
struct gptimer_alarm_config_t::[anonymous] flags
Alarm config flags
```

Type Definitions

```
typedef struct gptimer_t *gptimer_handle_t
Type of General Purpose Timer handle.
```

```
typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
Timer alarm callback prototype.
```

```
  Param timer [in] Timer handle created by gptimer_new_timer()
  Param edata [in] Alarm event data, fed by driver
  Param user_ctx [in] User data, passed from gptimer_register_event_callbacks()
  Return Whether a high priority task has been waken up by this function
```
Header File

- components/hal/include/hal/timer_types.h

Type Definitions

typedef `soc_periph_gptimer_clk_src_t` gptimer_clock_source_t

GPTimer clock source.

**Note:** Usershould select the clock source based on the power and resolution requirement

Enumerations

enum gptimer_count_direction_t

GPTimer count direction.

**Values:**

enumerator GPTIMER_COUNT_DOWN

Decrease count value

enumerator GPTIMER_COUNT_UP

Increase count value

2.6.8 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has 2 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master
Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

### Configuration

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master or slave from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

**Configuration example (master):**

```c
int i2c_master_port = 0;
i2c_config_t conf = {
  .mode = I2C_MODE_MASTER,
  .sda_io_num = I2C_MASTER_SDA_IO,  // select GPIO specific to your...
  .scl_io_num = I2C_MASTER_SCL_IO,  // select GPIO specific to your...
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .master.clk_speed = I2C_MASTER_FREQ_HZ,  // select frequency specific to your...
  .clk_flags = 0,  // you can use I2C_SCLK_SRC_FLAG_...
  .flags to choose i2c source clock here
};
```

**Configuration example (slave):**

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
  .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your...
  .scl_io_num = I2C_SLAVE_SCL_IO,  // select GPIO specific to your...
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .slave.addr_10bit_en = 0,
  .slave.slave_addr = ESP_SLAVE_ADDR,  // address of your project
};
```

(continues on next page)
At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

**Source Clock Configuration**  
Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB clock</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. **I2C_SCLK_SRC_FLAG_AWARE_DFS:** Clock’s baud rate will not change while APB clock is changing.
2. **I2C_SCLK_SRC_FLAG_LIGHT_SLEEP:** It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver**  
After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send
buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.

- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in esp_hw_support/include/esp_intr_alloc.h)

**Communication as Master**  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**  
The example below shows how to build a command link for an I2C master to send n bytes to a slave.

![Fig. 7: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
   Then, populate it with the series of data to be sent to the slave:
   a) **Start bit** - `i2c_master_start()`
   b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) **Data** - One or more bytes as an argument of `i2c_master_write()`
   d) **Stop bit** - `i2c_master_stop()`  
      Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read**  
The example below shows how to build a command link for an I2C master to read n bytes from a slave.
Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address. For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves:

- `i2c_slave_read_buffer()`
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in ` peripherals/i2c`.

**Interrupt Handling** During driver installation, an interrupt handler is installed by default.
Customized Configuration As mentioned at the end of Section Configuration, when the function $i2c_param_config()$ initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in $I2C_APB_CLK_FREQ$.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td>$i2c_set_period()$</td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of start signals</td>
<td>$i2c_set_start_timing()$</td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of stop signals</td>
<td>$i2c_set_stop_timing()$</td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td>$i2c_set_data_timing()$</td>
</tr>
<tr>
<td>I2C timeout</td>
<td>$i2c_set_timeout()$</td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in $i2c_trans_mode_t$</td>
<td>$i2c_set_data_mode()$</td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call $i2c_get_timeout()$.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function $i2c_set_pin()$. If you want to modify already entered values, use the function $i2c_param_config()$.

**Note:** ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

Error Handling The majority of I2C driver functions either return ESP_OK on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt $I2C_TIME_OUT_INT$ will be triggered. For detailed information, see Interrupt Handling.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions $i2c_reset_tx_fifo()$ and $i2c_reset_rx_fifo()$ for the send and receive buffers respectively.

Delete Driver When the I2C communication is established with the function $i2c_driver_install()$ and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling $i2c_driver_delete()$.

Before calling $i2c_driver_delete()$ to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C examples: peripherals/i2c.
API Reference

Header File

- components/driver/include/driver/i2c.h

Functions

```c
esp_err_t i2c_driver_install (i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

Install an I2C driver.

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we cannot access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Parameters**

- **i2c_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv_rx_buf_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

```c
esp_err_t i2c_driver_delete (i2c_port_t i2c_num)
```

Delete I2C driver.

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Parameters**

- **i2c_num** – I2C port to delete

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_param_config (i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
```

Configure an I2C bus with the given configuration.

**Parameters**

- **i2c_num** – I2C port to configure
- **i2c_conf** – Pointer to the I2C configuration

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t** `i2c_reset_tx_fifo(i2c_port_t i2c_num)`  
reset I2C tx hardware fifo  

**Parameters**  
- **i2c_num** - I2C port number  

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error  

**esp_err_t** `i2c_reset_rx_fifo(i2c_port_t i2c_num)`  
reset I2C rx fifo  

**Parameters**  
- **i2c_num** - I2C port number  

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error  

**esp_err_t** `i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)`  
Configure GPIO pins for I2C SCK and SDA signals.  

**Parameters**  
- **i2c_num** - I2C port number  
- **sda_io_num** - GPIO number for I2C SDA signal  
- **scl_io_num** - GPIO number for I2C SCL signal  
- **sda_pullup_en** - Enable the internal pullup for SDA pin  
- **scl_pullup_en** - Enable the internal pullup for SCL pin  
- **mode** - I2C mode  

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error  

**esp_err_t** `i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)`  
Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc…It shall only be called in I2C master mode.  

**Parameters**  
- **i2c_num** - I2C port number to perform the transfer on  
- **device_address** - I2C device’s 7-bit address  
- **write_buffer** - Bytes to send on the bus  
- **write_size** - Size, in bytes, of the write buffer  
- **ticks_to_wait** - Maximum ticks to wait before issuing a timeout.  

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error  
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.  
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.  
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.  

**esp_err_t** `i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`  
Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc…It shall only be called in I2C master mode.  

**Parameters**  
- **i2c_num** - I2C port number to perform the transfer on  
- **device_address** - I2C device’s 7-bit address  
- **read_buffer** - Buffer to store the bytes received on the bus  
- **read_size** - Size, in bytes, of the read buffer
ticks_to_wait – Maximum ticks to wait before issuing a timeout.

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

\[ \text{esp_err_t} \text{ i2c_master_write_read_device(} \text{i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait) } \]

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc. It shall only be called in I2C master mode.

Parameters
• i2c_num – I2C port number to perform the transfer on
• device_address – I2C device’s 7-bit address
• write_buffer – Bytes to send on the bus
• write_size – Size, in bytes, of the write buffer
• read_buffer – Buffer to store the bytes received on the bus
• read_size – Size, in bytes, of the read buffer
• ticks_to_wait – Maximum ticks to wait before issuing a timeout.

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

\[ \text{i2c_cmd_handle_t} \text{ i2c_cmd_link_create_static(} \text{uint8_t *} \text{buffer, uint32_t size) } \]

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

**Note:** It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

Parameters
• buffer – Buffer to use for commands allocations
• size – Size in bytes of the buffer

Returns Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

\[ \text{i2c_cmd_handle_t} \text{ i2c_cmd_link_create(} \text{void) } \]

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Returns Handle to the I2C command link or NULL in case of insufficient dynamic memory.

\[ \text{void} \text{ i2c_cmd_link_delete_static(} \text{i2c_cmd_handle_t cmd_handle) } \]

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.
void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

Parameters

- **cmd_handle** - I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Parameters

- **cmd_handle** - I2C commands list

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** - I2C commands list
- **data** - Byte to send on the port
- **ack_en** - Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t* data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** - I2C commands list
- **data** - Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, data should be allocated from internal RAM.
- **data_len** - Length, in bytes, of the data buffer
- **ack_en** - Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** - I2C commands list
- **data** - Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
- **ack** - ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- `cmd_handle` - I2C commands list
- `data` - Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- `data_len` - Size, in bytes, of the `data` buffer
- `ack` - ACK signal

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters**

- `cmd_handle` - I2C commands list

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

**Parameters**

- `i2c_num` - I2C port number
- `cmd_handle` - I2C commands list
- `ticks_to_wait` - Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**

- `i2c_num` - I2C port number
- `data` - Bytes to write into internal buffer
- `size` - Size, in bytes, of `data` buffer
• **ticks_to_wait** – Maximum ticks to wait.

**Returns**
• ESP_FAIL (-1) Parameter error
• Other (>0) The number of data bytes pushed to the I2C slave buffer.

```c
int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**
• **i2c_num** – I2C port number
• **data** – Buffer to fill with ringbuffer’s bytes
• **max_size** – Maximum bytes to read
• **ticks_to_wait** – Maximum waiting ticks

**Returns**
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes read from I2C slave buffer.

```c
esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

**Parameters**
• **i2c_num** – I2C port number
• **high_period** – Clock cycle number during SCL is high level, high_period is a 14 bit value
• **low_period** – Clock cycle number during SCL is low level, low_period is a 14 bit value

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)
```

Get I2C master clock period.

**Parameters**
• **i2c_num** – I2C port number
• **high_period** – pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• **low_period** – pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note:** Enable filter will slow down the SCL clock.

**Parameters**
• **i2c_num** – I2C port number to filter
• **cyc_num** – the APB cycles need to be filtered (0 <= cyc_num <= 7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
```

Disable filter on I2C bus.

**Parameters**
- i2c_num – I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

set I2C master start signal timing

**Parameters**
- i2c_num – I2C port number
- setup_time – clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time – clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```

get I2C master start signal timing

**Parameters**
- i2c_num – I2C port number
- setup_time – pointer to get setup time
- hold_time – pointer to get hold time

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

set I2C master stop signal timing

**Parameters**
- i2c_num – I2C port number
- setup_time – clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- hold_time – clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```

get I2C master stop signal timing

**Parameters**
- i2c_num – I2C port number
- setup_time – pointer to get setup time.
- hold_time – pointer to get hold time.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)

set I2C data signal timing

Parameters

• i2c_num – I2C port number
• sample_time – clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
• hold_time – clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

Parameters

• i2c_num – I2C port number
• sample_time – pointer to get sample time
• hold_time – pointer to get hold time

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)

set I2C timeout value

Parameters

• i2c_num – I2C port number
• timeout – timeout value for I2C bus (unit: APB 80Mhz clock cycle)

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)

get I2C timeout value

Parameters

• i2c_num – I2C port number
• timeout – pointer to get timeout value

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)

set I2C data transfer mode

Parameters

• i2c_num – I2C port number
• tx_trans_mode – I2C sending data mode
• rx_trans_mode – I2C receiving data mode

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)

get I2C data transfer mode

Parameters

• i2c_num – I2C port number
Chapter 2. API Reference

- **tx_trans_mode** – pointer to I2C sending data mode
- **rx_trans_mode** – pointer to I2C receiving data mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Structures**

```
struct i2c_config_t

I2C initialization parameters.
```

**Public Members**

```
i2c_mode_t mode

I2C mode
```

```
int sda_io_num

GPIO number for I2C sda signal
```

```
int scl_io_num

GPIO number for I2C scl signal
```

```
bool sda_pullup_en

Internal GPIO pull mode for I2C sda signal
```

```
bool scl_pullup_en

Internal GPIO pull mode for I2C scl signal
```

```
uint32_t clk_speed

I2C clock frequency for master mode, (no higher than 1MHz for now)
```

```
struct i2c_config_t::[anonymous]::[anonymous] master

I2C master config
```

```
uint8_t addr_10bit_en

I2C 10bit address mode enable for slave mode
```

```
uint16_t slave_addr

I2C address for slave mode
```

```
uint32_t maximum_speed

I2C expected clock speed from SCL.
```

```
struct i2c_config_t::[anonymous]::[anonymous] slave

I2C slave config
```

```
uint32_t clk_flags

Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice
```
Chapter 2. API Reference

Macros

**I2C_APB_CLK_FREQ**
I2C source clock is APB clock, 80MHz

**I2C_NUM_MAX**
I2C port max

**I2C_NUM_0**
I2C port 0

**I2C_NUM_1**
I2C port 1

**I2C_SCLK_SRC_FLAG_FOR_NOMAL**
Any one clock source that is available for the specified frequency may be chosen

**I2C_SCLK_SRC_FLAG_AWARE_DFS**
For REF tick clock, it won’t change with APB.

**I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**
For light sleep mode.

**I2C_INTERNAL_STRUCT_SIZE**
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C_LINK_RECOMMENDED_SIZE** (TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions

typedef void *i2c_cmd_handle_t
I2C command handle

**Header File**

- components/hal/include/hal/i2c_types.h

**Type Definitions**

typedef int i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

typedef soc_periph_i2c_clk_src_t i2c_clock_source_t
I2C group clock source.
Enumerations

enum i2c_mode_t
Values:

enumerator I2C_MODE_SLAVE
I2C slave mode

enumerator I2C_MODE_MASTER
I2C master mode

enumerator I2C_MODE_MAX

enum i2c_rw_t
Values:

enumerator I2C_MASTER_WRITE
I2C write data

enumerator I2C_MASTER_READ
I2C read data

enum i2c_trans_mode_t
Values:

enumerator I2C_DATA_MODE_MSB_FIRST
I2C data msb first

enumerator I2C_DATA_MODE_LSB_FIRST
I2C data lsb first

enumerator I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:

enumerator I2C_ADDR_BIT_7
I2C 7bit address for slave mode

enumerator I2C_ADDR_BIT_10
I2C 10bit address for slave mode

enumerator I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:

enumerator I2C_MASTER_ACK
I2C ack for each byte read
enumerator **I2C_MASTER_NACK**
I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**
I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

### 2.6.9 Inter-IC Sound (I2S)

**Introduction**

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicate in Standard or TDM mode consists of the following lines:

- **MCLK**: Master clock line. It’s an optional signal depends on slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK**: Bit clock line. The bit clock for data line.
- **WS**: Word(Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT**: Serial data input/output line. (Data will loopback internally if din and dout are set to a same GPIO)

And for the I2S bus that communicate in PDM mode, the lines are:

- **CLK**: PDM clock line.
- **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in simplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

**I2S File Structure**

**Public headers that need to be included in the I2S application**

- **i2s.h**: The header file of legacy I2S APIs (for apps using legacy driver).
- **i2s_std.h**: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- **i2s_pdm.h**: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- **i2s_tdm.h**: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note**: The legacy driver can’t coexist with the new driver. Including **i2s.h** to use the legacy driver or the other three headers to use the new driver. The legacy driver might be removed in future.

**Public headers that have been included in the headers above**
• `i2s_types_legacy.h`: The legacy public types that only used in the legacy driver.
• `i2s_types.h`: The header file that provides public types.
• `i2s_common.h`: The header file that provides common APIs for all communication modes.

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate, but if APPLL has been occupied by emac or other channels already, the APPLL frequency is not allowed to change, the driver will try to work under this APPLL frequency, if this APPLL frequency can’t meet the requirements of I2S, the clock configuration will fail.

### Clock Terminology

- **sample rate**: The number of sampled data in one second per slot.
- **sclk**: Source clock frequency. It is the frequency of the clock source.
- **mclk**: Master clock frequency. bclk is generate from this clock, mclk is mostly needed in the case that requires the MCLK signal as a reference clock to synchronize BCLK and WS between I2S master role and slave role.
- **bclk**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. It means there will be 8/16/24/32 bclk ticks in one slot, because the number of bclk ticks in one slot is equal to the `i2s_std_slot_config_t::slot_bit_width`.
- **lrck / ws**: Left/Right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

### Note:

Normally mclk should be the multiple of sample rate and bclk at the same time. This field `i2s_std_clk_config_t::mclk_multiple` means the multiple of mclk to the sample rate. If `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep mclk a multiple to the bclk, `i2s_std_clk_config_t::mclk_multiple` should be set to `I2S_MCLK_MULTIPLE_384`, otherwise the ws will be inaccurate. But in the most other cases, `I2S_MCLK_MULTIPLE_256` should be enough.
I2S Communication Mode

**Standard Mode** Standard mode always has left and right two sound channels which are called ‘slots’. These slots can support 8/16/24/32 bits width sample data. And the communication format for the slots mainly includes these following formats:

- **Philip Format**: Data signal have one bit shift comparing to the WS(word select) signal. And the duty of WS signal is 50%.

- **MSB Format**: Almost same as philip format, but its data have no shift.

- **PCM Short Format**: Data have one bit shift and meanwhile WS signal becomes a pulse lasting one BCLK(Bit Clock) cycle.
PDM Mode (TX)  PDM (Pulse-density Modulation) mode for tx channel can convert PCM data into PDM format which always has left and right slots. PDM TX can only support 16 bits width sample data. PDM TX only needs CLK pin for clock signal and DOUT pin for data signal (i.e. WS and SD signal in the following figure, the BCK signal is an internal bit sampling clock, not needed between PDM devices). This mode allows user to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by `up_sample_rate = fp / fs`, there are up-sampling modes in PDM TX:

- **Fixed Clock Frequency**: In this mode the up-sampling rate will change according to the sample rate. Setting `fp = 960` and `fs = sample_rate / 100`, then the clock frequency(Fpdm) on CLK pin will be fixed to `128 * 48 KHz = 6.144 MHz`, note that this frequency is not equal to the sample rate(Fpcm).
- **Fixed Up-sampling Rate**: In this mode the up-sampling rate is fixed to 2. Setting `fp = 960` and `fs = 480`, then the clock frequency(Fpdm) on CLK pin will be `128 * sample_rate`.

PDM Mode (RX)  PDM (Pulse-density Modulation) mode for rx channel can receive PDM format data and convert the data into PCM format. PDM RX can only support 16 bits width sample data. PDM RX only need WS pin for clock signal and DIN pin for data signal. This mode allows user to configure the down-sampling parameter `i2s_pdm_dsr_t::I2S_PDM_DSR_8S` `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`. There are two down-sampling modes in PDM RX:

- **i2s_pdm_dsr_t::I2S_PDM_DSR_8S**: In this mode, the clock frequency(Fpdm) on WS pin will be sample_rate(Fpcm) * 64.
- **i2s_pdm_dsr_t::I2S_PDM_DSR_16S**: In this mode, the clock frequency(Fpdm) on WS pin will be sample_rate(Fpcm) * 128.

ADC/DAC Mode  ADC and DAC modes only exist on ESP32 and are only supported on I2S0. Actually, they are two sub-modes of LCD/Camera mode. I2S0 can be routed directly to the internal analog-to-digital converter (ADC) and digital-to-analog converter (DAC). In other words, ADC and DAC peripherals can read or write continuously via I2S0 DMA. As they are not an actual communication mode, the I2S driver does not implement them.

Functional Overview

The I2S driver offers following services:
**Resources Management** There are three levels’ resources in I2S driver:

- **platform level**: Resources of all I2S controllers in the current target.
- **controller level**: Resources in one I2S controller.
- **channel level**: Resources of tx or rx channel in one I2S controller.

The public APIs are all channel level APIs, the channel handle `i2s_chan_handle_t` can help user to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and will be managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before going into light sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if target support APLL), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever user is reading or writing via I2S (i.e. calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after reading or writing finished.

**Finite-State Machine** There are three states for an I2S channel, they are registered, ready and running. Their relationship is shown in the following diagram:

![Finite-State Machine Diagram](image)

The `<mode>` in the diagram can be replaced by corresponding I2S communication mode like `std` for standard two-slot mode, for other information of communication mode, please refer to I2S Communication Mode section.
**Data Transport**  The data transport of I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reach the size of one DMA buffer, I2S_OUT_EOF or I2S_IN_SUC_EOF interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`, one frame here means all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the transmit case, users can input the data by calling `i2s_channel_write()`. This function will help users to copy the data from the source buffer to the DMA tx buffer and wait for the transmission finished. Then it’ll repeat until the sent bytes reach the given size. For the receive case, the function `i2s_channel_read()` will wait for receiving the message queue which contains the DMA buffer address, it will help users to copy the data from DMA rx buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions, they will keep waiting until the whole source buffer are sent or the whole destination buffer loaded, unless they exceed the max blocking time, then the error code `ESP_ERR_TIMEOUT` will return in this case. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`, users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, don’t do complex logic, floating operation or call non-reentrant functions in the callback.

**Configuration Setting**  Users can initialize a channel by corresponding function (i.e. `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` or `i2s_channel_init_tdm_mode()`), the channel will be initialized to the specific mode. If the configurations need to be updated after initialization, `i2s_channel_disable()` has to be called first to ensure the channel has stopped, and then calling corresponding ‘reconfig’ functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe**  By default, the I2S interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the EOF interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety**  All the public I2S APIs are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Notice that I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Example**

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:
**Standard TX/RX Usage**  Different slot communication formats can be generated by following helper macros for standard mode. As described above, there are three formats in standard mode, their helper macros are:

- `I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to `Standard Mode` for STD API information. And for more details, please refer to `driver/include/driver/i2s_std.h`.

**STD TX Mode**  Take 16-bit data width for example, when the data in a `uint16_t` writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|----
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 |    |

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`

</tbody>
</table>

**Note:** It’s similar when the data is 32-bit width, but take care when using 8-bit and 24-bit data width. For 8-bit width, the written buffer should still use `uint16_t` (i.e. align with 2 bytes), and only the high 8 bits will be valid, the low 8 bits are dropped, and for 24-bit width, the buffer is supposed to use `uint32_t` (i.e. align with 4 bytes), and only the high 24 bits valid, the low 8 bits are dropped.

Another point is that, for the 8-bit and 16-bit mono mode, the real data on the line are swapped. To get the correct sequence, the writing buffer need to swap the data every two bytes.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by helper macro. */
/* This helper macro is defined in 'i2s_common.h' and shared by all the i2s_common communication mode. */
/* It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate a new tx channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros is defined in 'i2s_std.h' which can only be used in STD mode. */
/* They can help to specify the slot and clock configurations for initialization or updating */
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before write data, start the tx channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_wait);

/* If the configurations of slot or clock need to be updated, */
/* stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_ */
resources */
i2s_del_channel(tx_handle);
```

**STD RX Mode**  
Take 16-bit data width for example, when the data on the line are:

<table>
<thead>
<tr>
<th></th>
<th>0x0001</th>
<th>0x0002</th>
<th>0x0003</th>
<th>0x0004</th>
<th>0x0005</th>
<th>0x0006</th>
<th>0x0007</th>
<th>0x0008</th>
</tr>
</thead>
<tbody>
<tr>
<td>ws low</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ws low</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Here is the table of the data that received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`

<table>
<thead>
<tr>
<th>data width</th>
<th>bit mode</th>
<th>slot mode</th>
<th>slot mask</th>
<th>data 0</th>
<th>data 1</th>
<th>data 2</th>
<th>data 3</th>
<th>data 4</th>
<th>data 5</th>
<th>data 6</th>
<th>data 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 bit</td>
<td>mono</td>
<td>left</td>
<td>0x0001</td>
<td>0x0000</td>
<td>0x0005</td>
<td>0x0003</td>
<td>0x0009</td>
<td>0x0007</td>
<td>0x000d</td>
<td>0x000b</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>right</td>
<td>0x0002</td>
<td>0x0000</td>
<td>0x0006</td>
<td>0x0004</td>
<td>0x000a</td>
<td>0x0008</td>
<td>0x000e</td>
<td>0x000c</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>any</td>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The receive case is a little bit complicated on ESP32. Firstly, when the data width are 8-bit or 24-bit, the received data will still align with two bytes or four bytes, which means the valid data are put in the high 8 bits in every two bytes and high 24 bits in every four bytes. For example, the received data will be 0x5A00 when the data on the line is 0x5A in 8-bit width, and receive 0x0000 5A00 if the data 0x00 005A on the line. Secondly, for
8-bit and 16-bit mono case, the data in buffer are swapped every two data, they may need to be swapped back manually to get the correct order.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;
/* Get the default channel configuration by helper macro. * This helper macro is defined in 'i2s_common.h' and shared by all the i2s_→communication mode. * It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_→MASTER);
/* Allocate a new rx channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can_→be generated by the macros * These two helper macros is defined in 'i2s_std.h' which can only be used in STD_→mode. * They can help to specify the slot and clock configurations for initialization_→or updating */
i2s_std_config_t std_cfg = {
  .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
  .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_→MODE_STEREO),
  .gpio_cfg = {
    .mclk = I2S_GPIO_UNUSED,
    .bclk = GPIO_NUM_4,
    .ws = GPIO_NUM_5,
    .dout = I2S_GPIO_UNUSED,
    .din = GPIO_NUM_19,
    .invert_flags = {
      .mclk_inv = false,
      .bclk_inv = false,
      .ws_inv = false,
    },
  },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before read data, start the rx channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel_→resources */
i2s_del_channel(rx_handle);

PDM TX usage  For PDM mode in tx channel, the slot configuration helper macro is:

  • `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

  • `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

Please refer to `PDM Mode` for PDM TX API information. And for more details, please refer to `driver/include/driver/i2s_pdm.h`.

The PDM data width is fixed to 16-bit, when the data in a int16_t writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|------
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different i2s_pdm_tx_slot_config_t::slot_mode and i2s_pdm_tx_slot_config_t::slot_mask (The PDM format on the line is transferred to PCM format for better comprehension).

</tbody>
</table>

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S tx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);
```

### PDM RX usage
For PDM mode in RX channel, the slot configuration helper macro is:

- I2S_PDM_RX_SLOT_DEFAULT_CONFIG

The clock configuration helper macro is:

- I2S_PDM_RX_CLK_DEFAULT_CONFIG

Please refer to [PDM Mode](#) for PDM RX API information. And for more details, please refer to driver/include/driver/i2s_pdm.h.

The PDM data width is fixed to 16-bit, when the data on the line (The PDM format on the line is transferred to PCM format for easier comprehension) are:

<table>
<thead>
<tr>
<th>left</th>
<th>right</th>
<th>left</th>
<th>right</th>
<th>left</th>
<th>right</th>
<th>left</th>

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S rx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
  .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
  .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE Mono),
  .gpio_cfg = {
    .clk = GPIO_NUM_5,
    .din = GPIO_NUM_19,
    .invert_flags = {
      .clk_inv = false,
    },
  },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);
```

**Full-duplex**  
Full-duplex mode will register tx and rx channel in an I2S port at the same time, and they will share the BCLK and WS signal. Currently STD and TDM communication mode are able to adopt full-duplex mode in following way, but PDM full-duplex is not supported because PDM TX and RX clock are not same.

Note that one handle can only stand for one channel, the slot and clock configurations for both tx and rx channel should be set one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate for tx and rx channel at the same time, then they will work in full-duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);
/* Set the configurations for BOTH TWO channels, since tx and rx channel have to be same in full-duplex mode */
i2s_std_config_t std_cfg = {
```
Simplex Mode  To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and gpio pins of TX/RX channel on ESP32 are not separate, therefore TX and RX channel can’t coexist on a same I2S port in simplex mode.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);
/* rx channel will be registered on another I2S, if no other available I2S unit found */
```

Chapter 2. API Reference

### Application Notes

#### How to Prevent Data Lost
For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering isr callback function to receive event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle rx queue overflow event ...
    return false;
}
```

```c
i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));
```

Please follow these steps to prevent data lost:

1. **Determine the interrupt interval.** Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., `dma_frame_num` should be as big as possible while the DMA buffer size won’t exceed its maximum value 4092. The relationships are:

   ```plaintext
   interrupt_interval(unit: sec) = dma_frame_num / sample_rate
   dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092
   ```

2. **Determine the `dma_desc_num`.** The `dma_desc_num` is decided by the max time of `i2s_channel_read` polling cycle, all the received data are supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

   ```plaintext
   dma_desc_num > polling_cycle / interrupt_interval
   ```

3. **Determine the receiving buffer size.** The receiving buffer that offered by user in `i2s_channel_read` should be able to take all the data in all dma buffers, that means it should be bigger than the total size of all the dma buffer.
buffers:

\[\text{recv\_buffer\_size} > \text{dma\_desc\_num} \times \text{dma\_buffer\_size}\]

For example, if there is an I2S application, and the known values are:

<table>
<thead>
<tr>
<th>Sample rate</th>
<th>144000 Hz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data bit width</td>
<td>32 bits</td>
</tr>
<tr>
<td>Slot num</td>
<td>2</td>
</tr>
<tr>
<td>Polling cycle</td>
<td>10 ms</td>
</tr>
</tbody>
</table>

Then the parameters dma_frame_num, dma_desc_num and recv_buf_size can be calculated according to the given known values:

\[
dma\_frame\_num \times slot\_num \times data\_bit\_width / 8 = dma\_buffer\_size \leq 4092
\]
\[
\text{interrupt\_interval} = \frac{\text{dma\_frame\_num}}{\text{sample\_rate}} = \frac{511}{144000} = 0.003549 \text{ s} = 3.549 \text{ ms}
\]
\[
dma\_desc\_num > \frac{\text{polling\_cycle}}{\text{interrupt\_interval}} = \text{cell}(\frac{10}{3.549}) = \text{cell}(2.818)_\leq 3
\]
\[
\text{recv\_buffer\_size} > dma\_desc\_num \times \text{dma\_buffer\_size} = 3 \times 4092 = 12276 \text{ bytes}
\]

API Reference

Standard Mode

Header File

- components/driver/include/driver/i2s_std.h

Functions

\[
\text{esp\_err\_t}\ i2s\_channel\_init\_std\_mode(i2s\_chan\_handle\_t\ handle, const i2s\_std\_config\_t \*std\_cfg)
\]

Initialize i2s channel to standard mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**

- `handle` [in] I2S channel handler
- `std_cfg` [in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S\_STD\_CLK\_DEFAULT\_CONFIG` The slot configuration can be generated by the helper macro `I2S\_STD\_PHILIP\__SLOT\_DEFAULT\_CONFIG`, `I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG` or `I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG`

**Returns**

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

\[
\text{esp\_err\_t}\ i2s\_channel\_reconfig\_std\_clock(i2s\_chan\_handle\_t\ handle, const i2s\_std\_clk\_config\_t \*clk\_cfg)
\]

Reconfigure the I2S clock for standard mode.
Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- handle [in] I2S channel handler
- clk_cfg [in] Standard mode clock configuration, can be generated by I2S_STD_CLK_DEFAULT_CONFIG

Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t i2s_channel_reconfig_std_slot(i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)

Reconfigure the I2S slot for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- handle [in] I2S channel handler
- slot_cfg [in] Standard mode slot configuration, can be generated by I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG and I2S_STD_MSB_SLOT_DEFAULT_CONFIG.

Returns
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t i2s_channel_reconfig_std_gpio(i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)

Reconfigure the I2S gpio for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring
Parameters

- `handle` - [in] I2S channel handler
- `gpio_cfg` - [in] Standard mode gpio configuration, specified by user

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

```c
struct i2s_std_slot_config_t
I2S slot configuration for standard mode.
```

Public Members

```c
i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample)
```

```c
i2s_slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot)
```

```c
i2s_slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data
```

```c
i2s_std_slot_mask_t slot_mask
Select the left, right or both slot
```

```c
uint32_t ws_width
WS signal width (i.e. the number of block ticks that ws signal is high)
```

```c
bool ws_pol
WS signal polarity, set true to enable high level first
```

```c
bool bit_shift
Set to enable bit shift in Philips mode
```

```c
bool msb_right
Set to place right channel data at the MSB in the FIFO
```

```c
struct i2s_std_clk_config_t
I2S clock configuration for standard mode.
```

Public Members

```c
uint32_t sample_rate_hz
I2S sample rate
```
Chapter 2. API Reference

two_clock_src_t clk_src

Choose clock source

two_mclk_multiple_t mclk_multiple

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of ‘3’ (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct i2s_std_gpio_config_t

I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t mclk

MCK pin, output

gpio_num_t bclk

BCK pin, input in slave role, output in master role

gpio_num_t ws

WS pin, input in slave role, output in master role

gpio_num_t dout

DATA pin, output

gpio_num_t din

DATA pin, input

uint32_t mclk_inv

Set 1 to invert the mclk output

uint32_t bclk_inv

Set 1 to invert the bclk input/output

uint32_t ws_inv

Set 1 to invert the ws input/output

struct i2s_std_gpio_config_t::[anonymous] invert_flags

GPIO pin invert flags

struct i2s_std_config_t

I2S standard mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_std_clk_config_t clk_cfg

Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG
Chapter 2. API Reference

```
i2s_std_slot_config_t slot_cfg

Standard mode slot configuration, can be generated by macros
I2S_STD_[mode]_SLOT_DEFAULT_CONFIG. [mode] can be replaced with PHILIP/MSB/PCM

i2s_std_gpio_config_t gpio_cfg

Standard mode gpio configuration, specified by user

Macros

I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

Philip format in 2 slots.

This file is specified for I2S standard communication mode Features:
• Philip/MSB/PCM are supported in standard mode
• Fixed to 2 slots

Parameters
• bits_per_sample -i2s data bit width
• mono_or_stereo -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

PCM(short) format in 2 slots.

Note: PCM(long) is sample as philip in 2 slots

Parameters
• bits_per_sample -i2s data bit width
• mono_or_stereo -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

MSB format in 2 slots.

Parameters
• bits_per_sample -i2s data bit width
• mono_or_stereo -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG (rate)

i2s default standard clock configuration

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

Parameters
• rate -sample rate

PDM Mode

Header File
• components/driver/include/driver/i2s_pdm.h
```
### Functions

- **esp_err_t i2s_channel_init_pdm_rx_mode**
  
  ```c
  (i2s_chan_handle_t handle, const i2s_pdm_rx_config_t *pdm_rx_cfg)
  ```

  Initialize i2s channel to PDM RX mode.

  **Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

  **Parameters**
  - `handle` [in] I2S rx channel handler
  - `pdm_rx_cfg` [in] Configurations for PDM RX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

  **Returns**
  - `ESP_OK` Initialize successfully
  - `ESP_ERR_NO_MEM` No memory for storing the channel information
  - `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
  - `ESP_ERR_INVALID_STATE` This channel is not registered

- **esp_err_t i2s_channel_reconfig_pdm_rx_clock**
  
  ```c
  (i2s_chan_handle_t handle, const i2s_pdm_rx_clk_config_t *clk_cfg)
  ```

  Reconfigure the I2S clock for PDM RX mode.

  **Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

  **Parameters**
  - `handle` [in] I2S rx channel handler
  - `clk_cfg` [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

  **Returns**
  - `ESP_OK` Set clock successfully
  - `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
  - `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

- **esp_err_t i2s_channel_reconfig_pdm_rx_slot**
  
  ```c
  (i2s_chan_handle_t handle, const i2s_pdm_rx_slot_config_t *slot_cfg)
  ```

  Reconfigure the I2S slot for PDM RX mode.

  **Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

  **Parameters**
  - `handle` [in] I2S rx channel handler
  - `clk_cfg` [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

  **Returns**
  - `ESP_OK` Set clock successfully
  - `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
  - `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., ‘i2s_channel_init_pdm_rx_mode’ has been called before reconfiguring.
Chapter 2. API Reference

`i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

### Parameters
- `handle` - [in] I2S rx channel handler
- `slot_cfg` - [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

### Returns
- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_rx_gpio(i2s_chan_handle_t handle, const i2s_pdm_rx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM RX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

---

The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

### Parameters
- `handle` - [in] I2S rx channel handler
- `gpio_cfg` - [in] PDM RX mode gpio configuration, specified by user

### Returns
- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

```c
esp_err_t i2s_channel_init_pdm_tx_mode(i2s_chan_handle_t handle, const i2s_pdm_tx_config_t *pdm_tx_cfg)
```

Initialize i2s channel to PDM TX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

### Parameters
- `handle` - [in] I2S tx channel handler
- `pdm_tx_cfg` - [in] Configurations for PDM TX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

### Returns
- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered
esp_err_t *i2s_channel_reconfig_pdm_tx_clock(i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)

Reconfigure the I2S clock for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring

**Parameters**

- handle -[in] I2S tx channel handler
- clk_cfg -[in] PDM TX mode clock configuration, can be generated by I2S_PDM_TX_CLK_DEFAULT_CONFIG

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t *i2s_channel_reconfig_pdm_tx_slot(i2s_chan_handle_t handle, const i2s_pdm_tx_slot_config_t *slot_cfg)

Reconfigure the I2S slot for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring

**Parameters**

- handle -[in] I2S tx channel handler
- slot_cfg -[in] PDM TX mode slot configuration, can be generated by I2S_PDM_TX_SLOT_DEFAULT_CONFIG

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t *i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)

Reconfigure the I2S gpio for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.
Note: The input channel handle has to be initialized to PDM TX mode, i.e., `m_i2s_channel_init_pdm_tx_mode` has been called before reconfiguring.

Parameters
- **handle** [in] I2S tx channel handler
- **gpio_cfg** [in] PDM TX mode gpio configuration, specified by user

Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

```c
struct i2s_pdm_rx_slot_config_t
I2S slot configuration for pdm rx mode.
```

Public Members

```c
i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_pdm_rx_clk_config_t clk_cfg
```

PDM RX clock configurations, can be generated by macro I2S_PDM_RX_CLK_DEFAULT_CONFIG

```c
i2s_pdm_rx_slot_config_t slot_cfg
```

PDM RX slot configurations, can be generated by macro I2S_PDM_RX_SLOT_DEFAULT_CONFIG

```c
i2s_pdm_rx_gpio_config_t gpio_cfg
```

PDM RX slot configurations, specified by user

```c
struct i2s_pdm_tx_slot_config_t
```

I2S slot configuration for pdm tx mode.

Public Members

```c
i2s_data_bit_width_t data_bit_width
```

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

```c
i2s_slot_bit_width_t slot_bit_width
```

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

```c
i2s_slot_mode_t slot_mode
```

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

```c
i2s_pdm_slot_mask_t slot_mask
```

Slot mask to choose left or right slot
uint32_t sd_prescale
Sigma-delta filter prescale

i2s_pdm_sig_scale_t sd_scale
Sigma-delta filter scaling value

i2s_pdm_sig_scale_t hp_scale
High pass filter scaling value

i2s_pdm_sig_scale_t lp_scale
Low pass filter scaling value

i2s_pdm_sig_scale_t sinc_scale
Sinc filter scaling value

struct i2s_pdm_tx_clk_config_t
I2S clock configuration for pdm tx mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source

i2s_mclk_multiple_t mclk_multiple
The multiple of mclk to the sample rate

uint32_t up_sample_fp
Up-sampling param fp

uint32_t up_sample_fs
Up-sampling param fs

struct i2s_pdm_tx_gpio_config_t
I2S PDM tx mode GPIO pins configuration.

Public Members

gpio_num_t clk
PDM clk pin, output

gpio_num_t dout
DATA pin, output
uint32_t clk_inv
    Set 1 to invert the clk output

struct i2s_pdm_tx_GPIO_config_t::[anonymous] invert_flags
    GPIO pin invert flags

struct i2s_pdm_tx_config_t
    I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_pdm_tx_clk_config_t clk_cfg
    PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t slot_cfg
    PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t gpio_cfg
    PDM TX gpio configurations, specified by user

Macros

I2S_PDM_RX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    PDM format in 2 slots(RX)

    This file is specified for I2S PDM communication mode Features:
    • Only support PDM tx/rx mode
    • Fixed to 2 slots
    • Data bit width only support 16 bits

    Parameters
        • bits_per_sample -i2s data bit width, only support 16 bits for PDM mode
        • mono_or_stereo -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_RX_CLK_DEFAULT_CONFIG (rate)
    i2s default pdm rx clock configuration

    Parameters
        • rate -sample rate

I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    PDM style in 2 slots(TX)

    Parameters
        • bits_per_sample -i2s data bit width, only support 16 bits for PDM mode
        • mono_or_stereo -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)
    i2s default pdm tx clock configuration

Note: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*480000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.
Chapter 2. API Reference

I2S Driver

Header File

- components/driver/include/driver/i2s_common.h

Functions

```c
esp_err_t i2s_new_channel(const i2s_chan_config_t *chan_cfg,
i2s_chan_handle_t *ret_tx_handle,
i2s_chan_handle_t *ret_rx_handle)
```

Allocate new I2S channel(s)

**Parameters**

- `rate` - sample rate

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**

- `chan_cfg` - [in] I2S controller channel configurations
- `ret_tx_handle` - [out] I2S channel handler used for managing the sending channel(optional)
- `ret_rx_handle` - [out] I2S channel handler used for managing the receiving channel(optional)

**Returns**

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in i2s_chan_config_t
- ESP_ERR_NOT_FOUND No available I2S channel found

```c
esp_err_t i2s_del_channel(i2s_chan_handle_t handle)
```

Delete the i2S channel.

**Note:** Only allowed to be called when the i2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).
Parameters handle — [in] I2S channel handler
    • ESP_OK Delete successfully
    • ESP_ERR_INVALID_ARG NULL pointer

esp_err_t i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
Get I2S channel information.

Parameters
    • handle — [in] I2S channel handler
    • chan_info — [out] I2S channel basic information

Returns
    • ESP_OK Get i2s channel information success
    • ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an i2s channel handle or not available any more
    • ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

esp_err_t i2s_channel_enable(i2s_chan_handle_t handle)
Enable the i2s channel.

Note: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

Note: Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

Parameters handle — [in] I2S channel handler
    • ESP_OK Start successfully
    • ESP_ERR_INVALID_ARG NULL pointer
    • ESP_ERR_INVALID_STATE This channel has not initialized or already started

esp_err_t i2s_channel_disable(i2s_chan_handle_t handle)
Disable the i2s channel.

Note: Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

Note: Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

Parameters handle — [in] I2S channel handler
Returns
    • ESP_OK Stop successfully
    • ESP_ERR_INVALID_ARG NULL pointer
    • ESP_ERR_INVALID_STATE This channel has not stated

esp_err_t i2s_channel_write(i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)
I2S write data.

Note: Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

Parameters
- **handle**  [in] I2S channel handler
- **src**  [in] The pointer of sent data buffer
- **size**  [in] Max data buffer length
- **bytes_written**  [out] Byte number that actually be sent
- **timeout_ms**  [in] Max block time

Returns
- **ESP_OK** Write successfully
- **ESP_ERR_INVALID_ARG** NULL pointer or this handle is not tx handle
- **ESP_ERR_TIMEOUT** Writing timeout, no writing event received from ISR within ticks_to_wait
- **ESP_ERR_INVALID_STATE** I2S is not ready to write

```c
esp_err_t i2s_channel_write(i2s_chan_handle_t handle, void* src, size_t size, size_t* bytes_written, uint32_t timeout_ms)
```

I2S read data.

Note: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

Parameters
- **handle**  [in] I2S channel handler
- **dest**  [in] The pointer of receiving data buffer
- **size**  [in] Max data buffer length
- **bytes_read**  [out] Byte number that actually be read
- **timeout_ms**  [in] Max block time

Returns
- **ESP_OK** Read successfully
- **ESP_ERR_INVALID_ARG** NULL pointer or this handle is not rx handle
- **ESP_ERR_TIMEOUT** Reading timeout, no reading event received from ISR within ticks_to_wait
- **ESP_ERR_INVALID_STATE** I2S is not ready to read

```c
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void* dest, size_t size, size_t* bytes_read, uint32_t timeout_ms)
```

Set event callbacks for I2S channel.

Note: Only allowed to be called when the channel state is REGISTARED / READY, (i.e., before channel starts)

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.
Note: When `CONFIG_I2S_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

Parameters
- handle – [in] I2S channel handler
- callbacks – [in] Group of callback functions
- user_data – [in] User data, which will be passed to callback functions directly

Returns
- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTARED or READY

Structures

```c
struct i2s_event_callbacks_t
```

Group of I2S callbacks.

Note: The callbacks are all running under ISR environment

Note: When `CONFIG_I2S_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

```c
i2s_isr_callback_t on_recv
```

Callback of data received event, only for rx channel. The event data includes DMA buffer address and size that just finished receiving data

```c
i2s_isr_callback_t on_recv_q_ovf
```

Callback of receiving queue overflowed event, only for rx channel. The event data includes buffer size that has been overwritten

```c
i2s_isr_callback_t on_sent
```

Callback of data sent event, only for tx channel. The event data includes DMA buffer address and size that just finished sending data

```c
i2s_isr_callback_t on_send_q_ovf
```

Callback of sending queue overflowed event, only for tx channel. The event data includes buffer size that has been overwritten

```c
struct i2s_chan_config_t
```

I2S controller channel configuration.

Public Members
i2s_port_t id
I2S port id

i2s_role_t role
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t dma_desc_num
I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t dma_frame_num
I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of ‘3’ when the data bit width is 24.

bool auto_clear
Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct i2s_chan_info_t
I2S channel information.

Public Members

i2s_port_t id
I2S port id

i2s_role_t role
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

i2s_dir_t dir
I2S channel direction

i2s_comm_mode_t mode
I2S channel communication mode

i2s_chan_handle_t pair_chan
I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros
I2S_CHANNEL_DEFAULT_CONFIG(i2s_num, i2s_role)
get default I2S property

I2S_GPIO_UNUSED
Used in i2s_gpio_config_t for signals which are not used

I2S Types

Header File
- components/driver/include/driver/i2s_types.h
Chapter 2. API Reference

Structures

struct i2s_event_data_t
Event structure used in I2S event queue.

Public Members

void **data
The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback NULL for on_recv_q_ovf and on_send_q_ovf callback

size_t size
The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_t *i2s_chan_handle_t
i2s channel handle, the control unit of the i2s driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t
I2S controller port number, the max port number is (SOC_I2S_NUM -1).
Values:

enumerator I2S_NUM_0
I2S controller port 0

enumerator I2S_NUM_1
I2S controller port 1

enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t
I2S controller communication mode.
Values:

enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support philip/MSB/PCM format
enumerator **I2S_COMM_MODE_PDM**
   I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_NONE**
   Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**
   The multiple of mclk to sample rate.
   Values:

   enumerator **I2S_MCLK_MULTIPLE_128**
      mclk = sample_rate * 128
   enumerator **I2S_MCLK_MULTIPLE_256**
      mclk = sample_rate * 256
   enumerator **I2S_MCLK_MULTIPLE_384**
      mclk = sample_rate * 384
   enumerator **I2S_MCLK_MULTIPLE_512**
      mclk = sample_rate * 512

**Header File**
- components/hal/include/hal/i2s_types.h

**Type Definitions**

typedef **soc_periph_i2s_clk_src_t i2s_clock_src_t**
   I2S clock source

**Enumerations**

enum **i2s_slot_mode_t**
   I2S channel slot mode.
   Values:

   enumerator **I2S_SLOT_MODE_MONO**
      I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

   enumerator **I2S_SLOT_MODE_STEREO**
      I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**
   I2S channel direction.
   Values:
enumerator **I2S_DIR_RX**
I2S channel direction RX

enumerator **I2S_DIR_TX**
I2S channel direction TX

**enum i2s_role_t**
I2S controller role.
**Values:**

enumerator **I2S_ROLE_MASTER**
I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S_ROLE_SLAVE**
I2S controller slave role, bclk and ws signal will be set to input

**enum i2s_data_bit_width_t**
Available data bit width in one slot.
**Values:**

enumerator **I2S_DATA_BIT_WIDTH_8BIT**
I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**
I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**
I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**
I2S channel data bit-width: 32

**enum i2s_slot_bit_width_t**
Total slot bit width in one slot.
**Values:**

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**
I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**
I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**
I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**
I2S channel slot bit-width: 24
enumerator **I2S_SLOT_BIT_WIDTH_32BIT**
I2S channel slot bit-width: 32

**enum i2s_pdm_dsr_t**
I2S PDM RX down-sampling mode.

*Values:*

enumerator **I2S_PDM_DSR_8S**
downsampling number is 8 for PDM RX mode

enumerator **I2S_PDM_DSR_16S**
downsampling number is 16 for PDM RX mode

enumerator **I2S_PDM_DSR_MAX**

**enum i2s_pdm_sig_scale_t**
pdm tx signal scaling mode

*Values:*

enumerator **I2S_PDM_SIG_SCALING_DIV_2**
I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**
I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**
I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**
I2S TX PDM signal scaling: x4

**enum i2s_std_slot_mask_t**
I2S slot select in standard mode.

*Note:* It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference.

*Values:*

enumerator **I2S_STD_SLOT_LEFT**
I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**
I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**
I2S transmits or receives both left and right slot
enum i2s_pdm_slot_mask_t
    I2S slot select in PDM mode.

    Values:

    enumerator I2S_PDM SLOT RIGHT
        I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

    enumerator I2S_PDM SLOT LEFT
        I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

    enumerator I2S_PDM SLOT BOTH
        I2S PDM transmits or receives both two slots

2.6.10 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Universal SPI LCD example with SPI touch - peripherals/lcd/spi_lcd_touch
- Jpeg decoding and LCD display - peripherals/lcd/tjgpd
- I80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- RGB panel example with scatter chart UI - peripherals/lcd/rgb_panel
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Type Definitions

typedef soc_periph_lcd_clk_src_t lcd_clock_source_t
    LCD clock source.
Chapter 2. API Reference

Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t

Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t

Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t

LCD color space type definition.

Values:

enumerator ESP_LCD_COLOR_SPACE_RGB

Color space: RGB

enumerator ESP_LCD_COLOR_SPACE_BGR

Color space: BGR

enumerator ESP_LCD_COLOR_SPACE_MONOCHROME

Color space: monochrome

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- io -[in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- lcd_cmd -[in] The specific LCD command, set to -1 if no command needed
- param -[out] Buffer for the command data
- param_size -[in] Size of param buffer

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success
**esp_err_t esp_lcd_panel_io_tx_param**(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

### Parameters
- **io** - [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`.
- **lcd_cmd** - [in] The specific LCD command (set to -1 if no command needed - only in SPI and I2C).
- **param** - [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command.
- **param_size** - [in] Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command.

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid.
- ESP_OK on success.

**esp_err_t esp_lcd_panel_io_tx_color**(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

### Parameters
- **io** - [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`.
- **color** - [in] Buffer that holds the RGB color data.
- **color_size** - [in] Size of `color` in memory, in bytes.

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid.
- ESP_OK on success.

**esp_err_t esp_lcd_panel_io_del**(esp_lcd_panel_io_handle_t io)

Destory LCD panel IO handle (deinitialize panel and free all corresponding resource).

### Parameters
- **io** - [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`.

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid.
- ESP_OK on success.

**esp_err_t esp_lcd_new_panel_io_spi**(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)

Create LCD panel IO handle, for SPI interface.

### Parameters
- **bus** - [in] SPI bus handle.
**Chapter 2. API Reference**

- **io_config** - [in] IO configuration, for SPI interface
- **ret_io** - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const
eсп_lcd_panel_io_i2c_config_t *io_config,
    esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

**Parameters**
- **bus** - [in] I2C bus handle
- **io_config** - [in] IO configuration, for I2C interface
- **ret_io** - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config,
    esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

**Parameters**
- **bus_config** - [in] Bus configuration
- **ret_bus** - [out] Returned bus handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

**Parameters**
- **bus** - [in] Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const
eсп_lcd_panel_io_i80_config_t *io_config,
    esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

**Parameters**
- **bus** - [in] Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
- **io_config** - [in] IO configuration, for i80 interface
- **ret_io** - [out] Returned panel IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Structures**
Chapter 2.  API Reference

struct esp_lcd_panel_io_event_data_t
    Type of LCD panel IO event data.

struct esp_lcd_panel_io_spi_config_t
    Panel IO configuration structure, for SPI interface.

Public Members

int cs_gpio_num
    GPIO used for CS line

int dc_gpio_num
    GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int spi_mode
    Traditional SPI mode (0~3)

unsigned int pclk_hz
    Frequency of pixel clock

size_t trans_queue_depth
    Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data transfer has finished

void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_low_on_data
    If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int octal_mode
    transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int lsb_first
    transmit LSB bit first

struct esp_lcd_panel_io_spi_config_t::[anonymous] flags
    Extra flags to fine-tune the SPI device

struct esp_lcd_panel_io_i2c_config_t
    Panel IO configuration structure, for I2C interface.
Public Members

uint32_t `dev_addr`
  I2C device address

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
  Callback invoked when color data transfer has finished

void *`user_ctx`
  User private data, passed directly to on_color_trans_done’s user_ctx

size_t `control_phase_bytes`
  I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int `dc_bit_offset`
  Offset of the D/C selection bit in control phase

int `lcd_cmd_bits`
  Bit-width of LCD command

int `lcd_param_bits`
  Bit-width of LCD parameter

unsigned int `dc_low_on_data`
  If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `disable_control_phase`
  If this flag is enabled, the control phase isn’t used

struct `esp_lcd_panel_io_i2c_config_t`: [anonymous] `flags`
  Extra flags to fine-tune the I2C device

struct `esp_lcd_i80_bus_config_t`
  LCD Intel 8080 bus configuration structure.

Public Members

int `dc_gpio_num`
  GPIO used for D/C line

int `wr_gpio_num`
  GPIO used for WR line

`lcd_clock_source_t clk_src`
  Clock source for the I80 LCD peripheral

int `data_gpio_nums`[(24)]
  GPIOs used for data lines
size_t **bus_width**
Number of data lines, 8 or 16

size_t **max_transfer_bytes**
Maximum transfer size, this determines the length of internal DMA link

size_t **psram_trans_align**
DMA transfer alignment for data allocated from PSRAM

size_t **sram_trans_align**
DMA transfer alignment for data allocated from SRAM

struct **esp_lcd_panel_io_i80_config_t**
Panel IO configuration structure, for intel 8080 interface.

**Public Members**

int **cs_gpio_num**
GPIO used for CS line, set to -1 will claim exclusively use of I80 bus

uint32_t **pclk_hz**
Frequency of pixel clock

size_t **trans_queue_depth**
Transaction queue size, larger queue, higher throughput

**esp_lcd_panel_io_color_trans_done_cb_t** **on_color_trans_done**
Callback invoked when color data was transferred done

void **user_ctx**
User private data, passed directly to on_color_trans_done’s user_ctx

int **lcd_cmd_bits**
Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_idle_level**
Level of DC line in IDLE phase

unsigned int **dc_cmd_level**
Level of DC line in CMD phase

unsigned int **dc_dummy_level**
Level of DC line in DUMMY phase
unsigned int dc_data_level
    Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
    Each i80 device might have its own D/C control logic

unsigned int cs_active_high
    If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int reverse_color_bits
    Reverse the data bits, D[1:N] -> D[0:N]

unsigned int swap_color_bytes
    Swap adjacent two color bytes

unsigned int pclk_active_neg
    The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int pclk_idle_low
    The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] flags
    Panel IO config flags

Type Definitions

typedef void *esp_lcd_spi_bus_handle_t
    Type of LCD SPI bus handle

typedef void *esp_lcd_i2c_bus_handle_t
    Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
    Type of LCD intel 8080 bus handle

typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
     esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

    Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

    Param panel_io [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
    Param edata [in] Panel IO event data, fed by driver
    Param user_ctx [in] User data, passed from esp_lcd_panel_io_xxx_config_t
    Return Whether a high priority task has been waken up by this function

Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h
## Functions

**esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)**

Reset LCD panel.

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

**Parameters**

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

---

**esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)**

Initialize LCD panel.

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

**Parameters**

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

---

**esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)**

Deinitialize the LCD panel.

**Parameters**

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

---

**esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)**

Draw bitmap on LCD panel.

**Parameters**

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** - [in] Start index on x-axis (x_start included)
- **y_start** - [in] Start index on y-axis (y_start included)
- **x_end** - [in] End index on x-axis (x_end not included)
- **y_end** - [in] End index on y-axis (y_end not included)
- **color_data** - [in] RGB color data that will be dumped to the specific window range

**Returns**

- ESP_OK on success

---

**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**

Mirror the LCD panel on specific axis.

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

**Parameters**

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** - [in] Whether the panel will be mirrored about the x axis
- **mirror_y** - [in] Whether the panel will be mirrored about the y axis
Returns

• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_swap_xy**(esp_lcd_panel_handle_t panel, bool swap_axes)
Swap/Exchange x and y axis.

**Note:** Combined with **esp_lcd_panel_mirror()**, one can realize screen rotation

**Parameters**

- panel -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- swap_axes -[in] Whether to swap the x and y axis

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_set_gap**(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Parameters**

- panel -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- x_gap -[in] Extra gap on x axis, in pixels
- y_gap -[in] Extra gap on y axis, in pixels

**Returns**

- ESP_OK on success

**esp_err_t esp_lcd_panel_invert_color**(esp_lcd_panel_handle_t panel, bool invert_color_data)
Invert the color (bit-wise invert the color data line)

**Parameters**

- panel -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- invert_color_data -[in] Whether to invert the color data

**Returns**

- ESP_OK on success

**esp_err_t esp_lcd_panel_disp_on_off**(esp_lcd_panel_handle_t panel, bool on_off)
Turn on or off the display.

**Parameters**

- panel -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- on_off -[in] True to turns on display, False to turns off display

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_disp_off**(esp_lcd_panel_handle_t panel, bool off)
Turn off the display.
Chapter 2. API Reference

Parameters
- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** – [in] Whether to turn off the screen

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File
- `components/esp_lcd/include/esp_lcd_panel_rgb.h`
- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

Functions

```c
esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

Parameters
- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

Parameters
- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

Parameters
- **io** – [in] LCD panel IO handle
- **panel_dev_config** – [in] general panel device configuration
- **ret_panel** – [out] Returned LCD panel handle

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

Structures

struct esp_lcd_panel_dev_config_t

Configuration structure for panel device.

Public Members

int reset_gpio_num

GPIO used to reset the LCD panel, set to -1 if it’s not used

esp_lcd_color_space_t color_space

Set the color space used by the LCD panel

unsigned int bits_per_pixel

Color depth, in bpp

unsigned int reset_active_high

Setting this if the panel reset is high level active

struct esp_lcd_panel_dev_config_t::[anonymous] flags

LCD panel config flags

void *vendor_config

Vendor specific configuration, optional, left as NULL if not used

2.6.11 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. Timer Configuration by specifying the PWM signal’s frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.
Timer Configuration

Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 5: Characteristics of ESP32 LEDC source clocks

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock freq</th>
<th>Speed mode</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB_CLK</td>
<td>80 MHz</td>
<td>High/Low</td>
<td>/</td>
</tr>
<tr>
<td>REF_TICK</td>
<td>1 MHz</td>
<td>High/Low</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
<tr>
<td>RTC8M_CLK</td>
<td>~8 MHz</td>
<td>Low</td>
<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
</tbody>
</table>

Note:

1. On ESP32, if RTCxM_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

Channel Configuration

When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Fig. 9: Key Settings of LED PWM Controller’s API
Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.

The range of the duty cycle values passed to functions depends on selected duty resolution and should be from 0 to \((2^{\text{duty resolution}}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes. Due to hardware limitations, there is no way to stop a fade before it reaches its target duty.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`
Chapter 2. API Reference

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion. For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**LEDC High and Low Speed Mode**

High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see *ESP32 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF].

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of \(0.012\%\) (\(2^{13} = 8192\) discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the *ESP32 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: `peripherals/ledc/ledc_fade`. The LEDC basic example: `peripherals/ledc/ledc_basic`. 
Chapter 2. API Reference

API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LED channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Parameters**
- `ledc_conf` - Pointer of LEDC channel configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Parameters**
- `timer_conf` - Pointer of LEDC timer configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LED update channel parameters.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)`

Set LEDC output gpio.

**Parameters**
- `gpio_num` - The LEDC output gpio
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

**Note:**
This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use ledc_channel_config() instead to fully configure a LEDC channel.
• **ledc_channel** – LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)
```

LEDC stop. Disable LEDC output, and set idle level.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **idle_level** – Set output idle level after LEDC stops.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
```

LEDC set channel frequency (Hz)

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** – LEDC timer index (0-3), select from `ledc_timer_t`
- **freq_hz** – Set the LEDC frequency

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Cannot find a proper pre-divider number base on the given frequency and the current duty_resolution.

```c
uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)
```

LEDC get channel frequency (Hz)

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** – LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**
- 0 error
- Others Current LEDC frequency

```c
esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.
Chapter 2. API Reference

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, \(2^{\text{duty}\_\text{resolution}} - 1\)]
- **hpoint** - Set the LEDC hpoint value (max: 0xfffff)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn’t take effect until the next cycle.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty
**esp_err_t ledc_set_fade**

```c
ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
    ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num,
    uint32_t duty_scale)
```

LEDC set gradient. Set LEDC gradient. After the function calls the `ledc_update_duty` function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` – LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty` – Set the start of the gradient duty, the range of duty setting is 
  `[0, (2**duty_resolution) - 1]`
- `fade_direction` – Set the direction of the gradient
- `step_num` – Set the number of the gradient
- `duty_cycle_num` – Set how many LEDC tick each time the gradient lasts
- `duty_scale` – Set gradient change amplitude

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**esp_err_t ledc_isr_register**

```c
ledc_isr_register(void (*fn)(void*), void* arg, int intr_alloc_flags,
    ledc_isr_handle_t *handle)
```

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- `fn` – Interrupt handler function.
- `arg` – User-supplied argument passed to the handler function.
- `intr_alloc_flags` – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle` – Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**esp_err_t ledc_timer_set**

```c
ledc_timer_set(ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
    uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Parameters**

- `speed_mode` – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel` – Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider` – Timer clock divide value, the timer clock is divided from the selected clock source
- `duty_resolution` – Resolution of duty setting in number of bits. The range of duty values is `\([0, (2**duty_resolution)]\)`
- `clk_src` – Select LEDC source clock.

**Returns**

- `(-1)` Parameter error
- Other Current LEDC duty

**esp_err_t ledc_timer_rst**

```c
ledc_timer_rst(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Reset LEDC timer.
Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

*esp_err_t* ledc_timer_pause(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

*esp_err_t* ledc_timer_resume(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

*esp_err_t* ledc_bind_channel_timer(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

*esp_err_t* ledc_set_fade_with_step(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

**Note:** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note:** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress.
on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters

- **speed_mode**  - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**  - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty**  - Target duty of fading \([0,(2^{\text{duty_resolution}})-1]\)
- **scale**  - Controls the increase or decrease step scale.
- **cycle_num**  - Increase or decrease the duty every cycle_num cycles

### Returns

- **ESP_ERR_INVALID_ARG**  - Parameter error
- **ESP_OK**  - Success
- **ESP_ERR.INVALID_STATE**  - Fade function not installed.
- **ESP_FAIL**  - Fade function init error

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters

- **speed_mode**  - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**  - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty**  - Target duty of fading \([0,(2^{\text{duty_resolution}})-1]\)
- **max_fade_time_ms**  - The maximum time of the fading (ms).

### Returns

- **ESP_ERR.INVALID_ARG**  - Parameter error
- **ESP_OK**  - Success
- **ESP_ERR.INVALID_STATE**  - Fade function already installed.

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters intr_alloc_flags**  - Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_.*` values. See `esp_intr_alloc.h` for more info.

**Returns**

- **ESP_OK**  - Success
- **ESP_ERR.INVALID_STATE**  - Fade function already installed.
void ledc_fade_func_uninstall (void)
Uninstall LEDC fade function.

esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
Start LEDC fading.

Note: Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

Note: Starting fade operation with this API is not thread-safe, use with care.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters
• speed_mode - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel - LEDC channel number
• fade_mode - Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT.Done mode is selected.

Returns
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_ERR_INVALID_ARG Parameter error.

esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
A thread-safe API to set duty for LEDC channel and return when duty updated.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters
• speed_mode - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• duty - Set the LEDC duty, the range of duty setting is [0, (2^duty_resolution) - 1]
• hpoint - Set the LEDC hpoint value(max: 0xfffff)

esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
A thread-safe API to set and start LEDC fade function, with a limited time.

Note: Call ledc_fade_func_install() once, before calling this function.
**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, \((2^{\text{duty_resolution}}) - 1\)]
- `max_fade_time_ms` - The maximum time of the fading (ms).
- `fade_mode` - Choose blocking or non-blocking mode

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note:** Call ledc_fade_func_install() once before calling this function.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, \((2^{\text{duty_resolution}}) - 1\)]
- `scale` - Controls the increase or decrease step scale.
- `cycle_num` - Increase or decrease the duty every cycle_num cycles
- `fade_mode` - Choose blocking or non-blocking mode

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.
Chapter 2. API Reference

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** – Group of LEDC callback functions
- **user_arg** – User registered data for the callback function

**Returns**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Structures**

```c
struct ledc_channel_config_t
    Configuration parameters of LEDC channel for ledc_channel_config function.
```

**Public Members**

```c
int gpio_num
    the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16
```

```c
ledc_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode
```

```c
ledc_channel_t channel
    LEDC channel (0 - 7)
```

```c
ledc_intr_type_t intr_type
    configure interrupt, Fade interrupt enable or Fade interrupt disable
```

```c
ledc_timer_t timer_sel
    Select the timer source of channel (0 - 3)
```

```c
uint32_t duty
    LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]
```

```c
int hpoint
    LEDC channel hpoint value, the max value is 0xffffffff
```

```c
unsigned int output_invert
    Enable (1) or disable (0) gpio output invert
```

```c
struct ledc_channel_config_t::[anonymous] flags
    LEDC flags
```

```c
struct ledc_timer_config_t
    Configuration parameters of LEDC Timer timer for ledc_timer_config function.
```
Public Members

`ledc_mode_t speed_mode`
LEDC speed speed_mode, high-speed mode or low-speed mode

`ledc_timer_bit_t duty_resolution`
LEDC channel duty resolution

`ledc_timer_t timer_num`
The timer source of channel (0 - 3)

`uint32_t freq_hz`
LEDC timer frequency (Hz)

`ledc_clk_cfg_t clk_cfg`
Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RTC8M_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RTC8M_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct `ledc_cb_param_t`
LEDC callback parameter.

Public Members

`ledc_cb_event_t event`
Event name

`uint32_t speed_mode`
Speed mode of the LEDC channel group

`uint32_t channel`
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

`uint32_t duty`
LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

struct `ledc_cbs_t`
Group of supported LEDC callbacks.

Note: The callbacks are all running under ISR environment

Public Members

`ledc_cb_t fade_cb`
LEDC fade_end callback function
Chapter 2. API Reference

Macros

**LEDC_APB_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, APB_CLK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible

**LEDC_REF_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, REF_TICK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible

**LEDC_ERR_DUTY**

**LEDC_ERR_VAL**

Type Definitions

typedef **intr_handle_t ledc_isr_handle_t**

typedef bool (*)(**ledc_cb_t**) (const **ledc_cb_param_t** *param, void *user_arg)
Type of LEDC event callback.

- **Param param** LEDC callback parameter
- **Param user_arg** User registered data

Enumerations

enum **ledc_cb_event_t**
LEDC callback event type.

*Values:*

- **enumerator LEDC_FADE_END_EVT**
  LEDC fade end event

Header File

- components/hal/include/hal/ledc_types.h

Enumerations

enum **ledc_mode_t**

*Values:*

- **enumerator LEDC_HIGH_SPEED_MODE**
  LEDC high speed speed_mode

- **enumerator LEDC_LOW_SPEED_MODE**
  LEDC low speed speed_mode
enumerator LEDC_SPEED_MODE_MAX
  LEDC speed limit

enum ledc_intr_type_t
  Values:

  enumerator LEDC_INTR_DISABLE
    Disable LEDC interrupt

  enumerator LEDC_INTR_FADE_END
    Enable LEDC interrupt

  enumerator LEDC_INTR_MAX

enum ledc_duty_direction_t
  Values:

  enumerator LEDC_DUTY_DIR_DECREASE
    LEDC duty decrease direction

  enumerator LEDC_DUTY_DIR_INCREASE
    LEDC duty increase direction

  enumerator LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t
  Values:

  enumerator LEDC_SLOW_CLK_RTC8M
    LEDC low speed timer clock source is 8MHz RTC clock

  enumerator LEDC_SLOW_CLK_APB
    LEDC low speed timer clock source is 80MHz APB clock

enum ledc_clk_cfg_t
  In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.
  Values:

  enumerator LEDC_AUTO_CLK
    The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

  enumerator LEDC_USE_APB_CLK
    LEDC timer select APB clock as source clock

  enumerator LEDC_USE_RTC8M_CLK
    LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
Chapter 2. API Reference

enumerator **LEDC_USE_REF_TICK**
LEDC timer select REF_TICK clock as source clock

enum **ledc_clk_src_t**
Values:

counter **LEDC_REF_TICK**
LEDC timer clock divided from reference tick (1Mhz)

counter **LEDC_APB_CLK**
LEDC timer clock divided from APB clock (80Mhz)

counter **LEDC_SCLK**
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum **ledc_timer_t**
Values:

counter **LEDC_TIMER_0**
LEDC timer 0

counter **LEDC_TIMER_1**
LEDC timer 1

counter **LEDC_TIMER_2**
LEDC timer 2

counter **LEDC_TIMER_3**
LEDC timer 3

counter **LEDC_TIMER_MAX**

enum **ledc_channel_t**
Values:

counter **LEDC_CHANNEL_0**
LEDC channel 0

counter **LEDC_CHANNEL_1**
LEDC channel 1

counter **LEDC_CHANNEL_2**
LEDC channel 2

counter **LEDC_CHANNEL_3**
LEDC channel 3
enumerator LEDC_CHANNEL_4
    LEDC channel 4

enumerator LEDC_CHANNEL_5
    LEDC channel 5

enumerator LEDC_CHANNEL_6
    LEDC channel 6

enumerator LEDC_CHANNEL_7
    LEDC channel 7

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
    Values:

enumerator LEDC_TIMER_1_BIT
    LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
    LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
    LEDC PWM duty resolution of 4 bits

enumerator LEDC_TIMER_5_BIT
    LEDC PWM duty resolution of 5 bits

enumerator LEDC_TIMER_6_BIT
    LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
    LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
    LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
    LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
    LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
    LEDC PWM duty resolution of 11 bits
enumerator **LEDC_TIMER_12_BIT**
LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**
LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**
LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_15_BIT**
LEDC PWM duty resolution of 15 bits

enumerator **LEDC_TIMER_16_BIT**
LEDC PWM duty resolution of 16 bits

enumerator **LEDC_TIMER_17_BIT**
LEDC PWM duty resolution of 17 bits

enumerator **LEDC_TIMER_18_BIT**
LEDC PWM duty resolution of 18 bits

enumerator **LEDC_TIMER_19_BIT**
LEDC PWM duty resolution of 19 bits

enumerator **LEDC_TIMER_20_BIT**
LEDC PWM duty resolution of 20 bits

enumerator **LEDC_TIMER_BIT_MAX**

**enum ledc_fade_mode_t**

*Values:*

enumerator **LEDC_FADE_NO_WAIT**
LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**
LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

### 2.6.12 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g. brushed/brushless DC motor, RC servo motor
- Switch mode based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog value like speed, distance
• Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

- **MCPWM Timer**: The time base of the final PWM signal, it also determines the event timing of other sub-modules.
- **MCPWM Operator**: The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead-time and carrier modulator.
- **MCPWM Comparator**: The compare module takes the time-base count value as input, and continuously compare to the threshold value that configured by user. When the time-base counter is equal to any of the threshold value, an compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator**: One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered from other submodules like MCPWM Timer, MCPWM Comparator.
- **MCPWM Fault**: The fault module is used to detect the fault condition from outside, mainly via GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state, to protect the system from damage.
- **MCPWM Sync**: The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from GPIO matrix or from MCPWM Timer event.
- **Dead Time**: This submodule is used to insert extra delay to the existing PWM edges that generated in the previous steps.
- **Carrier Modulation**: The carrier submodule allows a high-frequency carrier signal to modulate the PWM waveforms generated by the generator and dead time submodules. This capability is mandatory if you need pulse transformer-based gate drivers to control the power switching elements.
- **Brake**: MCPWM operator can set how to brake the generators when particular fault is detected. We can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depends on how critical the fault is.
- **MCPWM Capture**: This is a standalone submodule which can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels. Each channel is connected to the GPIO, a pulse on the GPIO will trigger the capture timer to store the time-base count value and then notify the user by interrupt. Using this feature, we can measure a pulse width precisely. What’s more, the capture timer can also be synchronized by the MCPWM Sync submodule.

**Functional Overview**

Description of the MCPWM functionality is divided into the following sections:

- **Resource Allocation and Initialization** - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
• **Timer Operations and Events** - describes control functions and event callbacks that supported by the MCPWM timer.
• **Comparator Operations and Events** - describes control functions and event callbacks that supported by the MCPWM comparator.
• **Generator Actions on Events** - describes how to set actions for MCPWM generators on particular events that generated by the MCPWM timer and comparators.
• **Classical PWM Waveforms and Generator Configurations** - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
• **Dead Time** - describes how to set dead time for MCPWM generators.
• **Classical PWM Waveforms and Dead Time Configurations** - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
• **Carrier Modulation** - describes how to set modulate a high frequency onto the final PWM waveforms.
• **Faults and Brake Actions** - describes how to set brake actions for MCPWM operators on particular fault event.
• **Generator Force Actions** - describes how to control the generator output level asynchronously in a forceful way.
• **Synchronization** - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
• **Capture** - describes how to use the MCPWM capture module to measure the pulse width of a signal.
• **Power Management** - describes how different source clock will affect power consumption.
• **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
• **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
• **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization**  As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers**  You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to \([0, \text{SOC}_\text{MCPWM}\_\text{GROUPS} - 1]\) range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` sets the expected resolution of the timer, the driver internally will set a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free timers in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.\(^1\)

On the contrary, calling `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators**  You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to \([0, \text{SOC}_\text{MCPWM}\_\text{GROUPS} - 1]\) range. Please note, operators located in different groups are totally independent.

\(^1\) Different ESP chip series might have different number of MCPWM resources (e.g. groups, timers, comparators, operators, generators and so on). Please refer to the [TRM](#) for details. The driver won’t forbid you from applying for more MCPWM resources, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.
Chapter 2. API Reference

- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` function will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free operators in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`(). The configuration structure is defined as:

- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` function will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`(). The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_generator()` function will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software. To allocate a GPIO fault object, you can call `mcpwm_new_gpio_fault()` function, with configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:
• `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO fault located in different groups are totally independent, i.e. GPIO fault in group 0 can not be detected by the operator in group 1.
• `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
• `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
• `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up or pull down GPIO internally.
• `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

Software fault object can be used to trigger a fault by calling a function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the fault object, this function will return `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, but the returned fault handle is of the same type.

On the contrary, calling `mcpwm_delFault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There’re three types of sync sources: A sync source reflected from the GPIO, a sync source generated by software and a sync source generated by MCPWM timer event.

To allocate a GPIO sync source, you can call `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO sync source located in different groups are totally independent, i.e. GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edge.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

To allocate a Timer event sync source, you can call `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e. the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, if a sync source has been allocated from the same timer before, this function will return `ESP_ERR_INVALID_STATE` error.
Last but not least, to allocate a software sync source, you can call `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the sync source object, this function will return `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, don’t forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling `mcpwm_del_sync_src()` function will free the allocated sync source object, this function works for all types of sync sources.

**MCPWM Capture Timer and Channels**  The MCPWM group has a dedicated timer which is used to capture the timestamp when specific event occurred. The capture timer is connected with several independent channels, each channel is assigned with a GPIO.

To allocate a capture timer, you can call `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture timer left in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

Next, to allocate a capture channel, you can call `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or negative edge of the input signal.
- `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
- `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture channel left in the capture timer, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` function will free the allocated capture channel and timer object accordingly.

**Timer Operations and Events**

**Register Event Callbacks**  The MCPWM timer can generate different events at runtime. If you have some function that should be called when particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets callback function for timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets callback function for timer when it counts to zero.
• `mcpwm_timer_event_callbacks_t::on_stop` sets callback function for timer when it is stopped.

The callback functions above are called within the ISR context, so they should not attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_timer_register_event_callbacks()` function is used to save user’s own context, it will be passed to each callback function directly.

This function will lazy install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also Enable and Disable timer for more information.

**Enable and Disable Timer** Before doing IO control to the timer, user needs to enable the timer first, by calling `mcpwm_timer_enable()`. Internally, this function will:

• switch the timer state from `init` to `enable`.
• enable the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
• acquire a proper power management lock if a specific clock source (e.g. PLL_160M clock) is selected. See also Power management for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to `init` state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What’s more, you can even start the timer for only one round, that means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM Timer should be connected with a MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Make sure the MCPWM timer and operator are in the same group, otherwise, this function will return `ESP_ERR_INVALID_ARG` error.

**Comparator Operations and Events**

**Register Event Callbacks** The MCPWM comparator can inform the user when the timer counter equals to the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

• `mcpwm_comparator_event_callbacks_t::on_reach` sets callback function for comparator when the timer counter equals to the compare value.

The callback function will provide event specific data of type `mcpwm_compare_event_data_t` to the user. The callback function is called within the ISR context, so is should not attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There’re a few points to note:
• New compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_sync`.

• Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return error code `ESP_ERR_INVALID_STATE`.

• The compare value shouldn’t exceed timer’s count peak, otherwise, the compare event will never get triggered.

Generator Actions on Events

Set Generator Action on Timer Event One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There’s a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

Set Generator Action on Compare Event One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See `MCPWM Comparators` for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There’s a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

Classical PWM Waveforms and Generator Configurations This section will demonstrate the classical PWM waveforms that can be generated by the pair of the generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The Symmetric or Asymmetric of the waveforms are determined by the count mode of the MCPWM timer.
- The active level of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer’s period and count mode.
- The duty cycle of the PWM waveform is determined by the generator’s various action combinations.

}
Dead Time  In power electronics, the rectifier and inverter are commonly used. This requires the use of rectifier bridge and inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm cannot conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, but the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave that generated by setting Generator Actions on Events.

The dead-time driver works like a decorator, which is also reflected in the function parameters of `mcpwm_generator_set_dead_time()`, where it takes the primary generator handle (`in_generator`), and returns a generator (`out_generator`) after applying the dead-time. Please note, if the `out_generator` and `in_generator` are the same, it means we’re adding the time delay to the PWM waveform in a “in-place” fashion. In turn, if the `out_generator` and `in_generator` are different, it means we’re deriving a new PWM waveform from the existing `in_generator`.

Dead-time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks`: set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means to bypass the dead-time module. The resolution of the dead-time tick is the same to the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output`: Whether to invert the signal after applying the dead-time, which can be used to control the delay edge polarity.

Note: It is also possible to generate the required dead time by setting Generator Actions on Events, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead-time submodule should be used.

Classical PWM Waveforms and Dead Time Configurations  This section will demonstrate the classical PWM waveforms that can be generated by the dead-time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.
### Active High, Complementary

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_timer_event(gena,
        MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH),
        MCPWM_GEN_TIMER_EVENT_ACTION_END()));
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_compare_event(gena,
        MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa,
        MCPWM_GENCOMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpb,
        MCPWM_GEN_COMPARE_EVENT_ACTION_END())));
}
```

```c
static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,
        .negedge_delay_ticks = 0
    };
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    dead_time_config.posedge_delay_ticks = 0;
    dead_time_config.negedge_delay_ticks = 100;
    dead_time_config.flags.invert_output = true;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}
```

### Active Low, Complementary

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_timer_event(gena,
        MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH),
        MCPWM_GEN_TIMER_EVENT_ACTION_END()));
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_compare_event(gena,

}

Carrier Modulation The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g. isolated digital power application) by passing the PWM output signals through transformers. Any of PWM output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call mcpwm_operator_apply_carrier(), and provide configuration structure mcpwm_carrier_config_t:

- mcpwm_carrier_config_t::frequency_hz: The carrier frequency in Hz.
- mcpwm_carrier_config_t::duty_cycle: The duty cycle of the carrier. Note that, the supported choices of duty cycle are discrete, the driver will search the nearest one based the user configuration.
- mcpwm_carrier_config_t::first_pulse_duration_us: The duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the
mcpwm_carrier_config_t::frequency_hz. The first pulse duration can’t be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.

- mcpwm_carrier_config_t::invert_before_modulate and mcpwm_carrier_config_t::invert_after_modulate: Set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling mcpwm_operator_apply_carrier() with a NULL configuration.

Faults and Brake Actions  The MCPWM operator is able to sense external signals with information about failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

Set Operator Brake Mode on Fault  The way that MCPWM operator reacts to the fault is called Brake. The MCPWM operator can be configured to perform different brake modes for each fault object by calling mcpwm_operator_set_brake_on_fault(). Brake specific configuration is passed as a structure mcpwm_brake_config_t:

- mcpwm_brake_config_t::fault set which fault that the operator should react to.
- mcpwm_brake_config_t::brake_mode set the brake mode that should be used for the fault. The supported brake modes are listed in the mcpwm_operator_brake_mode_t. For MCPWM_OPER_BRAKE_MODE_CBC mode, the operator will recover itself automatically as long as the fault disappears. You can specify the recovery time in mcpwm_brake_config_t::cbc_recover_on_tez and mcpwm_brake_config_t::cbc_recover_on_tep. For MCPWM_OPER_BRAKE_MODE_OST mode, the operator can’t recover even though the fault disappears. User has to call mcpwm_operator_recover_from_fault() to manually recover it.

Set Generator Action on Brake Event  One generator can set multiple actions on different brake events, by calling mcpwm_generator_set_actions_on_brake_event() with variable number of action configurations. The action configuration is defined in mcpwm_gen_brake_event_action_t:

- mcpwm_gen_brake_event_action_t::direction specific the timer direction. The supported directions are listed in mcpwm_timer_direction_t.
- mcpwm_gen_brake_event_action_t::brake_mode specifies the brake mode. The supported brake modes are listed in the mcpwm_operator_brake_mode_t.
- mcpwm_gen_brake_event_action_t::action specifies the generator action to be taken. The supported actions are listed in mcpwm_generator_action_t.

There’s a helper macro MCPWM_GEN_BRAKE_EVENT_ACTION to simplify the construction of a brake event action entry.

Please note, the argument list of mcpwm_generator_set_actions_on_brake_event() must be terminated by MCPWM_GEN_BRAKE_EVENT_ACTION_END.

Register Fault Event Callbacks  The MCPWM fault detector can inform the user when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such event happens, you should hook your function to the interrupt service routine by calling mcpwm_fault_register_event_callbacks(). The callback function prototype is declared in mcpwm_fault_event_cb_t. All supported event callbacks are listed in the mcpwm_fault_event_callbacks_t:

- mcpwm_fault_event_callbacks_t::on_fault_enter sets callback function that will be called when a fault is detected.
- mcpwm_fault_event_callbacks_t::on_fault_exit sets callback function that will be called when a fault is cleared.
The callback function is called within the ISR context, so is should not attempt to block (e.g., make sure that only FreeRTOS APIs with ISR suffix is called within the function).

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform the user when it going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets callback function that will be called when the operator is going to take a CBC action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets callback function that will be called when the operator is going to take an OST action.

The callback function is called within the ISR context, so is should not attempt to block (e.g., make sure that only FreeRTOS APIs with ISR suffix is called within the function).

The parameter `user_data` of `mcpwm_operator_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator’s output level will be controlled by the event actions again.
- Set the `hold_on` to true, the force output level will keep alive, until it’s removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a predefined phase, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM capture timer *MCPWM Capture Timer* can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

![Fig. 11: GPIO Sync All MCPWM Timers](image)

**Sync Timers by GPIO**

```c
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO fault should be in the same group of _
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // by default, a posedge pulse can trigger a_
        .sync_event_
   );
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
        .sync_src = gpio_sync_source, // sync source
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
        .config));
    }
}
```

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantity like distance or speed.
in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, we can use the capture submodule to sense the rotor position from Hall sensor.

![Fig. 12: MCPWM BLDC with Hall Sensor](image.png)

The capture timer is usually connected with several capture channels, please refer to howtoallocatecapturetimerandchannels#mcpwm-capture-timer-and-channels for resource allocation.

**Register Event Callbacks**  The MCPWM capture channel can inform the user when there’s a valid edge detected on the signal. You have to register a callback function to get the timer count value of the capture moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets callback function for the capture channel when a valid edge is detected.

The callback function will provide event specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`.

The callback function is called within the ISR context, so is should not attempt to block (e.g., make sure that only FreeRTOS APIs with ISR suffix is called within the function).

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Timer**  Before doing IO control to the capture timer, user needs to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function will:

- switch the capture timer state from `init` to `enable`.
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also Power management for more information.
On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to `init` state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometime, the software also wants to trigger a “fake” capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it’s a “fake” capture event, it can still cause an interrupt, thus your capture event callback function will get invoked as well.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the PLL, APB frequency before going into light sleep, thus potentially changing the period of a MCPWM timer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a MCPWM timer instance that has selected `MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_timer_enable()`. Likewise, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, Whenever the driver creates a MCPWM capture timer instance that has selected `MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_capture_timer_enable()`. And will release the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** The factory functions like `mcpwm_new_timer()` are guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

No functions are allowed to run within ISR environment.

Functions that are not related to Resource Allocation, are not thread safe. Thus, you should avoid calling them in different tasks without mutex protection.

**Kconfig Options**

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

---

2 Callback function and the sub-functions invoked by itself should also be placed in IRAM, users need to take care of this by themselves.
Chapter 2. API Reference

Application Examples

- Brushed DC motor speed control by PID algorithm: `peripherals/mcpwm/mcpwm_bdc_speed_control`
- BLDC motor control with hall sensor feedback: `peripherals/mcpwm/mcpwm_blde_hall_control`
- Ultrasonic sensor (HC-SR04) distance measurement: `peripherals/mcpwm/mcpwm_capture_hc_sr04`
- Servo motor angle control: `peripherals/mcpwm/mcpwm_servo_control`
- MCPWM synchronization between timers: `peripherals/mcpwm/mcpwm_sync`

API Reference

Header File

- `components/driver/include/driver/mcpwm_timer.h`

Functions

`esp_err_t mcpwm_new_timer(const mcpwm_timer_config_t *config, mcpwm_timer_handle_t *ret_timer)`

Create MCPWM timer.

**Parameters**

- `config` [in] MCPWM timer configuration
- `ret_timer` [out] Returned MCPWM timer handle

**Returns**

- ESP_OK: Create MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create MCPWM timer failed because of other error

`esp_err_t mcpwm_del_timer(mcpwm_timer_handle_t timer)`

Delete MCPWM timer.

**Parameters**

- `timer` [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Delete MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete MCPWM timer failed because timer is not in init state
- ESP_FAIL: Delete MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_enable(mcpwm_timer_handle_t timer)`

Enable MCPWM timer.

**Parameters**

- `timer` [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Enable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_disable(mcpwm_timer_handle_t timer)`

Disable MCPWM timer.

**Parameters**

- `timer` [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Disable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already
• ESP_FAIL: Disable MCPWM timer failed because of other error

```c
esp_err_t mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)
```

Send specific start/stop commands to MCPWM timer.

### Parameters

- `timer` – [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `command` – [in] Supported command list for MCPWM timer

### Returns

- ESP_OK: Start or stop MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP_FAIL: Start or stop MCPWM timer failed because of other error

```c
esp_err_t mcpwm_timer_register_event_callbacks(mcpwm_timer_handle_t timer, const mcpwm_timer_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM timer.

### Parameters

- `timer` – [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `cbs` – [in] Group of callback functions
- `user_data` – [in] User data, which will be passed to callback functions directly

### Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM timer.

### Parameters

- `timer` – [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` – [in] MCPWM timer sync phase configuration

### Returns

- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

### Structures

**struct mcpwm_timer_event_callbacks_t**

Group of supported MCPWM timer event callbacks.

---

**Note:** The callbacks are all running under ISR environment

### Public Members

**mcpwm_timer_event_cb_t on_full**

Callback function when MCPWM timer counts to peak value
Chapter 2. API Reference

```c
mcpwm_timer_event_cb_t on_empty
    callback function when MCPWM timer counts to zero
```

```c
mcpwm_timer_event_cb_t on_stop
    callback function when MCPWM timer stops
```

```c
struct mcpwm_timer_config_t
    MCPWM timer configuration.
```

**Public Members**

```c
int group_id
    Specify from which group to allocate the MCPWM timer
```

```c
mcpwm_timer_clock_source_t clk_src
    MCPWM timer clock source
```

```c
uint32_t resolution_hz
    Counter resolution in Hz, ranges from around 300KHz to 80MHz. The step size of each count tick equals to \((1 / \text{resolution}_hz)\) seconds
```

```c
mcpwm_timer_count_mode_t count_mode
    Count mode
```

```c
uint32_t period_ticks
    Number of count ticks within a period
```

```c
uint32_t update_period_on_empty
    Whether to update period when timer counts to zero
```

```c
uint32_t update_period_on_sync
    Whether to update period on sync event
```

```c
struct mcpwm_timer_config_t::[anonymous] flags
    Extra configuration flags for timer
```

```c
struct mcpwm_timer_sync_phase_config_t
    MCPWM Timer sync phase configuration.
```

**Public Members**

```c
mcpwm_sync_handle_t sync_src
    The sync event source. Set to NULL will disable the timer being synced by others
```

```c
uint32_t count_value
    The count value that should lock to upon sync event
```

```c
mcpwm_timer_direction_t direction
    The count direction that should lock to upon sync event
```
Header File

- components/driver/include/driver/mcpwm_oper.h

Functions

\texttt{esp_err_t mcpwm_new_operator (const mcpwm_operator_config_t *config, mcpwm_oper_handle_t *ret_oper)}

Create MCPWM operator.

\textbf{Parameters}

- \texttt{config} - [in] MCPWM operator configuration
- \texttt{ret_oper} - [out] Returned MCPWM operator handle

\textbf{Returns}

- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can’t find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

\texttt{esp_err_t mcpwm_del_operator (mcpwm_oper_handle_t oper)}

Delete MCPWM operator.

\textbf{Parameters}

- \texttt{oper} - [in] MCPWM operator, allocated by mcpwm_new_operator()

\textbf{Returns}

- ESP_OK: Delete MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

\texttt{esp_err_t mcpwm_operator_connect_timer (mcpwm_oper_handle_t oper, mcpwm_timer_handle_t timer)}

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

\textbf{Parameters}

- \texttt{oper} - [in] MCPWM operator handle, allocated by mcpwm_new_operator()
- \texttt{timer} - [in] MCPWM timer handle, allocated by mcpwm_new_timer()

\textbf{Returns}

- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

\texttt{esp_err_t mcpwm_operator_set_brake_on_fault (mcpwm_oper_handle_t operator, const mcpwm_brake_config_t *config)}

Set brake method for MCPWM operator.

\textbf{Parameters}

- \texttt{operator} - [in] MCPWM operator, allocated by mcpwm_new_operator()
- \texttt{config} - [in] MCPWM brake configuration

\textbf{Returns}

- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

\texttt{esp_err_t mcpwm_operator_recover_from_fault (mcpwm_oper_handle_t operator, mcpwm_fault_handle_t fault)}

Try to make the operator recover from fault.

\textbf{Note:} To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can’t succeed.
Chapter 2. API Reference

Parameters

- **operator** - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** - [in] MCPWM fault handle

Returns

- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

```c
esp_err_t mcpwm_operator_register_event_callbacks
(mcpwm_oper_handle_t oper, const mcpwm_operator_event_callbacks_t *cbs,
void *user_data)
```

Set event callbacks for MCPWM operator.

Parameters

- **oper** - [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_operator_apply_carrier
(mcpwm_oper_handle_t oper, const mcpwm_carrier_config_t *config)
```

Apply carrier feature for MCPWM operator.

Parameters

- **oper** - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** - [in] MCPWM carrier specific configuration

Returns

- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

**Structures**

```c
struct mcpwm_operator_config_t
```

MCPWM operator configuration.

**Public Members**

```c
int group_id
```

Specify from which group to allocate the MCPWM operator

```c
uint32_t update_gen_action_on_tezer
```

Whether to update generator action when timer counts to zero

```c
uint32_t update_gen_action_on_tep
```

Whether to update generator action when timer counts to peak

```c
uint32_t update_gen_action_on_sync
```

Whether to update generator action on sync event
uint32_t update_dead_time_on_tez
  Whether to update dead time when timer counts to zero

uint32_t update_dead_time_on_tep
  Whether to update dead time when timer counts to peak

uint32_t update_dead_time_on_sync
  Whether to update dead time on sync event

struct mcpwm_operator_config_t::[anonymous] flags
  Extra configuration flags for operator

struct mcpwm_brake_config_t
  MCPWM brake configuration structure.

Public Members

mcpwm_fault_handle_t fault
  Which fault causes the operator to brake

mcpwm_operator_brake_mode_t brake_mode
  Brake mode

uint32_t cbc_recover_on_tez
  Recovery CBC brake state on tez event

uint32_t cbc_recover_on_tep
  Recovery CBC brake state on tep event

struct mcpwm_brake_config_t::[anonymous] flags
  Extra flags for brake configuration

struct mcpwm_operator_event_callbacks_t
  Group of supported MCPWM operator event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_brake_event_cb_t on_brake_cbc
  callback function when mcpwm operator brakes in CBC

mcpwm_brake_event_cb_t on_brake_ost
  callback function when mcpwm operator brakes in OST

struct mcpwm_carrier_config_t
  MCPWM carrier configuration structure.
Chapter 2. API Reference

Public Members

```c
uint32_t frequency_hz
Carrier frequency in Hz

uint32_t first_pulse_duration_us
The duration of the first PWM pulse, in us

float duty_cycle
Carrier duty cycle

uint32_t invert_before_modulate
Invert the raw signal

uint32_t invert_after_modulate
Invert the modulated signal

struct mcpwm_carrier_config_t::[anonymous] flags
Extra flags for carrier configuration
```

Header File

- components/driver/include/driver/mcpwm_cmpr.h

Functions

```c
esp_err_t mcpwm_new_comparator (mcpwm_oper_handle_t oper, const mcpwm_comparator_config_t *config,
                                 mcpwm_cmpr_handle_t *ret_cmpr)
```

Create MCPWM comparator.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by mcpwm_new_operator(), the new comparator will be allocated from this operator
- `config` - [in] MCPWM comparator configuration
- `ret_cmpr` - [out] Returned MCPWM comparator

**Returns**

- ESP_OK: Create MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can’t find free resource
- ESP_FAIL: Create MCPWM comparator failed because of other error

```c
esp_err_t mcpwm_del_comparator (mcpwm_cmpr_handle_t cmpr)
```

Delete MCPWM comparator.

**Parameters**

- `cmpr` - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()

**Returns**

- ESP_OK: Delete MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP_FAIL: Delete MCPWM comparator failed because of other error
**esp_err_t mcpwm_comparator_register_event_callbacks**

```
( mcpwm_cmpr_handle_t cmpr, const mcpwm_comparator_event_callbacks_t *cbs, void *user_data )
```

Set event callbacks for MCPWM comparator.

**Parameters**
- `cmpr` - [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**esp_err_t mcpwm_comparator_set_compare_value**

```
( mcpwm_cmpr_handle_t cmpr, uint32_t cmp_ticks )
```

Set MCPWM comparator’s compare value.

**Parameters**
- `cmpr` - [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- `cmp_ticks` - [in] The new compare value

**Returns**
- ESP_OK: Set MCPWM compare value successfully
- ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn’t have a timer connected
- ESP_FAIL: Set MCPWM compare value failed because of other error

**Structures**

- `struct mcpwm_comparator_config_t`

  MCPWM comparator configuration.

  **Public Members**

  - `uint32_t update_cmp_on_tez`
    - Whether to update compare value when timer count equals to zero (tez)
  - `uint32_t update_cmp_on_tep`
    - Whether to update compare value when timer count equals to peak (tep)
  - `uint32_t update_cmp_on_sync`
    - Whether to update compare value on sync event

  **flags**

  Extra configuration flags for comparator

- `struct mcpwm_comparator_event_callbacks_t`

  Group of supported MCPWM compare event callbacks.

**Note:** The callbacks are all running under ISR environment
Public Members

`mcpwm_compare_event_cb_t on_reach`
ISR callback function which would be invoked when counter reaches compare value

Header File

- `components/driver/include/driver/mcpwm_gen.h`

Functions

`esp_err_t mcpwm_new_generator (mcpwm_oper_handle_t oper, const mcpwm_generator_config_t *config, mcpwm_gen_handle_t *ret_gen)`
Allocate MCPWM generator from given operator.

**Parameters**
- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `config` - [in] MCPWM generator configuration
- `ret_gen` - [out] Returned MCPWM generator

**Returns**
- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can’t find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

`esp_err_t mcpwm_del_generator (mcpwm_gen_handle_t gen)`
Delete MCPWM generator.

**Parameters**
- `gen` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

**Returns**
- `ESP_OK`: Delete MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM generator failed because of other error

`esp_err_t mcpwm_generator_set_force_level (mcpwm_gen_handle_t gen, int level, bool hold_on)`
Set force level for MCPWM generator.

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator’s behaviour.

**Note:** If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to -1.

**Note:** If the `hold_on` is false, the force level can be overridden by the next event action.

**Parameters**
- `gen` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `level` - [in] GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
• **hold_on** [-in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**
- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_timer_event (mcpwm_gen_handle_t gen,
                                                   mcpwm_gen_timer_event_action_t ev_act, ...)
```

Set generator actions on different MCPWM timer events.

**Parameters**
- `gen` [-in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [-in] MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_compare_event (mcpwm_gen_handle_t generator,
                                                        mcpwm_gen_compare_event_action_t ev_act, ...)
```

Set generator actions on different MCPWM compare events.

**Parameters**
- `generator` [-in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [-in] MCPWM compare event action list, must be terminated by `MCPWM_GENCOMPARE_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_brake_event (mcpwm_gen_handle_t generator,
                                                    mcpwm_gen_brake_event_action_t ev_act, ...)
```

Set generator actions on different MCPWM brake events.

**Parameters**
- `generator` [-in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [-in] MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_dead_time (mcpwm_gen_handle_t in_generator, mcpwm_gen_handle_t out_generator,
                                         const mcpwm_dead_time_config_t *config)
```

Set dead time for MCPWM generator.

**Parameters**
- `in_generator` [-in] MCPWM generator, before adding the dead time
• out_generator  [in] MCPWM generator, after adding the dead time
• config  [in] MCPWM dead time configuration

Returns
• ESP_OK: Set dead time for MCPWM generator successfully
• ESP_ERR_INVALID_ARG: Set dead time for MCPWM generator failed because of invalid argument
• ESP_FAIL: Set dead time for MCPWM generator failed because of other error

Structures

struct mcpwm_generator_config_t
MCPWM generator configuration.

Public Members

int gen_gpio_num
The GPIO number used to output the PWM signal

uint32_t invert_pwm
Whether to invert the PWM signal (done by GPIO matrix)

uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well

struct mcpwm_generator_config_t::[anonymous] flags
Extra configuration flags for generator

struct mcpwm_gen_timer_event_action_t
Generator action on specific timer event.

Public Members

mcpwm_timer_direction_t direction
Timer direction

mcpwm_timer_event_t event
Timer event

mcpwm_generator_action_t action
Generator action should perform

struct mcpwm_gen_compare_event_action_t
Generator action on specific comparator event.

Public Members

mcpwm_timer_direction_t direction
Timer direction
Chapter 2. API Reference

```c
mcpwm_cmpr_handle_t comparator
    Comparator handle
```

```c
mcpwm_generator_action_t action
    Generator action should perform
```

```c
struct mcpwm_gen_brake_event_action_t
    Generator action on specific brake event.
```

```c
MCPWM_GEN_BRAKE_EVENT_ACTION_END ()
```
Chapter 2. API Reference

**MCPWM_GEN_BRAKE_EVENT_ACTION_END**()

**Header File**
- components/driver/include/driver/mcpwm_fault.h

**Functions**

```c
esp_err_t mcpwm_new_gpio_fault (const mcpwm_gpio_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)
```

Create MCPWM GPIO fault.

**Parameters**
- `config` - [in] MCPWM GPIO fault configuration
- `ret_fault` - [out] Returned GPIO fault handle

**Returns**
- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO fault failed because can’t find free resource
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

```c
esp_err_t mcpwm_new_soft_fault (const mcpwm_soft_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)
```

Create MCPWM software fault.

**Parameters**
- `config` - [in] MCPWM software fault configuration
- `ret_fault` - [out] Returned software fault handle

**Returns**
- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

```c
esp_err_t mcpwm_del_fault (mcpwm_fault_handle_t fault)
```

Delete MCPWM fault.

**Parameters**
- `fault` - [in] MCPWM fault handle allocated by mcpwm_new_gpio_fault() or mcpwm_new_soft_fault()

**Returns**
- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

```c
esp_err_t mcpwm_soft_fault_activate (mcpwm_fault_handle_t fault)
```

Activate the software fault, trigger the fault event for once.

**Parameters**
- `fault` - [in] MCPWM soft fault, allocated by mcpwm_new_soft_fault()

**Returns**
- ESP_OK: Trigger MCPWM software fault event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software fault event failed because of other error

```c
esp_err_t mcpwm_fault_register_event_callbacks (mcpwm_fault_handle_t fault, const mcpwm_fault_event_callbacks_t *cbs, void *user_data)
```

Espressif Systems 1132

Release v5.1-dev-131-g2761ad4865

Submit Document Feedback
Set event callbacks for MCPWM fault.

**Parameters**

- **fault** *(in)* MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** *(in)* Group of callback functions
- **user_data** *(in)* User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Structures**

```c
struct mcpwm_gpio_fault_config_t
```
MCPWM GPIO fault configuration structure.

**Public Members**

- **int group_id**
  In which MCPWM group that the GPIO fault belongs to
- **int gpio_num**
  GPIO used by the fault signal
- **uint32_t active_level**
  On which level the fault signal is treated as active
- **uint32_t io_loop_back**
  For debug/test, the signal output from the GPIO will be fed to the input path as well
- **uint32_t pull_up**
  Whether to pull up internally
- **uint32_t pull_down**
  Whether to pull down internally
- **struct mcpwm_gpio_fault_config_t::[anonymous] flags**
  Extra configuration flags for GPIO fault

```c
struct mcpwm_soft_fault_config_t
```
MCPWM software fault configuration structure.

```c
struct mcpwm_fault_event_callbacks_t
```
Group of supported MCPWM fault event callbacks.

**Note:** The callbacks are all running under ISR environment
Chapter 2. API Reference

Public Members

`mcpwm_fault_event_cb_t on_fault_enter`
ISR callback function that would be invoked when fault signal becomes active

`mcpwm_fault_event_cb_t on_fault_exit`
ISR callback function that would be invoked when fault signal becomes inactive

Header File

- components/driver/include/driver/mcpwm_sync.h

Functions

```c
esp_err_t mcpwm_new_timer_sync_src(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM timer sync source.

Parameters

- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` - [in] MCPWM timer sync source configuration
- `ret_sync` - [out] Returned MCPWM sync handle

Returns

- ESP_OK: Create MCPWM timer sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer sync source failed because out of memory
- ESP_ERR_INVAL_STATE: Create MCPWM timer sync source failed because the timer has created a sync source before
- ESP_FAIL: Create MCPWM timer sync source failed because of other error

```c
esp_err_t mcpwm_new_gpio_sync_src(const mcpwm_gpio_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM GPIO sync source.

Parameters

- `config` - [in] MCPWM GPIO sync source configuration
- `ret_sync` - [out] Returned MCPWM GPIO sync handle

Returns

- ESP_OK: Create MCPWM GPIO sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO sync source failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO sync source failed because can’t find free resource
- ESP_FAIL: Create MCPWM GPIO sync source failed because of other error

```c
esp_err_t mcpwm_new_soft_sync_src(const mcpwm_soft_sync_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM software sync source.

Parameters

- `config` - [in] MCPWM software sync source configuration
- `ret_sync` - [out] Returned software sync handle

Returns

- ESP_OK: Create MCPWM software sync successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software sync failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM software sync failed because out of memory
• ESP_FAIL: Create MCPWM software sync failed because of other error

`esp_err_t mcpwm_del_sync_src (mcpwm_sync_handle_t sync)`
Delete MCPWM sync source.

Parameters sync [in] MCPWM sync handle, allocated by
mcpwm_new_timer_sync_src() or mcpwm_new_gpio_sync_src() or mcpwm_new_soft_sync_src()

Returns
• ESP_OK: Delete MCPWM sync source successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM sync source failed because of invalid argument
• ESP_FAIL: Delete MCPWM sync source failed because of other error

`esp_err_t mcpwm_soft_sync_activate (mcpwm_sync_handle_t sync)`
Activate the software sync, trigger the sync event for once.

Parameters sync [in] MCPWM soft sync handle, allocated by
mcpwm_new_soft_sync_src()

Returns
• ESP_OK: Trigger MCPWM software sync event successfully
• ESP_ERR_INVALID_ARG: Trigger MCPWM software sync event failed because of invalid argument
• ESP_FAIL: Trigger MCPWM software sync event failed because of other error

Structures

struct mcpwm_timer_sync_src_config_t
MCPWM timer sync source configuration.

Public Members

`mcpwm_timer_event_t timer_event`
Timer event, upon which MCPWM timer will generate the sync signal

uint32_t propagate_input_sync
The input sync signal would be routed to its sync output

struct mcpwm_timer_sync_src_config_t::[anonymous] flags
Extra configuration flags for timer sync source

struct mcpwm_gpio_sync_src_config_t
MCPWM GPIO sync source configuration.

Public Members

int group_id
MCPWM group ID

int gpio_num
GPIO used by sync source
### Chapter 2. API Reference

- **uint32_t active_neg**
  - Whether the sync signal is active on negedge, by default, the sync signal’s posedge is treated as active

- **uint32_t io_loop_back**
  - For debug/test, the signal output from the GPIO will be fed to the input path as well

- **uint32_t pull_up**
  - Whether to pull up internally

- **uint32_t pull_down**
  - Whether to pull down internally

- **struct mcpwm_gpio_sync_src_config_t::[anonymous] flags**
  - Extra configuration flags for GPIO sync source

- **struct mcpwm_soft_sync_config_t**
  - MCPWM software sync configuration structure.

### Header File

- `components/driver/include/driver/mcpwm_cap.h`

### Functions

- **esp_err_t mcpwm_new_capture_timer** (const mcpwm_capture_timer_config_t *config, mcpwm_cap_timer_handle_t *ret_cap_timer)
  - Create MCPWM capture timer.

  **Parameters**
  - `config` - [in] MCPWM capture timer configuration
  - `ret_cap_timer` - [out] Returned MCPWM capture timer handle

  **Returns**
  - ESP_OK: Create MCPWM capture timer successfully
  - ESP.ERR.INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
  - ESP.ERR.NO_MEM: Create MCPWM capture timer failed because out of memory
  - ESP.ERR.NOT_FOUND: Create MCPWM capture timer failed because can’t find free resource
  - ESP.FAIL: Create MCPWM capture timer failed because of other error

- **esp_err_t mcpwm_del_capture_timer** (mcpwm_cap_timer_handle_t cap_timer)
  - Delete MCPWM capture timer.

  **Parameters**
  - `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

  **Returns**
  - ESP_OK: Delete MCPWM capture timer successfully
  - ESP.ERR.INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
  - ESP.FAIL: Delete MCPWM capture timer failed because of other error

- **esp_err_t mcpwm_capture_timer_enable** (mcpwm_cap_timer_handle_t cap_timer)
  - Enable MCPWM capture timer.

  **Parameters**
  - `cap_timer` - [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

  **Returns**
• ESP_OK: Enable MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
• ESP_FAIL: Enable MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_disable (mcpwm_cap_timer_handle_t cap_timer)
```

Disable MCPWM capture timer.

Parameters

- `cap_timer` [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

Returns

- ESP_OK: Disable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_start (mcpwm_cap_timer_handle_t cap_timer)
```

Start MCPWM capture timer.

Parameters

- `cap_timer` [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

Returns

- ESP_OK: Start MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Start MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Start MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_stop (mcpwm_cap_timer_handle_t cap_timer)
```

Start MCPWM capture timer.

Parameters

- `cap_timer` [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

Returns

- ESP_OK: Stop MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Stop MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Stop MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_set_phase_on_sync (mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM capture timer.

Parameters

- `cap_timer` [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `config` [in] MCPWM capture timer sync phase configuration

Returns

- ESP_OK: Set sync phase for MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_new_capture_channel (mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_channel_config_t *config,
                                      mcpwm_cap_channel_handle_t *ret_cap_channel)
```

Create MCPWM capture channel.
Chapter 2. API Reference

Parameters

• **cap_timer** [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
• **config** [in] MCPWM capture channel configuration
• **ret_cap_channel** [out] Returned MCPWM capture channel

Returns

• ESP_OK: Create MCPWM capture channel successfully
• ESP_ERR_INVALID_ARG: Create MCPWM capture channel failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM capture channel failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM capture channel failed because can’t find free resource
• ESP_FAIL: Create MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_del_capture_channel(mcpwm_cap_channel_handle_t cap_channel)
```

Delete MCPWM capture channel.

Parameters **cap_channel** [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

• ESP_OK: Delete MCPWM capture channel successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
• ESP_FAIL: Delete MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_capture_channel_register_event_callbacks(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM capture channel.

Parameters

• **cap_channel** [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
• **cbs** [in] Group of callback functions
• **user_data** [in] User data, which will be passed to callback functions directly

Returns

• ESP_OK: Set event callbacks successfully
• ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)
```

Trigger a catch by software.

Parameters **cap_channel** [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

• ESP_OK: Trigger software catch successfully
• ESP_ERR_INVALID_ARG: Trigger software catch failed because of invalid argument
• ESP_FAIL: Trigger software catch failed because of other error

Structures

```c
struct mcpwm_capture_timer_config_t
```

MCPWM capture timer configuration structure.
Public Members

int group_id
  Specify from which group to allocate the capture timer

mcpwm_capture_clock_source_t clk_src
  MCPWM capture timer clock source

struct mcpwm_capture_timer_sync_phase_config_t
  MCPWM Capture timer sync phase configuration.

Public Members

mcpwm_sync_handle_t sync_src
  The sync event source

uint32_t count_value
  The count value that should lock to upon sync event

mcpwm_timer_direction_t direction
  The count direction that should lock to upon sync event

struct mcpwm_capture_channel_config_t
  MCPWM capture channel configuration structure.

Public Members

int gpio_num
  GPIO used capturing input signal

uint32_t prescale
  Prescale of input signal, effective frequency = cap_input_clk/prescale

uint32_t pos_edge
  Whether to capture on positive edge

uint32_t neg_edge
  Whether to capture on negative edge

uint32_t pull_up
  Whether to pull up internally

uint32_t pull_down
  Whether to pull down internally

uint32_t invert_cap_signal
  Invert the input capture signal
uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
struct mcpwm_capture_channel_config_t::[anonymous] flags
```
Extra configuration flags for capture channel

```c
struct mcpwm_capture_event_callbacks_t
```
Group of supported MCPWM capture event callbacks.

**Note:** The callbacks are all running under ISR environment

### Public Members

```c
mcpwm_capture_event_cb_t on_cap
```
Callback function that would be invoked when capture event occurred

#### Header File

- components/driver/include/driver/mcpwm_types.h

#### Structures

```c
struct mcpwm_timer_event_data_t
```
MCPWM timer event data.

**Public Members**

```c
uint32_t count_value
```
MCPWM timer count value

```c
mcpwm_timer_direction_t direction
```
MCPWM timer count direction

```c
struct mcpwm_brake_event_data_t
```
MCPWM brake event data.

```c
struct mcpwm_fault_event_data_t
```
MCPWM fault event data.

```c
struct mcpwm_compare_event_data_t
```
MCPWM compare event data.

**Public Members**

```c
uint32_t compare_ticks
```
Compare value
Chapter 2. API Reference

`mcpwm_timer_direction_t` \textit{direction}

Count direction

struct `mcpwm_capture_event_data_t`

MCPWM capture event data.

Type Definitions

typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t
MCPWM timer clock source.

typedef soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t
MCPWM capture clock source.

Enumerations

define mcpwm_timer_direction_t
MCPWM timer count direction.
    Values:
enumerator **MCPWM_TIMER_DIRECTION_UP**  
Counting direction: Increase

enumerator **MCPWM_TIMER_DIRECTION_DOWN**  
Counting direction: Decrease

enum **mcpwm_timer_event_t**  
MCPWM timer events.

Values:

enumerator **MCPWM_TIMER_EVENT_EMPTY**  
MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM_TIMER_EVENT_FULL**  
MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM_TIMER_EVENT_INVALID**  
MCPWM timer invalid event

enum **mcpwm_timer_count_mode_t**  
MCPWM timer count modes.

Values:

enumerator **MCPWM_TIMER_COUNT_MODE_PAUSE**  
MCPWM timer paused

enumerator **MCPWM_TIMER_COUNT_MODE_UP**  
MCPWM timer counting up

enumerator **MCPWM_TIMER_COUNT_MODE_DOWN**  
MCPWM timer counting down

enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**  
MCPWM timer counting up and down

enum **mcpwm_timer_start_stop_cmd_t**  
MCPWM timer commands, specify the way to start or stop the timer.

Values:

enumerator **MCPWM_TIMER.Stop_EMPTY**  
MCPWM timer stops when next count reaches zero

enumerator **MCPWM_TIMER_STOP_FULL**  
MCPWM timer stops when next count reaches peak

enumerator **MCPWM_TIMER_START_NO_STOP**  
MCPWM timer starts counting, and don’t stop until received stop command
enum MCPWM_TIMER_START_STOP_EMPTY
MCPWM timer starts counting and stops when next count reaches zero

enumerator MCPWM_TIMER_START_STOP_FULL
MCPWM timer starts counting and stops when next count reaches peak

enum mcpwm_generator_action_t
MCPWM generator actions.
Values:

enumerator MCPWM_GEN_ACTION_KEEP
Generator action: Keep the same level

enumerator MCPWM_GEN_ACTION_LOW
Generator action: Force to low level

enumerator MCPWM_GEN_ACTION_HIGH
Generator action: Force to high level

enumerator MCPWM_GEN_ACTION_TOGGLE
Generator action: Toggle level

enum mcpwm_operator_brake_mode_t
MCPWM operator brake mode.
Values:

enumerator MCPWM_OPER_BRAKE_MODE_CBC
Brake mode: CBC (cycle by cycle)

enumerator MCPWM_OPER_BRAKE_MODE_OST
Brake mode, OST (one shot)

enumerator MCPWM_OPER_BRAKE_MODE_INVALID
MCPWM operator invalid brake mode

enum mcpwm_capture_edge_t
MCPWM capture edge.
Values:

enumerator MCPWM_CAP_EDGE_POS
Capture on the positive edge

enumerator MCPWM_CAP_EDGE_NEG
Capture on the negative edge
2.6.13 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32 contains multiple pulse counter units in the module. Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured to react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- Resource Allocation - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- Set Up Channel Actions - covers how to configure the PCNT channel to behave on different signal edges and levels.
- Watch Points - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- Register Event Callbacks - describes how to hook your specific code to the watch point event callback function.
- Set Glitch Filter - describes how to enable and set the timing parameters for the internal glitch filter.
- Enable and Disable Unit - describes how to enable and disable the PCNT unit.
- Unit IO Control - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- Power Management - describes what functionality will prevent the chip from going into low power mode.
- IRAM Safe - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.
- Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation  The PCNT unit and channel are represented by pcnt_unit_handle_t and pcnt_channel_handle_t respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

Install PCNT Unit  To install a PCNT unit, there’s a configuration structure that needs to be given in advance: pcnt_unit_config_t:

- pcnt_unit_config_t::low_limit and pcnt_unit_config_t::high_limit specify the range for the internal counter. Counter will back to zero when it crosses either limit value.

1 Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more PCNT units and channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. pcnt_new_unit()).
Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e. unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it’s recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100
pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

Install PCNT Channel To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by edge type signal and level type signal. Please note, either of them can be assigned to -1 if it’s not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO will cause that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for edge and level input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to -1.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO’s input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e. channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it’s recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2
(continues on next page)
Set Up Channel Actions  The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- **pcnt_channel_set_edge_action()** function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- **pcnt_channel_set_level_action()** function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to -1 when allocating PCNT channel by `pcnt_new_channel()`.

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_→DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_→counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_→KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

Watch Points Each PCNT unit can be configured to watch several different values that you’re interested in. The value to be watched is also called Watch Point. The watch point itself can’t exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See Register Event Callbacks for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly used watch points are: zero cross, maximum / minimum count and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can’t find any free hardware resource to save the watch point. You can’t add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```c
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

Register Event Callbacks When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

```c
pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```
• `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different counting direction and counting step size.

Registering callback function will result in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

### Set Glitch Filter
The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and won’t increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (usually 12.5 ns if APB equals 80MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter won’t work as expect in that case. So the driver will install a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see **Power Management**.

```c
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
```
Enable and Disable Unit  Before doing IO control to the PCNT unit, you need to enable it first, by calling \textit{pcnt\_unit\_enable()}. Internally, this function will:

- switch the PCNT driver state from \textit{init} to \textit{enable}.
- enable the interrupt service if it has been lazy installed in \textit{pcnt\_unit\_register\_event\_callbacks()}.
- acquire a proper power management lock if it has been lazy installed in \textit{pcnt\_unit\_set\_glitch\_filter()}. See also Power Management for more information.

On the contrary, calling \textit{pcnt\_unit\_disable()} will do the opposite, that is, put the PCNT driver back to the \textit{init} state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear  Calling \textit{pcnt\_unit\_start()} will make the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling \textit{pcnt\_unit\_stop()} will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling \textit{pcnt\_unit\_clear\_count()}.  

Note, \textit{pcnt\_unit\_start()} and \textit{pcnt\_unit\_stop()} should be called when the unit has been enabled by \textit{pcnt\_unit\_enable()}. Otherwise, it will return \textit{ESP\_ERR\_INVALID\_STATE} error.

Get Count Value  You can check current count value at any time by calling \textit{pcnt\_unit\_get\_count()}.  

Note: The returned count value is a \textit{signed} integer, where the sign can be used to reflect the direction. The internal counter will overflow when it reaches high or low limit, but this function doesn’t compensate for that loss.

```c
int pulse_count = 0;
ESP\_ERROR\_CHECK(pcnt\_unit\_get\_count(pcnt\_unit, &pulse\_count));
```

Power Management  When power management is enabled (i.e. \textit{CONFIG\_PM\_ENABLE} is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type \textit{ESP\_PM\_APB\_FREQ\_MAX}. Whenever you enable the glitch filter by \textit{pcnt\_unit\_set\_glitch\_filter()}, the driver will guarantee that the power management lock is acquired after the PCNT unit is enabled by \textit{pcnt\_unit\_enable()}. Likewise, the driver releases the lock after \textit{pcnt\_unit\_disable()} is called.

IRAM Safe  By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option \textit{CONFIG\_PCNT\_ISR\_IRAM\_SAFE} that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

\textsuperscript{2} \textit{pcnt\_event\_callbacks_t::on\_reach} callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.
This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see IRAM Safe for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Examples**

- Decode the quadrature signals from rotary encoder: peripherals/pcnt/rotary_encoder.

**API Reference**

**Header File**

- `components/driver/include/driver/pulse_cnt.h`

**Functions**

```
esp_err_t pcnt_new_unit(const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)
```

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- `config` [in] PCNT unit configuration
- `ret_unit` [out] Returned PCNT unit handle

**Returns**

- ESP_OK: Create PCNT unit successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)`
Delete the PCNT unit handle.

**Note:** A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

`esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)`
Set glitch filter for PCNT unit.

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** - [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**
- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

`esp_err_t pcnt_unit_enable (pcnt_unit_handle_t unit)`
Enable the PCNT unit.

**Note:** This function will transit the unit state from init to enable.
Note: This function will enable the interrupt service, if it’s lazy installed in pcnt_unit_register_event_callbacks().

Note: This function will acquire the PM lock if it’s lazy installed in pcnt_unit_set_glitch_filter().

Note: Enable a PCNT unit doesn’t mean to start it. See also pcnt_unit_start() for how to start the PCNT counter.

Parameters

- unit - [in] PCNT unit handle created by pcnt_new_unit()

Returns

- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error

esp_err_t pcnt_unit_disable (pcnt_unit_handle_t unit)

Disable the PCNT unit.

Note: This function will do the opposite work to the pcnt_unit_enable()

Note: Disable a PCNT unit doesn’t mean to stop it. See also pcnt_unit_stop() for how to stop the PCNT counter.

Parameters

- unit - [in] PCNT unit handle created by pcnt_new_unit()

Returns

- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

esp_err_t pcnt_unit_start (pcnt_unit_handle_t unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

Note: This function should be called when the unit is in the enable state (i.e. after calling pcnt_unit_enable())

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters

- unit - [in] PCNT unit handle created by pcnt_new_unit()
### Returns

- **ESP_OK**: Start PCNT unit successfully
- **ESP_ERR_INVALID_ARG**: Start PCNT unit failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Start PCNT unit failed because the unit is not enabled yet
- **ESP_FAIL**: Start PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_stop (pcnt_unit_handle_t unit)
```

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

**Note:** The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters**

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`

---

**Returns**

- **ESP_OK**: Stop PCNT unit successfully
- **ESP_ERR_INVALID_ARG**: Stop PCNT unit failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Stop PCNT unit failed because the unit is not enabled yet
- **ESP_FAIL**: Stop PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit)
```

Clear PCNT pulse count value to zero.

---

**Note:** It’s recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled

---

**Parameters**

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`

---

**Returns**

- **ESP_OK**: Clear PCNT pulse count successfully
- **ESP_ERR_INVALID_ARG**: Clear PCNT pulse count failed because of invalid argument
- **ESP_FAIL**: Clear PCNT pulse count failed because of other error

```c
esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int *value)
```

Get PCNT count value.
Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled

Parameters
- unit - [in] PCNT unit handle created by pcnt_new_unit()
- value - [out] Returned count value

Returns
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

\[\text{esp_err_t} \ \text{pcnt_unit_register_event_callbacks} (\text{pcnt_unit_handle_t} \ \text{unit}, \text{const pcnt_event_callbacks_t} *\text{cbs}, \text{void} *\text{user_data})\]

Set event callbacks for PCNT unit.

Note: User registered callbacks are expected to be runnable within ISR context

Note: This function is only allowed to be called when the unit is in the init state (i.e. before calling pcnt_unit_enable())

Parameters
- unit - [in] PCNT unit handle created by pcnt_new_unit()
- cbs - [in] Group of callback functions
- user_data - [in] User data, which will be passed to callback functions directly

Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the unit is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

\[\text{esp_err_t} \ \text{pcnt_unit_add_watch_point} (\text{pcnt_unit_handle_t} \ \text{unit}, \text{int} \ \text{watch_point})\]

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

Parameters
- unit - [in] PCNT unit handle created by pcnt_new_unit()
- watch_point - [in] Value to be watched

Returns
- ESP_OK: Add watch point successfully
- ESP_ERR_INVALID_ARG: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in \text{pcnt_unit_config_t})
- ESP_ERR_INVALID_STATE: Add watch point failed because the same watch point has already been added
- ESP_ERR_NOT_FOUND: Add watch point failed because no more hardware watch point can be configured
- ESP_FAIL: Add watch point failed because of other error

\[\text{esp_err_t} \ \text{pcnt_unit_remove_watch_point} (\text{pcnt_unit_handle_t} \ \text{unit}, \text{int} \ \text{watch_point})\]

Remove a watch point for PCNT unit.
### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Watch point value

### Returns
- **ESP_OK**: Remove watch point successfully
- **ESP_ERR_INVALID_ARG**: Remove watch point failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- **ESP_FAIL**: Remove watch point failed because of other error

```c
esp_err_t pcnt_new_channel (pcnt_unit_handle_t unit, const pcnt_chan_config_t *config, pcnt_channel_handle_t *ret_chan)
```

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** - [in] PCNT channel configuration
- **ret_chan** - [out] Returned channel handle

### Returns
- **ESP_OK**: Create PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Create PCNT channel failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create PCNT channel failed because of insufficient memory
- **ESP_ERR_NOT_FOUND**: Create PCNT channel failed because all PCNT channels are used up and no more free one
- **ESP_ERR_INVALID_STATE**: Create PCNT channel failed because the unit is not in the init state
- **ESP_FAIL**: Create PCNT channel failed because of other error

```c
esp_err_t pcnt_del_channel (pcnt_channel_handle_t chan)
```

Delete the PCNT channel.

### Parameters
- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`

### Returns
- **ESP_OK**: Delete the PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Delete the PCNT channel failed because of invalid argument
- **ESP_FAIL**: Delete the PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_edge_action (pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
```

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

### Parameters
- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`
- **pos_act** - [in] Action on posedge signal
- **neg_act** - [in] Action on negedge signal

### Returns
- **ESP_OK**: Set edge action for PCNT channel successfully
- **ESP_ERR_INVALID_ARG**: Set edge action for PCNT channel failed because of invalid argument
- **ESP_FAIL**: Set edge action for PCNT channel failed because of other error
`esp_err_t pcnt_channel_set_level_action(pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)`

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**
- `chan` [in] PCNT channel handle created by `pcnt_new_channel()`
- `high_act` [in] Action on high level signal
- `low_act` [in] Action on low level signal

**Returns**
- ESP_OK: Set level action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set level action for PCNT channel failed because of other error

**Structures**

`struct pcnt_watch_event_data_t`

PCNT watch event data.

**Public Members**

- `int watch_point_value`
  Watch point value that triggered the event

  `pcnt_unit_zero_cross_mode_t zero_cross_mode`
  Zero cross mode

`struct pcnt_event_callbacks_t`

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Note:** When `CONFIG_PCNT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM.

---

**Public Members**

- `pcnt_watch_cb_t on_reach`
  Called when PCNT unit counter reaches any watch point

`struct pcnt_unit_config_t`

PCNT unit configuration.

**Public Members**
Chapter 2. API Reference

```c
int low_limit
    Low limitation of the count unit, should be lower than 0

int high_limit
    High limitation of the count unit, should be higher than 0

struct pcnt_chan_config_t
    PCNT channel configuration.

Public Members

int edge_gpio_num
    GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int level_gpio_num
    GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t invert_edge_input
    Invert the input edge signal

uint32_t invert_level_input
    Invert the input level signal

uint32_t virt_edge_io_level
    Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t virt_level_io_level
    Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct pcnt_chan_config_t::[anonymous] flags
    Channel config flags

struct pcnt_glitch_filter_config_t
    PCNT glitch filter configuration.

Public Members

uint32_t max_glitch_ns
    Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions

typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.
typedef struct pcnt_chan_t *pcnt_channel_handle_t
    Type of PCNT channel handle.

typedef bool (*pcnt_watch_cb_t)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
    PCNT watch event callback prototype.

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

**Header File**
- components/hal/include/hal/pcnt_types.h

**Enumerations**

enum pcnt_channel_level_action_t
    PCNT channel action on control level.

    **Values:**

    enumerator PCNT_CHANNEL_LEVEL_ACTION_KEEP
        Keep current count mode

    enumerator PCNT_CHANNEL_LEVEL_ACTION_INVERSE
        Invert current count mode (increase -> decrease, decrease -> increase)

    enumerator PCNT_CHANNEL_LEVEL_ACTION_HOLD
        Hold current count value

enum pcnt_channel_edge_action_t
    PCNT channel action on signal edge.

    **Values:**

    enumerator PCNT_CHANNEL_EDGE_ACTION_HOLD
        Hold current count value

    enumerator PCNT_CHANNEL_EDGE_ACTION_INCREASE
        Increase count value

    enumerator PCNT_CHANNEL_EDGE_ACTION_DECREASE
        Decrease count value

enum pcnt_unit_zero_cross_mode_t
    PCNT unit zero cross mode.

    **Values:**
Chapter 2. API Reference

enumerator PCNT_UNIT_ZERO_CROSS_POS_ZERO
start from positive value, end to zero, i.e. +N->0

enumerator PCNT_UNIT_ZERO_CROSS_NEG_ZERO
start from negative value, end to zero, i.e. -N->0

enumerator PCNT_UNIT_ZERO_CROSS_NEG_POS
start from negative value, end to positive value, i.e. -N->+M

enumerator PCNT_UNIT_ZERO_CROSS_POS_NEG
start from positive value, end to negative value, i.e. +N->-M

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, the functionality of RMT can be extended to a versatile and general purpose transceiver. From the perspective of network layering, the RMT hardware contains both physical and data link layer. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called RMT symbol, which is represented by rmt_symbol_word_t in the driver.

ESP32 contains multiple channels in the RMT peripheral. Each channel can be configured as either transmitter or receiver, independently.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g. NEC
- General purpose sequence generator
- Transmit signals in a hardware controlled loop, with finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols

The RMT hardware defines data in its own pattern—the RMT symbol. Each symbol consists of two pairs of two values. The first value in a pair describes the signal duration in RMT ticks and is 15 bits long. The second provides the signal level (high or low) and is contained in a single bit, as shown below:

RMT Transmitter Overview

The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver will encode user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview

The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It’s feasible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high frequency carrier from the base signal.

---

1 Different ESP chip series might have different number of RMT channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more RMT channels, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.

Fig. 14: RMT Transmitter Overview

Fig. 15: RMT Receiver Overview
Chapter 2. API Reference

Functional Overview

Description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate RMT channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Carrier Modulation and Demodulation** - describes how to modulate carrier for TX channel and demodulate carrier for RX channel.
- **Register Event Callbacks** - covers how to hook user specific code to RMT channel specific events.
- **Enable and Disable channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group and start transaction at the same time.
- **RMT Encoder** - focuses on how to write a customized encoder in a combination way, with the help of the primitive encoders provided by the driver.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation**  Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The available channels are managed in a resource pool, which will hand out a free channel on request.

**Install RMT TX Channel**  To install an RMT TX channel, there’s a configuration structure that needs to be given in advance: `rmt_tx_channel_config_t`:

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that is used to store RMT encoding artifacts.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.
- `rmt_tx_channel_config_t::io_od_mode` configures the GPIO as open-drain mode. It is useful for simulating bi-directional buses, such as 1-wire bus, combined with `rmt_tx_channel_config_t::io_loop_back`.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return `ESP_ERR_NOT_FOUND` error. If some feature (e.g. DMA backend) is not supported by hardware, it will return `ESP_ERR_NOT_SUPPORTED` error.
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .gpio_num = 0, // GPIO number
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .trans_queue_depth = 4, // set the number of transactions that can... pending in the background
    .flags.invert_out = false, // don't invert output signal
    .flags.with_dma = false, // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));

Install RMT RX Channel  To install an RMT RX channel, there’s a configuration structure that needs to be given in advance: rmt_rx_channel_config_t:

• rmt_rx_channel_config_t::gpio_num sets the GPIO number used by the receiver.
• rmt_rx_channel_config_t::clk_src selects the source clock for the RMT channel. The available clocks are listed in rmt_clock_source_t. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to Power Management section.
• rmt_rx_channel_config_t::resolution_hz sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
• rmt_rx_channel_config_t::mem_block_symbols sets the size of the dedicated memory block or DMA buffer that used to store RMT encoding artifacts.
• rmt_rx_channel_config_t::invert_in is used to decide whether to invert the input signals before they going into RMT receiver. The inversion is done by GPIO matrix instead of by the RMT peripheral.
• rmt_rx_channel_config_t::with_dma is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter ESP_ERR_NOT_SUPPORTED error.
• rmt_rx_channel_config_t::io_loop_back is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

Once the rmt_rx_channel_config_t structure is populated with mandatory parameters, users can call rmt_new_rx_channel() to allocate and initialize a RX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return ESP_ERR_NOT_FOUND error. If some feature (e.g. DMA backend) is not supported by hardware, it will return ESP_ERR_NOT_SUPPORTED error.

rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
    .gpio_num = 2, // GPIO number
    .flags.invert_in = false, // don’t invert input signal
    .flags.with_dma = false, // don’t need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));

Uninstall RMT Channel  If a previously installed RMT channel is no longer needed, it’s recommended to recycle the resources by calling rmt_del_channel(), which in return allows the underlying hardware to be usable for other purposes.
Carrier Modulation and Demodulation  The RMT transmitter can generate a carrier wave and modulate it onto the base signal. Compared to the base signal, the carrier frequency is usually high. In addition, user can only set the frequency and duty cycle for the carrier. The RMT receiver can demodulate the carrier from the incoming signal. Note that, carrier modulation and demodulation is not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter an ESP_ERR_NOT_SUPPORTED error.

Carrier related configurations lie in rmt_carrier_config_t:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e. on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for TX channel.

Note: For RX channel, we shouldn’t set the carrier frequency exactly to the theoretical value. It’s recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25KHz, instead of the 38KHz that configured on the TX side. The reason is that reflection and refraction will occur when a signal travels through the air, leading to a distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {    
  .duty_cycle = 0.33, // duty cycle 33%    
  .frequency_hz = 38000, // 38KHz    
  .flags.polarity_active_low = false, // carrier should modulated to high level
}; // modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {    
  .duty_cycle = 0.33, // duty cycle 33%    
  .frequency_hz = 25000, // 25KHz carrier, should be smaller than transmitter's carrier frequency    
  .flags.polarity_active_low = false, // the carrier is modulated to high level
}; // demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks  When an RMT channel finishes transmitting or receiving, a specific event will be generated and notify the CPU by interrupt. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

TX channel supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for trans done event. The function prototype is declared in `rmt_tx_done_callback_t`.

RX channel supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for receive complete event. The function prototype is declared in `rmt_rx_done_callback_t`.

User can save own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to each callback function.
In the callback function, users can fetch the event specific data that is filled by the driver in the edata. Note that the edata pointer is only valid for the duration of the callback.

The TX done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` tells the number of transmitted RMT symbols. This also reflects the size of encoding artifacts.

The RX complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the buffer parameter of `rmt_receive()` function. User shouldn’t free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` tells the number of received RMT symbols. This value won’t be bigger than buffer_size parameter of `rmt_receive()` function. If the buffer_size is not sufficient to accommodate all the received RMT symbols, the driver will truncate it.

**Enable and Disable channel**  
`rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For transmitters, enabling a channel will enable a specific interrupt and prepare the hardware to dispatch transactions. For RX channels, enabling a channel will enable an interrupt, but the receiver is not started during this time, as it has no idea about the characteristics of the incoming signals. The receiver will be started in `rmt_receive()`.

`rmt_disable()` does the opposite work by disabling the interrupt and clearing pending status. The transmitter and receiver will be disabled as well.

```c
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction**  
RMT is a special communication peripheral as it’s unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware doesn’t help to convert the user data into RMT symbols, this can only be done in software — by the so-called RMT Encoder. The encoder is responsible for encoding user data into RMT symbols and then write to RMT memory block or DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder].

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, payload buffer. Besides that, we also need to provide a transmission specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loop. After the transmitter finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences at the cost of a very little CPU intervention. Specially, setting `rmt_transmit_config_t::loop_count` to -1 means an infinite loop transmission. In this situation, the channel won’t stop until manually call of `rmt_disable()`. And the trans done event won’t be generated as well. If `rmt_transmit_config_t::loop_count` is set to a positive number, the trans done event won’t be generated until target number of loop transmission have finished. Note that, the loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option. Or you might encounter ESP_ERR_NOT_SUPPORTED error.
- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.

**Note:** There’s a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero (i.e. to enable the loop feature). The encoded RMT symbols should not exceed the capacity of RMT hardware memory block size. Or you might see error message like encoding artifacts can’t exceed hw memory block for loop transmission. If you have to start a large transaction by loop, you can try either:
• Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach doesn’t work if the DMA backend is also enabled.

• Customize an encoder and construct a forever loop in the encoding function. See also RMT Encoder.

Internally, `rmt_transmit()` will construct a transaction descriptor and send to a job queue, which will be dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transaction to complete, user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission**  In some real-time control applications, we don’t want any time drift in between when startup multiple TX channels. For example, to make two robotic arms move simultaneously. The RMT driver can help to manage this by creating a so-called Sync Manager. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

![RMT TX Sync](image)

**Install RMT Sync Manager**  To create a sync manager, user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Specially, when the sync manager has been installed before, and there’re no hardware resources to create another manager, this function will report ESP_ERR_NOT_FOUND error. In addition, if the sync manager is not supported by the hardware, it will report ESP_ERR_NOT_SUPPORTED error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously**  For any managed TX channel, it won’t start the machine until all the channels in the `rmt_sync_manager_config_t::tx_channel_array` are called with `rmt_transmit()`. Before that, the channel is just put in a waiting state. Different channel usually take different time to finish the job if the transaction is different, which results in a loss of sync. So user needs to call `rmt_sync_reset()` to pull the channels back to the starting line again before restarting a simultaneous transmission.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterwards.
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = (0, 2);
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}

// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_num * 3, &transmit_config));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_num * 3, &transmit_config));
